Introducing Dell™ OpenManage™ IT Assistant

Dell™ OpenManage™ IT Assistant provides a central point of access to monitor and manage systems on a local area network (LAN) or wide area network (WAN). By allowing an administrator a comprehensive view across the enterprise, IT Assistant can increase system uptime, automate repetitive tasks, and prevent interruption in critical business operations.

Simplifying System Administration

You can use IT Assistant to do the following:

- "Identify the Systems for Remote Management"
- "Generate a Consolidated View of All Your Systems"
- "Create Alert Filters and Actions"
- "Create Customized Discovery and Inventory Reports"
- "Create Tasks That Enable Configuration Management From a Central Console"
- "Install Dell Agents on Dell Systems"
- "Measure the Performance of Systems"
- "Monitor the Power and Energy Consumption of Dell Systems"

Identify the Systems for Remote Management

IT Assistant performs discovery and status polling, allowing system administrators to identify systems and devices on a network by host name, IP address, or IP subnet range. During a status poll, IT Assistant queries the health, or *status*, of a system and its components. Information that is gathered during discovery and status polling is displayed in the management console and written to the IT Assistant database. The default database packaged with IT Assistant is the Microsoft® SQL Server® 2005 Express Edition SP2. If you require a more powerful database, use Microsoft SQL 2005 Server or SQL Server 2000.

Generate a Consolidated View of All Your Systems

IT Assistant allows system administrators to take actions on managed systems from the management console. Using IT Assistant, you can create tasks that apply to a single system or each system in a group, create dynamic groups of systems to facilitate management, and conduct inventory on any system.

In addition, IT Assistant provides a consolidated launch point for the following Dell systems management applications and devices: Dell OpenManage Server Administrator, Dell OpenManage Array Manager, Remote Access Console, Dell OpenManage Switch Administrator, Digital keyboard/video/mouse (KVM), printers, tapes, storage devices, client systems and Intelligent Platform Management Interface (IPMI) devices.

Create Alert Filters and Actions

You can use IT Assistant to create alert *filters* to isolate alerts that are of greatest interest to a system administrator. System administrators can then create corresponding alert *actions* that are triggered when the criteria used to define the alert filter are met. For example, IT Assistant can alert a system administrator when a server fan is in warning or critical state. By creating a filter with a corresponding e-mail action, the administrator is e-mailed if a fan reaches the defined status. The administrator can then act on the notification by using IT Assistant to shut down the system, if necessary, or launch Server Administrator to troubleshoot the problem.

Create Customized Discovery and Inventory Reports

Using IT Assistant's report wizard, you can create customized reports for any device or group across the enterprise. These reports can contain device inventory information based on a broad selection of attributes. For example, you can create a report that lists details for each add-on card in all systems in a group, including bus speed and width, manufacturer, and slot length and/or number. IT Assistant also provides a collection of pre-formatted reports that gather common information from the enterprise. The Compliance Tool uses this information to compare the inventory of each managed system with the packages/bundles imported in the IT Assistant repository.

Create Tasks That Enable Configuration Management From a Central Console

IT Assistant enables you to drive common configuration management tasks across the entire enterprise from a single console. By setting up simple tasks using IT Assistant's wizard-based user interface (UI), you can perform device control tasks (shut down/wake up), software updates, deploy agents, export and import tasks, or run command line tasks on systems in your managed group. IT Assistant allows you to load Dell Update Packages (DUP) and System Update Sets (from the *Dell Server Updates* media or from the Dell Support website at support.dell.com) into a central repository, and run a compliance check on systems in the enterprise. The system administrator can then instruct IT Assistant to perform the updates immediately or according to a defined schedule.

NOTE: For Dell OpenManage version 5.3 and above, the Software Update Utility is available only on the Dell Server Updates DVD. However, for Dell OpenManage version below 5.3, the Software Update Utility is available on the Dell PowerEdge™ Server Update Utility CD. For the purposes of this guide, the Dell Server Updates DVD and the Dell PowerEdge Server Update Utility CD will be hereafter called the Server Updates media.

NOTE: To perform a software update, the appropriate agent software must be installed on the target device. For more information on agents, see "Agents on the Systems That You Want to Monitor".

Install Dell Agents on Dell Systems

IT Assistant provides an integrated method to install Dell OpenManage Server Administrator on supported Dell systems. Server Administrator provides a comprehensive, one-to-one systems management solution and is designed for system administrators to manage systems locally and remotely on a network. Server administrator provides the necessary instrumentation for the server and helps maximize server manageability (discovering, classifying, inventorying, monitoring systems, and updating the BIOS, firmware and drivers) from IT Assistant. You can install Server Administrator from the *Dell Systems Management Tools and Documentation* DVD or from the Dell Support website at support.dell.com.

Measure the Performance of Systems

IT Assistant helps you to monitor the performance of a device or a group of devices with supported operating systems over a specified period of time. Performance is monitored with the help of a set of performance counters that you can configure to send alerts when the thresholds are crossed.

Monitor the Power and Energy Consumption of Dell Systems

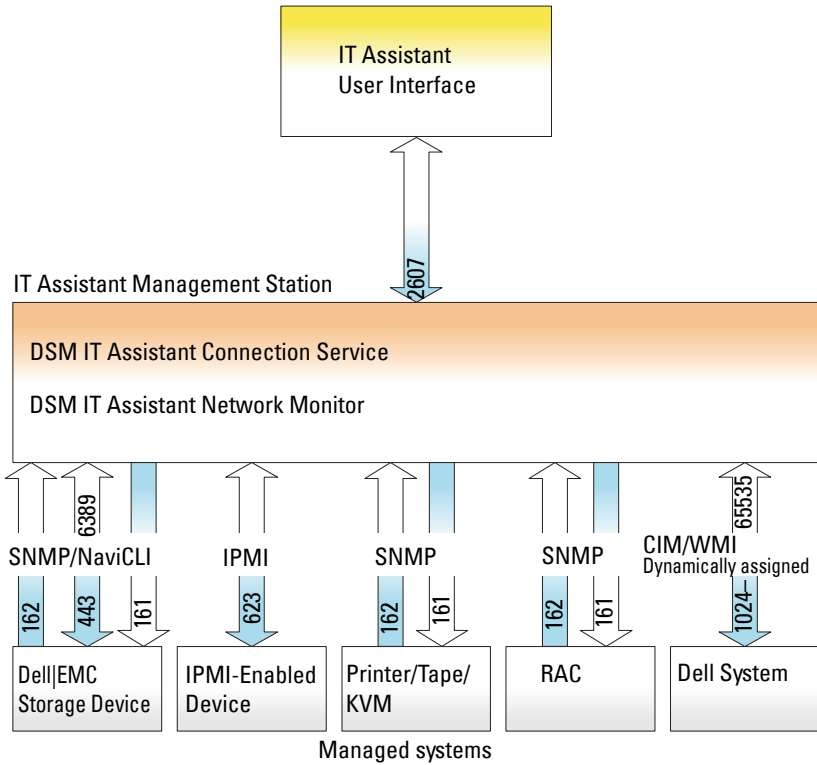

IT Assistant helps you to monitor the power consumption of a single system, a group of systems, and unknown devices on your network. Power Monitoring helps you to collect, store, and display the instantaneous values of power (watts) consumed, amperes drawn by each power supply, and the total energy consumed by a device.

Components of IT Assistant

IT Assistant has the following components:

- "User Interface"
- "IT Assistant Services Tier"(Network Monitoring Service, Connection Service, and database)
- "Managed System"
- "Utilities"

Figure 1-1. IT Assistant User Interface, Services System, and Managed System

NOTE: The numbers in Figure 1-1 are the port numbers used by IT Assistant to communicate with the managed systems. For more information on the ports used by IT Assistant, see IT Assistant UDP/TCP Default Ports.

User Interface

The IT Assistant UI provides a graphical user view of the information gathered by the IT Assistant Services Tier. This information depicts the overall health and configuration details of each system in the managed group. From the IT Assistant UI, you can perform a wide variety of configuration and management tasks, such as specifying systems to discover, creating alert filters and actions, and power-cycling systems.

The IT Assistant UI is based on Sun™ Microsystems™, Java technology. The browser-based UI can be launched from the management station itself or remotely from a different system through either a web browser (Internet Explorer®, Mozilla Firefox) or a web browser launched in a terminal service session on a Windows® or Linux machine.

IT Assistant Services Tier

The IT Assistant Services Tier is installed as part of the standard installation. Technically, the Services Tier consists of:

- Network Monitoring Service
- Connection Service
- Database

In highly customized installations, some users may install their database on a separate system. If you are configuring the simple network management protocol (SNMP) agent on a managed system, trap destinations for the SNMP service must point to the host name or IP address of the system where IT Assistant is installed.

Managed System

For the purposes of IT Assistant, a *managed system* is a system that has supported instrumentation or agents installed that allow the system to be discovered and polled for status. In other words, systems in the managed group that are being monitored by IT Assistant are referred to as managed systems; the system running the IT Assistant UI is generally called the network management station.

IT Assistant simplifies system administration of many managed systems by allowing an administrator to monitor them from one management console. For more information on agents, see "Agents on the Systems That You Want to Monitor".

In this guide, the terms *IT Assistant system* or *network management station* are used to identify the system on which the IT Assistant software is installed.

Utilities

IT Assistant has three utilities:

- **Import Node List Utility:** Allows you to create a file that defines a discovery list comprised of managed devices, IP addresses, or IP address ranges.
- **Database Management Utility:** Allows you to perform operations on databases and tables that reside in the IT Assistant data repository.
- **Simple Network Management Protocol (SNMP) Event Source Import Utility:** Allows you to import multiple event sources, not natively supported in IT Assistant, into the IT Assistant database.

Integrated Features

Native Install

The Dell OpenManage systems management software products are installed using the install process native to the operating system.

User Interface and Online Help

IT Assistant user interface (UI) includes wizard-based dialogs for performing many standard tasks. Comprehensive online help is available, both from the **Help** link at the top right of the IT Assistant window and from context-specific **Help** buttons within individual dialogs and wizards.

Single Sign-On

IT Assistant supports Single Sign-On on Dell systems running supported Windows operating systems. Use Single Sign-On to bypass the login page and directly access IT Assistant by clicking the **IT Assistant** icon on your desktop. The desktop icon queries the registry to see if the **Automatic Logon with current username and password** option is enabled in Internet Explorer. If this option is enabled, then Single Sign-On is executed; otherwise, the normal login page is displayed. For more information on how to set these options, see "Single Sign-On".

User Authentication

Starting with version 7.0, IT Assistant uses operating system or domain-based authentication. The IT Assistant 6.x read/write password is no longer used. For information on the Microsoft Active Directory® schema and how to configure it for use with IT Assistant, including how to install the required snap-in, see the *Dell OpenManage Installation and Security User's Guide*.

Dynamic Groups

You can create dynamic groups of devices to help you manage and monitor them more effectively. For more information, see the Group Configuration topic in the *Dell OpenManage IT Assistant Online Help*.

NOTE: You can re-use the device selection queries created in one module of IT Assistant in other modules as well. For example, a query created from the search-devices module is also available when you are creating or editing a report, an alert filter, or a task.

Inventory Information

IT Assistant collects inventory information, such as software and firmware versions, as well as device-related information about memory, processor, power supply, PCI cards and embedded devices, and storage. For details about the inventory information that IT Assistant collects and stores in its database, see "Add Report — Using the IT Assistant Reporting System" in the online help. For configuring inventory settings, see "Inventory Poll Settings — Configuring IT Assistant to Perform Inventory" in the online help.

Reporting

IT Assistant offers a customizable reporting feature that gathers data from the IT Assistant database. Report results are based on the data gathered in the last discovery and/or inventory cycle.

The report interface wizard is designed to allow you to select actual fields in the IT Assistant database. You can create a report containing information such as:

- Details of the hardware devices being managed by IT Assistant, including systems, switches, and storage devices
- BIOS, firmware, and driver versions

- Field Replaceable Units (FRU) data
- Other asset or Cost Of Ownership details

You can also specify the output format, such as HTML, XML, or comma-separated values (CSV). CSV is normally used in a spreadsheet tool, such as Microsoft Excel[®]. IT Assistant saves the report definitions for later use and retrieval.

To use the IT Assistant report wizard, select **Views**→**Reports**. A full description of the capabilities and steps for using the report wizard is available in the *IT Assistant Online Help*.

Task Management

IT Assistant provides an updated task management functionality that allows you to set up and remotely run certain tasks on all systems in your enterprise, including device control (shutdown and wake up), software update, software deployment, exporting and importing tasks, and command line execution.

To use the task management functionality, select **Manage**→**Tasks**. For more information, see the Task topic in the *IT Assistant Online Help*.

Software Updates

IT Assistant allows you to manage your hardware and software from a single console. You can also update the BIOS, firmware, and drivers using IT Assistant.

IT Assistant uses Dell Update Packages and bundles (System Update Sets) to update the drivers and firmware. You can import the packages either from the *Dell Server Updates* media or the Dell website at support.dell.com to a central repository in IT Assistant.

You can compare the packages to the software versions currently running on your enterprise systems, perform device compliance, and then decide on updating systems that are not in compliance, either immediately or according to a schedule you define.

You can also customize the view of the package information by operating system, component name, system type, and software type. You can also update only part of the system sets by using the custom bundle feature.

To use the software update feature, select **Manage**→**Software Updates**. For more information, see the Software Update topic in the *IT Assistant Online Help*.

Power and Performance Monitoring

Performance Monitoring helps you monitor the performance of a group of devices with supported Windows or Linux operating systems over a specified period of time. The power monitoring feature helps you to collect, store, and display the instantaneous values of power (watts) consumed, amperes drawn by each power supply, and the total energy consumed by a device.

Application Launch

IT Assistant provides a consolidated launch point for the following Dell systems management applications: Server Administrator, Array Manager, Remote Access Console, CMC Console, Dell OpenManage Switch Administrator, Digital keyboard/video/mouse (KVM), printers, tapes, storage devices, Intelligent Platform Management Interface (IPMI) devices, and client systems. For more information, see the Application Launch topic in the *IT Assistant Online Help*.

NOTE: Network Address Translation (NAT) is not a supported configuration on IT Assistant. Therefore, application launch does not work in conjunction with NAT, even though IT Assistant successfully discovers the managed systems. You should use IT Assistant to connect only to the IP address with which a system was discovered. Other IP addresses available on the system may not be accessible to IT Assistant. In many implementations, such as a server farm or load balancer implementation, the system will be behind a NAT. In such environments, IT Assistant will fail to connect to Server Administrator running on those systems.

Troubleshooting Tool

A graphical troubleshooting tool is available at **Tools**→**Troubleshooting Tool** to diagnose and resolve discovery and configuration problems, including SNMP and Common Information Model (CIM) related issues. You can also use the tool to test device and e-mail connectivity.

For more information, see the *IT Assistant Online Help*.

User Preferences

User Preferences are independent of user privileges. For example, you can use this feature to customize your view of the device groups or to select a default filter when you visit the alert logs view. You can access this feature from **Tools→User Preferences**. For more information on how to use this feature, see "User Preferences — Customizing the IT Assistant User Interface" in the online help.

Topology View

In the UI, you can select **Views→Topology** to see a graphical presentation of the devices in your network. When you double-click the icon for the group you want to view, you move down through the hierarchy. In addition, you can display detailed device information by moving the cursor over each icon. You can also perform tasks on the devices in this view, such as application launch, refresh inventory and status, and troubleshooting.

Privilege Levels in the IT Assistant UI

IT Assistant provides different privileges to its three user levels who can perform various tasks using the windows, dialogs, and wizards in the UI.

The three user levels are: User, Power User, and Administrator.

- *Users* have read-only access to IT Assistant.
- *Power Users* have administrator access except:
 - Configuring IT Assistant for alerts and discovery
 - Creating a favorite application
 - Editing a task
 - Running a performance and power monitoring task that has been paused by an administrator
- *Administrators* have full access to all the operations within IT Assistant.

Other Information You May Need

This *User's Guide* is intended to present a high-level view of IT Assistant. Not all features and capabilities are shown in this document. However, each feature is fully explained in the online help available from the IT Assistant UI. Additionally, the following resources are available on either the Dell Support website at support.dell.com or the *Dell Systems Management Tools and Documentation* DVD:

- The *Dell OpenManage Server Administrator User's Guide* documents the features, installation, and services that make up Dell's primary suite of one-to-one server management tools.
- The *Dell OpenManage Server Administrator SNMP Reference Guide* documents the Server Administrator SNMP management information base (MIB). The MIB defines variables that extend the standard MIB to cover the capabilities of systems management agents.
- The *Dell OpenManage Server Administrator CIM Reference Guide* documents the Server Administrator CIM provider, an extension of the standard management object format (MOF) file. The CIM provider MOF documents supported classes of management objects.
- The *Dell OpenManage Installation and Security User's Guide* documents how to install the Dell OpenManage systems management software on your system, as well as how to configure Active Directory and extend the schema for IT Assistant.
- The *Dell Systems Software Support Matrix* provides information about the various Dell systems, the operating systems supported by these systems, and the Dell OpenManage components that can be installed on these systems.

You can access the *IT Assistant Online Help* in two places: either by clicking the **Help** link at the top right of the browser window, or by clicking the **Help** button within the dialog or wizard you are using.

Getting Started With Dell™ OpenManage™ IT Assistant

You can use Dell OpenManage IT Assistant to monitor and manage systems on a local area network (LAN) or a wide area network (WAN), as well as identify the groups of systems that you want to manage remotely and consolidate your view of all systems, giving you a central launch point for managing these systems.

Management station is the system where IT Assistant is installed. A management station can be used to remotely manage one or more managed systems from a central location. The systems that are monitored by IT Assistant are called managed system.

The steps for installing and using IT Assistant are as follows:

- "Plan your IT Assistant installation"— Depending on your company's network management objectives, you can use IT Assistant as a discovery and status polling tool that quickly scans the network to retrieve managed system information, to receive and forward alerts to support personnel about problems on specific managed systems for performance and power monitoring, to update firmware and drivers across your network and as a tool to run scheduled tasks across your network.
- "Install IT Assistant"— You can download and install IT Assistant from the Dell Support website at support.dell.com. The Dell OpenManage Management Station installer program is used to install IT Assistant as well as other Dell OpenManage software.
- "Set up protocols"—You must configure the appropriate protocols (SNMP, CIM, and IPMI) to discover the systems in your network and to receive alerts that report the status of their components. For more information, see "Configuring Protocols to Send Information to Dell™ OpenManage™ IT Assistant."

- "Configure IT Assistant to monitor your systems"—IT Assistant can perform a variety of tasks for each system in your network. To be able to perform these tasks, configure IT Assistant to:
 - Discover systems, printers, switches, and storage devices. For more information, see "Configuring Discovery Settings."
 - Collect inventory information about memory, processor, power supply, embedded devices, and software and firmware versions. For more information, see "Configuring Inventory Settings."
 - Define status polling settings to perform a power and connectivity health check for all discovered devices. This determines whether a device is operating normally, is in a non-normal state, or is powered down. For more information, see "Configuring Status Polling Settings."
 - Define a discovery range. A discovery range is a network segment (subnet, range of IP addresses on a subnet, individual IP addresses, or an individual host name) that IT Assistant uses to discover devices. For more information, see "Configuring Discovery Ranges."
- Perform various tasks, such as:
 - Creating an Alert Action: To receive notification when, for example, a critical or warning threshold is met on one of the managed systems.
 - Creating a Performance and Power Monitoring Task: To analyze performance of systems based on, for example, memory usage and power consumption.
 - Using Software Web Updates: To obtain the latest drivers, firmware, and BIOS updates for the systems on your network.
 - Creating a New Report: To obtain data in a presentable format.

What's New for Dell™ OpenManage™ IT Assistant Version 8.4?

New Features and Enhancements

The following feature enhancements are new in IT Assistant 8.4:

Display of VFlash Media, iDRAC6 Express and iDRAC6 Enterprise information

The VFlash Media, iDRAC6 Express and iDRAC6 Enterprise enables On-board Server Diagnostics and the Unified Server Configurator for firmware update, hardware configuration including RAID creation and OS deployment, available from the BIOS during system boot.

IT Assistant displays information on VFlash Media and iDRAC6 Express information in the iDRAC information table and iDRAC6 Enterprise details in the Field Replacement Unit table in the Device details page.

Enhancements to Microsoft Hyper-V and Hyper-V Server Support

Following IT Assistant enhancements are supported for Hyper-V and Hyper-V Server:

- IT Assistant will display automatic update of the host configuration if a virtual machine moves from one host to another.
- Canned report for guests running on Hyper-V and Hyper-V Server similar to VMware ESXi. For more information, see the *IT Assistant Online Help*.

Secure Shell (SSH) Connectivity Troubleshooting

The troubleshooting tool of IT Assistant has been enhanced to detect the cause of SSH connection failure. You can use the SSH troubleshooting feature of IT Assistant to determine failures such as incorrect credentials, SSH daemon not running, SSH port blocked by the firewall, SSH not running on the configured port and so on, for Linux systems. A common scenario where this test can be run, is to detect failure of the performance or power monitoring task on the target Linux system.

Application Launch for IPv6 URLs

You can launch Dell OpenManage Server Administrator from IT Assistant using IPv6 URL in a network consisting of systems that have both IPv4 and IPv6 addresses. However, the device discovery feature of IT Assistant, still uses the IPv4 addresses.

Enhancement to Out-of-band Management Capability

On *xxlx* systems, iDRAC6 allows for out-of-band SNMP management. You can use both SNMP and IPMI for out-of-band management.

Support for Server Administrator Sideband Interface

Dell OpenManage Server Administrator supports configuration of additional LOMs for sideband interface. IT Assistant can be used to create a Server Administrator CLI task for sideband interface management.

Features From Previous Releases

The following features were introduced in previous versions of IT Assistant:

IT Assistant Virtualization Support

IT Assistant can be used to manage new virtualization environments including Microsoft® Hyper-V Server® 2008, Microsoft Hyper-V Server, VMware® ESX 3i, and Citrix® XenServer.

Table 3-1. IT Assistant Support for Virtualization

Virtualization Environment	IT Assistant Features Supported	IT Assistant Features Not Supported
VMware ESX Server™	Grouping of host and guests on the Devices tree and display of host-guest association information, Power monitoring, Alerting, Application launch, Tasks, Software updates (BIOS, firmware and driver), inventory.	Performance monitoring
VMware ESXi 3.5 Update 3 and later	All VMware ESX 3i traps are displayed. Also, systems with VMware ESX 3i will be discovered under the Unknown category.	Grouping of host and guests on the Devices tree and display of host-guest association information, Performance and power monitoring, application launch, tasks, software updates, and inventory.
Microsoft Hyper-V Server 2008	Grouping of host and guests on the Devices tree and display of host-guest association information, Performance and power monitoring, alerting, application launch, tasks, software updates, and inventory.	Automatic update of the host configuration if a virtual machine migrates from one host to another. (Supported with IT Assistant 8.4)

Table 3-1. IT Assistant Support for Virtualization

Virtualization Environment	IT Assistant Features Supported	IT Assistant Features Not Supported
Microsoft Hyper-V Server	Grouping of host and guests on the Devices tree and display of host-guest association information, Performance and power monitoring, alerting, application launch, tasks, software updates, and inventory.	Automatic update of the host configuration if a virtual machine moves from one host to another. (Supported with IT Assistant 8.4)
Citrix XenServer	Performance and power monitoring, alerting, application launch, tasks, software updates, and inventory	Grouping of host and guests on the Devices tree and display of host-guest association information.

IT Assistant does not use any VMware API for host or guest discovery or correlation. IT Assistant supports discovery of VMware host only with SNMP. On discovering a VMware host IT Assistant creates a custom group with the string “Host_<hostname (IP, DNS name etc)>”.

IT Assistant supports discovery of a Windows guest with both SNMP and CIM and Linux guests can be discovered only with SNMP. CIM, WMI or SNMP must be enabled on guests for successful discovery.

On discovering a guest IT Assistant lists the guests under the Host_<hostname> group only when the host is also discovered in IT Assistant. The discovered guest has a “briefcase” icon. There is also an additional entry of the guest under the Unknown group. IT Assistant lists the guest only under Unknown group if the host is not discovered in IT Assistant or if the guest does not respond to the discovery protocol.

Dynamic VMware Host Group

IT Assistant discovers VMware ESX Server systems. Each host is discovered under the **Device Group VMware ESX Servers→Hosts**. For each host, IT Assistant creates a new group **Host_<hostname>**. The ESX Server host and virtual machines (on discovery) are added as a child nodes in this group.

Also, IT Assistant automatically updates the host configuration if a virtual machine moves from one host to another. You are not required to manually refresh the inventory of the source or destination hosts to reflect the change in hosts.

 **NOTE:** IT Assistant automatically displays the new status of the virtual machine provided you set the trap destination correctly in the host system. For more information, see the *VMware Basic Administration Guide* on the Dell Support website at support.dell.com.

VMware ESX Server Integration

You can use IT Assistant to discover and monitor VMware ESX Server version 3.x, as well as to retrieve information about the associated virtual machines through Simple Network Management Protocol (SNMP).

You can discover multiple virtual machines in your network environment using IT Assistant, and view them in the Device tree with the other devices in your network.

You can discover:

- ESX Server systems through SNMP and IPMI only
- Linux virtual machines through SNMP only
- Windows-based virtual machines through SNMP and CIM

 **NOTE:** IT Assistant can manage only those ESX Server hosts that have Dell OpenManage Server Administrator version 5.x or later installed on them.

If Dell OpenManage Server Administrator is installed on the ESX Server host, the host will be discovered under the **Server** and the **VMware ESX Server** → **Hosts** categories in the Device tree.

 **NOTE:** If Server Administrator is not installed on the ESX Server host, you can discover the system using Intelligent Platform Management Interface (IPMI). In this case, the system is discovered under IPMI-discovered devices.

 **NOTE:** To discover ESX Server hosts, you must configure IPMI on the ESX Server host as well. For more information, see the white paper on *Managing Dell PowerEdge Servers Using IPMItool* on the Dell Support site at support.dell.com.

Click **View**→**Refresh** in the **Devices** view to:

- View the virtual machines' names in the **Device Details** page of the host; if you have discovered the host before the virtual machines.
- Move the virtual machines' names from **Unknown** to **Guest Devices** under **VMware ESX Server** in the Device tree; if you have discovered the virtual machine before the host.

NOTE: Right-click the host name and select **Refresh Inventory** if the virtual machine state has changed, or if you have moved the virtual machine to a different host.

Starting with IT Assistant 8.1, you can generate reports of virtual machines using the pre-defined virtual machine report. For more information, see "Custom Reporting".

New Search Criterion for Dynamic Groups Created Using IT Assistant

You can now use the "System Revision Number" criterion for searching devices in a new group. Also, you can combine this criteria with 'System Model' for retrieving information on devices that are part of new groups. For example, search for devices that have System Model 1900 and System Revision Number II for retrieving a list of all Dell PowerEdge 1900 II servers.

