##
DELL(TM) OPENMANAGE(TM) DEPLOYMENT TOOLKIT README FOR EMBEDDED LINUX
##

Version 3.0
Release Date: March 2009

This file contains updated information for your "Dell OpenManage
Deployment Toolkit User's Guide" and any other technical
documentation included with the Deployment Toolkit (DTK).

The DTK documentation includes the "Command Line
Interface Reference Guide" and the "User's Guide." See the Dell
Support website at "support.dell.com" for the most current
information.

##
CRITICALITY
##

3 - Optional

Dell recommends that you review the specifics about the update to
determine if it applies to your system. The update contains changes
that may impact only certain configurations, or provides new
features that may/may not apply to your environment.

##
COMPATIBILITY/MINIMUM REQUIREMENTS
##

The Deployment Toolkit version 3.0 supports the following Dell
PowerEdge(TM) systems:

800, 830, 840, 850, 860, 1800, 1850, 1855, 2800, 2850, 6800,
6850, 1900, 1950, 1955, 2900, 2970, 6950, SC1435, 2950, T105, R200,
R900, R805, M600, M605, T605, R300, T300, R805, R905, M805, M905,
R610, R710, T610, M610 and M710.

NOTE: Other systems may be supported with this release. See the Dell
    Support website at "support.dell.com" to verify the supported
    systems and to download the latest version of the toolkit.

The sample scripts included with DTK have been tested with the
deployment of the following operating systems:

    - Red Hat Enterprise Linux Server version 4 (32- and 64-bit)
    - Red Hat Enterprise Linux Server version 5 (32- and 64-bit)
    - SUSE(R) Linux Enterprise Server version 10 (64-bit)

==
Installation Prerequisites
==

Before installing the DTK components for embedded Linux, ensure
that you have:

* The DTK ISO image, which contains the utilities, sample scripts,
  sample configuration files, and documentation you need to deploy
  your Dell system

* A Linux workstation that has at least 200 MB of free hard-drive
  space

When building customized Linux ISOs, you might need to incorporate
the following Red Hat Package Managers (RPMs) and scripts provided
by DTK to ensure a successful build:

* dell.tar.gz - Dell Deployment Toolkit which contains the DTK tools
  and sample scripts.

* omreg.cfg - Configuration file for instrumentation software. Edit
  this file, if required, to point to where the DTK tools are placed.
  The modified file should be under the location "/etc."

* start-hapi.sh - Startup script to load and configure the HAPI
  drivers. You need to run this script to load the OpenIPMI Modules
  and to create files required by HAPI.

* start-raid.sh - Contains basic setup for RAID to work. You need to
  run this script to create device nodes required by RAIDCFG and
  files required by HAPI.

* start-stage3.sh - A sample DTK startup script that loads all
  the modules and drivers required for the ISO to work. You will
  have to replicate this setup in your customized Linux ISO.

* srvadmin-hapi RPM - Contains a set of libraries and drivers used
  by DTK tools to interact with the hardware.

* srvadmin-omilcore RPM - Contains a set of libraries and drivers

used by DTK tools to interact with the hardware

If you have the DTK CD mounted under "/mnt/cdrom," you can extract
the DTK tools, scripts, and other essentials to build your customized
ISO image under the "tools" folder at the root of the CD.

==
Deployment Prerequisites
==

Before installing DTK components, ensure that you have:

* Advanced knowledge of Linux and Linux scripting (BASH), Linux
  networking, installing and working with RPMs, and creating and
  modifying loop file systems.

* Any third party deployment system or tool.

* A workstation that has
      -At least 500 MB of free hard-drive space
      -A writable CD drive and CD-writing software (optional)
      -Network access

* A minimum BIOS version is recommended on some of the platforms for
  all the DTK options to work correctly. In general, it is good
  practice to use the latest ("n") version of BIOS firmware or
  the "n-1" version that is available on "support.dell.com."

##
RELEASE HIGHLIGHTS - FEATURES
##

The new features for DTK version 3.0 include:

* Support for Dell PowerEdge system R610, R710, T610, M610 and M710.