Online Synchronization Enhancement

IT Assistant inventories the systems on the network and stores the information in the database. Based on this information, IT Assistant *intelligently* decides on the packages to be downloaded. In other words, IT Assistant downloads only those packages and bundles that correspond to at least one managed system in your network.

Online Synchronization

You can now check the Dell Support website at <ftp.dell.com> periodically for availability of new updates. You can configure various options for online synchronization:

- Select the schedule to synchronize IT Assistant with the Dell Support website
- Configure connection settings
- Select the criteria to check for updates available on the Dell Support website

- Configure additional attributes, such as e-mail notification
- Configure automatic downloads and imports to the IT Assistant repository

NOTE: IT Assistant version 8.1 and later download only hardware packages (BIOS, firmware, and drivers), and not software (OpenManage) packages.

Simplified Repository View

The Software Update view in IT Assistant displays a *simplified* view of the repositories by default. In this view you will only see the update packages/bundles that correspond to at least one device on your network. To view all update packages/bundles available in the repositories (as seen in earlier IT Assistant versions), select the **Classic View**.

Compliance Tool

IT Assistant provides an easy launch point on the user interface (UI) to generate a comprehensive compliance report for the systems being managed. It evaluates each system for current status of BIOS, firmware, and drivers against the update packages/bundles imported into the IT Assistant repository. The output is available in easy-to-use Microsoft Excel[®] format.

Power Monitoring

You can use IT Assistant to set thresholds for power management using the Server Administrator command line interface (CLI) as well as for power consumption reporting. Power Monitoring is supported on Microsoft Windows, Linux, and VMware ESX Server and Citrix XenServer operating systems.

NOTE: This feature is supported only on systems that have PMBus capability and requires Server Administrator 5.3 or later to be installed on the system.

Dell Client Manager Launch

IT Assistant displays Dell Client Manager (DCM) launch point for those devices that have Dell OpenManage Client Instrumentation 7.4 or later installed.

NOTE: The IT Assistant user interface should be running on a Microsoft Windows operating system for the DCM Web page to display.

You can discover client systems by providing the required CIM credentials in the Discovery wizard. See "Configuring Discovery Settings" for more information. The discovered systems will display under **Clients** in the device tree. Right-click the device and select DCM Launch under Application Launch to open the:

- DCM Web page
- DCM feature definition page, if the device is not managed by an instance of DCM

Exporting and Importing Tasks

The export/import feature allows you to export the task configuration information for the selected tasks in IT Assistant to an XML file. You can import this file to a new network environment where IT Assistant is installed, instead of recreating and reconfiguring the tasks.

Storage Integration

Starting with IT Assistant 8.0, you can use IT Assistant to:

- Discover, monitor, and display Dell PowerVault™ Modular Disk storage arrays, such as the PowerVault MD3000.
- Display the inventory information for the Modular Disk storage arrays, such as name, model, firmware version, configured disk space, and so on.
- Receive Simple Network Management Protocol (SNMP) alerts, and format and display them for monitoring Modular Disk storage arrays, such as the PowerVault MD3000.

NOTE: If you have installed the Modular Disk Storage Array Management Software on a system to monitor the PowerVault MD3000, you can use it to configure and send these alerts.

Performance Monitoring

Performance Monitoring helps you monitor the performance of a group of supported Microsoft Windows or Linux systems in your network environment over a specified period of time. Performance is monitored with the help of performance counters available for each component. You can select and monitor the performance counters. You can also configure threshold alerts to flag and notify you of under- or over-utilized systems on your network. For more information, see "Performance and Power Monitoring".

Simple Network Management Protocol (SNMP) Event Source Import Utility

You can import multiple event sources, that are not natively supported in IT Assistant, into the IT Assistant database. For more information, see "Simple Network Management Protocol Event Source Import Utility".

IPMI Discovery Support

IT Assistant discovers systems equipped with baseboard management controllers (BMC) that support Intelligent Platform Management Interface (IPMI) versions 1.5 or later. IT Assistant communicates with the BMC directly or through the Windows IPMI Provider on a Microsoft Windows Server 2003 R2 system.

IT Assistant discovers and classifies the BMC of the discovered system through IPMI. However, if the Dell agent is installed on this system, IT Assistant will correlate the information with the discovered system through the service tag.

Software Deployment

You can use this feature to deploy and upgrade Dell OpenManage Server Administrator on Dell systems running Microsoft Windows, SUSE Linux Enterprise Server, Red Hat Enterprise operating systems as well as VMware ESX server that do not have Server Administrator installed. Server Administrator assists in discovering, classifying, inventorying, monitoring systems, and updating software on your network.

Digital Signature Verification

IT Assistant checks the authenticity and integrity of the update packages and MSI files using digital signature verification.

Digital signature verification of each Dell Update Package (DUP) will happen when you manually import the packages from the *Server Updates* media or a repository on a network share. IT Assistant also supports signature verification for the Server Administrator MSI package.

NOTE: For Dell OpenManage version 5.3 and above, the Software Update Utility is available only on the Dell Server Updates DVD. However, for Dell OpenManage version below 5.3, the Software Update Utility is available on the Dell PowerEdge™

Server Update Utility CD. For the purposes of this guide, the Dell Server Updates DVD and the Dell PowerEdge Server Update Utility CD will be hereafter called the Server Updates media.

Custom Bundles

With IT Assistant, you can create a custom System Update Set or bundle.

You can create custom bundles that contain only the packages you want. For example, you can create a custom bundle out of an existing Dell custom bundle that will enable you to update just the device drivers on a given set of target devices.

This custom bundle can be subsequently used to drive system compliance reports and do custom updates.

Favorite Application Launch

IT Assistant supports launching user-configured applications for multiple devices or a group of devices, such as printers and switches. For more information, see the *Dell OpenManage IT Assistant Online Help*.

Storage Integration

IT Assistant discovers Dell|EMC arrays in your storage environment and displays them in the **Dell|EMC Arrays** category present in the **Storage Devices** group.

For more information, see the *Dell OpenManage IT Assistant Online Help*.

Printer Integration

IT Assistant version 8.0 and later support discovery of Dell network-enabled printers and classifies them under the **Printers** category in the **Device** tree.

IT Assistant uses SNMP to communicate with the printer devices. Dell printers have implemented a standard Printer MIB, enabling standardized access to important information.

NOTE: You can also use this feature of IT Assistant to discover non-Dell printers in your network environment.

For more information, see the *Dell OpenManage IT Assistant Online Help*.

Tape Integration

IT Assistant version 8.0 and later support discovery of those Dell tape library devices that have an out-of-band management port. IT Assistant classifies them under the **Tape Devices** category under the **Storage Devices** tree. For more information, see the *Dell OpenManage IT Assistant Online Help*.

FRU Support

With IT Assistant version 8.0 and later, you can view the field replaceable units (FRU) information for a managed system. IT Assistant retrieves FRU information from Dell OpenManage Server Administrator during an inventory cycle and stores it in the database.

For more information, see the *Dell OpenManage IT Assistant Online Help*.

DMI Support

IT Assistant no longer supports the Desktop Management Interface (DMI) protocol. As a result, systems running DMI using Dell OpenManage Server Agent 4.5.1 (and earlier) and Dell OpenManage Client Instrumentation 6.0 (and earlier) are not discovered by IT Assistant.

Power Control Tasks

Starting with IT Assistant 8.0 and later, before trying SNMP power control tasks, IT Assistant will try the **omremote** command on the managed system. This applies only if the managed system has Dell OpenManage version 4.3 or later installed.

NOTE: For Dell OpenManage versions earlier than 4.3, the Power Control tasks remain unchanged.

NOTE: The **omremote** command uses the operating system credentials for authentication.

IT Assistant version 8.0 and later support performing remote power control operations and alert processing for Alert Standard Format (ASF) 2.0 compliant devices.

NOTE: IT Assistant uses the in-band Broadcom Windows Management Instrumentation (WMI) provider to verify if a device has ASF capabilities. See the system documentation for enabling remote power control through ASF.

Planning Your Dell™ OpenManage™ IT Assistant Installation

It is important to plan before installing Dell OpenManage IT Assistant. Depending on your company's network management objectives, you could use IT Assistant:

- primarily as a discovery and status polling tool that quickly scans the network to retrieve managed system information
- to receive and forward alerts to support personnel about problems on specific managed systems
- for performance and power monitoring to update firmware and drivers across your network
- as a tool to run scheduled tasks across your network.

Decisions That You Make Before Installation

After you have determined your network size and network management objectives, you must then make configuration decisions specific to your network management goals. If your network is well established and you already have a well-defined IT Assistant management plan, many of these decision-points may have already been addressed. Pre-installation planning includes choosing the following:

- Event filtering and notification strategy
- Database that will be used to store IT Assistant data
- Hardware configuration
- Operating system

- Systems management protocol(s)
- Agents for your managed systems

NOTE: This document assumes that your systems are connected through a TCP/IP network and makes no assumption regarding your network's complexity or whether you are already using any systems management applications. In addition, no assumption is made regarding the type of systems and devices that exist on your network. See "Installing, Uninstalling, and Upgrading Dell™ OpenManage™ IT Assistant" for all installation, uninstallation, and upgrade procedures.

Primary Planning Questions

System types and network management objectives differ among enterprises. Answering the following questions can better prepare you for an IT Assistant installation that will support your company's goals for network management. After reading this section, see Table 4-4 before performing your installation.

- 1 What are the basic hardware and operating system requirements for installing IT Assistant? Does my enterprise meet them?
- 2 Is there any reason to select a particular operating system among those that are supported when installing IT Assistant?
- 3 Is there any reason to select a particular hardware configuration when installing IT Assistant?
- 4 Do I want to use the default installed database (Microsoft® SQL Server 2005 Express Edition SP2) or should I install the Microsoft SQL 2005 Server database?
 - How many systems do I want to discover or manage?
 - How dense do I expect the event traffic to be on my network?
- 5 Which systems management protocol(s) should I plan to install or enable?
 - What type of systems do I want to manage?
 - What agents and instrumentation are currently installed on my managed systems?
 - What agents do I want to eventually run on my managed systems?
 - Which protocols do these agents require or support?
- 6 How should I organize my managed systems' IP addresses if I am using more than one systems management protocol on a subnet?

Selecting the Operating System

You can install IT Assistant on any system that is running one of the operating systems in Table 4-1.

Table 4-1. Minimum Supported Operating System Requirements for IT Assistant

Small (up to 500 Managed Systems)	Large (500+ Managed Systems)
Microsoft® Windows® XP Professional with SP2	Windows Server® 2008 (includes Standard, Enterprise, and Web editions)
Windows Server 2003 with SP2	Windows Server 2003 with SP2
Windows Server 2003 R2 (Web Edition)	Windows Server 2003 R2 (Standard and Enterprise Editions)
Windows Vista® (Business and Enterprise Editions)	

NOTE: IT Assistant is not supported on Microsoft Windows Small Business Server 2003.

NOTE: IT Assistant can be installed on Microsoft Windows Server 2008 Server Core but can only be launched remotely.

NOTE: See your Microsoft operating system documentation when installing and configuring Terminal Services or Remote Desktop.

NOTE: If you use the performance and power monitoring feature, see Table 7-3 for hardware and operating system requirements.

Selecting the Web Browser

See the *Systems Software Support Matrix* on the *Dell Systems Management Tools and Documentation DVD* or the Dell Support website at support.dell.com for the latest detailed list of the supported browsers for IT Assistant.

NOTE: IT Assistant cannot be installed on Dell systems running Red Hat Enterprise Linux or SUSE Linux Enterprise Server operating systems. These systems can, however, launch IT Assistant through supported browsers, such as Firefox.

Selecting a Hardware Configuration

The hardware configuration you choose must meet or exceed the recommended configuration for IT Assistant. Depending on your specific IT Assistant deployment and your network environment, it may be advisable to exceed the recommended configurations for processor speed, amount of memory, and hard-drive space. For example, you may want to exceed or choose the upper end of the recommended configuration if you:

- Anticipate heavy managed systems alert traffic
- Have complex alert filters with configured alert actions
- Are performing frequent discovery, inventory, status polls, or performance monitoring
- Are running Microsoft SQL Server tuned to maximum performance
- Decide to check the Dell Support website at support.dell.com frequently for updates and select a large number of packages for auto-download

The recommended minimum hardware configuration for IT Assistant is shown in Table 4-2.

Table 4-2. Recommended Minimum Hardware Configuration for IT Assistant (by Enterprise Size)

Component	Small (up to 500 Managed Systems)	Large (500+ Managed Systems)
Processor	1 processor (1.8-GHz minimum)	2 to 4 processors (800-MHz minimum)
Memory	1–2 GB	2–4 GB
Disk Space	at least 1 GB	at least 5 GB

NOTE: The amount of disk space needed may increase if you import numerous Dell Update Packages (DUPs) and MSI files for software update and deployment.

NOTE: If you use the performance and power monitoring feature, see Table 7-3 for hardware and operating system requirements.

Selecting the SQL Server 2005 Express Edition SP2 Default Database or SQL 2005 Server

In general, the number of systems you expect to manage and the number of alerts you expect from your managed systems determine the database to use with IT Assistant. If you will be managing fewer than 500 systems, the SQL Server-compliant default database that ships with IT Assistant, SQL Server 2005 Express Edition SP2, is most likely a suitable data repository. However, if you are going to manage 500 systems or more and/or are receiving several alerts per second, you should use Microsoft SQL Server 2000 or later as your database. You will also need to consider the impact of the performance monitoring feature on your database choice. For more information, see the "Performance and Power Monitoring". In addition, if you are performing frequent discoveries or status polls, you may benefit by the increased performance offered by SQL 2005 Server over SQL Server 2005 Express Edition SP2.

NOTE: You can configure IT Assistant version 6.3 and later to use Microsoft SQL Server running on a remote, dedicated server instead of configuring on the IT Assistant system. For more information, see "Remote Microsoft SQL Server and IT Assistant".

NOTE: IT Assistant version 8.0 and later are backward-compatible with the SQL Server-compliant default database that ships with IT Assistant 7.x.

E-Mail Notification Features

E-mail Alert Actions are useful in environments in which a system administrator does not want to use the IT Assistant user interface (UI) to visually monitor the status of managed systems. By coupling e-mail alert actions with alert action filters, an administrator may identify a person to be electronically notified when a specific system sends alerts to the IT Assistant network management station. This individual can then choose to take the appropriate corrective action for that system. By configuring alert filters with corresponding alert actions, constant monitoring of system status in the IT Assistant user interface becomes unnecessary because e-mail notification is set up to occur whenever the event criteria is met.

Determining Systems Management Protocols

One of the most important decisions you will make in planning your IT Assistant installation is determining the protocols to use with IT Assistant. In general, your choice of protocols is determined by the systems you want to monitor and the respective agent protocols they support. If the systems you want to monitor have agents that use the Simple Network Management Protocol (SNMP), Common Information Model (CIM) or the Intelligent Platform Management Interface (IPMI) protocols, these protocols must also be configured in IT Assistant.

Supported Protocols

IT Assistant supports three systems management protocols: SNMP, CIM, and IPMI. These protocols allow communication between the IT Assistant network management station and the managed systems on your network. For communication between IT Assistant and each managed system to occur successfully, agents (instrumentation) must be installed on each of the systems you want to manage. For systems management, it is strongly recommended that you enable and configure all protocols.

NOTE: Dell OpenManage Server Administrator only sends events to IT Assistant as SNMP traps. It does not send CIM indications for either instrumentation or storage events from a server.

NOTE: If the appropriate protocol is not configured correctly on the managed systems, IT Assistant will fail to classify the systems properly, which may limit the manageability for those systems.

NOTE: The Dell|EMC storage arrays and Dell PowerVault™ Modular Disks use both SNMP and NaviCLI protocols.

SNMP

In order to successfully perform an IT Assistant installation, you must install and enable the operating system SNMP service.

CIM

CIM is used for managing both client and server systems. It can also be used for monitoring server instrumentation in a network that does not allow SNMP management.

IPMI

Intelligent Platform Management Interface (IPMI) operates independently of the operating system and allows administrators to manage a system remotely even in the absence of the operating system or the systems management software, or even if the monitored system is not powered on. IPMI can also function when the operating system has started, and offers enhanced features when used with the systems management software.

In order to successfully discover systems through IPMI, you must have a baseboard management controller (BMC) running IPMI version 1.5 or later on your systems.

NOTE: The BMC does not monitor the storage subsystem on your network. To monitor these devices, you must install Server Administrator on your managed systems.

Factors That Affect Protocol Choice

Two factors affect protocol choice:

- The systems that you want to monitor
- Agents on the systems that you want to monitor

Systems That You Want to Monitor

Your network may consist of a combination of client and server systems, Dell|EMC storage arrays or Dell PowerVault™ Modular Disks, printers, and tape libraries. When planning for IT Assistant installation, you will be surveying these systems, as well as any systems you plan to add to your network, and determining which of these you want to monitor. During this assessment, you will be looking not only at the number of client and server systems, but also at any systems management agents and operating systems installed on these systems. The following section discusses the agents and corresponding protocols that you may need to configure in IT Assistant. Correctly configuring these protocols within IT Assistant is required to successfully manage your network.

Agents on the Systems That You Want to Monitor

The agents that you run on your managed systems may support a specific systems management protocol. If you want to retain the agents that are already installed on these systems, you must continue to manage them with their respective protocols. If the protocols used by certain agents are older,

you can choose, in most cases, to replace or upgrade these agents with those that support newer protocols. Table 4-3 lists a number of agents and instrumentation that may be installed on Dell clients and servers. As long as the corresponding protocol is enabled in IT Assistant, these systems can be discovered and managed on your network.

Agent is a general term applied to the software components of systems management instrumentation. The following table provides the management and alerting agents supported by IT Assistant. Degrees of support vary among agents. For example, IT Assistant automatically discovers, displays, receives alerts from, and can perform actions on the systems managed by Dell OpenManage Server Administrator, but IT Assistant can only receive alerts from certain storage device agents.

 **NOTE:** IT Assistant no longer supports the Desktop Management Interface (DMI) protocol. As a result, systems running DMI using Dell OpenManage Server Agent 4.5.1 (and earlier) and Dell OpenManage Client Instrumentation 6.0 (and earlier) will not be discovered by IT Assistant.

Table 4-3. Agents Supported by IT Assistant

Device	Version(s) Supported	Auto Discoverable	Alerting
Dell Systems Agents			
Server Administrator	4.5 and later	Yes	Yes
Baseboard Management Controller	1.0 and later NOTE: Supports only Dell x8xx and later systems	Yes	Yes
Array Manager	3.7	Yes	Yes
Chassis Management Controller	N/A	Yes	Yes
DRAC 5	1.0 and later	Yes	Yes
DRAC 4	1.0 and later	Yes	Yes
DRAC III, DRAC III/XT	1.0 and later	Yes	Yes

NOTE: DRAC III is not supported on Red Hat Enterprise Linux version 5 and Windows Server 2008.

Table 4-3. Agents Supported by IT Assistant (continued)

Device	Version(s) Supported	Auto Discoverable	Alerting
ERA, ERA/O	1.0 and later	Yes	Yes
iDRAC	1.0 and later	Yes	Yes
CMC	1.0 and later	Yes	Yes
	NOTE: Supports the Dell xx0x modular systems only		
DRAC/MC	Supports only PowerEdge 1855 and 1955 systems	Yes	Yes
ERA/MC	Supports only PowerEdge 1655	Yes	Yes
PowerEdge 1655MC Integrated Switch	N/A	Yes	Yes
Dell PowerVault™ Agents			
PowerVault 701N	N/A	Yes	Yes
PowerVault MD3000	NA	Yes	Yes
PowerVault MD3000i	NA	Yes	Yes
PowerVault 705N	N/A	Yes	Yes
PowerVault 735N	N/A	Yes	Yes
PowerVault 750N	N/A	Yes	Yes
PowerVault 755N	N/A	Yes	Yes
PowerVault 715N	N/A	Yes	Yes
PowerVault 725N	N/A	Yes	Yes
PowerVault 770N	N/A	Yes	Yes
PowerVault 775N	N/A	Yes	Yes
PowerVault 745	N/A	Yes	Yes
PowerVault Adaptec CIO	4.02	No	Yes
Dell PowerConnect™ Agents and PowerConnect Firmware Versions Supported by IT Assistant			

Table 4-3. Agents Supported by IT Assistant (continued)

Device	Version(s) Supported	Auto Discoverable	Alerting
PowerConnect 3024	5.2.5.x, 6.0.4.x, 6.1.2.x	Yes	Yes
PowerConnect 3048	5.2.5.x, 6.0.4.x, 6.1.2.x	Yes	Yes
PowerConnect 3248	1.0.1.x, 2.0.0.x, 2.1.0.x	Yes	Yes
PowerConnect 3324	1.0.0.x, 1.1.0.x, 1.2.0.x	Yes	Yes
PowerConnect 3348	1.0.0.x, 1.1.0.x, 1.2.0.x	Yes	Yes
PowerConnect 3424	1.0.0.x	Yes	Yes
PowerConnect 3424P	1.0.0.x	Yes	Yes
PowerConnect 3448	1.0.0.x	Yes	Yes
PowerConnect 3524	1.0.0.20	Yes	Yes
PowerConnect 3524p	1.0.0.20	Yes	Yes
PowerConnect 3548	1.0.0.20	Yes	Yes
PowerConnect 3548p	1.0.0.20	Yes	Yes
PowerConnect 5012	5.2.5.x, 6.0.4.x, 6.1.2.x	Yes	Yes
PowerConnect 5212	1.0.0.x, 3.1.0.x	Yes	Yes
PowerConnect 5224	1.0.1.x, 2.0.0.x, 2.1.0.x, 3.1.0.x	Yes	Yes
PowerConnect 5316M	1.0.0.x	Yes	Yes
PowerConnect 5324	1.0.0.x	Yes	Yes
PowerConnect 5424	1.0.0.31	Yes	Yes
PowerConnect 5448	1.0.0.31	Yes	Yes

NOTE: You can configure SNMP only through the panel on the device.

NOTE: The default community string is publicCmtyStr.

Summary of Pre-Installation Decisions

This section lists the major factors you must consider before installing and using IT Assistant to manage systems on your network. Table 4-4 summarizes questions raised in the previous sections, the option(s) and action(s) available, and the section of this guide where you can find the corresponding procedure for performing that action.

Table 4-4. Pre-Installation Questions, Options, and Actions

Question	Option/Action	Option/Action	Next Step
Is there any reason to select a particular operating system among those that are supported when installing IT Assistant?	Ensure that the operating system is supported for the components you are installing.	For a large network, install IT Assistant on a server operating system.	See the latest IT Assistant readme.txt on the Dell Support website at support.dell.com .
Is there any reason to select a particular hardware configuration when installing IT Assistant?	Ensure that your hardware configuration meets or exceeds the recommended requirements for the components that will be installed on the system.		
Should I use the default installed database (SQL Server 2005 Express Edition SP2) or should I install the Microsoft SQL 2005 Server database?	Generally, SQL Server 2005 Express Edition SP2 is adequate if you are managing fewer than 500 systems. However, heavy event traffic or the usage of the performance monitoring subsystem may lead you to select SQL 2005 Server.	Selection of the SQL database and heavy event traffic are examples of choices that require higher processor speed and/or extra processors, more memory, and greater hard-drive space to ensure IT Assistant performance.	

Table 4-4. Pre-Installation Questions, Options, and Actions (continued)

Question	Option/Action	Option/Action	Next Step
Which systems management protocol(s) should I plan to install or enable?	Survey the agents that you want to run on your managed systems and find out which protocols they support; consider the type of system you are managing.		See "Installing, Uninstalling, and Upgrading Dell™ OpenManage™ IT Assistant" and "Configuring Dell™ OpenManage™ IT Assistant to Monitor Your Systems".
How should I organize my managed systems' IP addresses if I am using more than one systems management protocol on a subnet?	Where possible, group systems using the same management protocol into contiguous subnets. This strategy increases manageability during the creation of IT Assistant discovery ranges.		
Will I use role-based access to assign user levels in IT Assistant?	IT Assistant supports standard role-based access levels. The three levels supported are User, Power User, and Administrator.	Using these access roles in your enterprise can provide an added level of security.	See "Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation".

Installing, Uninstalling, and Upgrading Dell™ OpenManage™ IT Assistant

Installation Requirements

When installing Dell OpenManage IT Assistant, it is important to see the latest `readme.txt` file on the Dell Support website at support.dell.com. This file defines the most current supported operating systems and hardware requirements for IT Assistant. In addition to meeting these requirements, there are additional IT Assistant installation requirements as well as requirements for the systems that will be managed by IT Assistant. See "Planning Your Dell™ OpenManage™ IT Assistant Installation" for more information.

TCP/IP Protocol Support

For IT Assistant to function properly, your network must support the TCP/IP protocol.

Setting Up or Enabling Protocols for Agent Communication

Before installing IT Assistant, you must install the operating system's Simple Network Management Protocol (SNMP) service. Additionally, to ensure that systems are visible to IT Assistant discovery and inventory functions, make sure that agents and instrumentation on managed systems are accessible through the Common Information Model (CIM), Simple Network Management Protocol (SNMP), or Intelligent Platform Management Interface (IPMI) protocol.

NOTE: CIM is installed by default on Microsoft® Windows® 2000, Microsoft Windows Server 2003, Windows XP Professional, Windows Vista and Windows Server 2008.

Installing SNMP on the IT Assistant System

The SNMP service must be installed and running on the IT Assistant system. SNMP (or CIM) must also be installed on the systems that you want to discover and manage.

NOTE: The following example uses Windows 2000 Advanced Server.

To install SNMP Service on the management station, perform the following steps:

- 1 Click the **Start** button. Point to **Settings**→**Control Panel**→**Add or Remove Programs**→**Add/Remove Windows Components**.
- 2 Select **Management and Monitoring Tools** click **Details**, select **Simple Network Management Protocol**, and click **OK**.
- 3 Click **Next** in the **Windows Components Wizard** window.
The Windows Components Wizard will install SNMP.
- 4 Once the installation is complete, click **Finish**.
- 5 Close the **Add or Remove Programs** window.
SNMP is now installed on your system.

See "Selecting the Operating System", for a list of operating systems on which IT Assistant can be installed.

Installing SNMP on Microsoft Windows Vista

- 1 Click the **Start** button and select **Control Panel**.
- 2 Double-click **Program and Features**.
- 3 Click **Turn the Windows Feature On or Off** on the left-hand tree.
- 4 Locate and select **SNMP Services**.
- 5 Click **OK**.
SNMP is now installed on your system.

Installing SNMP on Microsoft Windows Server 2008

- 1 Click **Start**→**Control Panel**.
- 2 Double-click **Program and Features**.
- 3 Click **Turn the Windows Feature On or Off** on the left-hand tree.
The **Server Manager** page appears.

- 4 On right-hand side, click **Add Features** under **Features Summary**. The **Select Features** dialog-box appears.
- 5 Locate and select **SNMP Services**.
- 6 Click **Install**.
SNMP is now installed on your system.

Starting SNMP Services:

- 1 Click the **Start** button and select **Control Panel**.
- 2 Double-click **Administrative Tools**.
- 3 Double-click **Services**.
- 4 Locate **SNMP Services**, right-click, and select **Start**.
SNMP Services are now started.

For information on how to configure SNMP on managed systems running Windows, see *Configuring the SNMP Service on a System Running a Supported Windows Operating System* and for Linux, see *Configuring the SNMP Agent on Managed Systems Running Supported Linux Operating Systems*.

Enabling CIM

The CIM/WMI (Windows Management Instrumentation) service is installed by default on Windows 2000, Windows Server 2003, Windows XP Professional, Windows Vista, and Windows Server 2008. CIM discovery requires proper user ID and password credentials. Failure to supply proper credentials on a subnet configured for CIM discovery can result in account lockout.

For examples on how to set up CIM, see "Configuring Protocols to Send Information to Dell™ OpenManage™ IT Assistant".

Setting Up RBAC User Information

IT Assistant supports role-based access control (RBAC) to define the specific operations each user can perform. However, the IT Assistant installation process does not require these user roles to be set up prior to installation. To set up RBAC users either before or after installing IT Assistant, see "Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation".

Installing IT Assistant

If you are installing IT Assistant for the first time, follow the steps shown here. If you are upgrading from a previous version, see "Upgrading from a Previous Version of IT Assistant".

You can download and install IT Assistant from the Dell Support website at support.dell.com. The Dell OpenManage Management Station installer program is used to install IT Assistant as well as other Dell OpenManage software. To install a product other than IT Assistant, refer to the installation instructions specific to that product.

You can also download Web packages of versions 6.0.1 of the Dell OpenManage Server Administrator and Dell OpenManage Management Station software from the Dell Support site at support.dell.com. You can transfer the contents of these Web packages to CDs or USB keys for systems that do not have DVD drives.

To download IT Assistant, perform the following steps:

- 1 Connect to the Dell Support website at support.dell.com.
- 2 Click the **Drivers and Downloads** link.
- 3 In the **Drivers and Downloads** page, choose either the model or the service tag of your system and confirm your selection.
- 4 In the results page, under the **Systems Management** category, search for the *Management Station* application.
- 5 Click **Download Now** and save the file to a location on the management station.

To install IT Assistant for the first time:

- 1 Navigate to the `\SYSMGMT\ManagementStation\windows` directory on the IT Assistant installer folder and double-click `setup.exe`.

If the installation program starts automatically, the **Dell OpenManage Install** screen is displayed. Select **Dell OpenManage Management Station** and click **Install** to install IT Assistant.

The installer first runs the Prerequisites Checker to check if all prerequisites are installed. If a prerequisite is not already installed, you can install it by clicking the appropriate hyperlink in the installer window and then following the instructions in the setup screens.

- 2 If there are no missing dependencies, click **Install, Modify, Repair or Remove Management Station**.

The Dell OpenManage Management Station install wizard is displayed. Click **Next**.

- 3 If you agree with the Dell Inc. software license agreement, click **Next**.
- 4 Select **Custom** installation from the **Setup Type** window and manually enable IT Assistant.

You can change the installation directory path and port settings for IT Assistant or accept the defaults.

- 5 Click **Next**.
- 6 Ensure that **IT Assistant** is included in the installation summary window, then click **Install** to begin the installation.

Launching IT Assistant

After IT Assistant is installed, to launch IT Assistant, do one of the following:

- Double-click the IT Assistant icon on your desktop.
- Open a supported Web browser (see the *Dell Systems Software Support Matrix* on the Dell Support website at support.dell.com for the latest supported browsers) and connect to the IT Assistant management station by typing:

```
https://<IT Assistant hostname>:<port number>
```

in the Address bar.

NOTE: The default IT Assistant port number is 2607.

NOTE: You can also access the browser-based user interface of IT Assistant from a remote system using the above method.

If you access the IT Assistant UI from a system running supported Windows operating system that does not have a minimum supported Java Runtime Environment (JRE) version 6 update 3, then IT Assistant would automatically start installation of JRE on that system.

NOTE: If the system that accesses the IT Assistant user interface has JRE version 6.0, then IT Assistant does not automatically update the JRE to version 6 update 3. In this case, update the JRE version manually by pointing the browser to <https://<host name>:<port number>/jre-6u3-windows-i586.exe>.

However, if you are accessing IT Assistant from a system running supported Linux operating system, perform the following steps:

- 1 Save the JRE installer (`jre-6u3-linux-i586-rpm.bin`) in the location of your choice.
- 2 Extract the RPM and install JRE.
- 3 Create a soft link to this JRE in the **plugins** folder of the browser.

For example, if you have installed the JRE in the default location, create the soft link by navigating to the **plugins** folder of your Web browser.

From this folder, run the following command:

```
ln -s /usr/java/jre1.6.0_03/plugin/i386/ns7/libjavaplugin_oji.so.
```

NOTE: To verify if the JRE plug-in was installed, type **aboutplugins** in the browser's address bar, click **Go**, and check the information that is displayed.

- 4 Close the Web browser and run IT Assistant again.

Upgrading from a Previous Version of IT Assistant

The Dell OpenManage Management Station installer program detects whether you currently have an upgradable version of IT Assistant on your system. Only IT Assistant versions 6.2 and later support upgrades from previous versions. Also, IT Assistant does not support a direct upgrade from version 6.x to version 8.4. If you want to retain information in the IT Assistant database, you will be required to first upgrade IT Assistant version 6.x to version 7.0 and then to IT Assistant version 8.3. When upgrading from IT Assistant version 6.x to version 7.2, you have to qualify the CIM user names. This qualification is necessary because CIM is enabled/disabled only per discovery range and requires each CIM user to be qualified with a domain, or local host if no trusted domain is configured. It is critical to provide this qualification when configuring CIM through a discovery range (for example: <domain\username>, or <localhost\username>) to authenticate and use the CIM protocol.

NOTE: While upgrading to IT Assistant version 8.4, if you also plan to upgrade the Microsoft SQL server, see "Selecting the SQL Server 2005 Express Edition SP2 Default Database or SQL 2005 Server" for the appropriate combination of the operating system and SQL Server.

Upgrading IT Assistant version 7.x to IT Assistant version 8.4

- 1 Navigate to the \SYSMGMT\ManagementStation\windows directory on the IT Assistant installer folder and double-click **setup.exe**.

If the installation program starts automatically, the **Dell OpenManage Install** screen is displayed. Select **Dell OpenManage Management Station** and click **Install** to install IT Assistant.

The installer automatically scans your system for any missing dependencies, such as whether you have SNMP installed or have a supported database application. If a dependency is missing, an information window is displayed and you may be prompted to install the required packages.

CAUTION: If you are using IT Assistant version 6.x to 7.x, the IT Assistant 8.4 installer removes all previous Management Station applications and re-installs the applications you select.

- 2 If there are no missing dependencies, click **Install, Modify, Repair or Remove Management Station**.

The Dell OpenManage Management Station install wizard is displayed. Click **Next**.

- 3 If you agree with the Dell Inc. software license agreement, click **Next**.
- 4 Select **Custom** installation from the **Setup Type** window and manually enable IT Assistant.
You can change the installation directory path and port settings for IT Assistant or accept the defaults.
- 5 Ensure that **IT Assistant** is selected in the list of installable components, then click **Next**.
- 6 If you are upgrading from IT Assistant 6.x to 7.0, by default, **Migrate IT Assistant Database Settings** is selected. When this option is selected, the following database settings in your existing IT Assistant installation are preserved in your new installation:
 - Global configuration
 - Event stored action
 - Discovery configuration

NOTE: **Migrate IT Assistant Database Settings** is not available if you are upgrading from IT Assistant version 7.x to version 8.4.

- 7 Click **Next**.
- 8 Ensure that **IT Assistant** is included in the installation summary window and click **Install** to begin the installation.

NOTE: If you want to configure IT Assistant in a remote database environment, see the "Remote Microsoft SQL Server and IT Assistant" section for details.

Upgrading IT Assistant version 8.x to IT Assistant version 8.4

- 1 Navigate to the `\SYSMGMT\ManagementStation\windows` directory on the IT Assistant installer folder and double-click `setup.exe`.
Select **Dell OpenManage Management Station** and click **Install** to upgrade IT Assistant.

- 2 The installer first runs the Prerequisites Checker to check if all prerequisites are installed. If a prerequisite is not already installed, you can install it by clicking the appropriate hyperlink in the installer window and then following the instructions in the setup screens.

 **CAUTION: IT Assistant 8.4 installer removes all previous Management Station applications and re-installs the applications you select.**

- 3 If there are no missing dependencies, click **Install, Modify, Repair or Remove Management Station**.

The Dell OpenManage Management Station install wizard is displayed. Click **Next**.

IT Assistant is upgraded to version 8.4.

Uninstalling IT Assistant

To uninstall IT Assistant:

- 1 Click the **Start** button, point to **Settings**, and double-click **Control Panel**.
- 2 Double-click **Add or Remove Programs**.
- 3 Select **Dell OpenManage Management Station** from the list of currently installed programs and click the **Change** button.

 **NOTE:** To uninstall the entire Management Station suite of products (including IT Assistant), select **Remove** in the previous step. If you select **Remove**, the uninstallation may appear to be unresponsive for several minutes if IT Assistant is performing discovery or polling.

The Management Station install wizard appears. Click **Next**.

- 4 In the **Program Maintenance** window, select **Modify** and click **Next**.
- 5 In the **Custom Setup** screen, deselect IT Assistant and click **Next**.
- 6 In the summary screen, ensure that IT Assistant is included in the list of applications to be removed. Click **Install**.
- 7 When the uninstallation is complete, click **Finish**.
- 8 Reboot your system if prompted by the installer.

Remote Microsoft SQL Server and IT Assistant

This section describes how to configure IT Assistant version 8.0 and later, to use Microsoft SQL Server 2005 running on a remote server as the IT Assistant database.

Configuring IT Assistant to Use a Remote Database

IT Assistant ships with the SQL Server-compliant default database—SQL Server 2005 Express Edition SP2. The IT Assistant Network Monitoring Service and the IT Assistant Connection Service access the SQL Server-compliant default database—SQL Server 2005 Express Edition SP2 that ships with IT Assistant.

When the database resides outside the IT Assistant management station, as in the case of a remote database, it is necessary to make the IT Assistant Network Monitoring Service and the IT Assistant Connection Service on the management station to access the remote database.

To do this, ensure that:

- The SQL Server service (MSSQLServer) is running through the service control panel on the management station as well as the remote database. You can start the SQL Server 2005 services either through the SQL Server Service Manager on the system tray or through the SQL Server Enterprise Manager's SQL Server group.
- The SQL Server-compliant database versions on management station and the remote database are the same.
- SQL Server 2005 uses the same authentication that is used on the SQL Server 2005 Express Edition SP2 on the management station.
- The management station and the remote database use the same authentication with Administrator rights, are logged in with the same account, and that the SQL Server databases on both systems are configured to use this account. This is because IT Assistant services log into SQL Server 2005 Express Edition SP2 using the Windows NT® Authentication.

In this example, let us assume that the user name is administrator on both servers with identical passwords and that both systems reside in the same NT domain.

Deploying the IT Assistant Database to the Remote Database

On the management station, stop the IT Assistant Connection Service and the IT Assistant Network Monitoring Service from the Service Control Manager. This stops the IT Assistant services from accessing the local IT Assistant database. Ensure that no other program is accessing the local IT Assistant database. If a database program such as the SQL Server's Enterprise Manager and/or Query Analyzer is running, close the program or ensure that the program is not accessing local IT Assistant database.

On the management station, detach the IT Assistant database from the local SQL Server by running the IT Assistant database management utility on the command line.

Run the following command from the IT Assistant **bin** directory:

```
dcdbmng /r
```

When the IT Assistant database has been successfully detached, the **Detach database** dialog box is displayed.

To ensure that the database is detached, perform the following steps:

- 1 Start the ODBC Data Source Administrator by clicking the **Start** button. Select **Settings**→**Control Panel**→**Administrative Tools**→**Data Sources (ODBC)**.

- 2 Select the **System DSN** tab.

Ensure that there no system data source with the name **ITAssist** (local IT Assistant database).

If such a system data source exists, click **Remove** to delete this data source.

On the management station, navigate to the **Data** folder under the SQL Server installation directory. By default, the installation path is **C:\Program Files\Microsoft SQL Server\MSSQL**. Copy the IT Assistant database file, **ITAssist_Data.mdf** to a location on the remote database system. For this example, let us consider the desired path to be **DB_PATH**.

On the remote database system, attach the database file, **ITAssist_Data.mdf** located in **DB_PATH** to the local SQL Server. You can do this by executing the following SQL statement against the local master database:

```
exec sp_attach_single_file_db @dbname=  
'ITAssist',@physname='DB_PATH\ITAssist_Data.mdf'
```

NOTE: The first argument **@dbname** specifies the name of the database and should always be **ITAssist**. The second argument **@physname** specifies where the database file is located and you should always use the correct location of file, **ITAssist_Data.mdf**.

If there are several instances of the SQL Server on the remote database system, then you can execute the above SQL statement and attach **ITAssist** to any one instance of your SQL Server. However, it is recommended that **ITAssist** be attached to the default instance of the local master database. This can be viewed in the SQL Server group of the SQL Enterprise Manager. All non-default instances of the SQL Server will have the instance name attached to it. For this example, consider **MYINST1** and **MYINST2** as the two non-default instances of the SQL Server. These SQL Server instances will be: **REMOTE_DB_SERVER\MYINST1** and **REMOTE_DB_SERVER\MYINST2**. This can also be viewed in the SQL Server group of the SQL Enterprise Manager. If the remote database system's SQL Enterprise Manager does not have a complete list of all the SQL Server instances on the system, register these non-default instances so that they are displayed in the SQL Server group.

Connecting IT Assistant to the Remote Database

- 1 On the management station, navigate to the IT Assistant installation directory and edit the configuration file, **dconfig.ini**, by replacing each (**local**) string with the name of the SQL Server that resides on the remote database system. You can find the string under the sections [**ITAssist_Odbc_Attributes**] and [**Master_Odbc_Attributes**].
- 2 If the IT Assistant database resides in the default instance of the SQL Server, IT Assistant database will be *<name of the database server>*. If the IT Assistant database resides in a non-default instance of the SQL Server, for example **MYINST1**, then the IT Assistant database will be *<name of the database server>\MYINST1*. In other words,

Attribute3=Server, *<name/IP address of the database server>* -- in case of default instance

Attribute3=Server, *<name of the database server>\MYINST1* -- in case of named instance

- 3 On the management station, change the IT Assistant services logon credentials from **Local System account** to the common account used to log into the local **SQL Server** on both management station and the remote database system. Let us assume that in this case, it is the local Administrator account.
- 4 You should change the logon credentials for the IT Assistant Connection Service and IT Assistant Network Monitoring Service. To do this, right-click the individual services from the **Service Control Manager** and select **Properties**. Select the **Log On** tab to change the logon credentials.

If you are configuring these services to run under a different user account, the user account used for **Logon** must have the following user privileges:

- Act as part of the operating system (this privilege is required on the Windows 2000 system)
- Replace a process level token
- Log on as a service

To set these privileges, perform the following steps:

- Run `secpol.msc` in the Command Prompt dialog box.
 - Select **Security Settings**→**Local Policies**→**User Rights Assignments**.
 - Right-click the policy and select **Properties** (or **Security**, in case of Windows 2000).
 - Add the user name to this policy.
 - Restart the system to apply the settings.
- 5 This step is optional and is required only if you plan to stop the **SQL Server** service from running on the management station.

During IT Assistant installation, IT Assistant services are created to depend on the **SNMP** service and the **SQL Server**'s **MSSQLServer** service. You can remove the dependency of the IT Assistant services on **SQL Server**'s **MSSQLServer** service by editing the registry for the IT Assistant services on the management station.

 **CAUTION: Before editing the registry, ensure that you save a copy of the registry and understand how to restore it if a problem occurs.**

On the management station, open the Microsoft Windows Registry Editor by typing `regedit` on the command prompt. Navigate to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\dcnetmon`

Double-click the **DependOnService** value name to edit its properties. This registry value is a UNICODE multiple string and its initial Value Data is `SNMP MSSQLServer`.

Delete `MSSQLServer` and save the changes. This removes the dependency of the IT Assistant Network Monitoring Service on the SQL Server service.

Next, navigate to

`HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\dcnonsvc` Double-click the **DependOnService** value name to edit its properties. This registry value is a UNICODE multiple string and its initial Value Data is `SNMP, MSSQLServer, dcnetmon`

Delete `MSSQLServer` and save the changes. This removes the dependency of the IT Assistant Connection Service on the SQL Server service.

Check the dependencies of the IT Assistant Network Monitoring Service and the IT Assistant Connection Service on management station by right-clicking the individual services from the **Service Control Manager** and select **Properties**. Select the **Dependencies** tab. There should be no dependency on `MSSQLServer` Service. Restart the management station to let these changes take effect.

- 6 On the management station, start the IT Assistant Connection Service and IT Assistant Network Monitoring Service. IT Assistant now connects to the IT Assistant database deployed on the SQL Server of the remote database system.

NOTE: If the IT Assistant services dependency on the local SQL Server service has not been removed as described in previous step, the SQL Server service on management station needs to be running for IT Assistant services to be started, even if the SQL Server database is not actually used by IT Assistant.

- 7 To verify that the management station has successfully connected to the IT Assistant database on the remote database system, start the ODBC Data Source Administrator from the **Control Panel**→**Administrative Tools** on the management station. Select the **System DSN** tab. The **ITAssist** system data source is displayed.
- 8 On the management station, open the IT Assistant user interface. The IT Assistant services on management station are now ready to use the IT Assistant database residing on the remote database system.

Configuring IT Assistant to Upgrade the Remote Database

IT Assistant does not upgrade the database which is configured on a remote system. This section discusses the steps required to upgrade the IT Assistant (version 7.0 and later) database.

Deploying IT Assistant Database to ITA_STATION

- 1 On the ITA_STATION, stop IT Assistant Connection Service and IT Assistant Network Monitoring Service from the Service Control Manager. This stops IT Assistant services from accessing the remote IT Assistant database. Also, make sure that no other program is accessing the IT Assistant database, **ITAssist**, of REMOTE_DB_SERVER. If a database program such as SQL Server's Enterprise Manager and/or Query Analyzer is running, close the program or ensure that the program is not accessing the IT Assistant database named ITAssist.
- 2 On the REMOTE_DB_SERVER, detach the IT Assistant database from the local SQL Server by executing the following SQL statement against local master database:

```
exec sp_detach_db @dbname='ITAssist'
```
- 3 To ensure that the database is detached, go to ITA_STATION system, start ODBC Data Source Administrator from **Start**→**Settings**→**Control Panel**→**Administrative Tools**→**Data Sources (ODBC)**. Click the **System DSN** tab. Ensure that there is no system data source with the name ITAssist. If there is, remove that data source by clicking on the **Remove** tab.

- 4 On the REMOTE_DB_SERVER, navigate to the Data folder under MSDE or SQL Server installed location. By default this is C:\Program Files\Microsoft SQL Server\MSSQL. Copy the IT Assistant database file, ITAssist_Data.mdf to the desired path on the ITA_STATION. For this example, let us consider the desired path to be DB_PATH.
- 5 On ITA_STATION, attach the database file, ITAssist_Data.mdf located in DB_PATH to the local SQL Server. This can be done by executing the following SQL statement against the local master database:

```
exec sp_attach_single_file_db @dbname='ITAssist',  
@physname='DB_PATH\ITAssist_Data.mdf'
```

 **NOTE:** Ensure that there are no ITAssist_Data and ITAssist_Log files on the ITA_STATION system.

First argument @dbname specifies the name of the database and must be kept as ITAssist. Second argument @physname specifies where the database file is located. You should customize it to reflect the correct location of ITAssist_Data.mdf. Ensure that there is no ITAssist_log.ldf file in the same path. If a file of the same name exists, delete it before executing this command.

Connecting IT Assistant to Database on ITA_STATION

- 1 On the ITA_STATION, navigate to the configuration directory where IT Assistant is installed. Edit the configuration file, dconfig.ini, by replacing each REMOTE_DB_SERVER (name of the database) string under the sections [ITAssist_Odbc_Attributes] and [Master_Odbc_Attributes] with (local).
- 2 On the ITA_STATION, change the IT Assistant services logon credentials from Common account to Local System account. This operation should be done for both the IT Assistant Connection Service and IT Assistant Network Monitoring Service. To perform these actions, right-click each service from the Service Control Manager and select Properties. Now select the **Log On** tab to change the logon credentials. Save the changes and start the IT Assistant services.
- 3 Launch IT Assistant.

Upgrading IT Assistant

See "Upgrading from a Previous Version of IT Assistant", for detailed instructions on upgrading IT Assistant. After the upgrade is completed, launch IT Assistant.

Deploy the IT Assistant Database to REMOTE_DB_SERVER

See "Deploying the IT Assistant Database to the Remote Database" to move IT Assistant database to the remote system.

Configuring Dell™ OpenManage™ IT Assistant to Monitor Your Systems

Dell™ OpenManage™ IT Assistant can discover, inventory, and perform a variety of other tasks such as power and performance monitoring. for each system in your enterprise. Managed systems can include a mixture of client systems (desktops, portable components, and workstations), servers, printers, tape devices, storage devices, systems with remote access cards, Dell™ PowerConnect™ switches, and digital keyboard/video/mouse (KVMs) switches used with rack-dense systems.

IT Assistant in Real-World User Scenarios

This section illustrates how IT Assistant can be used in two different customer scenarios:

- A small-to-medium size business (see "Discovery in Jane's Small-to-Medium Size Business")
- A large enterprise environment (see "Discovery in Tom's Enterprise-Size Business")

Although fictional, both scenarios presented in this section illustrate how administrators in charge of managing network environments might configure IT Assistant. While many configuration concepts are the same for both scenarios, others depend on the type and number of systems being managed. Use the scenario that best suits your situation as a general guide for configuring IT Assistant.

Regardless of the size of your network, it is useful to read through both scenarios to gain a more complete understanding of IT Assistant procedures and concepts.

NOTE: Neither scenario shown in this section is intended to illustrate the full capabilities of IT Assistant. Based on your enterprise, you may choose to use options and features in IT Assistant not shown here. For more information on IT Assistant's full range of capabilities, see the *IT Assistant Online Help*.

Running Applications That Require Different Versions of the JRE On Your System

The IT Assistant user interface (UI) uses the Java™ Runtime Environment (JRE) version 6 update 3. If IT Assistant detects an older version of JRE on your system, it installs version 6 update 3 to run correctly. If you encounter problems running other third-party applications that were using the older version of the JRE, perform these steps to uninstall JRE version 6 update 3:

On supported Microsoft® Windows® operating systems:

- 1 Click **Start**→**Settings**→**Control Panel**→**Add Remove Programs**.
- 2 Select **Java™ SE Runtime Environment 6 Update 3** and click **Remove**.

NOTE: IT Assistant will install the required JRE version when you launch IT Assistant the next time.

On supported Linux operating systems:

- 1 Navigate to the **plugins** folder of your Web browser.
- 2 Remove the link to the JRE install by typing:

```
rm libjavaplugin_oji.so
```

NOTE: To run IT Assistant again, re-create the link to the JRE. See "Getting Started With Dell™ OpenManage™ IT Assistant" for information on creating a soft link.

Ensure That Agents and Instrumentation Are Installed and Running

Dell agents required for managed systems are contained in Dell OpenManage Server Administrator; Dell agents required for client systems (workstations, desktops, and portable components) are contained in Dell OpenManage Client Instrumentation.

These agents gather status information from BIOS or other firmware on the systems they are installed on, then provide that information to IT Assistant. Systems that are monitored by IT Assistant are generally referred to as *managed systems*—the system that manages them is referred to as *management station*, or *IT Assistant system*.

If either of these agents is not installed, see the *Dell OpenManage Server Administrator* and *Dell OpenManage Client Instrumentation* documentation before continuing with IT Assistant configuration. If the appropriate agent is installed and running correctly, start IT Assistant and read on.

 **NOTE:** Starting with IT Assistant version 8.0, you can discover devices using the IPMI Discovery support feature. See "Configuring IPMI for System Manageability" for more information.

Start IT Assistant

 **NOTE:** IT Assistant supports role-based access control (RBAC) to define the specific operations each user can perform. To set up RBAC users, see "Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation."

To log on to IT Assistant:

- 1 Double-click the **IT Assistant** icon on your system's desktop.
- 2 The **Log in** dialog box appears. (If Single Sign-On is configured as described in "Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation," the **Log in** dialog box does not appear.)
- 3 Enter a user name and password.
- 4 Select **Active Directory Login** if you have configured user information using the Microsoft Active Directory® plug-in. The privileges you have in IT Assistant are dependent on the user settings defined.

 **NOTE:** For more information on setting up role-based access, see "Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation." For information on installing the Active Directory plug-in and extending the Active Directory schema for IT Assistant, see the *Dell OpenManage Installation and Security User's Guide*.

 **NOTE:** To access IT Assistant remotely, you must enter `https://<hostname>:<portnumber>`. The default port number is 2607.

- 5 Enter your password.

As IT Assistant starts up, an authentication certificate pop-up box will appear. You must click **OK** within 5 minutes to accept these certificates or IT Assistant will not load properly and certain critical features will not function.

You may see several pop-ups during IT Assistant startup. Pop-ups prompting you to accept an authorization certificate can be avoided by selecting **View Certificate**→**Install Certificate** (if available) or choosing **Always** in response to the request to accept the certificate.

NOTE: If the system from where you are accessing the IT Assistant UI from a Windows Vista® or Windows Server® 2008, you may get several warning dialogs prompting you to allow `regedit` to be used. This is caused by IT Assistant modules trying to find what applications are installed on that system. Click **OK** to allow `regedit` to run. IT Assistant does not make changes to the registry; it only reads the registry.

NOTE: See the *Dell™ OpenManage™ Installation and Security User's Guide* for more information on X.509 Certificate management.

Configuring SNMP for System Manageability

Before configuring SNMP for system manageability, let us look at the two scenarios we will use to illustrate IT Assistant in this section:

Two systems administrators—let us call them Jane and Tom—are responsible for managing two separate network environments. Jane represents the small-to-medium size business (50 servers, plus over 200 client systems, and 10 switches), while Tom represents a much larger enterprise (1,000 servers, plus printers, tapes, and virtual machines). Although Jane and Tom both use IT Assistant to discover and manage their systems, the way they configure and use IT Assistant will differ significantly. However, before highlighting the differences, let us look at some basic steps both must perform.