  NOTE: Other systems may be supported with this release. Check
        "support.dell.com" to verify the supported systems and to
        download the latest version of the toolkit.

##
RELEASE HIGHLIGHTS - FIXES
##

N/A

##
INSTALLATION
##

For complete installation instructions, see the "Dell OpenManage
Deployment Toolkit User's Guide."

```
##############################################################################
UPGRADING
##############################################################################
```

When upgrading from a previous release (1.x) of the DTK, ensure that
you create the new DTK version 3.x environment separately from your
previous version of DTK. This step is necessary because the
environments and requirements for DTK version 3.x are completely
different.

```
##############################################################################
USER NOTES
##############################################################################
```

This section provides information that can help enhance your
experience with the DTK.

* The sample scripts are provided as examples for customers that want
  to develop their own deployment process. Some customers may find
  that the scripts work well in their environment, while some
  customers may need to develop their own scripts entirely from
  scratch. Customers deploying multiple systems need to provide
  unique information for each server when appropriate. For example,
  system host names, IP addresses, and BIOS asset tags need to be
  unique for each system. The batch scripts and configuration files
  need to be modified to reflect the unique information for each
  system being deployed. Many options are available to optimize this
  process.

* In the previous releases, you could use a system profile
  generated on a specific Dell system to deploy only that same system
  model. Beginning this release, you can use a system BIOS
  configuration profile generated for all systems belonging to the
  same generation.
  For example, "syscfg_x8xx.ini" for x8xx systems, "syscfg_x9xx.ini"
  for x9xx systems, and so on.

* The "sshd" port is left open on the server after the DTK CD is
  booted. You can log in as "root" without a password. This is done
  so that scripts can be debugged easily. However, it could be a
  security issue to leave the CD booted on a system.

```
=============================================================================
TOOL NOTES
=============================================================================
```

* SYSCFG:

  - Some options may not be present on all systems, which may
    be due to the BIOS version or hardware feature set. The usage
    information generated by running SYSCFG without arguments shows

only those options that are valid for your system.

- The "--devseq" option is present only if you have an
  available, bootable hard-disk partition. If this option is
  present in the configuration file, but not present on your
  system, you will receive a usage error.

- You may need to reboot your system for options to be enabled.
  Dell recommends you use the "reboot" command on shell prompt
  or press the "Ctrl+Alt+Del" keys.

- If you perform operations that change the "--redmem"
  option, reboot the system immediately. This is applicable
  to command line usage as well as "--infile" usage.

   NOTE: Additionally, the "--redmem" option should not be
       issued with any other command and should be
       immediately followed by a system reboot. This is
       important when you develop scripts that can alter
       the "--redmem" setting.

- For options that use text strings such as username,
  password, hostname, and community string, using characters
  such as <space>, "<," ">," "|," "=" on the command line can be
  misinterpreted by the command line parser and may cause errors.
  To avoid such errors, use only alphanumeric characters.

- If you set the username using syscfg username option, SOL access
  for the corresponding user will be enabled by default. You can
  disable SOL access for a user using "syscfg solaction
  --userid=<userid> --action=disable" command.

- The maximum reliably supported baud rates (--solbitrate) are:
    - 19200 for PowerEdge x8xx systems.
    - 57600 for PowerEdge x9xx systems without Dell Remote
      Access Controller 5 (DRAC 5).
    - 115200 for PowerEdge x9xx systems with DRAC 5.
  If you enter an unsupported baud rate, you may receive an
  error, "Parameter out of range."

* RAIDCFG:

- When creating virtual disks, the chunk (stripe) size is always
  in KB. Do not specify any units for the chunk size.

- When providing multiple physical disks for the "create
  virtual disk" command, do not separate the disks with spaces.
  For example, "-ad=1:4, 1:5" causes an error. The correct way
  to input multiple physical disks is "-ad=1:4,1:5,1:6" or
  "-ad=1:4:0,1:5:0,1:6:0".