Both Jane and Tom must configure the Simple Network Management Protocol (SNMP) systems management protocol to discover their systems and to receive traps (asynchronous, alert notifications) that report the status of their components. On managed systems, the Server Administrator agent generates SNMP traps in response to changes in the status of sensors and other monitored parameters on a managed system. In order to correctly send these traps, the operating system's SNMP service must be configured with one or more trap destinations that correspond to the system where IT Assistant is installed.

Details on Configuring the SNMP Service

For detailed information about SNMP configuration for the IT Assistant system and for all supported managed system, operating systems, see "Configuring the SNMP Service."

Configuring SNMP on Systems You Want to Manage

In addition to having the SNMP service installed and running on the IT Assistant system, each managed system's operating system must have the SNMP service or daemon configured.

SNMP Best Practices

When configuring SNMP, adhere to the following requirements:

- Use a host name or a static IP address for the IT Assistant system.
- On all managed systems, configure the static IP address or host name as the SNMP trap destination. If you use a host name as the SNMP trap destination (the IT Assistant system name), you must correctly configure name resolution on your network.
- Ensure that **Get** and **Set** community names for SNMP are different.
- When assigning community names to managed systems, keep the total number of different community names low. The fewer community names, the easier it will be to manage your network.

Information on the Managed System Needed for Optimal SNMP Configuration

For every system (running the Windows operating system) to be discovered and managed using SNMP protocol, ensure that SNMP is installed and properly configured.

The two community names that are to be set up are the **Get** (or read) community name and the **Set** (or write) community name. The read community name, which is sometimes labeled *read only*, allows IT Assistant to read information from the managed system, while the write community name, sometimes labeled *read write*, allows IT Assistant to read and write information to the managed system.

NOTE: Community names are case sensitive.

NOTE: Although you can set up just one community name as both read and read/write, it is advisable to create a separate name for each to allow restricted access to the write action.

The community names that you assign for SNMP for managed systems in the operating system must also be recorded in IT Assistant when you set up SNMP discovery ranges.

In the **Discovery Range** dialog box under the protocols section, make sure that the **Get** (or read) and **Set** (or write) community names of all of the managed systems are entered. If there is more than one community name per field, separate each community name with a comma.

For more information, see "Configuring the SNMP Service."

Configuring CIM for Manageability

Depending on your network environment, configuring CIM may be a required task. CIM is the preferred systems management protocol for newer client instrumentation and is required for Dell systems instrumented with OMCI version 7.x. CIM is also used for performing remote Windows software updates.

In her small-to-medium size network, Jane must install, enable, and configure CIM to be able to manage client systems running the latest Client Instrumentation (OMCI 7.x). Although Tom's group of managed systems are made up entirely of servers, he will also install and enable CIM. Generally, CIM should be enabled if your enterprise includes any managed system running a Microsoft Windows operating system.

NOTE: Dell OpenManage Server Administrator only sends events to IT Assistant as SNMP traps. It does not send CIM indications for either instrumentation or storage events from a server.

Configuring CIM in the Operating System

IT Assistant uses the Windows Management Interface (WMI) core to make CIM connections. The WMI core uses Microsoft network security to protect CIM instrumentation from unauthorized access.

For more information on operating system CIM configuration, see "Setting Up CIM."

NOTE: IT Assistant requires the CIM user name and password with administrator rights that you established on the managed systems. If you are using a domain user, be sure to specify the correct domain in the user name field. A user name must always be qualified with a domain, or **localhost** if a domain is not present. The format is either `<domain>\<user>` or `<localhost>\<user>`.

NOTE: CIM discovery requires proper user ID and password credentials. Failure to supply proper credentials on a subnet configured for CIM discovery can result in account lockout.

Best Practices for Setting Up Discovery Targets

Regardless of the size of your network, the following table shows Dell's recommendations for the best way to set up discovery targets. IT Assistant users define discovery target systems and ranges on a network to identify the systems that they want to locate and record in their database. When you set up a discovery target and range in IT Assistant, you are given the option of selecting a host name, an IP address, or a subnet range to identify the systems that you want IT Assistant to discover. This section shows which discovery type is best for the network environment you have.

Table 6-1. Best Practice Recommendations for Setting Up Discovery

Preferred Discovery Range Type	DHCP	Primarily Static IP Addresses
Host name	Recommended	Recommended if DNS is present and IP addresses are spread among many different network segments
IP address	Not recommended	Recommended if IP addresses are spread among many different network segments
IP range	Recommended if located on one or a few network segments	Recommended if located on one or a few network segments

Configuring IPMI for System Manageability

To be able to use the Intelligent Interface Management Protocol (IPMI) discovery feature, ensure that you have:

- Dell PowerEdge™ x8xx systems and above with IPMI version 1.5 and later. This feature will not work for older systems.
- The iDRAC on xx0x modular systems and xx1x systems supports IPMI.

- All systems equipped with a baseboard management controller (BMC).
- Configured the BMC/iDRAC of every managed system.

NOTE: For more information on configuring the BMC, see the "Configuring Your Managed System" section in the *Dell OpenManage Baseboard Management Controller Utilities User's Guide* and for iDRAC see the "Configuring iDRAC" section in the *Integrated Dell Remote Access Controller User's Guide* on the Dell Support website at support.dell.com or on the *Dell Systems Management Tools and Documentation DVD*.

NOTE: For more information on configuring SNMP, see "Configuring the SNMP Service" on page 232.

Using the Microsoft IPMI Provider

Microsoft Windows Server 2003 R2 and Microsoft Windows Server 2008 is equipped with an IPMI driver and an IPMI Common Information Model (CIM) Provider. The CIM Provider exposes system information that is exposed by the BMC/iDRAC through the IPMI interface. IT Assistant uses this feature to extract information. You can use IT Assistant to discover and classify the BMC/iDRAC through IPMI.

However, ensure that you have the following to be able to use the Microsoft IPMI Provider to send information about your systems:

- Windows Server 2003 R2 or Windows Server 2008 operating system on the managed systems
- All managed systems have BMC/iDRAC with IPMI version 1.5 or later.
- CIM is configured on the managed systems

For more information, see step 6 of "Configuring Discovery Configuration Settings."

- IPMI drivers are loaded
- Hardware Management MSI

For more information, see the *Dell OpenManage IT Assistant Online Help*.

Best Practices for Using the IPMI Discovery Feature

IPMI discovery provides you with information about a system even if the system is powered down. IPMI uses the Remote Management Control Packets (RMCP) protocol to communicate with the BMC/iDRAC of the managed systems.

NOTE: RMCP is a UDP-based protocol, which communicates over port 623. The IPMI messages are encapsulated in the RMCP packets. RMCP protocol enables remote server control in all states where the system is powered on.

- Configure the BMC/iDRAC on managed systems that will be discovered using the IPMI Discovery support feature.
- Connect the BMC/iDRAC network interface card (NIC) to the network.

If your systems have a Dell Remote Access Controller (DRAC) 5, then the RAC should be connected to the network.

NOTE: For Dell x8xx systems, you should setup the DRAC 4 and the BMC if you want to use the functionality of both. However, for Dell x9xx and later systems, DRAC 5 takes over the full functionality of the BMC. Therefore, you need to setup only the DRAC 5. For Dell xx0x modular systems, you should setup iDRAC.

- In the discovery ranges, provide the SNMP/CIM IP address and credentials (user name and password) for the device as well as the BMC/iDRAC IP address and credentials.

Connectivity using IPMI is inherently slow due to the RMCP protocol. It is, therefore, recommended that you create a separate discovery range for devices that do not have a Dell agent installed on them. For this discovery range alone you can enable the IPMI discovery feature.

NOTE: Systems discovered only through the IPMI protocol are identified on the IT Assistant UI through the BMC/iDRAC IP address. For this reason, tasks such as software deployment and performance and power monitoring cannot be run on such systems.

Configuring IT Assistant to Discover Storage Devices

Starting with IT Assistant version 8.0, you can discover and monitor Dell|EMC storage devices or Dell PowerVault™ Modular Disks.

You can display the status of the discovered Dell|EMC storage arrays or Modular Disks in the **Dell/EMC Arrays** category under **Storage Devices** group. The status of Dell|EMC storage arrays and Modular Disks will be red for failed/critical and green for normal. The Dell|EMC storage arrays and Modular Disks recognize all SNMP traps from the device including logging, filtering, and actions information.

NOTE: Use IT Assistant's Event Management System to associate actions, such as e-mailing an administrator or creating a trouble ticket in a help-desk system through an Application Launch, with the critical event sources associated with the arrays. For more information, see the *Dell OpenManage IT Assistant Online Help*.

Prerequisites for Dell|EMC

You should have the following software configured to enable the Storage Integration feature:

- EMC® Navisphere® Secure CLI on the same system that is running IT Assistant
- SNMP enabled on your Dell|EMC array
- FLARE® operating environment version 19 or later on your Dell|EMC array

Navisphere Secure CLI

IT Assistant uses Navisphere Secure CLI for getting inventory information from the storage devices. The IT Assistant installer detects if the Navisphere Secure CLI is not installed on the management station and gives you the option of installing it.

NOTE: EMC releases new versions of Navisphere Secure CLI periodically, and you may need to update the version of the CLI on the IT Assistant management station.

NOTE: As new versions of IT Assistant are released, the Navisphere Secure CLI version will be updated.

If your storage environment has storage arrays, you can navigate to the element manager to manage the Dell|EMC device.

See the *Dell OpenManage IT Assistant Online Help* for connecting to the remote array for troubleshooting Navisphere agent issues.

See the EMC Navisphere online help for details on monitoring SNMP alerts.

Setup and Configuration

- IT Assistant supports discovery on Dell|EMC storage arrays (for example, AX100 or AX150) arrays that have been upgraded to Navisphere Manager.

NOTE: IT Assistant does not manage arrays running Navisphere Express.

NOTE: If you are discovering an AX100i storage array, see the IT Assistant readme for the latest information.

- IT Assistant uses SNMP for discovering the Dell|EMC arrays. Use the Navisphere Manager to enable SNMP on your Dell|EMC array, before it can be discovered in IT Assistant. Set SNMP in Navisphere under the Network settings of the Storage Processor properties.

NOTE: The storage processors on the Dell|EMC CX3-20, CX3-40, CX3-80 products each have one management port and one service local area network (LAN) port. Do not connect the service ports to the network for general use. Connecting these ports to the network may result in unpredictable status and event reporting within IT Assistant.

- Ensure that the following ports are open on the firewall:
 - TCP 80/443 (Web and SSL)
 - TCP 6389 (Navisphere CLI)
 - UDP 161/162 (SNMP and bi-directional)

NOTE: These are default ports. If you have changed the port configuration, ensure that the correct ports are open.

NOTE: For more information on ports used by IT Assistant, see "IT Assistant UDP/TCP Default Ports".

- IT Assistant discovers and displays the information for the storage processor value stored in the discovery range. Since the storage processors are redundant, you only need to enter the IP address of one storage processor for discovery and inventory purposes.

Using the Troubleshooting Tool

The EMC connectivity test can be used to test the communication between the IT Assistant management station and the Navisphere agent on the storage device. The test requires the IP address of the storage processor and Navisphere credentials.

NOTE: The Navisphere credentials should have a global scope.

Creating Reports

You can create custom reports for the Dell|EMC arrays. The report wizard of the IT Assistant allows you to select fields from a variety of tables including Device, NIC, Physical disk, Virtual disk, Enclosure, and Controller.

The reports can be created in HTML, XML, and comma-separated value (CSV) format.

NOTE: IT Assistant has pre-defined controller and enclosure reports for the Dell|EMC arrays.

Discovery in Jane's Small-to-Medium Size Business

Jane wants to discover all of the systems on her network. Discovery is a process whereby IT Assistant identifies each system and records identifying information for that system in the IT Assistant database.

As we mentioned previously, Jane is the sole system administrator of a mixed network of systems that includes:

- 50 Dell PowerEdge systems
- 200 Dell OptiPlex™ desktops
- 10 Dell PowerConnect switches

Jane is going to use IT Assistant to monitor global status for her systems, as well as to receive notification when a Dell system or a PowerConnect switch on her network is in the warning or critical state. Jane does not plan to use IT Assistant to notify her when one of her desktop systems generates an alert.

Decisions to be Made Prior to Configuring IT Assistant Discovery

Before using IT Assistant to configure discovery, Jane needs to make some basic decisions about her network. Specifically, she must decide the:

- Systems management protocols needed to manage the systems and devices on her network
- Community names and trap destinations for systems to be managed by SNMP
- SNMP requirements for PowerConnect switches
- CIM authentication credentials
- Host names, IP addresses, or IP subnet ranges of systems she wants to monitor

Systems Management Protocols Needed for Jane's Network

In planning to configure discovery, Jane has a mixture of system types (server, client, and switches). The systems management protocols that Jane requires to manage these networked systems and devices are:

- SNMP for her Dell systems and PowerConnect switches
- CIM for her systems running Windows, assuming that Jane has newer, CIM-compatible client instrumentation installed on her client systems

For a review of protocol requirements, see "Configuring Protocols to Send Information to Dell™ OpenManage™ IT Assistant."

Community Names and Trap Destinations

Jane's requirements for configuring **Get** and **Set** community names and trap destinations for SNMP on her managed systems are not affected by the size of her business. For SNMP configuration requirements associated with servers, see "Configuring the SNMP Service."

Configuring SNMP for PowerConnect Switches

Jane can monitor her ten PowerConnect switches by using IT Assistant. Each model of PowerConnect switch has documentation that provides the following information on setting up the SNMP service for that switch:

- Community names
- Trap destinations
- The hosts from which the switch will accept SNMP packets

Initial Tasks for Finding Systems on Jane's Network

Now that Jane has reviewed the prerequisite information for her discovery configuration, she is ready to perform first-time discovery configuration. Jane must perform the following tasks:

- Configure communication protocols on the managed systems.
- Configure discovery settings.
- Enter all of the discovery ranges.

Using IT Assistant to Find and Manage Jane's Networked Systems

If this is the first time IT Assistant has been launched since installation, Jane is presented with a welcome screen indicating that IT Assistant has not yet been configured. The four basic steps of configuration are listed:

Step 1—Discovery Configuration – controls how often IT Assistant polls the network for the addition of new systems

Step 2—Inventory Configuration – controls how often IT Assistant retrieves a detailed inventory of all discovered systems

Step 3—Status Polling – controls how often IT Assistant retrieves the health and network connectivity status of discovered systems

Step 4—Ranges – identifies specific ranges for IT Assistant to either limit or expand its discovery, inventory, or polling tasks

Clicking any of the steps will take her to the corresponding dialog box under the **Discovery and Monitoring** menu bar in IT Assistant. Steps 1 through 3 are single-window dialog boxes; step 4 is a wizard-based procedure for defining discovery ranges.

Configuring Discovery Settings

Jane begins by configuring the discovery settings for her systems using the **Discovery Configuration Settings** dialog box. This dialog is displayed either automatically when she clicks *Step 1: Discovery Configuration* from the IT Assistant or by choosing **Discovery Configuration** from the menu bar. Here, Jane enters information that IT Assistant will use for discovery. These values remain unchanged and apply to the corresponding discovery ranges that she will create later in this procedure. However, she can change these values at any time.

To configure discovery settings in IT Assistant, Jane performs the following steps:

- 1 Jane selects **Discovery and Monitoring**→**Discovery Configuration** from the IT Assistant menu bar.

The **Discovery Configuration Settings** dialog box appears. **Enable Device Discovery** is selected by default.

- 2 In the dialog box under **Initiate Device Discovery**, Jane selects the period she wants IT Assistant to perform discovery.

Jane selects all seven days of the week at 6:00:00 AM because the data maybe dynamic, but she wants to select a non-peak period.

 **NOTE:** Dell recommends that you schedule discovery at non-peak times.

- 3 Under **Discovery Speed**, Jane uses the sliding bar to indicate how much network bandwidth and system resources she wants to allocate to discovery.

 **NOTE:** The faster you set the discovery speed, the more network resources discovery will consume. Faster discovery speeds may impact network performance.

- 4 Under **Discover**, Jane can choose whether to discover **All Devices** or **Only Instrumented Devices**.

She chooses **Only Instrumented Devices** since she wants IT Assistant to discover only devices that have SNMP or CIM instrumentation. If she wanted to discover any device that responded to a **ping** command, she would have chosen **All Devices**. For a list of supported agents, see "Agents Supported by IT Assistant."

 **NOTE:** Dell recommends that if you have Domain Name System (DNS) configured on your network, select the default, **DNS Name Resolution**.

- 5 Under **Name Resolution**, Jane selects **DNS Name Resolution** or **Instrumentation Name Resolution**.

DNS name resolution matches the IP address of a system to a host name. Instrumentation name resolution queries the managed system's agent instrumentation for its name. See your device or system documentation for more information on how to configure instrumentation name resolution.

 **NOTE:** Dell recommends that if you have DNS configured on your network, select the default, **DNS Name Resolution**.

- 6 Jane clicks **OK**.

Configuring Inventory Settings

Next, Jane needs to enter inventory settings. IT Assistant collects inventory information about software and firmware versions, as well as device-related information about memory, processor, power supply, PCI cards and embedded devices, and storage. This information is stored in the IT Assistant database and can be used to generate customized reports.

To set inventory settings, Jane performs the following steps:

- 1 Jane selects **Discovery and Monitoring**→**Inventory Configuration** from the menu bar.

The **Inventory Poll Settings** dialog box is displayed. **Enable Inventory** is selected by default.

- 2 Under **Initiate Inventory**, Jane selects when she wants IT Assistant to perform inventory.

Jane selects all seven days of the week at 6:00:00 AM, a non-peak period for network traffic.

- 3 Under **Inventory Speed**, Jane uses the sliding bar to indicate how much network bandwidth and system resources she wants to allocate to inventory.

 **NOTE:** The faster you set the inventory speed, the more network resources discovery will consume. Faster inventory speeds may impact network performance.

- 4 Jane clicks **OK**.

 **NOTE:** IT Assistant versions 8.0 and later can display the inventory information for printers, tapes, and storage devices. For more information, see the *Dell OpenManage IT Assistant Online Help*.

Configuring Status Polling Settings

Next, Jane defines status polling settings for her systems. IT Assistant performs a power and connectivity health check for discovered devices, determining whether a device is operating normally, is in a non-normal state, or is powered down. Status messages in IT Assistant include *healthy*, *warning*, *critical*, and *powered down*. Status icons also indicate if a system is not instrumented, there is no information for the system, or the state the system was in before it was last powered down.

To set status polling settings, Jane performs the following steps:

- 1 Jane selects **Discovery and Monitoring**→**Status Polling Configuration** from the menu bar.

The **Status Polling Configuration Settings** dialog box is displayed. **Enable Status Polling** is selected by default.

- 2 Under **Status Polling Interval**, Jane selects the interval that she wants IT Assistant to use to perform status polling.
- 3 Under **Status Polling Speed**, Jane uses the sliding bar to indicate how much network bandwidth and system resources she wants to allocate to status polling.

NOTE: The faster you set the status polling speed, the more network resources discovery will consume. Faster speeds may impact network performance.

- 4 Jane clicks **OK**.

Configuring Discovery Ranges

IT Assistant maintains a register of network segments that it uses to discover devices. A discovery range can be a subnet, a range of IP addresses on a subnet, an individual IP address, or an individual host name.

To identify her systems to IT Assistant, Jane must define a discovery range.

To define an *include* range, Jane performs the following steps:

- 1 Jane selects **Discovery and Monitoring**→**Ranges** from the menu bar.

The **Discovery Ranges** navigation tree is displayed on the left side of the IT Assistant window.

- 2 Jane expands **Discovery Ranges**, right-clicks **Include Ranges** and selects **New Include Range**.

The **New Discovery Wizard** starts.

NOTE: To *exclude* a specific system or host name from discovery, right-click **Exclude Range** in the **Discovery Ranges** navigation tree and enter the name or IP address of the system. In most small-to-medium businesses like Jane's, this option is not used.

- 3 In step 1 of the wizard, Jane enters an IP address (or range) or host name. She clicks **Add** to add multiple ranges of IP addresses or host names.

She clicks **Next** to go to the next step.

 **NOTE:** Acceptable values for the include range are subnet range, host name, or IP address of a single system. Jane refers to the IP subnet ranges she wrote down for her servers, desktop systems, and switches. On Jane's list, Jane may have 192.166.153.* and 192.166.154.*, where the first subnet range is for Jane's servers, the second subnet range is for Jane's desktops, and the switches are spread out on both subnets.

 **NOTE:** The Import Node List utility offers a convenient way to specify a list of host names, IP addresses, and subnet ranges for IT Assistant to discover. See the *IT Assistant Online Help* for instructions on how to run the utility from the command line. The **importnodelist.exe** file is in the **bin** directory of the IT Assistant base directory.

- 4 In step 2 of the wizard, Jane uses the default values for Internet Control Message Protocol (ICMP) time-out and retry for the range. She uses the Troubleshooting Tool to determine these values.

 **NOTE:** IT Assistant offers a troubleshooting tool that can be useful in gathering system information and subnet ranges. Access the tool by selecting **Tools**→**Troubleshooting Tool** from the menu bar. For more information, open the Troubleshooting Tool dialog box and click **Help**.

- 5 In step 3 of the wizard, Jane configures the SNMP parameters to be used during discovery:

- Jane ensures the **Enable SNMP Discovery** option is selected.
- She enters a case-sensitive value for the **Get Community** name.

Jane's considerations:

Jane is managing 50 servers, so she wants to configure SNMP. The **Get Community** name is a read-only password that SNMP agents installed on managed systems use for authentication. Jane considers the following as she selects a **Get Community** name:

Each SNMP-enabled managed system has a **Get Community** name. Jane ensures that she lists each of the community names on all of the systems that she wants to manage. If Jane's managed systems have more than one community name, she enters multiple community names separated by commas in the **Get Community** name field.

Although the **Get Community** name affects read-only information retrieved by IT Assistant from managed systems, such as the results of discovery, status polling, and alert logs, Jane wants to limit access to this data. Therefore, she changes the default **Get Community** name (**public**) to a name known only to her and her designated backup.

 **NOTE:** Community names entered in the SNMP Get and Set community name fields for the managed system's operating system must match the Get Community and Set Community names assigned in IT Assistant.

- Jane enters a case-sensitive value for the **Set Community** name.

Jane's considerations:

The **Set Community** name is a read-write password that allows access to a managed system. SNMP agents running on the managed system use this password for authentication when actions are attempted on the system, only power cycle tasks use SNMP sets.

 **NOTE:** Although Dell server instrumentation has an authentication layer above the SNMP Set community name (which requires a host name and password), many SNMP agents do not. Agents without this added security layer may allow any user who knows the SNMP Set community name to gain control of the managed system.

 **NOTE:** IT Assistant only uses SNMP sets to power cycle systems if the Server Administrator remote command line is not available. If SNMP sets are not required for this purpose, do not enter an SNMP set community name in the discovery wizard.

Jane chooses a **Set Community** name that matches the SNMP Set community value on the system she is managing. She also makes sure the name she chooses follows the secure password standards in place across her enterprise.

 **NOTE:** If you want to specify more than one SNMP Get or Set community name in an individual discovery range (for example, one community name for each IP subnet range), separate your community names with commas.

- Jane enters the SNMP time-out and retry values for the discovery range. In Jane's type of network, the default values are usually good choices.

- 6 In step 4 of the wizard, Jane configures the CIM parameters to be used during discovery.

Since Jane has a mix of servers and client systems in her managed group running Windows, she will configure CIM.

- Jane ensures **Enable CIM Discovery** is selected.
- In **Domain\User Name**, she enters the same name she used to configure CIM on the managed system.
- She enters the same password she used for the CIM password on the managed system.

 **NOTE:** You should enable the CIM Discovery option if you want to use the Microsoft hardware agent for IPMI in Microsoft Windows Server 2003 R2.

- 7 In step 5 of the wizard, Jane does not select **Enable Dell/EMC Array Discovery** because she does not have Dell|EMC storage devices on her network.
- 8 In step 6 of the wizard, Jane does not configure the IPMI parameters because she does not want to monitor her systems through IPMI.
- 9 In step 7 of the wizard, Jane chooses what action IT Assistant will take upon completion of the wizard.
- 10 In step 8 of the wizard, Jane reviews her selections and clicks **Finish** to complete the wizard.

 **NOTE:** You can click **Back** to change your selections.

 **NOTE:** In a network consisting of systems that have both IPv4 and IPv6 addresses, post SNMP discovery, only IPv4 addresses are displayed by IT Assistant.

Changing Discovery, Inventory, and Status Polling Settings After Original Setup

You can return to the **Discovery and Monitoring** menu at any time to edit the settings you entered. The new settings you enter will become effective the next time you perform the corresponding action.

Viewing Devices and Launching Applications

After configuring the discovery, inventory, and status polling settings, Jane can view the health of the devices on her network by clicking **View**→**Devices**. The performance status of the devices rolls up into overall system health status and is displayed in the **Devices** view.

To manage the devices displayed with a warning or critical state, Jane can select the following options available as part of the Application Launch feature (right-click a device and select **Application Launch**):

- Dell OpenManage Server Administrator — the Web browser is launched with the Web address corresponding to the Server Administrator application for the selected device. However, this option is available only on systems that have the Server Administrator Web stack enabled.
- Array Manager — the Array Manager console is launched. The Array Manager console must be installed on the system where the IT Assistant UI is running.
- RAC Console — IT Assistant launches the RAC that it discovers through out-of-band or inband through the server agent.
- CMC Console — IT Assistant launches the Chassis Management Controller (CMC) console that it discovers the CMC out-of-band or in-band through the server agent.

NOTE: The CMC Console option is available only on limited Dell systems.

- Web interface for PowerConnect Console — the Web browser is launched with the Web address corresponding to the PowerConnect Console for the selected device. This option is available only for PowerConnect network switches.
- Digital KVM Console — IT Assistant launches the Digital KVM Console application. This option is enabled only for devices that are discovered as digital KVMs. Additionally, the client application must be installed on the system running the IT Assistant UI.
- Remote Desktop Connection — IT Assistant launches it on any Windows operating system. The remote desktop client must be installed on the system where the IT Assistant UI is running.
- Telnet — IT Assistant launches a telnet console on any Linux operating system. Telnet must be enabled on the system where the IT Assistant UI is running. Jane may also need to configure the Linux server to accept the telnet connection, and if she is using a firewall, she should ensure that the appropriate ports are open.

- **SOL Proxy** — IT Assistant launches a telnet console on the Serial-over-LAN (SOL) Proxy application installed on the IT Assistant Services Tier. Jane will then need to use the SOL Proxy application to communicate with a remote managed system's baseboard management controller (BMC/iDRAC). IT Assistant does not launch the SOL Proxy in context to the BMC/iDRAC. The IP address and credentials for the remote managed system's BMC/iDRAC will be entered within the SOL session.
- **Client Console** — Jane must have the remote client instrumentation application—Dell OpenManage Client Connector (OMCC)—installed on the IT Assistant system. Since Jane will use this option to manage client systems running Dell OpenManage Client Instrumentation (OMCI), OMCI version 7.3 or earlier must be installed on the desktop system. Jane should also enable Common Information Model (CIM) for discovery because IT Assistant does not support Simple Network Management Protocol (SNMP) for desktop systems.
- **Dell Client Manager (DCM)** — If the desktops on Jane's network have OMCI version 7.4 and later, the **Application Launch** menu displays this option.

Jane can also choose the applications she wants to launch for multiple devices or a group of devices, such as for printers and switches, from the IT Assistant UI. For more information, see the *Dell OpenManage Online Help*.

Creating Alert Action Filters and Alert Actions for Jane's Small-to-Medium Size Business

Jane creates an *Alert Action Filter* in IT Assistant by specifying a set of conditions. When tied to an *Alert Action*, IT Assistant will automatically execute whatever action Jane has defined.

IT Assistant has three types of Alert filters:

Alert Action Filters – used to trigger actions when an alert condition is met

Ignore/Exclude Filters – used to ignore SNMP traps and CIM indications when they are received.

Alert View Filters – used to customize the Alert Log view

Jane chooses to use an Alert Action Filter in IT Assistant to filter *warning* and *critical* events for her servers and PowerConnect switches. That way, she will be able to create an Alert Action that will automatically send her an e-mail

notification when her server and switch components enter these states. From there, she can take action to prevent a more serious event, such as a system failure. Being the only system administrator of her network, Jane must be selective about which systems she monitors, as well as the Alert Action Filters she creates. She decides to reserve these filters and actions only for her most mission-critical equipment and most severe events.

Creating an Alert Action Filter

- 1 Select **Alerts**→**Filters** from the menu bar.

The **Alert Filters** window appears.

- 2 Expand the Alert Filters in the navigation tree and right-click **Alert Action Filters**. Select **New Alert Action Filter**.

The **Add Filter Wizard** appears.

- 3 Enter a descriptive name for the filter. For example, *Jane's Network Warning and Critical*.

- 4 Under **Severity**, select the severity of the events for which you want to receive alerts and logs.

Jane selects **Warning** and **Critical**.

Click **Next**.

- 5 Under **Alert Category Configuration**, either select **Select All**, or select the categories of events to include in the alert filter.

Jane selects **Select All** because she wants to be notified of any warning or critical event that affects her network switches or servers.

Click **Next**.

- 6 Under **Device/Group Configuration**, select the devices or groups to associate with the new action alert filter.

Jane selects **Servers and Network Devices**.

Click **Next**.

- 7 Under **Date/Time Range Configuration**, enter values for any or all of the optional categories.

Jane leaves these options unselected since she wants the filter to apply at all times.

Click **Next**.

- 8 Under **Alert Action Associations**, select whether you want the event captured by the filter to trigger an alert or be written to a log file.

Jane selects **Alert** to get a console notification.

- 9 The **New Filter Summary** shows your selections. Click **Finish** to accept, or **Back** to make changes.

- 10 Verify that the filter name you created in step 3 of the wizard appears in the **Summary of Alert Action Filters** window.

Creating an Alert Action

Now, Jane wants to create an Alert Action that is triggered by the Alert Action Filter she just set up.

To create an Alert Action:

- 1 Jane selects **Alerts**→**Actions** from the menu bar.
- 2 Jane right-clicks **Alert Actions** in the navigation tree and selects **New Alert Action**.

The **Add Alert Action Wizard** appears.

- 3 Jane gives the action a logical name in the **Name** field.
- 4 From the **Type** pull-down menu, Jane chooses **Email**.

NOTE: Jane could also choose **Trap Forwarding** or **Application Launch** from the action type pull-down list. **Trap Forwarding** allows large-scale enterprise managers to send SNMP traps to a specific IP address or host. **Application Launch** allows an administrator to specify an executable to run when the alert action filter is met.

NOTE: Any trap forwarded by IT Assistant will not have the **EnterpriseOID**, **Generic TrapID**, and **Specific Trap ID** of the original trap. These values will appear in the description of the forwarded trap.

- 5 In the **E-mail Configuration** dialog, Jane specifies a valid e-mail address (within your enterprise's SMTP server group) to receive the automatic notification.

NOTE: Jane can test the e-mail configuration she specified by using the **Test Action** button. A success/failure message will be issued. A success should be interpreted as IT Assistant sending the message, not that the recipient received it. For more information on using the **Test Action** button, see the Troubleshooting topic in the *IT Assistant Online Help*.

NOTE: To send e-mail through IT Assistant, the enterprise's SMTP server must be correctly configured. To configure the SMTP server, go to **Preferences**→**Web Server** on the top navigation bar, and configure the **SMTP Server Name (or IP Address)** and **DNS Suffix for SMTP Server**.

- 6 In **Alert Filter Associations**, Jane identifies the Action Alert filter that will trigger this e-mail.

She selects *Jane's Network Warning and Critical*—the name she gave the Alert Action Filter she set up earlier.

- 7 A summary dialog shows Jane's selections.

Jane verifies that the name of the Alert Action she assigned in step 3 appears in the **Summary of Alert Actions** window.

Jane clicks **Finish** to accept the changes.

As a result of how Jane has configured Alert Action Filters and Alert Actions in IT Assistant, here is what will happen:

- IT Assistant will continuously monitor all servers and network switches on Jane's network.
- When any server or network switch reaches a warning or critical state, the Alert Action Filter that Jane set up in IT Assistant will automatically trigger the accompanying Alert Action.
- The Alert Action will send Jane an e-mail notification to the address she specified.
- Jane then decides what action to take on the affected system, such as power cycling the system, shutting it down, or running a remote command using other IT Assistant capabilities.

Many more features are available in IT Assistant than those illustrated here. Click the **Help** button in the appropriate IT Assistant dialog box to see detailed online help about that feature.

Now, let us look at how a much larger enterprise might use IT Assistant to accomplish basically the same tasks as Jane did for a small enterprise.

Discovery in Tom's Enterprise-Size Business

In a larger enterprise, Tom is the systems administrator for a network of 1,000 servers. Tom also supervises four technicians who assist him by taking corrective action on servers when notified that a critical or warning event has occurred. Tom's four technicians have the following areas of responsibility:

- One administrator responsible for all remote systems
- One technician for the first shift (12 hours)
- One technician for the second shift (12 hours)
- One technician for weekends who works 24-hour shifts but who responds only to critical and warning events when notified

Configuring the Discovery Settings

Since Tom is monitoring a network of servers and no clients, his primary choice for a systems management protocol is SNMP. However, since he also manages systems running Windows, he will also enable CIM (like Jane).

To configure the discovery settings for his servers, he will need to perform the following tasks:

- Determine subnet ranges, IP addresses, and/or host names for the servers that he wants to monitor.
- Determine the subnet ranges, host names, or IP addresses that he does not want to monitor.
- Determine SNMP read-only (Get) and read-write (Set) community names that he will use for his network.
- Install and configure the SNMP agents and the operating system SNMP service on each system he wants to monitor.
- Determine appropriate discovery time-out values for the network.

IP Subnet Ranges for Servers

Tom's first decision is to determine which of the 1,000 servers he wants to monitor with IT Assistant. Tom may want to record the IP subnet range of each subnet he wants to include in his discovery, any systems or ranges he wants to exclude from discovery, corresponding community names used on each subnet, and any other data he determines is relevant to his network. An example of a form that captures this data appears in Table 6-2. Note that Tom may monitor systems based on subnet range, host name, or IP address. Although it is advisable to limit the number of community names used in a network, Tom may also define multiple read-only and read-write community names in his network environment. For example, Tom may decide that he wants a common Get community name for all systems on this network but unique Set community names for certain data centers.

NOTE: IT Assistant offers a troubleshooting tool that can be useful in analyzing problems with discovery and inventory. Access the tool by selecting **Tools**→**Troubleshooting Tool** from the menu bar, or by right-clicking a device in the **Device** view and selecting **Troubleshoot**. For more information, open the Troubleshooting Tool dialog box and click Help.

Configuring SNMP on Each Managed System

Before configuring discovery, Tom needs to determine the Get and Set community names he wants to use for his network, and install and configure the SNMP agent and operating system SNMP service of each server he wants to manage.

Table 6-2 provides information about the remote systems that Tom is monitoring.

Table 6-2. Example Subnet Ranges, IP Addresses, or Host Names and Corresponding Information for Data Center and Remote Servers

System Group Name	Include Subnet Range	Exclude Hosts or Subnet Range	Read-Only/Read-Write Community Names	Number of Devices on Subnet	Longest Ping Response Time Observed on Subnet (milliseconds)
Data Center Servers 1	192.166.153.*	192.166.153.2	dcp123/dcsecure01	100	64
Data Center Servers 2	192.166.154.*	examplehost	dcp123/dcsecure01	100	128
Data Center Servers 3	192.166.155.*	192.166.155.10-25	dcp123/dcprivall	100	78
Data Center Servers 4	192.166.156.*		dcp123/dcprivall	100	32
Data Center Servers 5	192.166.157.*		dcp123/dcprivall	100	146
Data Center Servers 6	192.166.158.*		dcp123/dcprivall	100	148
Data Center Servers 7	192.166.159.*		dcp123/dcprivall	100	132
Data Center Servers 8	192.166.160.*		dcp123/dcprivall	100	59
Data Center Servers 9	192.166.161.*		dcp123/dcprivall	50	128
Remote Servers 1	10.9.72.*		dcp123/dcprivrem	50	5600
Remote Servers 2	10.9.73.*		dcp123/dcprivrem	100	2400
Dell EMC Storage Devices	192.166.162.1-10		dcp123/NA	5	32
Printers	192.166.163.51-100		dcp123/NA	25	32

Table 6-2. Example Subnet Ranges, IP Addresses, or Host Names and Corresponding Information for Data Center and Remote Servers (continued)

System Group Name	Include Subnet Range	Exclude Hosts or Subnet Range	Read-Only/Read-Write Community Names	Number of Devices on Subnet	Longest Ping Response Time Observed on Subnet (milliseconds)
Tape Devices	192.166.163.1-20		dcp123/NA	10	59
Virtual Machine – 1	192.166.164.1		dcp123/dcsecure01	10	64
Virtual Machine – 2	192.166.164.2		dcp123/dcsecure01	10	128

Selecting An Appropriate Discovery Time-Out Value for the Network

Since Tom is monitoring remote systems across a WAN, time-out values may differ significantly between local systems and those further removed. In this case, it is recommended that Tom determine and set an appropriate time-out for the discovery of the systems located over the WAN.

In environments with long network latency times, such as global WANs, Tom may want to consider increasing ping time-outs across the enterprise. He can determine the ping times of systems that exhibit the greatest latency on the network by using the **Tools→Troubleshooting Tool** and selecting the **Device Connectivity** tab. From there, Tom can test the connection of high-latency systems to see whether he should increase specific ping times for better WAN performance.

Configuring Discovery Settings for the First Time in the Enterprise Network

Like Jane, if this is the first time IT Assistant has been launched since installation, Tom is presented with a welcome screen indicating that IT Assistant has not yet been configured. The four basic steps of configuration are listed:

- Step 1: Discovery Configuration
- Step 2: Inventory Configuration
- Step 3: Status Polling
- Step 4: Ranges

Clicking any of the steps will take him to the corresponding dialog box under the **Discovery and Monitoring** menu bar in IT Assistant. Steps 1 through 3 are single-window dialog boxes; step 4 is a wizard-based procedure for defining discovery ranges.

Configuring Discovery Configuration Settings

Tom begins by configuring the discovery settings for his systems using the **Discovery Configuration Settings** dialog box. This dialog is displayed either automatically when he clicks *Step 1: Discovery Configuration* from the IT Assistant welcome screen or by choosing **Discovery Configuration** from the menu bar. Here, Tom enters information that IT Assistant will use for discovery. These values remain unchanged and apply to all the discovery ranges he will create later in this procedure. However, he can change these values at any time using this dialog box.

To configure discovery settings in IT Assistant for a large enterprise, Tom performs the following steps:

- 1** Tom selects **Discovery and Monitoring**→**Discovery Configuration** from the IT Assistant menu bar.
The **Discovery Configuration Settings** dialog box appears. **Enable Device Discovery** is selected by default.
- 2** Under **Initiate Device Discovery**, Tom selects when he wants IT Assistant to perform discovery.
Tom wants to perform discovery every day, so he selects **Every Week On**, each day of the week, and 2:00 a.m. for the start time. His network traffic is the lightest at this time.
- 3** Under **Discovery Speed**, Tom uses the sliding bar to indicate how much network bandwidth and system resources he wants to allocate to discovery.
Tom sets the discovery speed to **Fast** (all the way to the right). Tom wants to discover all of the systems he is going to manage with IT Assistant rapidly and get them in the database. For subsequent discoveries, if Tom finds that this setting dramatically impacts the network performance while he is attempting to perform other tasks on the network, he can change the **Discovery Speed** to consume fewer network resources.
- 4** Under **Discover**, Tom can choose whether to discover all devices or only instrumented devices.

- 5 Under **Name Resolution**, Tom can select **DNS Name Resolution** or **Instrumentation Name Resolution**.
- 6 Domain Name System (DNS) name resolution matches the IP address of a system to a host name. Instrumentation name resolution queries the managed system's agent instrumentation for its name. See your device or system documentation for more information on how to configure instrumentation name resolution.
 -  **NOTE:** If you are managing a cluster, you must use instrumentation name resolution to be able to discern each independent node (system); otherwise, using DNS name resolution is recommended.
- 7 Tom clicks **OK**.

Configuring Inventory Settings

Next, Tom enters inventory settings. IT Assistant collects inventory information about software and firmware versions, as well as device-related information about memory, processor, power supply, PCI cards and embedded devices, and storage. This information is stored in the IT Assistant database and can be used to generate customized reports.

To set inventory settings, Tom performs the following steps:

- 1 Tom selects **Discovery and Monitoring**→**Inventory Configuration** from the menu bar.

The **Inventory Poll Settings** dialog box is displayed. **Enable Inventory** is selected by default.
- 2 In the dialog box under **Initiate Inventory**, Tom selects when he wants IT Assistant to perform inventory.

Tom sets inventory for weekly on Saturday at 3:00 a.m.
- 3 Under **Inventory Speed**, Tom uses the sliding bar to indicate how much network bandwidth and system resources he wants to allocate to inventory.
 -  **NOTE:** The faster you set the inventory speed, the more network resources discovery will consume. Faster inventory speeds may impact network performance adversely.
- 4 Tom clicks **OK**.

-  **NOTE:** IT Assistant versions 8.0 and later can display the inventory information for printers, tapes, and storage devices. For more information, see the *Dell OpenManage IT Assistant Online Help*.

Configuring Status Polling Settings

Next, Tom defines status polling settings for his systems. IT Assistant performs a power and connectivity health check for discovered devices, determining whether a device is operating normally, is in a non-normal state, or is powered down. Status messages in IT Assistant include *healthy*, *warning*, *critical*, and *powered down*. Status icons also indicate if a system is not instrumented, if there is no information for the system, or the state the system was in when it was last powered down.

To set status polling settings, Tom performs the following steps:

- 1 Tom selects **Discovery and Monitoring**→**Status Polling Configuration** from the menu bar.

The **Status Polling Configuration Settings** dialog box is displayed. **Enable Status Polling** is selected by default.

- 2 Under **Status Polling Interval**, Tom selects the interval he wants IT Assistant to use to perform status polling.
- 3 Under **Status Polling Speed**, Tom uses the sliding bar to indicate how much network bandwidth and system resources he wants to allocate to status polling.

NOTE: The faster you set the status polling speed, the more network resources discovery will consume. Faster speeds may impact network performance.

- 4 Tom clicks **OK**.

Configuring Discovery Ranges

IT Assistant maintains information about network segments that it uses to discover devices. A discovery range can be a subnet, range of IP addresses on a subnet, individual IP address, or an individual host name.

Tom's enterprise network is organized into a number of subnets. There are 850 servers in the datacenter and 150 remote servers. Tom refers to the IP subnet ranges he wrote down for his servers (see Table 6-2).

Tom's datacenter servers are divided into eight separate subnets, and his remote servers are divided into two subnets.

To identify his systems to IT Assistant, Tom must define a discovery range.

To identify an *include* range, Tom performs the following steps:

- 1 Tom selects **Discovery and Monitoring**→**Ranges** from the menu bar.
The **Discovery Ranges** navigation tree is displayed on the left side of the IT Assistant window.
- 2 Tom expands **Discovery Ranges**, right-clicks **Include Ranges** and selects **New Include Range**.
The **New Discovery Wizard** starts.
- 3 In step 1 of the wizard, Tom can enter an IP address, an IP address range, or a host name.

Based on the information about Tom's systems in Table 6-2, he must add different IP address ranges. Tom can combine those ranges that have common settings (community name, timeouts, retry intervals, choice of protocol for discovery, and user credentials). For example, he can combine the Data Center Servers 3 to Data Center Servers 9 groups.

He enters the IP address range as:

192.166.155.*

Instead of completing this wizard multiple times with same entries in all the wizard panes to include all these systems, Tom clicks **Add** to add multiple ranges of IP addresses. The second time, he enters:

192.166.156.*

and so on.

 **NOTE:** Ensure that you have a separate range for Dell|EMC devices. This is because apart from the SNMP credentials, Dell|EMC devices also require the Navisphere credentials.

Tom clicks **Next** to go to the next step.

 **NOTE:** The Import Node List utility offers a convenient way to specify a list of host names, IP addresses, and subnet ranges for IT Assistant to discover. See the *IT Assistant Online Help* for instructions on how to run the utility from the command line. The **importodelist.exe** file is in the **/bin** directory.

- 4 In step 2 of the wizard, Tom enters the Internet Control Message Protocol (ICMP) time-out and retry values for the range. Tom chooses the highest time-out retry value for the ranges that he combines. For example, in Table 6-2 for Data Center Servers 3 to Data Center Servers 9, Tom chooses 148 milliseconds, the highest time-out interval in that range.
- 5 In step 3 of the wizard, Tom configures the SNMP parameters to be used during discovery:
 - Tom ensures the **Enable SNMP Discovery** option is selected.

NOTE: Tom will have to select this option if he wants to discover the Virtual Machines on his network.

- Tom enters a case-sensitive value for the **Get Community** name. The **Get Community** name is a read-only password that SNMP agents installed on managed systems use for authentication.

Tom's considerations:

Tom considers the following as he selects a **Get Community** name:

Each SNMP managed system has a **Get Community** name. Tom ensures that he lists each of the community names on all of the systems he wants to manage. If Tom's managed systems have more than one community name, he can enter multiple community names separated by commas in the **Get Community** name field.

Although the **Get Community** name affects read-only information retrieved by IT Assistant from managed systems, such as the results of discovery, status polling, and alert logs, Tom wants to limit access to this data. Therefore, he changes the default **Get Community** name (**public**) to a name known only to him and his system administrators.

NOTE: Community names entered in the SNMP Get and Set community name fields for the managed system's operating system must match the Get Community and Set Community names assigned in IT Assistant.

- Tom enters a case-sensitive value for the **Set Community** name.

Tom's considerations:

The **Set Community** name is a read-write password that allows access to a managed system. SNMP agents running on the managed system use this password for authentication when actions are attempted on the system, including shutting down, configuring action alerts, and updating software.

NOTE: Although Dell server instrumentation has an authentication layer above the SNMP Set community name (which requires a host name and password), many SNMP agents do not. Agents without this added security layer allow any user who knows the SNMP Set community name to gain control of the managed system.

Tom chooses a **Set Community** name that matches the SNMP Set community value on the system he is managing. He also makes sure the name he chooses follows the secure password standards in place across his enterprise.

NOTE: If you want to specify more than one SNMP Get or Set community name in an individual discovery range (for example, one community name for each IP subnet range), separate your community names with commas.

NOTE: IT Assistant only uses SNMP sets to power cycle systems if the Server Administrator remote command line is not available. If SNMP sets are not required for this purpose, do not enter an SNMP set community name in the discovery wizard.

- Tom enters time-out and retry values for the SNMP discovery range.

- 6 In step 4 of the wizard, Tom configures the CIM parameters to be used during discovery.

Since Tom also has systems running Windows, he needs to configure CIM.

- Tom ensures **Enable CIM Discovery** is selected.

NOTE: Ensure that CIM is configured for Hyper-V and Hyper-V Server to enable full virtualization support.

- In **Domain\User Name**, Tom enters the same name that he used to configure CIM on the managed system. Also, ensure that CIM is selected.
- Tom enters the same **Password** that he used for the CIM password on the managed system.

NOTE: For inband IPMI support enable CIM Discovery option from the wizard. However, this is supported only on Dell PowerEdge *xx8x* and later systems running Windows Server 2003 R2 or Windows Server 2008. For out-of-band IPMI support on *xx8x* servers, enable IPMI from the wizard.

- 7 In step 5 of the wizard, Tom selects the **Enable Dell/EMC Array Discovery**.

In this screen, Tom gives the following details:

- Navisphere Username
- Navisphere Password

NOTE: You can use this field only if you have Dell|EMC devices in the discovery range.

- 8 In step 6 of the wizard, Tom configures the following IPMI parameters of the BMC/iDRAC of his managed systems.

- User name
- Password
- KG Key

NOTE: KG Key is applicable only on Dell PowerEdge *x9xx* and later systems, which support IPMI version 2.0. By default, KG Key is disabled on the BMC/iDRAC.

NOTE: If you have Dell PowerEdge *x8xx* and later systems on your network and you enable the KG Key on, for example, Dell *x9xx* systems, you must specify two separate ranges to discover these systems.

Since Tom has new uninstrumented (without any Dell agent installed) Dell x9xx systems, he can discover these systems using IPMI discovery.

For more information, see "Using IPMI Discovery in Tom's Enterprise-Size Business."

- 9 In step 7 of the wizard, Tom can choose what action IT Assistant will take upon completion of the wizard.
- 10 In step 8 of the wizard, Tom reviews his selections and clicks **Finish** to complete the wizard.

NOTE: IT Assistant versions 8.0 and later can discover printers, tapes, and storage devices. For more information, see the *Dell OpenManage IT Assistant Online Help*.

NOTE: In a network consisting of systems that have both IPv4 and IPv6 addresses, post SNMP discovery, only IPv4 addresses are displayed by IT Assistant.

Exclude Systems From Discovery

IT Assistant also provides the capability to exclude specific systems from discovery. This feature is normally used in larger enterprise environments to improve speed, to isolate a system with a problematic agent, or to enhance security and convenience.

Tom has one system in his enterprise that contains highly sensitive information. So sensitive, in fact, that he doesn't even want the system visible to his system administrators. Therefore, he sets an **Exclude Range** to isolate that system from routine network discovery.

- 1 Tom selects **Discovery and Monitoring**→**Ranges** from the menu bar.
The **Discovery Ranges** navigation tree is displayed on the left side of the IT Assistant window.
- 2 Tom expands **Discovery Ranges**, right-clicks **Exclude Ranges** and selects **New Exclude Range**.
The **New Exclude Range** dialog box appears.
- 3 Tom enters the IP address for the system and clicks **OK**.
As a result, that system is hidden from routine discovery by IT Assistant.

Changing Discovery, Inventory, and Status Polling Settings After Original Setup

Tom can return to the **Discovery and Monitoring** menu at any time and edit the settings he entered. The new settings will become effective the next time he performs the corresponding action.

For information on how Tom can view devices on his network, and the applications that he can launch to manage the health of his devices, see "Viewing Devices and Launching Applications."

Creating Alert Action Filters and Alert Actions for Tom's Large Enterprise

IT Assistant offers Tom the ability to set up Alert Action Filters that specify a set of system conditions. When these conditions are met, Tom can also create an Alert Action in IT Assistant that is triggered by the Alert Action Filter. The Alert Action takes whatever action Tom has defined.

NOTE: Dell OpenManage Server Administrator only sends events to IT Assistant as SNMP traps. It does not send CIM indications for either instrumentation or storage events from a server.

IT Assistant has three types of filters:

Alert Action Filters – used to trigger actions when an alert condition is met

Ignore/Exclude Filters – used to ignore SNMP traps and CIM indications when they are received.

Alert View Filters – used to customize the Alert Log view

Before Tom creates Alert Action Filters or Alert Actions for his 1,000-server environment, he creates two custom groups to better facilitate event notification. According to the scenario outlined previously, most of Tom's servers are housed in a datacenter while some are remote. Tom's decides on this strategy for setting up IT Assistant.

He decides to:

- 1 Create one custom group for the datacenter servers and one custom group for the remote servers.
- 2 Create an Alert Action Filter for each of the four administrators who help Tom with the remote and datacenter servers on different days and different shifts.
- 3 Create an Alert Action that will be triggered by the corresponding Alert Action Filter to automatically e-mail the appropriate administrator at the appropriate day and time.

Tom's Administrators

Tom has three administrators; all are responsible for keeping the datacenter servers operational, and they work the following hours:

- Bob works onsite for the first shift Monday through Friday (7 A.M. to 7 P.M.)
- John works onsite second shift Monday through Friday (7 P.M. to 7 A.M.)
- Jill is on call weekends from 7 P.M. Friday to 7 A.M. Monday

Therefore, Tom wants to configure IT Assistant to:

- Notify Bob, John, and himself by e-mail any time a datacenter server warning or critical events occur
- Notify Jill by e-mail of any warning or critical events, but only if they occur during the time that she is on call

Creating Custom Groups

Tom requires two custom groups to manage notification of his four administrators who are going to take action on the critical and warning events for his 1,000 servers. The custom groups are remote servers and datacenter servers.

- 1 From the IT Assistant menu bar, Tom selects **Views**→**Devices**.
- 2 Tom right-clicks the top-level root in the IT Assistant navigation tree and selects **New Group**.
The **Add Group Wizard** appears.
- 3 Tom enters a name and description for the group he wants to add.
Tom names the group **Datacenter Servers**.

- 4 In the **Group Membership** dialog, Tom can either select the devices to include in the new group or, if a query-based group, he selects the query from the pull-down menu.
- 5 Tom review his selections in the summary screen and clicks **Finish** to complete the wizard.
- 6 Tom repeats the previous steps to create a second group named **Remote Servers**.

Creating an Alert Action Filter

Now, Tom will create an Alert Action Filter that includes each of the four administrators who work for him. In the following procedure, you can see how creating custom groups for the two types of servers make it easier to create the filters.

To create an alert action filter, Tom performs the following steps:

- 1 Tom selects **Alerts→Filters** from the menu bar.
The **Alert Filters** window appears.
- 2 Tom expands the Alert Filters in the navigation tree and right-clicks **Alert Action Filters**. He selects **New Action Alert Filter**.

The **Add Filter Wizard** appears.