 - If you change the controller mode from SCSI to RAID mode,

expect data loss to occur. Back up any data you want to save
before changing the modes.

##
KNOWN ISSUES
##

RAIDCFG Issues:

* You cannot delete a virtual disk on CERC SATA 2S when RAID 1 is
  created. The virtual disk can be cleared from the controller BIOS.

* Because of an issue in the kernel, for PowerEdge 1855 systems,
  you must reboot your system after you create a virtual disk, to
  use the created virtual disk. This only affects PERC 4/IM
  controllers.
  (116779)

SYSCFG Issues:

* Demand based power management (DBPM) option does not work on
  PowerEdge 1855 with BIOS firmware versions earlier than A05.

* The suboption for "powerctl," "softshutdown," causes your system
  to reboot. If you use a customized kernel with Advanced
  Configuration and Power Interface (ACPI) support, this option
  will work as designed.

* Using the "solcfgparams" option may produce an error message saying
  "Hardware subsystem error" when an invalid value is used. This does
  not indicate a problem with the hardware. Check the option value
  and try again.

* The "--solbitrate" option in "solcfgparams" and the
  "--msgcommbitrate" option in "serialcfgparams" accept a baud
  rate of 57600, but tools such as "ipmish" and "solproxy" do not
  function at this baud rate for PowerEdge x8xx systems.

* On PowerEdge 1950 and 2950 systems with internal USB, BIOS setting
  configuration for internal USB Port is possible only if
  User Accessible/external (UA) USB ports are set to
  "All Ports On." If UA USB ports are not set to "All Ports On"
  and you try to configure the BIOS setting for the internal USB port
  using SYSCFG, the configuration will appear to be successful
  but the changes will not take effect after the next reboot. If
  UA USB ports settings are changed from "All Ports On" to
  "All Ports Off" or "Only Back Ports On," the USB port will
  be automatically Set to "Off" during the next reboot.

RACADM Issues:

* The "racadm gettracelog" option may cause the system to hang. You

may need to restart the system.

Operating system installation issues:

* Installation of legacy Red Hat Enterprise Linux operating systems
  may fail due to lack of support for new hardware. You should
  modify the '%post' section of "ks.cfg" to update to a newer
  version of the kernel or install the drivers from this section.

* The default root password for Linux installation is "root123."
  This could be changed to be encrypted in the template "ks.cfg"
  provided.

* The Red Hat Enterprise Linux operating system installation may
  fail on systems equipped with multiple RAID and/or SCSI
  controllers, whether installed on the system board or in PCI
  slots. This failure may occur when using "Server Setup" or
  performing a manual installation. When two or more RAID or
  SCSI controllers are present, install Red Hat Enterprise
  Linux with only one configured RAID or SCSI controller.
  Configure the other controllers after you install the Red
  Hat Enterprise Linux operating system.

Instrumentation issues:

* The "/opt/dell/srvadmin" directory in the DTK ISO image should be
  writable. This enables the instrumentation services to
  work properly.

* The file "omreg.cfg" should be present in the "/etc/" directory
  for the tools to function properly. This is applicable if DTK
  is being customized to fit in an embedded Linux environment
  other than the Dell-provided embedded Linux.

and trade names other than its own.

The sample scripts provided with the Dell OpenManage Deployment
Toolkit are provided "as is." Dell disclaims any and all warranties,
express, implied or statutory, with respect to the sample scripts,
including, but not limited to, the implied warranties of
merchantability, fitness for a particular purpose, title and any
warranty of non-infringement. Use the sample scripts at your own
risk. Dell shall not be liable for any direct or indirect damages
incurred in using the sample scripts. In no event shall Dell or its
suppliers be responsible for any direct or indirect damages
whatsoever (including, without limitation, damages for loss of
profits, loss of use, loss of data, business interruption, or
other pecuniary loss, nor for punitive, incidental, consequential,
or special damages of any kind, under any part of this agreement,
even if advised or aware of the possibility of such damage.