Tom plans to create three filters, one for each of the notification event actions that he is going to create for each of his administrators. Tom has to create each of his three filters one at a time. Tom creates filters for the following:

- Datacenter first shift (M–F, 7 A.M.–7 P.M.)
 - Datacenter second shift (M–F, 7 P.M.–7A.M.)
 - Weekend administrator (7 P.M. Friday to 7 A.M. Monday)
- 3 Tom enters a descriptive name for the filter.
Tom chooses **DC 1st Shift** as his name for the first filter. The names he chooses for the other two filters will be **DC 2nd Shift**, and **Weekend Admin**.
 - 4 Under **Severity**, Tom selects the severity of the events for which he wants to receive alerts and logs.
For the DC 1st Shift filter, Tom selects **Warning** and **Critical** and clicks **Next**.

- 5 Under **Alert Category Configuration**, Tom selects **Select All** because he wants to monitor all of the servers in his enterprise and clicks **Next**.
- 6 Under **Device/Group Configuration**, Tom selects the name of device or group to associate with the new action alert filter.
Tom selects **Datacenter Servers**, the name of one of the custom groups he created previously and clicks **Next**.
- 7 Under **Date/Time Range Configuration**, Tom enters values for any or all of the optional categories.
Tom selects different time and day values for each of the three filters. Tom does not select date filters, but could use this value if he wanted to create a filter and action for a vacation, an outside service vendor, or another special situation.
For the DC 1st Shift filter, Tom enables the time range 7:00:00 A.M. to 7:00:00 P.M. and enables the days Monday through Friday.
For the DC 2nd Shift filter, Tom enables the time range 7:00:00 P.M. to 7:00:00 A.M. and enables the days Monday through Friday.
For the Weekend Admin filter, Tom specifies two filters (WA1 and WA2):
 - For WA1, Tom enables the time range 7:00:00 P.M. to 7:00:00 A.M. and selects the days Friday to Monday.
 - For WA2, he enables the time range 7:00:00 A.M. to 7:00:00 P.M. and selects the days Saturday and Sunday.Tom clicks **Next**.
- 8 Under **Alert Action Associations**, Tom decides whether he wants the event captured by the filter to trigger an action or be written to a log file.
Tom selects **Alert**, since he wants IT Assistant to notify the selected administrators by e-mail when the system enters a Critical or Warning state.
Click **Next**.
- 9 The **New Filter Summary** shows Tom's selections.
He verifies that the filter name he assigned in step 3 appears in the **Summary of Alert Action Filters** window.
Tom clicks **Finish** to accept the changes.

Notification Alert Actions in the Enterprise Environment

Tom's alert action filters and groups are now configured so that he can set up e-mail alert actions to automatically notify himself and his three administrators. Tom's strategy is as follows:

- Set up IT Assistant to send e-mail to his administrators when any warning or critical events occur, depending on their on-call or shift status
- Copy himself on all messages so he can stay aware of overall server events

Tom is configuring e-mail for himself, as well as for his first- and second-shift datacenter administrators and his weekend administrator. Therefore, he will repeat the following procedure four times—for himself, Bob, John, and Jill.

NOTE: To send e-mail through IT Assistant, go to **Preferences**→**Web Server** on the top navigation bar, and configure the **SMTP Server Name (or IP Address)** and **DNS Suffix for SMTP Server**.

Creating an Alert Action

To create an alert action:

- 1 Tom selects **Alerts**→**Actions** from the menu bar.
- 2 Tom right-clicks **Alert Actions** in the navigation and selects **New Alert Action**. The **Add Alert Action Wizard** appears.

- 3 Tom gives the action a logical name in the **Name** field.

Tom is configuring a separate Alert Action for himself, Bob, John, and Jill. Each time he repeats the procedure here, he uses the following names in the **Name** field:

- Tom ADMIN MGR e-mail
 - DC 1st Shift Bob e-mail
 - DC 2nd Shift John e-mail
 - Weekend Admin Jill e-mail
- 4 From the **Type** pull-down menu, Tom chooses **Email**.

- 5 In the **E-mail Configuration** dialog, Tom specifies a valid e-mail address (within your enterprise's SMTP server group) to receive the automatic notification.

NOTE: Tom can test the e-mail configuration he specified by using the **Test Action** button. A success/failure message will be issued. Tom can specify multiple e-mail addresses, separated by a comma or semi-colon.

- 6 In **Alert Filter Associations**, Tom identifies the Action Alert filter that will trigger this e-mail.

Tom supplies the names of the Alert Filters he set up in the previous procedure—either **DC 1st Shift**, **DC 2nd Shift**, or **Weekend Admin**—each time he performs this step.

- 7 A summary dialog shows Tom's selections. He clicks **Finish** to accept the changes.

He verifies that the Alert Action he defined in step 3 appears in the **Summary of Alert Actions** window.

As a result of how Tom has configured Alert Action Filters and Alert Actions in IT Assistant, here is what will happen:

- IT Assistant will continuously monitor all servers on Tom's network.
- When any server reaches a warning or critical state, IT Assistant will automatically send Tom an e-mail notification at the address he specified in the Alert Action wizard.
- When any server reaches a warning or critical state, IT Assistant will automatically send either Bob, John, or Jill an e-mail notification depending on the date range specified in the Alert Action Filter wizard.

Using IPMI Discovery in Tom's Enterprise-Size Business

Let us say that Tom has purchased 100 Dell PowerEdge x9xx systems for his enterprise. These systems are equipped with the BMC/iDRAC that support IPMI versions 1.5 or later. These new systems are uninstrumented, that is, they do not have any Dell agent installed on them.

IT Assistant versions 8.0 and later communicate with the BMC/iDRAC directly (out-of-band) or through the Windows IPMI Provider on a Windows Server 2003 R2 system (in-band) and Windows Server 2008, and classifies these systems under the **Server** category in the **Device** tree.

Using the IPMI discovery feature, Tom can:

- Classify his uninstrumented Dell devices
- View information about the uninstrumented devices
- Launch the Serial-Over-LAN (SOL) Proxy
- Launch the IPMI Shell (IPMISH) and perform remote power control tasks on the managed systems

Classification and Display of Non-Dell Systems

Devices discovered through IPMI will display under **Out of Band Unclassified Devices**→**IPMI Unclassified Devices**.

 **NOTE:** This is applicable for non-Dell devices.

Each device will display in the tree as `<server hostname>`.

 **NOTE:** If the host name is unavailable, the device will display the device IP address.

Devices with IPMI version 1.5 support only a limited notion of system health, including intrusion, fans, power supplies, and drives (off the internal backplane only). This health is a yellow or green indicator. Devices with IPMI version 2.0 support all health states, including normal, warning, and critical.

 **NOTE:** Dell PowerEdge x8xx systems support IPMI version 1.5 and Dell x9xx and later systems support IPMI version 2.0 or later.

Hardware Logs

Devices under the **IPMI Discovered Devices** group have a tab for viewing the hardware logs. Each time the view is refreshed, a connection will be made by the IT Assistant management system to the target system to retrieve the up-to-date logs. The connection will be closed after all the records are retrieved to free up resources and minimize connection usage, since the BMC/iDRAC has a limit on open connections.

The **Hardware Logs** tab is used for log retrieval through all supported protocols.

Launch Points

Tom right-clicks each device under **IPMI Discovered Devices** to access the launch point for Serial-Over-LAN (SOL). SOL is the only pre-configured application that can be launched from the **IPMI Discovered Devices** group.

NOTE: The Dell Remote Access Controller (DRAC) also has a telnet launch point to connect to the DRAC.

IPMISH Tasks

Tom can run IPMI Shell (IPMISH) tasks on the devices discovered through IPMI. If he selects devices from the **IPMI Enabled Devices** group, he can use either \$IP or \$BMC_IP.

NOTE: Use the -k parameter on the Baseboard Management Utility (BMU) command line to enter the IPMI encryption key.

Viewing Information on a Non-Dell System

Tom can view the embedded logs on a non-Dell device with Windows Server 2003 R2 (with System Management MSI installed), as well as view information available through the standard operating system instrumentation.

He should have enabled CIM discovery for the include range corresponding to the device, using the administrator privilege user account for CIM discovery.

NOTE: For non-administrator user accounts, the hardware management agent will not be discovered.

Click a device in the Device tree to view device information. The Hardware Logs tab contains information corresponding to the embedded logs.

The device summary tab contains information retrieved through the standard operating system instrumentation. This data includes NIC, operating system, BIOS, contact, memory, and processor information. The device will be listed under the **Unknown** category, as there is no device type information available through the standard operating system instrumentation.

Summary

This chapter has covered IT Assistant configuration in both the small-to-medium business and large enterprise network environments. Following the examples shown here will allow you to more successfully configure IT Assistant.

Many more features are available in IT Assistant than those illustrated here. Click the **Help** button in the appropriate IT Assistant dialog box to see detailed online help about that feature.

Performance and Power Monitoring

Use Dell™ OpenManage™ IT Assistant to monitor the performance and power consumption of a single system or a group of systems on your network.

Performance Monitoring

Performance Monitoring helps you monitor the performance of a group of devices with supported Microsoft® Windows® or Linux operating systems over a specified period of time. Performance is monitored with the help of a set of performance counters available for each component. You can select and monitor these performance counters. You can configure thresholds for each performance counter and also configure alerts to be sent when the thresholds are crossed.

Using the Performance Monitoring feature, you can view the performance of individual devices rolled up on the **Device** tree. The overall performance of a device is calculated as the worst case status of the individual performance counter attributes monitored for the device. For example, if the status for the CPU Utilization counter is critical and the status of the memory paging counter is warning, the overall performance status of the devices is displayed as critical. From the **Device** tree, you can drill down to the performance counters and take appropriate actions.

To view details of how each performance counter is performing on a Dell™ system, do the following:

- 1 From the **Device** tree, expand the Server category
- 2 Select the system for which you want information.
- 3 On the right hand side pane, select the **Performance and Power** tab.

This tab displays the performance and power counter information for the selected system.

From this view, you can create multiple tasks to monitor multiple devices and manage these tasks, view results, and logs of these tasks.

NOTE: Performance monitoring enables you to monitor the usage of your systems as against monitoring the health of the systems, which is provided by alerts and notifications.

Power Monitoring

The power monitoring feature helps you to collect, store, and display the instantaneous values of power (watts) consumed, amperes drawn by each power supply, and the total energy consumed by a device.

 **NOTE:** The power monitoring feature requires that the Dell OpenManage Server Administrator version 5.3 or later be installed on the managed systems.

You can choose the appropriate power monitoring counters from the performance and power manager task wizard and select the frequency in which the data is collected. The collected data is available on the **Performance and Power** tab associated with each device, or the **Execution Results** tab associated with each Performance and Power Monitoring task.

The maximum value observed for a given system (Watts/Amps) is also collected during each polling cycle. This value is compared with the existing peak value in the IT Assistant database, and if the values are different, the database value is replaced with the values in the current polling cycle. The new value is displayed on the **Group Summary and Maximum Values** tab in the Performance and Power Monitoring screen.

 **NOTE:** IT Assistant polls the managed systems at a frequency that you determine. If you select a polling frequency that is too low, it is possible that the variations in the power consumption are not captured adequately, and this may result in inaccurate instantaneous power consumption graphs.

Performance and Power Monitoring in Tom's Enterprise-Size Business

Tom wants to use this feature to monitor how the Dell systems, specifically the PowerEdge™ x9xx systems, on his network are being used.

His main considerations for using this feature are:

- Are the systems on my network under- or over-utilized?
- Do I need to move my hardware (for example, CPU) or applications to another system?
- How are my systems performing during peak and non-peak hours?
- What is the energy consumption and the peak power values in my systems?
- Would I need to balance the load among my systems?

To be able to answer these questions, Tom would need to perform the following:

- Create a performance and power monitoring task
- Monitor the systems over a period of time
- View the data on the IT Assistant console
- Export the data into comma-separated values and save it for later use

Creating a Performance and Power Monitoring Task

To create a performance and power monitoring task, Tom performs the following steps:

- 1** Tom selects **Manage**→**Performance and Power Monitoring** from the menu bar.
- 2** Tom right-clicks **Performance and Power Monitoring Task** and selects **New Task...**
The **New Task Wizard** appears.
- 3** Tom enters a descriptive name for the task. For example, *All x9xx systems*. Tom clicks **Next**.
- 4** Under **Select Schedule**, Tom selects a start date and an optional end date to measure the performance attribute. He selects a 24-hour schedule to monitor his systems during peak and non-peak hours.

Tom also adjusts the sampling interval based on how often he wants to sample his systems.

 **NOTE:** Tom should take the network capacity into consideration. A bigger sampling interval would not give an accurate picture and a smaller interval may load the network and the monitored systems.

 **NOTE:** The minimum frequency that Tom can set is two minutes, which means that the task will be triggered every two minutes.

5 Under **Select Attributes**, Tom selects the performance, as well as the power monitoring counters: CPU and Memory attributes (for performance), Power Consumption, Energy Consumption, and Peak Amperage (for power management). He sets their warning and critical threshold values and specifies the number of samples for which the threshold values should be crossed. For example, he sets the warning threshold for:

- **%Kernel Utilization Time** as > 70% for 10 samples
- **%Processor Utilization Time** as > 70% for 10 samples
- **%Power Consumption** as > 1000 W
- **%Amperage per Power Supply** as >7000 milliAmps for 10 samples

NOTE: The Power Monitoring attributes are supported only on limited Dell systems.

NOTE: Tom cannot set threshold values for energy and peak measurement (Peak power and Peak amperage) counters.

And the critical threshold for:

- **%Kernel Utilization Time** as > 90% for 15 samples
- **%Processor Utilization Time** as > 90% for 15 samples
- **%Power Consumption** as > 1200 W
- **%Amperage per Power Supply** as > 10000 milliAmps for 10 samples

Tom can select **Send Warning Alert** or **Send Critical Alert** to receive warning or critical alerts in the Alert logs.

NOTE: If Tom sets a smaller sampling interval but selects a large number of counters, and devices, he may see a warning message indicating excess resource utilization. Tom should set a higher sampling interval or decrease the number of counters and devices to avoid this situation.

6 Under **Device Selection**, Tom can select the groups having Dell x9xx systems from the tree or provide a query.

- 7 Under **Enter Credentials**, Tom enters the operating system **User ID** and **Password**, which is valid for all selected devices.
- 8 Tom reviews his selection in the **Summary** screen and clicks **Finish**.
The *All x9xx systems* task appears on the tree under the **Performance and Power Monitoring Tasks** parent node.

NOTE: Performance monitoring tasks are not supported on VMware ESX and VMware ESX 3i hosts. Power monitoring tasks are supported on all virtualization hosts except VMware ESX 3i.

Monitoring the Usage of the Systems on the Network

To monitor the usage of all PowerEdge x9xx systems on the network, Tom performs the following steps:

- 1 Tom clicks the *All x9xx systems* task under the **Performance and Power Monitoring Tasks** parent node.
- 2 The summary of the task is displayed under the **Summary** tab on the right hand side of the screen.
- 3 To view the monitoring in greater detail, Tom selects the **Execution Results** tab.

This tab displays the counters Tom chose in step 5 of the "Creating a Performance and Power Monitoring Task."

The counters keep a count of how a system is utilized.

Tom can sort on the counters to view how a particular component, for example, the **%Kernel Utilization Time** for each system is being utilized.

If the counters have been *appropriately* set, the counter colors would fairly indicate how well that systems are being utilized. Hover the mouse over the counter to get an indication of how the system component is performing.

For example,

If the counter is green for most of the time, it could indicate that the counter is well within the specified limits and could indicate that the system component can take more load, depending on the levels that Tom has set.

If the counter is yellow or red for a small amount of time, it could indicate that the system component is still partially-utilized.

If the counter is red for most samples, it could indicate that the system component is over-utilized.

See Table 7-1 for a sample of how systems on Tom’s network may be utilized.

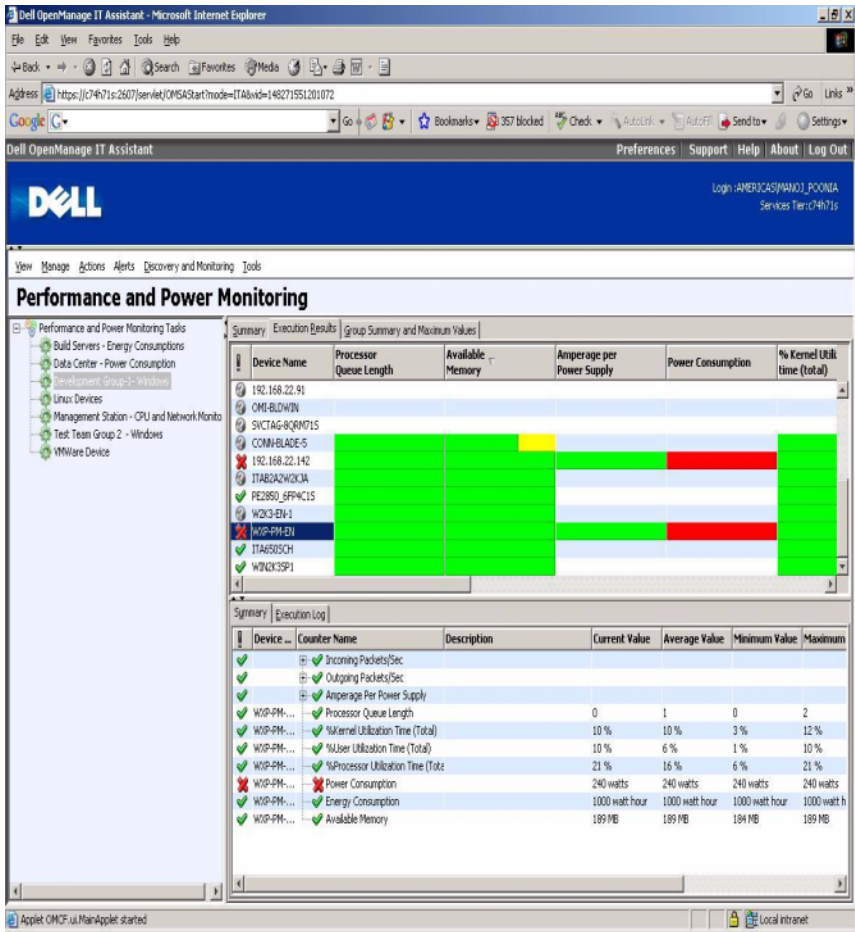

Table 7-1. Sample of Tom’s network utilization

	CPU Utilization	Memory Utilization	Network Usage
System 1	High	Low	Medium
System 2	Low	High	Medium

If **%CPU Utilization Time** is red for most of the samples collected (highly used), it could mean that some application is over-utilizing the CPU. Tom could consider moving this application to a system for which the **%CPU Utilization Time** is green for most samples. In this case, from System 1 to System 2. Tom could also move a memory module from System 1 to System 2 to balance the load, or he could consider upgrading the hardware or purchasing new memory modules.

If Tom monitors his systems over the *weekend*, and finds out the network and CPU utilization counters are green (within the specified range) for 70% of the samples, yellow (non-critical) for 20% of the samples, and red (critical) for 10% of the samples collected, it could mean that the network and CPU utilization counters could be red for most samples during the *weekdays*. The systems will be overloaded, and Tom could decide to add more systems to his network or decide on some other form of load-balancing.

Figure 7-1. Sample Performance and Power Monitoring Screen

- 4 In the **Execution Results** tab, Tom can right-click a counter and do one of the following:
 - Select **Export**. This will export the details into a comma-separated values (CSV) file. Tom can then use other tools like Microsoft Excel[®] to generate better reports.
 - Click **View Chart** to view the graphical representation of the performance, aggregate power consumed, and the aggregate energy consumed information of the device. Tom can give a time range and view the system usage graphically.

 **NOTE:** Tom can also view the charts and export them from the **Summary** tab, in the lower pane.

 - Click **Delete Execution Results**.
 - Right-click a column header and select **Customize View**. This view customizes the view for the devices.
- 5 In the **Group Summary and Maximum Values** tab, Tom can view the maximum watts/amps and the aggregate power or energy used by each device for which this task is running.

 **NOTE:** The **Group Summary and Maximum Values** tab is available only if Tom selects the aggregate (Aggregate power and Aggregate energy) or peak counters (Peak power and Peak amperage) in the Power Management attribute.
- 6 In the **Execution Log** tab, Tom can view the execution summary information for each run of the task. He can also use the time selection fields to select the **From** time he wants to view the logs.

 **NOTE:** Execution log entries older than 14 days will be purged.
- 7 In the **Performance and Power** tab on the **Device** tree, Tom can view the performance and power counters information for the selected device.

Suggested Threshold Configuration for Performance and Power Monitoring

Table 7-2 shows the sample threshold settings for each performance and power counter.

Table 7-2. Sample Threshold Settings for Performance and Power Counters

Resource	Performance Counter Attribute	Suggested Threshold	Comments
CPU	%Processor Utilization Time	Less than 85%	Total processor usage should remain under 85%, infrequent spikes exceeding 85% for brief periods is acceptable.
System	Context Switch/second	Depends on the system activity	Continued spikes for a prolonged time may indicate an increase in system load.
System	Processor Queue Length	2	Depends on the number of processors in the system. This is an instantaneous number. Needs observation over several cycles.
Memory	Available Memory	Less than 10 -20% of installed RAM Less than 4MB for systems with large memory	If available memory is under 10% – 20% of the installed RAM for an extended period, it may indicate need for more memory.
Memory	Pages/Second	Less than 20	Should remain under 20 with the exception of brief spikes.
Memory	%Page File Usage	95%	Review this value in conjunction with Available Memory and Pages/Second.

Table 7-2. Sample Threshold Settings for Performance and Power Counters (continued)

Resource	Performance Counter Attribute	Suggested Threshold	Comments
Network	BytesReceived/Second PacketsReceived/Second BytesSent/Second PacketsSent/Second	Sharp deviation from average values for an extended period of time. Depends on the type of network	A sharp increase or decrease above normal levels is a strong indicator of network issues.
Physical Disk	Physical Disk I/O per Second	Depends on manufacturer's specifications	Check the specified transfer rate for your disks to verify that this rate does not exceed the specifications. In general, Ultra Wide SCSI disks can handle 50 to 70 I/O operations per second.
Logical Disk	Free Space	Less than 15%	Threshold value is relative to the total amount of disk space and the average I/O activity on the system.  NOTE: Starting with IT Assistant 8.4, IT Assistant does not display data for the LogicalDiskFreeSpace counter on Windows 2000 managed nodes.

Resource Usage by SQL Server and IT Assistant

Table 7-3 shows the recommended hardware configuration required for performance and power monitoring.

Table 7-3. Recommended Hardware Configuration for IT Assistant for Performance and Power Monitoring

Minimum Number of CPUs	Minimum Memory Required	Database	Maximum Number of user sessions per user	Maximum Number of Performance Counters	Minimum Supported Sampling Frequency	Maximum Number of Devices
Single CPU 2.0 GHz	512 MB	MSDE/SQL Express 2005	1	10	2 minutes	15
Single CPU 2.0 GHz	512 MB	MSDE/SQL Express 2005	1	18	2 minutes	8
Single CPU 2.0 GHz	1 GB	SQL 2000/ SQL 2005 Server	2	10	2 minutes	30
Single CPU 2.0 GHz	1 GB	SQL 2000/ SQL 2005 Server	2	18	2 minutes	20
Dual CPU 2.0 GHz	1 GB	SQL 2000/ SQL 2005 Server	2	10	3 minutes	100
Dual CPU 2.0 GHz	1 GB	SQL 2000/ SQL 2005 Server Enterprise Edition	5	10	5 minutes	200

NOTE: The hardware configuration listed in this table refer to the minimum supported configuration. For the most recent update on these requirements, see the IT Assistant readme on the Dell Support website at support.dell.com.

Software Updates

IT Assistant provides a centralized software update capability. You can load Dell Update Packages and System Update Sets (system bundles) into the IT Assistant repository, either from the *Dell Server Updates* media or from the Dell support website at ftp.dell.com, then run a compliance check of all the systems in your enterprise against the Update Packages.

NOTE: A System Update Set is a logical set of Dell-certified packages that work together without problems.

NOTE: For Dell OpenManage version 5.3 and above, the Software Update Utility is available only on the Dell Server Updates DVD. However, for Dell OpenManage version below 5.3, the Software Update Utility is available on the Dell PowerEdge™ Server Update Utility CD. For the purposes of this guide, the Dell Server Updates DVD and the Dell PowerEdge Server Update Utility CD will be hereafter called the Server Updates media.

The highlights of the software update feature of Dell™ OpenManage™ IT Assistant are:

- **Software Web updates:** You can schedule a task to check the Dell Support website at ftp.dell.com for availability of new update packages in System Update Sets. You can configure an e-mail task to notify you of new updates. You can also configure the task to send notification of all updates or just those updates that apply to the systems in your network.
- **Digital Signature verification:** IT Assistant checks the authenticity and integrity of the update packages, catalogs, and MSI files using digital signature verification.

NOTE: If you are running the software update task across a wide area network (WAN), the task could fail if the network does not have sufficient bandwidth. However, if you want to perform this task across WAN locations, Dell recommends that you install IT Assistant locally on a system at the remote location, have the update package/installers available locally on the IT Assistant system and access the IT Assistant through Remote Desktop to that system.

Jane and Tom can upgrade their BIOS, firmware, or drivers for the servers and storage devices on their network using IT Assistant. Depending on the differences in the size/nature of organization, and their usage model, they can use one of the following sources to obtain the latest updates:

- Starting with IT Assistant version 8.1, users can configure IT Assistant to synchronize with the Dell support website at <ftp.dell.com> to automatically download update packages. For more information, see "Using Software Web Updates."
- Import the update packages from the *Server Updates* media, which is released about once every quarter, and contains latest update packages.
- Manually obtain update packages from the Dell Support website and import them to the IT Assistant Repository. This method is simpler, if Tom/Jane have to download a couple of packages.

NOTE: In the system where you run the IT Assistant user interface from, the Java Runtime Environment (JRE) should have at least 256 MB of free space for the JRE memory (heap memory) to run the software updates task. For information on how to set this parameter, see "Setting the Java Runtime Parameter in Supported Windows Environment" and "Setting the Java Runtime Parameter in Supported Linux Environment."

Using Software Web Updates

When you install (or upgrade to) IT Assistant version 8.4, on a new node—Online Repository—is displayed in the **Repositories** tree. This repository is empty and will contain update packages only when you synchronize IT Assistant with the Dell website at <ftp.dell.com>. The Online Repository will now display the last known contents at <ftp.dell.com>. You can configure IT Assistant to check <ftp.dell.com> for new updates and download them into the Online Repository.

NOTE: Starting with IT Assistant 8.2 and later, the repository tree, by default, will show a simplified view; displaying only those update packages/bundles that are discovered on your network. Click **Classic View** to display all systems, irrespective of whether there are corresponding devices on your network.

NOTE: For applying hotfixes, you can do a direct import of a DUP to the repository. The individual DUPs can be obtained from <support.dell.com>. Once imported, copy the DUPs to a local windows directory. From IT Assistant, invoke a file-chooser widget and select this DUP to be imported to IT Assistant repository.

If you select automatic download of updates from **ftp.dell.com** to the Online Repository, you could use the repository as a cache to review the contents of the Online Repository before importing them to IT Assistant Repository. Alternatively, you may choose to automatically download *and* import any new updates to the IT Assistant repository during each synchronization.

To see the latest updates available at **ftp.dell.com**, configure the Online Synchronization task and run it. Synchronization of the Online Repository causes IT Assistant to check the availability of latest contents at **ftp.dell.com**. You may also choose to automatically download only the relevant packages so that they are ready for import to IT Assistant Repository.

You can then schedule and configure how often you want IT Assistant to check **ftp.dell.com** for new updates. You can synchronize the Online Repository on-demand through the user interface.

IT Assistant verifies the integrity and authenticity of every content downloaded from **ftp.dell.com** by verifying its digital signature.

Let us look at how Tom might use this feature in his enterprise.

Tom represents a large enterprise (about 1,000 systems, plus printers, tapes, and virtual machines). His systems have different operating systems, and comprise various controllers and storage components. Tom wants to be notified as soon as new/updated packages are available. This will enable him to decide if his systems require immediate upgrade or if he can schedule the upgrade for later.

Tom may want to consider the following before using this feature:

- How should I to connect to the Internet through my corporate firewall/proxy?
- Would I want to be notified of updates *every time* IT Assistant detects a new package on the Dell website?
- How do I schedule the update? Would it make a difference when I schedule updates for download?
- How do I determine which updates would be applicable to the systems on my network?
- When IT Assistant detects new updates, should it only download the updates (without importing them into the IT Assistant Repository) or should it also download *and* import them automatically into the IT Assistant Repository?

Synchronizing IT Assistant With the Dell Website

NOTE: This feature requires at least one of the communication protocols—HTTP or FTP—to be supported in your network.

To synchronize IT Assistant with Dell website, Tom performs the following steps:

- 1 Right-clicks **Online Repository** and selects **Configure Online Synchronization**.
- 2 In the **Connection Settings** screen, Tom selects **ftp.dell.com** as the **Download Site** and provides the **ftp** protocol as the connection parameter. Tom could select the HTTP protocol as well, if his corporate firewall blocked FTP downloads.

Based on the corporate setup in his enterprise, Tom may be required to configure a proxy. He configures the proxy by providing the **Address** and **Port** number in the **Proxy Server** section. He also provide the appropriate username and password. If Tom's proxy works without authentication, he would leave these fields blank.

Tom clicks **Test Connectivity** to validate if IT Assistant can successfully download the required contents from the Dell website.

For testing the connectivity, IT Assistant uses the specified parameters to connect and download the latest catalog available on the Dell website. IT Assistant uses the same parameters for all subsequent synchronization sessions.

NOTE: The connectivity test can fail because of multiple reasons, including proxy authentication failure, incorrect protocol, incorrect proxy port, network failure, a firewall blocking the communication, and so on.

- 3 In the **Package Selection Criteria** screen, Tom can select one of the following options:
 - **Select the packages/bundles that apply to devices in my network (Recommended).** This is the recommended option as Tom will not need to specify details such as, operating systems, system models, and so on for all the systems.
 - **Select only the packages/bundles that meet the below criteria.** This option allows Tom to specify the components, operating systems, and systems that he wants IT Assistant to include in the online update operation.

 **NOTE:** Tom must select at least one component from **All Components**, **All Operating Systems**, and **All Systems** on his network. If he does not do this, no package or bundle will be considered for auto-download during online synchronization. However, he may still import them later from the IT Assistant user interface.

Tom selects:

- All Components
- All Operating Systems
- Dell PowerEdge x7xx, x8xx, and x9xx systems on his network

After choosing one of the above selections, Tom clicks **Update Catalog Now...** This updates the catalog stored in the IT Assistant Repository to the most recent components available on the Dell website.

- 4 In the **Select Schedule** screen, Tom could choose to synchronize with the Dell website now, or he could set a schedule.

He selects a monthly schedule and clicks **Next**.

 **NOTE:** Tom does not select a daily or weekly schedule because he knows that the updates typically do not happen very frequently on the Dell website. Also, a daily schedule would increase network usage, system resources, and Internet charges.

 **NOTE:** The automatic download is a resource-intensive task that consumes network bandwidth and increases CPU and memory usage during each synchronization. Hence, it is recommended that online synchronization be scheduled during off-peak hours.

- 5 In the **Notification and Auto-Download Settings** screen:

- a Tom selects **Enable E-mail Notification** and specifies his e-mail address in the **E-mail Address** field.

 **NOTE:** If Tom configures the E-mail Notification feature of software Web updates, IT Assistant will notify him during the next synchronization cycle if there is a new update package available on ftp.dell.com.

 **NOTE:** Selecting this option sends e-mail notifications with information on the new packages, to configured users. Tom can select a mailing list of administrators, or he could enter e-mail address of multiple users separated by commas or semi-colons.

 **NOTE:** The e-mail notification is in addition to the user interface notification.

- b Tom can select **Download automatically when updates are available**. This will cause automatic download of new packages to a cache maintained by IT Assistant.

NOTE: After the synchronization, Tom can identify the packages and bundles that were downloaded and those that were not downloaded, by their different icons under the Online Repository.

NOTE: IT Assistant ensures the integrity of all downloaded packages by verifying the digital signature and discards all packages that fail digital signature verification.

Tom can also select **Auto-import**. This option causes the updates to be automatically imported to the IT Assistant Repository during synchronization. However, Tom may choose to ignore this option if he does not want to get content into the IT Assistant Repository without his intervention/knowledge.

- c Tom wants to see which systems on his network are compliant with the latest update packages, or he may want to know if there is a major update that affects most of his systems, such as a BIOS upgrade. Therefore, he also selects **Include compliance report for every downloaded component in the E-mail**.

NOTE: If Tom does not select this option, the e-mail will not contain the compliance report of the update packages. However, he can still view the compliance report in the Compliance tab. For more information, see "Viewing Compliance Report for Downloaded Update Packages/Bundles."

NOTE: Compliance reporting is a resource-intensive task that consumes network bandwidth and increases CPU and memory usage. Hence, online synchronization must be scheduled during off-peak hours.

- 6 The **Summary** screen shows Tom's selections. He clicks **Finish** to accept, or **Back** to make changes.

When Tom clicks **Finish**, IT Assistant does the following:

- Synchronizes with **ftp.dell.com** as per the schedule he set in step 4.
IT Assistant maintains the current (n) and the immediate predecessor (n-1) versions of the catalog in the repository. IT Assistant downloads the catalog and compares the last-known catalog (n-1) present in the IT Assistant Repository. Tom can view the comparison between the two versions in the **Online Repository Comparison** tab in the user interface. A report can also be included in the e-mail if Tom selected the option.
- Extracts the latest contents from the catalog
- Deletes packages for which the MD5 hash has changed.

NOTE: IT Assistant checks if two packages are the same using the algorithm supplied by the Product Development Kit (PDK), as well as the MD5 hash of the package. Only if both criteria match, IT Assistant confirms that the packages are same.

Comparing the Update Packages in the Repositories With Those On the Dell Website

Tom wants to compare the update packages in cache with the update packages in the repositories.

Tom can compare the update packages by:

- Comparing two repositories
- Comparing the contents of two catalogs

Comparing Two Repositories

Tom performs the following steps:

- 1 From the **Software Update Repositories** tree, Tom selects **Online Repository**.
- 2 In the right-hand side pane, he selects the **Repository Comparison** tab.
- 3 In the **Select Target Repository** field, he can select the IT Assistant Repository or click **Open New Repository** to open the *Server Updates* media to view the available update packages.
- 4 He clicks **Compare**.

IT Assistant compares the two selected repositories and provides status and version information as a result of the comparison.

Comparing Contents of Two Catalogs

Tom can compare the result of two online synchronizations.

He performs the following steps:

- 1 From the **Software Update Repositories** tree, Tom selects **Online Repository**.
- 2 In the right-hand side pane, he selects the **Online Repository Comparison** tab.

NOTE: To be able to view contents in this tab, Tom should have performed online synchronization.

IT Assistant compares the catalogs and provides status and version information.

After comparing, Tom can decide if he wants to import the contents into the IT Assistant Repository.

Tom can **Filter** to view the comparison results. This enables him to view a subset of the results, especially:

- since the number of packages in the Online Repository maybe large or
- he only wants to see the comparison of packages/bundles that he is interested in

Tom can filter based on:

- Components, such as the Baseboard Management Controller, Remote Access Controller, and so on.
- Operating systems
- Systems
- A combination of any of the above

Or he could click **Show All** to remove all filtering criteria.

NOTE: Any filtering criteria only changes the view in the **Comparison Results** tab; it does not affect the actual contents or downloaded packages and bundles in the repositories.

NOTE: The filter settings are only retained within the active browser session.

He can then click **Import** to import the packages or bundles to the IT Assistant Repository tree.

Importing Packages From the Online Repository

To apply update packages to his systems, Tom should first import the update packages in the IT Assistant Repository.

Tom can import packages/bundles in the following ways.

- Auto-import during online synchronization
- Manual import from the **Repository Comparison** or **Online Repository Comparison** tabs
- From the Online Repository

To import packages/bundles from the **Online Repository**, Tom performs the following steps:

- 1 He expands the **Online Repository**.
- 2 He right-clicks the package he wants to import, and selects **Import...**

The packages/bundles that are not imported in the cache, but referred to in the cache, are indicated by special icons.

The icons for downloaded packages/bundles are same as those in IT Assistant /*Server Updates* media repositories.

Before importing update packages, IT Assistant first checks for the availability of the packages in the cache maintained on the management station. If the package is available, IT Assistant imports the package from the cache into the IT Assistant Repository. If the package is not available in the cache, IT Assistant downloads the package from the Dell Support website at <ftp.dell.com> and imports it into the IT Assistant Repository.

Viewing Compliance Report for Downloaded Update Packages/Bundles

After downloading the update packages, Tom wants to determine if the devices on his network comply with the update packages he downloaded, as well as check the devices that the update packages can be applied to. Tom can do this by clicking the downloaded packages in the IT Assistant Repository and selecting the **Compliance** tab that is displayed in the right hand side pane. This tab displays the device selection pane from which Tom can select a specific group of devices (or even a query for the devices) that he wants to include in the compliance report.

NOTE: For the Online Repository, the **Compliance** tab is available only for packages/bundles that are downloaded to the cache.

Starting with IT Assistant 8.2 and later, Tom can retrieve a compliance report by selecting **Tools**→**Compliance Tool**. Tom can click **Open** or **Save** from the **File Download** dialog box to either save the file to a location of his choice or to view the report as a Microsoft® Excel® file.

For more information on selecting the devices, see the *Dell OpenManage IT Assistant Online Help*.

Clicking **Compare** performs the comparison and generates the compliance report. The report provides the following information:

- an iconic representation of the differences found (!)
- name of the package or object
- the devices version (the device version is the version associated with the device component)
- the repository packages version (the repository package version is the version associated with the Update Package or System Update Set that Tom specified for the comparison.)

Clicking **Update** starts the Software Update task. For more information on **Software Update Tasks**, see the "Using Software Updates."

NOTE: The **Update** option is disabled in the Online Repository. Import the package to the IT Assistant Repository to enable the **Update** option.

The Compliance tab displays only for the imported packages in the IT Assistant Repository and the downloaded packages in the Online Repository.

NOTE: Compliance reporting is a resource-intensive task that consumes network bandwidth and increases CPU and memory usage. Hence, Tom schedules this task during off-peak hours.

Using Software Updates in IT Assistant

Let us look at how Jane might use this feature in her enterprise.

Jane has a small-to-medium size business (50 servers, plus over 200 client systems). She does not have network bandwidth for large downloads. Instead, she chooses to get the update packages periodically using the *Server Updates* media.

Using the Server Updates Media

To use the Dell Update Packages from within IT Assistant, Jane performs the following steps:

- 1 Inserts the *Server Updates* media into the media drive
- 2 On the IT Assistant UI, Jane navigates to **Manage**→**Software Updates**.
- 3 Right-clicks the root node (**Software Update Repositories**) and selects **Open Repository (Update CD)**....
- 4 Navigates to the DVD location and locates the repository directory.
- 5 Selects **catalog.xml** and clicks **Open**.
The contents of the *Server Updates* media will be displayed on the IT Assistant user interface. Jane can then perform operations such as importing packages, performing compliance checks, and performing software updates.

Jane sometimes manually downloads individual update packages from the Dell Support website at ftp.dell.com. She knows that some of her systems need the firmware upgrade that the update package contains, but she wants to determine which ones without manually checking each of her 50 servers. She can use IT Assistant to quickly find out.

Here is how she would find out how many systems need an update:

- 1 Selects **Manage**→**Software Updates** from the menu bar.
- 2 Right-clicks **IT Assistant Repository** in the left navigation pane and chooses **Add**.

Jane navigates to the location on her system where she downloaded the Update Package. When she selects the package and clicks **Open**, the selected package is added to the repository tree as a child node of the IT Assistant Repository.

- 3 Clicks the Update Package name in the left-hand pane to view a summary of its contents in the right hand pane.
- 4 Clicks the **Compliance** tab, then selects a specific group of devices (or a query) against which she wants to check the package.

NOTE: Starting with IT Assistant 8.2, Jane can retrieve a compliance report by selecting **Tools**→**Compliance Tool**. She can click **Open** or **Save** from the **File Download** dialog box to either save the file to a location of her choice or to view the report as a Microsoft Excel file.

- 5 Clicks **Compare** to check the devices she selected against the contents of the update package.

IT Assistant performs a comparison and generates a compliance report that shows a graphical presentation of the differences, full version information on the selected devices, and other information that can help identify non-compliant systems or devices.

Jane can use the compliance report to find which systems on her network are compliant, and accordingly run update packages on those systems. Or she may just want to keep a record of what update packages were available in a quarter/year.

- 6 If IT Assistant finds systems or devices that need updating, Jane can select the devices she wants to update and click the **Update** button. This action automatically starts the **Software Updates** task wizard.

For more information on the software updates task, see "Using Software Updates."

NOTE: Jane cannot apply updates on the system running IT Assistant. To apply updates on this system, she should run the software updates from another system.

Managing Tasks

IT Assistant allows you to remotely run certain tasks on managed systems across the enterprise remotely. These tasks include:

- Generic command line execution (the ability to invoke the Dell™ OpenManage™ Server Administrator command line interface remotely is also supported if Dell OpenManage 4.3 or later instrumentation is enabled)
- Device control, including shutdown and wake up
- Scheduled software updates
- Ability to execute Intelligent Platform Management Interface (IPMI) commands remotely
- Ability to execute Remote Client Instrumentation commands remotely

NOTE: IPMI and Remote Client Instrumentation command line options may not be available if IT Assistant does not detect the necessary components (Baseboard Management Controller (BMC) Utilities and OpenManage Client Connector respectively) installed on the IT Assistant Services Tier.

- Ability to deploy the Dell agent (Server Administrator) on supported Microsoft® Windows® and Linux operating systems
- Ability to monitor the performance of a group of discovered devices with supported Microsoft Windows and Linux operating systems over a period of time.
- Ability to export and import task configuration information from one management station to another

These tasks can be configured to run on specific schedules or execute immediately. For more information, see the *Dell OpenManage IT Assistant Online Help*.

NOTE: If you are running the software deploy task across a wide area network (WAN), the task could fail if the network does not have sufficient bandwidth. However, if you want to perform this task across WAN locations, Dell recommends that you install IT Assistant locally on a system at the remote location, have the update package/installers available locally on the IT Assistant system and access the IT Assistant through Remote Desktop to that system.

Creating a Command Line Task

The **Command Line** tasks allow you to execute commands on your management station. IT Assistant displays different screens on the wizard depending on the tasks you choose. IT Assistant also displays different options depending on the hardware (BMC) or the software component (OpenManage Client Connector or BMC Utilities) that it detects on your management station. For example, if you have installed the BMC Utilities on your management station, then the wizard for creating the command Line task will display the IPMI Command Line in the **Task Type** pull-down menu.

To create a **Command Line** task, perform the following steps:

- 1 Select **Manage**→**Tasks** and right-click **Command Line** in the left navigation pane.
- 2 Select **New Task**.

The Task Creation wizard appears.

- 3 Enter a **Task Name**, then choose the task type from the **Task Type** pull-down menu and click **Next**.
- 4 In the **Task Executable Specification** window, enter the command executable and the arguments, and click **Next**.

For more information, see the *Dell OpenManage IT Assistant Online Help*.

- 5 In the **Device Selection** window, select the devices/groups on which you want to run the command line task or provide a query.

NOTE: This window is available only if you have chosen \$IP or \$NAME as arguments in the **Task Executable Specification** window.

- 6 Under **Select Schedule**, you can either schedule the task to run at a specified time, or run the task immediately.
- 7 If you are rebooting an SNMP-enabled system, enter the instrumentation user name and password in the **Enter Credentials** window. If your system is CIM-enabled, enter the fully-qualified domain user name and password.
- 8 Confirm your selections in the **Summary** window, or choose **Back** to make changes.

Tasks Available in Command Line

Generic Command Line

Choosing **Generic Command Line** from the pull-down menu allows you to execute commands from within your network.

NOTE: For **Generic Command Line** tasks, programs will run on a background command shell instance on the IT Assistant system itself.

Remote Server Administrator Command Line

Remote Server Administrator Command Line allows you to execute Server Administrator command line interface (CLI) commands remotely.

For a full list of the arguments accepted by IT Assistant, see the *Dell OpenManage IT Assistant* online help.

IPMI Command Line

Choosing **IPMI Command Line** from the pull-down menu allows you to execute IPMI commands.

For more information, see the *Dell OpenManage IT Assistant* online help.

Remote Client Instrumentation Command Line

Choosing **Remote Client Instrumentation Command Line** allows you to execute client instrumentation commands remotely including sideband interface management.

You can view this option only if you have Dell OpenManage Client Connector (OMCC) installed on your management station.

Creating a Device Control Task

A device control task helps you to power control a system through IT Assistant.

To perform these tasks in IT Assistant, perform the following steps:

- 1 Select **Manage**→**Tasks** and right-click **Device Control** in the left navigation pane.
- 2 Select **New Task**.

The Task Creation wizard appears.

- 3 Enter a **Task Name**, then choose, for example, **Shutdown Device** from the **Task Type** pull-down menu and click **Next**.
- 4 From the **Select Shutdown Type** window, choose:
 - a **Reboot** to reboot a troublesome server that may have issued several e-mail alerts
 - b **Power Cycle (if supported)**. This option performs a power cycle when IT Assistant communicates to the system through Dell instrumentation using the SNMP. The power to the device is turned off and turned on again after a pause. When the power is restored, the device is restarted.
 **NOTE: Power Cycle** is not supported on client devices.
 - c **Power Off** to power down the system.
 - d **Shutdown Operating System first**. This option performs a graceful shutdown of the operating system before performing the selected shutdown action.
 **NOTE: Shutdown Operating System first** will not display for ASF-enabled devices.
- 5 In the **Enter Credentials** window, enter the authentication parameters required for out-of-band access to ASF-enabled devices
- 6 In the **Device Selection** window, select the devices/groups on which you want to run the command line task or provide a query.
- 7 Under **Select Schedule**, you can either schedule the task to run at a specified time, or run the task immediately.
- 8 Confirm your selections in the **Summary** window, or choose **Back** to make changes.

Tasks Available in Device Control Task

Shutdown Device(via in-band)

Choosing **Shutdown Device(via in-band)** allows you to specify the shutdown operation that you want to perform.

 **NOTE:** This task requires CIM or SNMP discovery to be enabled, or Server Administrator to be installed on the managed node.

 **NOTE:** The shutdown task is not supported for devices discovered using IPMI only.

Wake Up Device(via WakeOnLAN)

Choosing **Wake Up Device(via WakeOnLAN)** allows you to specify the port number of the device that you want to wake up. To wake up a device, IT Assistant uses the MAC addresses and subnet mask that were discovered for that device. If NIC teaming is configured on the device, only one MAC is advertised by the operating system. For Wake-on-LAN (WOL) to work, WOL must be enabled for all NICs in that team. For a WOL packet to reach its intended destination, directed broadcasting (also known as subnet broadcasting) must be enabled on the intermediate routers. Directed broadcasting is typically disabled on the routers, so you must configure this feature on the routers to enable it.

NOTE: Enable the WOL property in the NIC settings and the system BIOS.

NOTE: WakeOnLAN(WOL) is recommended to be run against client devices.

Power Control Device(via ASF)

Choosing **Power Control Device(via ASF)** allows you to perform remote power control operations on the Alert Standard Format (ASF) 2.0 compliant devices.

NOTE: See the system documentation for ASF configuration and setup instructions.

NOTE: IT Assistant uses the in-band Broadcom Windows Management Instrumentation (WMI) provider to verify if a device has ASF capabilities.

IT Assistant also uses the in-band Broadcom WMI provider to detect if a device is enabled for remote secure Remote Management Control Packets (RMCP) operations and whether the administrator roles have sufficient privileges to perform power control operations.

NOTE: You can configure the power control operations through the Broadcom ASF Configuration Utility.

NOTE: Verify that **ASF Enabled**, **Remote Management**, and **Secure Management(ASF 2.0)** options are enabled in the Broadcom ASF Configuration Utility. Also ensure that the Authentication Key and the KG Key are entered in the correct format (Hex or ASCII).

The WMI provider is available as part of the Broadcom ASF Management suite—available on the Dell Support website at support.dell.com—and must be installed on the remote client device.

You can select the devices that are detected as being enabled, in the device selection pane of the ASF power control wizard. If the remote device does not have the WMI provider installed, is not enabled for remote secure RMCP operations, or if the administrator privileges have not been configured for the power control operation correctly, the device will appear disabled in IT Assistant.

 **NOTE:** You can select the disabled devices, if you select the **Enable All** option.

If the settings are altered, rediscover the device. This allows IT Assistant to use the updated configuration to enable/disable the client devices in the wizard.

Using Server Software Deployment

IT Assistant provides an integrated method to install Dell OpenManage Server Administrator on supported Dell systems.

 **NOTE:** In the system where you run the IT Assistant user interface from, the Java Runtime Environment (JRE) should have at least 256 MB of free space for the JRE memory (heap memory). This memory requirement is recommended for IT Assistant to download the MSI file that contains the Dell agent. The MSI file size is typically in the range of 60–64 MB.

Setting the Java Runtime Parameter in Supported Windows Environment

- 1 Click the **Start** button. Point to **Settings**→**Control Panel**→**Java**.
- 2 In the **Java** tab, click **View** in the **Java Applet Runtime Settings** section.
- 3 Set **Java Runtime Parameters** to **-Xmx256M**.

Setting the Java Runtime Parameter in Supported Linux Environment

- 1 Navigate to the Java home directory. The default path is `/usr/java/jre1.6.0_03/bin/`.
- 2 Run `./ControlPanel`.
- 3 In the **Java** tab, click **View** in the **Java Applet Runtime Settings** section.
- 4 Set **Java Runtime Parameters** to **-Xmx256M**.

Installing the Dell Agent on a Remote Managed Node

If you are managing a corporate network using IT Assistant, you can install the latest Dell OpenManage Server Administrator on multiple systems in the environment. These systems may or may not have Server Administrator previously installed on them.

Obtain a Server Administrator **.msi** file for Windows or the **.tar.gz** for Linux from one of the following sources:

- *Dell Systems Management Tools and Documentation* DVD
- Dell Support website at support.dell.com

Obtain a Server Administrator **.msp** file for Windows or the **.tar.gz** for Linux from one of the following sources:

- *Dell Server Updates* DVD or the *Dell PowerEdge™ Server Update Utility* CD
- Dell Support website at support.dell.com

Use the task management feature in IT Assistant to create a Software Agent Deployment task to schedule the deployment of Server Administrator on multiple systems on the network. After Server Administrator is installed, the new status will display:

- Only if you forcibly discover, inventory, or do a manual status poll.
- After the next scheduled discovery, inventory, or status poll.

NOTE: The protocol configuration settings for inventory must be specified for the device during initial device detection and the corresponding services must be running on the device.

Creating a Software Deployment Task

- 1 Select **Manage**→**Tasks** from the menu bar.
- 2 Under the **Task** parent node, right-click **Software Deployment** and select **New Task...**
The **New Task Wizard** appears.
- 3 Under **Task Creation**, enter a descriptive name for the task and select the **Server Administrator Deploy / Upgrade** task for Windows or Linux.
Click **Next**.

4 Under **Task Installer Specification**, specify the **Installation File Path**.

 **NOTE:** The .msi file will install the entire management station application on the managed system; whereas the .msp file contains the delta for the upgrade across minor or patch release for Windows. The .tar.gz, on the other hand, contains the upgrade across both major and minor versions for Linux.

The option of choosing between MSI and MSP should be based on the optimal use of network bandwidth versus an update action that successfully updates all devices configured in the task. The MSP, usually, being much smaller in size, would be the preferred way for conserving network bandwidth. However, the pre-requisite for MSP is the last preceding major version (OpenManage version 5.4). The pre-requisite for MSI is much less (currently, OpenManage version 4.3).

 **NOTE:** Look for the **SysMgmt.msi** on the media that has the Dell OpenManage Server Administrator application.

 **NOTE:** Ensure that you select only the Dell OpenManage version 5.0 or later **SysMgmt.msi** file. The .msi files of earlier versions of Dell OpenManage are not supported by IT Assistant 8.1 and later. You can check the version of Server Administrator by right-clicking the **SysMgmt.msi** file and selecting **Properties**. The Server Administrator version is displayed in the **Summary** tab.

 **NOTE:** Ensure that there is sufficient free space (at least 130 MB) on the management station for creating the task. The managed node should have about 130 MB of free space in **%SYSTEMDRIVE%** or the drive where the operating system is installed.

 **NOTE:** This feature supports only **ADDLOCAL** parameter. For more information on this parameter and the arguments you use with it, see the *Dell OpenManage Installation and Security User's Guide*.

It is recommended that you select **Upgrade Installer Engine on target node (if required)**. This option ensures that the latest version of **msiexec** is installed on the managed systems.

If you do not select this option, and the managed systems do not have the required version, and an error message is displayed.

 **NOTE:** This option fails if the required upgrade engine files (**.exe** and **.bat**) are not found in the same folder as the Systems Management installer (**.msi**). If you deleted these files, go to **ftp.dell.com** and download them to the **SystemsManagement** folder.

- 5 Under **Device Selection**, select the appropriate systems on which Server Administrator is to be deployed.

NOTE: IT Assistant performs prerequisite checks at the time of task execution and execution details can be viewed in the **Task Execution Details** pane. If the task execution fails, correct the error (for example, inadequate disk space) and run the task again. For more information, see the *Dell OpenManage IT Assistant Online Help*.

- 6 Under **Select Schedule**, you can either schedule the task to run at a specified time, or run the task immediately.
- 7 Under **Enter Credentials**, enter your operating system credentials.
- 8 View and verify your selections in **Summary**.
- 9 Click **Finish** to accept your selection, or **Back** to make changes.

NOTE: At this point, the files will be uploaded to the IT Assistant Repository. This process may take a few minutes.

Using Software Updates

You can use **Manage**→**Tasks**→**Software Updates** to update systems or devices with latest update packages or bundles acquired from the *Dell Server Updates* DVD, or from the online synchronization with the Dell Support Website at <ftp.dell.com>.

NOTE: Before creating the task, you must import update packages and bundles to the IT Assistant Repository. For more information, see "Importing Packages From the Online Repository."

Creating a Software Update Task

 **NOTE:** Before creating a software update task, you must have already begun to manage your repositories. If you have not done so, go to **Manage→Software Updates** and open the target repository to import the update packages or bundles that you require. For more information, see "Using Software Updates in IT Assistant."

To create a software update task, perform the following steps:

- 1 Select **Manage→Tasks** from the menu bar.
- 2 Under the **Task** parent node, right-click **Software Update** and select **New Task...**

The **New Task Wizard** appears.

 **NOTE:** Dell recommends that you run a device compliance report, and then create the software update task based on that report. For more information on creating the compliance report, see "Viewing Compliance Report for Downloaded Update Packages/Bundles."

- 3 In the **Repository Contents** window, select a package or bundle for the update.
 - 4 In the **Select Options** window, select the appropriate options.
-  **NOTE:** For security reasons, Dell recommends the use of SSH version 2, or later on the managed system.
- 5 Under **Device Selection**, select the devices on which the update packages or bundles need to be deployed.
 - 6 Under **Select Schedule**, you can either schedule the task to run at a specified time, or run the task immediately.
 - 7 Confirm your selections in the **Summary** window, or choose **Back** to make changes.

The software update packages are applied to the selected devices at the scheduled time.

Exporting and Importing Tasks

The export/import feature allows you to export the task configuration information for the selected tasks in IT Assistant to an XML file. You can import this file to a new network environment where IT Assistant is installed, instead of recreating and reconfiguring the tasks.

 **NOTE:** This feature is limited to Command Line tasks only.

Let us assume that Tom has created 10 command line tasks, out of which five tasks are of interest to Jane. Instead of reconfiguring the five tasks, Tom can export the five tasks to an XML file and send it to Jane through e-mail. Jane can then import these tasks directly into IT Assistant, without having to manually configure the tasks again.

Exporting Tasks

- 1 Select **Manage**→**Tasks**.
- 2 Expand the **Command Line** task.
- 3 Select the command line tasks you want export, right-click and select **Export Tasks**.
- 4 Enter the file name in the **File Save As** dialog box to save the task configuration information.

 **NOTE:** All task information, except the device selection and user credential information, is exported.

Importing Tasks

- 1 Select **Manage**→**Tasks**.
- 2 Right-click **Tasks** and select **Import Tasks**.
- 3 Select the export task XML file from the **Open** dialog box.

NOTE: IT Assistant checks the XML file and verifies the version of IT Assistant mentioned in the file. IT Assistant allows only the files exported from IT Assistant version 8.1 and later to be imported into the new import task.

The **Import Tasks** wizard is displayed.

- 4 The **Task Selection** window displays the task information in the selected task configuration file.

Select a task to view details of the task in the right-hand side pane.

NOTE: If the schedule of the selected task has expired, a warning is displayed. You can reconfigure this task after import is complete.

NOTE: If a task type is not applicable on the target management station, the task will be disabled on the UI.

Reporting

Dell™ OpenManage™ IT Assistant provides the ability to:

- Generate ready-made reports using the Reports Wizard.
- Create customized reports for all systems in your enterprise.
- Create software compliance reports.

The basics of these capabilities are shown here using the same user scenarios presented in "Configuring Dell™ OpenManage™ IT Assistant to Monitor Your Systems." For more detailed information on these topics, see the *Dell OpenManage IT Assistant Online Help*.

Ready-made Reports

IT Assistant provides several pre-defined reports you can use immediately. These reports will be displayed in the left portion of the **Reports** window. Click the report name to see a summary of the information the report is designed to gather. Table 10-1 describes the various ready-made reports available with IT Assistant. For more information on the individual reports, see the *Dell OpenManage IT Assistant Online Help*.

Table 10-1. Ready-made Reports

Type of Report	Description
Dell/EMC Array Controller Report	Returns Controller information for Dell/EMC Storage Arrays
Dell/EMC Enclosure report	Returns Enclosure information for Dell/EMC Storage Arrays
Device Card/Embedded Device Report	Returns Device Card data for servers
Memory Report	Returns Memory information for servers.
PowerVault MD Array Controller Report	Returns Controller information for PowerVault MD Storage Arrays.

Table 10-1. Ready-made Reports

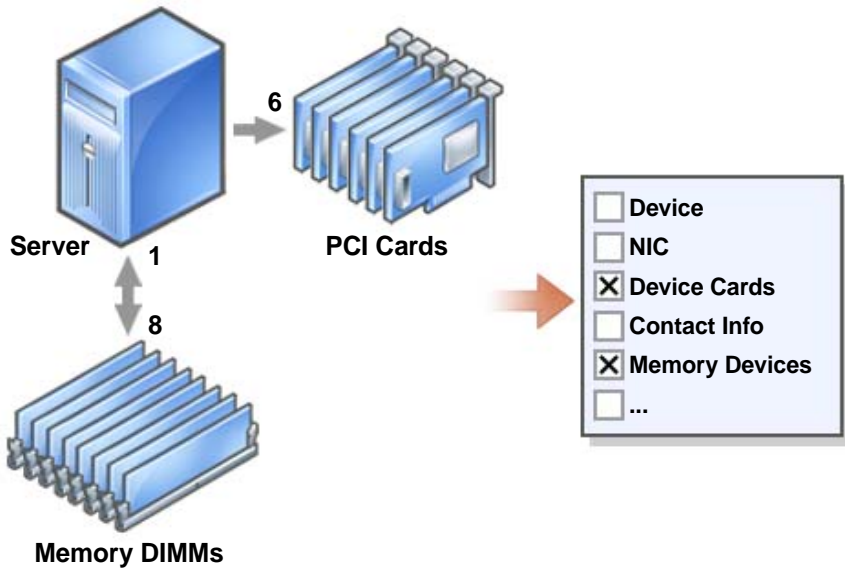

Type of Report	Description
PowerVault MD Array Report	Returns Array information for PowerVault MD Storage Arrays.
Printer Low Toner Report	Returns all Printers with toner levels at or below 20% of capacity.
Software Inventory Report	Returns Software Inventory data for servers.
Tape Report	Returns the Library and drive information for Tape Devices.
Virtual Machine Report	Returns Virtual Machine information.
Volume Info Report	Returns Storage Volume information for servers.
Microsoft Virtual Machine Report	Returns information on Microsoft hypervisor.

Custom Reporting

IT Assistant uses data from the Microsoft® SQL Server database to create customized reports. These reports are based on data gathered during discovery and inventory cycles.

The devices or groups that you select to include in your report correspond to fields in the IT Assistant database. When you execute a report, a database query is created. The following figure provides an example.

Figure 10-1. Custom Reporting in IT Assistant

For example, you can compile a report containing:

- Details of the hardware devices being managed by IT Assistant, including servers, switches, and storage devices
- BIOS, firmware, and driver versions contained on specific devices
- Other asset or cost of ownership details

You can specify different output formats for any report, such as HTML, XML, or CSV (comma-separated values). Any customized report template you create can be saved and used later.

Creating a New Report

To illustrate IT Assistant’s report capabilities, let us take another look at Jane’s enterprise:

Among her group of managed systems, she has 50 Dell™ servers. However, she is not sure of the type of network interface card installed on her servers. She can answer that question quickly by using IT Assistant’s reporting tool:

From IT Assistant, Jane will:

- 1 Select **Views**→**Reports**, then right-click **All Reports** in the left navigation pane.
- 2 Choose **New Report**.
The Add Report wizard starts.

She then specifies the following:

- A **Name** for her report, not to exceed 64 characters
- An optional **Description**

Click **Next**.

- 3 In the **Select Devices** dialog box, Jane chooses **Select devices/groups from the tree below**, then **Servers** from the available devices list.

NOTE: Selecting the top-level attribute in the device list automatically selects all of the attributes below it. Expanding the attributes in the tree allows you to select the specific attributes that you want to include. A check mark with a gray background for the group selection indicates that you have made individual selections within the group. A check mark with a white background indicates that you have selected the entire group. Consequently, as the group membership changes, the selection is applicable to the modified group members.

Click **Next**.

- 4 Under **Select Attributes**, she chooses **NIC**.
- 5 Then, she specifies a preferred **Sort by** order and clicks **Next**.
- 6 On the **Summary** page, she either accepts her choices or goes back and changes them. This creates a new report with the name Jane specified in step 2.

When Jane has confirmed her configuration, she goes to the reports window in IT Assistant and right-clicks the report name she created and chooses **Execute**→**HTML Reports**.

An HTML format-based report showing NIC device information for each of the 50 systems in her enterprise is displayed.

Choosing a query-based report:

Jane could also opt for a query-based report. Instead of choosing **Select devices/groups from the tree below** in the report wizard, she could choose **Select a query**. Then, she can either select a query that she created earlier, or create a new query by clicking the **New** button. She can specify the parameters for a query report as shown in Table 10-2:

Table 10-2. Query Report Parameters

Parameter	Description
Name of the <u>Q</u> uery	Specifies the name of the query.
<u>Q</u> uery Criteria	<p>Specifies the query criteria. For example, to create a new query with the query criteria for all devices that correspond to a subnet, specify:</p> <pre>Where: IP Address Starts With 143.166.155</pre> <p>The query operators are:</p> <ul style="list-style-type: none">• Contains — Specifies that the query criteria string contain a certain set of characters.• Ends With — Specifies that the query criteria string ends with a certain set of characters.• Is — Specifies that the query criteria string exactly match these characters.• Starts With — Specifies that the query criteria string starts with these characters. <p>You can expand the query with up to 10 subqueries, which together constitute the complete query. Join the subqueries by using AND/OR operators.</p> <p>NOTE: If you make any changes while editing an existing query and save that query, the original query is replaced.</p>
Run Q uery	Runs the query and displays the results.
<p>NOTE: You can click Run Query to test a query before saving it.</p>	

Parameter	Description
Save <u>Q</u> uery	Saves the query.
Cancel	Closes the <u>Q</u> uery Editor window without saving your input.

 **NOTE:** If you want to run reports on RAC devices, and choose **RAC type** as one of the attributes to include in the report, the generated report may list the values 2, 8, or 16 against the RAC type column. These values are mapped as follows:
 2 = DRAC II
 8 = DRAC III/DRAC 4/DRAC 5
 16 = Baseboard Management Controller (BMC)

Compliance Tool Report

IT Assistant provides an easy launch point on the user interface (UI) to generate a comprehensive compliance report for all systems being managed. This report provides an overall system compliance status for each managed system for BIOS, firmware and driver versions.

To create a compliance tool report, perform the following steps:

- 1 Click **Tools**→**Compliance Tool**.
- 2 Click **Open** or **Save** from the **File Download** dialog box to either save the file to a location of your choice or to view the report as a Microsoft Excel® file.

Editing, Deleting, or Running Reports

Whichever type of report she creates, Jane can edit, delete, rename, or run it at any time by right clicking the report name in the **Reports** window.

IT Assistant Database Schema Information

IT Assistant gathers data that is stored in associated tables and is linked by the **DeviceID**, an internal identifier. The associated data is stored in the following tables.

 **NOTE:** The primary keys for the tables are marked with an asterisk (*).

Table 10-3. IT Assistant Database Schema

Column Name	Data Type	Data Size	Nulls Allowed	Description
Device Table				
DeviceId*	int	4	No	Internal device identification used as a Foreign Key in all related tables.
DeviceName	nvarchar	256	Yes	The name IT Assistant uses to identify the device, which is the name shown in the Device Tree in the user interface (UI).
DeviceInstrumentationName	nvarchar	256	Yes	The name of the device retrieved from the MIB II SysName or CIM.
DeviceDNSName	nvarchar	256	Yes	Fully qualified name as returned by the DNS Server
DeviceType	int	4	Yes	The type of device. Workstations = 3 Servers = 4 Desktops = 5 Portables = 6 Network Switches = 8 RACs = 9 KVMs = 10 Unknown = 2 or any value not listed
DeviceInventoryTime	datetime	8	Yes	The last time that IT Assistant collected inventory data from the device.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
DeviceStatusedTime	datetime	8	Yes	The last time that IT Assistant collected the global health data from the device.
DeviceDiscoveredTime	datetime	8	Yes	The last time IT Assistant interrogated the system to determine what agents were present.
DeviceProtocols	int	4	Yes	Bitmask indicating what protocols the device supported. Bit 1 = SNMP Bit 4 = CIM Bit 8 = IPMI
DevicePreferredProtocol	int	4	Yes	The protocol by which the remote device prefers to be managed. 1 = SNMP 2 = CIM
DeviceAssetTag	nvarchar	64	Yes	This attribute defines the device's asset tag.
DeviceServiceTag	nvarchar	64	Yes	This attribute defines the device's service tag.
DeviceSystemId	int	4	Yes	The manufacturer's ID for the system model.
DeviceSystemModelType	nvarchar	64	Yes	The manufacturer's model name.
DeviceLocation	nvarchar	256	Yes	The device location as retrieved from the remote agent.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
DellSystem	int	4	Yes	The Boolean flag indicating if the device has a Dell-enabled agent.
SubnetLastDiscoveredOn	nvarchar	256	Yes	The last discovery range that was used to discover the device.
Agent Table				
DeviceId*	int	4	No	The Foreign Key (FK) to the Device Table.
AgentName*	nvarchar	256	No	The name of the agent.
AgentVersion	nvarchar	64	Yes	The version of the agent.
AgentManufacturer	nvarchar	64	Yes	The manufacturer of the agent.
AgentDescription	nvarchar	256	Yes	A brief description of what the agent manages.
AgentGlobalStatus	int	4	Yes	The global status of the agent. Not Known = 0 Unknown = 1 Normal = 4 Warning = 8 Critical = 16
AgentInstallTime	datetime	8	Yes	The time the agent was installed, if available.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
AgentId	int	4	Yes	Internal ID used to distinguish between agents. RAC Out-Of-Band Agent = 1 Server Administrator = 2 Microsoft WMI = 3 OMCI = 4 Physical Manager = 6 Storage Manager = 7 Dell™ PowerEdge™ 1655MC Switch = 8 Dell PowerConnect™ 3248 = 9 PowerConnect 5224 = 10 PowerConnect 3024 = 11 PowerConnect 5012 = 12 PowerConnect 3048 = 13 PowerConnect 3000MIB = 14 KVM = 15 Inventory Agent = 16 RAC In-Band Agent = 17
AgentURL	nvarchar	256	Yes	The Web address of the management application (if the agent supports a Web-based access).
AgentData	ntext	16	Yes	Extended agent data; for internal use only.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
Array Disk Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ArrayDiskNumber*	int	4	No	The instance number of this array disk entry.
ArrayDiskName	nvarchar	256	Yes	The array disk's name as represented in Storage Management.
ArrayDiskVendorName	nvarchar	64	Yes	The array disk's (re)seller's name.
ArrayDiskModelNumber	nvarchar	64	Yes	The array disk's model number.
ArrayDiskSerialNumber	nvarchar	64	Yes	The array disk's unique identification number from the manufacturer.
ArrayDiskPartNumber	nvarchar	64	Yes	The array disk's part number.
ArrayDiskRevision	nvarchar	64	Yes	The array disk's firmware version.
ArrayDiskEnclosureId	nvarchar	64	Yes	The SCSI ID of the enclosure processor to which this array disk belongs.
ArrayDiskChannel	int	4	Yes	The bus to which this array disk is connected.
ArrayDiskLength	int	4	Yes	The array disk's size in gigabytes. If the size is 0, it is smaller than a gigabyte.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
ArrayDiskBusType	nvarchar	64	Yes	The array disk's bus type. Possible values: SCSI, IDE, Fibre Channel, SSA, USB, and SATA.
ArrayDiskTargetId	int	4	Yes	The SCSI target ID which this array disk is assigned.
ArrayDiskLUNId	int	4	Yes	The durable unique ID for this array disk.
Controller Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ControllerNumber*	int	4	No	The instance number of this controller entry.
ControllerName	nvarchar	64	Yes	The name of the controller in this subsystem as represented in Storage Management. Includes the controller type and instance, for example: PERC 3/QC 1.
ControllerVendor	nvarchar	64	Yes	The controller's reseller's name.
ControllerType	nvarchar	64	Yes	The type of controller.
ControllerState	nvarchar	64	Yes	The current condition of the controller's subsystem.
ControllerStatus	int	4	Yes	The controller's status
ControllerFWVersion	nvarchar	64	Yes	The controller's current firmware version.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
ControllerCacheSize	int	4	Yes	The controller's current amount of cache memory.
ControllerPhysicalDeviceCount	int	4	Yes	The number of physical devices on the controller channel, including both disks and the controller.
ControllerLogicalDeviceCount	int	4	Yes	The number of virtual disks on the controller.
ControllerPartnerStatus	nvarchar	64	Yes	Indicates the availability of the redundant controller in a redundant configuration.
ControllerMemorySize	int	4	Yes	The amount of memory on the controller.
ControllerDriveChannelCount	int	4	Yes	The number of redundant controller drive channels.
ControllerChargeCount	int	4	Yes	The number of charges that have been applied to the battery on this controller.
ControllerDriverVersion	nvarchar	64	Yes	The currently installed driver version for this controller.
ControllerSPAReadCacheSize	int		Yes	The read cache size on controller A.
ControllerSPAWriteCacheSize	int		Yes	The write cache size on controller A.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
ControllerSPBReadCacheSize	int		Yes	The read cache size on controller B.
ControllerSPBWriteCacheSize	int		Yes	The write cache size on controller B.
ControllerCachePageSize	int		Yes	The page cache size for the controller.
ControllerSPARReadCachePolicy	nvarchar	64	Yes	The read cache policy on controller A.
ControllerSPAWriteCachePolicy	nvarchar	64	Yes	The write cache policy on controller A.
ControllerSPBReadCachePolicy	nvarchar	64	Yes	The read cache policy on controller B.
ControllerSPBWriteCachePolicy	nvarchar	64	Yes	The write cache policy on controller B.
DeviceCard Table				
DeviceId	int	4	No	The Foreign Key to the Device Table.
DeviceCardIndex	int	4	No	This attribute defines the index (one based) of the PCI device.
DeviceCardSlotNumber	int	4	Yes	This attribute defines the slot number of the PCI device.
DeviceCardManufacturer	nvarchar	64	Yes	This attribute defines the name of the manufacturer of the PCI device.
DeviceCardDescription	nvarchar	256	Yes	This attribute defines the description of the PCI device.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
DeviceCardDataBuswidth	nvarchar	64	Yes	This attribute defines the width of the data bus of the PCI device.
DeviceCardBusSpeed	int	4	Yes	This attribute defines the bus speed in MHz of the PCI device. Zero indicates the speed is unknown.
DeviceCardAdapterSpeed	int	4	Yes	This attribute defines the adapter speed of the PCI device.
DeviceCardSlotLength	nvarchar	64	Yes	This attribute defines the slot length of the PCI device.
Enclosure Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
EnclosureNumber*	int	4	No	The instance number of the enclosure entry.
EnclosurePartNumber	nvarchar	64	Yes	The part number of the enclosure entry.
EnclosureSerialNumber	nvarchar	64	Yes	The serial number of the enclosure entry.
EnclosureName	nvarchar	256	Yes	The enclosure's name.
EnclosureVendor	nvarchar	256	Yes	The enclosure's reseller's name.
EnclosureId	int	4	Yes	The SCSI address of the processor.
EnclosureLocationofManufacture	nvarchar	256	Yes	The enclosure's manufacture location.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
EnclosureServiceTag	nvarchar	64	Yes	The enclosure identification used when consulting customer support.
EnclosureAssetTag	nvarchar	64	Yes	The user-definable asset tag for the enclosure.
EnclosureAssetName	nvarchar	64	Yes	The user-definable asset name for the enclosure.
EnclosureProductId	nvarchar	64	Yes	The enclosure's product identification, which also corresponds to the enclosure type.
EnclosureType	nvarchar	64	Yes	The type of enclosure.
EnclosureChannelNumber	int	4	Yes	The channel number, or bus, to which the enclosure is connected.
EnclosureBackplanePartNum	nvarchar	64	Yes	The part number of the enclosure's backplane.
EnclosureSCSIId	int	4	Yes	The SCSI ID of the controller to which this enclosure is attached.
Enclosure Management Module Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
EMMNumber*	int	4	No	The instance number of the enclosure management module.
EMMName	nvarchar	256	Yes	The name of the enclosure.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
EMMVendor	nvarchar	256	Yes	The management module reseller's name.
EMMPartNumber	nvarchar	64	Yes	The part number of the enclosure memory module.
EMMFWVersion	nvarchar	64	Yes	Firmware version of the enclosure memory module.
VirtualDisk Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
VirtualDiskNumber*	int	4	No	Instance number of this virtual disk entry.
VirtualDiskName	nvarchar	256	Yes	The virtual disk's label generated by Storage Management or entered by the user.
VirtualDiskDeviceName	nvarchar	256	Yes	Device name used by this virtual disk's member disks.
VirtualDiskLength	int	4	Yes	The size of this virtual disk in gigabytes.
VirtualDiskWritePolicy	nvarchar	64	Yes	Indicates whether the controller's write cache will be used when writing to a virtual disk.
VirtualDiskReadPolicy	nvarchar	64	Yes	Indicates whether the controller's read cache will be used when reading from a virtual disk.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
VirtualDiskCachePolicy	nvarchar	64	Yes	Indicates whether the controller's cache is used when reading from or writing to a virtual disk.
VirtualDiskLayout	nvarchar	64	Yes	The virtual disk's RAID type.
VirtualDiskStripeSize	int	4	Yes	The stripe size of this virtual disk in bytes.
VirtualDiskStripeElementSize	int	4	Yes	The stripe element size of this virtual disk in blocks.
VirtualDiskTargetId	int	4	Yes	Unique ID for the virtual disk.
VirtualDiskLUNId	nvarchar	64	Yes	The durable unique LUN ID for this virtual disk.
Volume Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
VolumeNumber*	int	4	Yes	Instance number of the volume entry.
VolumeDriveLetter	nvarchar	64	Yes	The volume's path (or drive letter) according to the operating system.
VolumeLabel	nvarchar	256	Yes	The user-definable label for this volume.
VolumeSize	int	4	Yes	The size of the volume in megabytes.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
Firmware Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
FirmwareChassisIndex*	int	4	No	The firmware chassis index (zero based).
FirmwareIndex*	int	4	No	The firmware index (zero based).
FirmwareType	nvarchar	64	Yes	The firmware type.
FirmwareName	nvarchar	64	Yes	The name of the firmware.
FirmwareVersion	nvarchar	64	Yes	The firmware version.
MemoryDevice Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
MemoryDeviceChassisIndex*	int	4	No	This attribute defines the index (one based) of the associated chassis.
MemoryDeviceIndex*	int	4	No	This attribute defines the index (one based) of the memory device.
MemoryDeviceName	nvarchar	256	Yes	This attribute defines the location of the memory device.
MemoryDeviceBankName	nvarchar	256	Yes	This attribute defines the location of the bank for the memory device.
MemoryDeviceType	nvarchar	256	Yes	This attribute defines the type of the memory device.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
MemoryDeviceFormFactor	nvarchar	256	Yes	This attribute defines the form factor of the memory device.
MemoryDeviceSize	int	4	Yes	This attribute defines the size of the memory device.
MemoryDeviceFailureMode	nvarchar	256	Yes	This attribute defines the failure mode of the memory device.
NIC Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
NICId*	int	4	No	The unique instance ID of the NIC.
NICIPAddress	nvarchar	40	Yes	The IP address assigned to the NIC.
NICNetmask	nvarchar	40	Yes	The subnet mask assigned to the NIC.
NICMACAddress	nvarchar	24	Yes	The MAC address of the NIC.
NICManufacturer	nvarchar	256	Yes	The reseller of the NIC.
NICPingable	int	4	Yes	A flag indicating that IT Assistant communicates with the device using this IP address.
Operating System Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
OSId*	int	4	No	The instance ID for the operating system.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
OSName	nvarchar	64	Yes	The name of the operating system.
OSRevision	nvarchar	64	Yes	The revision of the operating system (for example, the Microsoft Windows® service pack or the Linux kernel version)
OSTotalPhysicalMemory	int	4	Yes	The total physical memory reported by the operating system in megabytes.
OSLocale	nvarchar	64	Yes	The locale for the operating system.
OSType	int	4	Yes	The type of operating system.
PowerSupply Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
PowerSupplyChassisIndex*	int	4	No	This attribute defines the index (one based) of the chassis.
PowerSupplyIndex*	int	4	No	This attribute defines the index (one based) of the power supply.
PowerSupplyType	nvarchar	256	Yes	This attribute defines the type of the power supply.
PowerSupplyLocation	nvarchar	256	Yes	This attribute defines the location of the power supply.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
PowerSupplyOutputWatts	int	4	Yes	This attribute defines the maximum sustained output wattage of the power supply, in tenths of watts.
PowerSupplyMonitorCapable	nvarchar	64	Yes	This attribute defines the capability of the power supply monitor.
Processor Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ProcessorChassisIndex*	int	4	No	This attribute defines the index (one based) of the chassis.
ProcessorIndex*	int	4	No	This attribute defines the index (one based) of the processor.
ProcessorFamily	nvarchar	256	Yes	This attribute defines the family of the processor device.
ProcessorCurrentSpeed	int	4	Yes	This attribute defines the current speed of the processor device in MHz. Zero indicates that the current speed is unknown.
ProcessorSlotNumber	int	4	Yes	This attribute defines the slot that the processor occupies.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
SMBIOS Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ParallelPortConfiguration	nvarchar	64	Yes	Defines the parallel port configuration.
ParallelPortMode	nvarchar	64	Yes	The mode of the parallel port.
SerialPortYesConfiguration	nvarchar	64	Yes	Defines the serial port 1 configuration.
SerialPort2Configuration	nvarchar	64	Yes	Defines the serial port 2 configuration.
IDEController	nvarchar	64	Yes	Defines whether the IDE controller is enabled or disabled.
BuiltinNIC	nvarchar	64	Yes	Defines whether the built-in NIC is enabled or disabled.
BuiltinFloppy	nvarchar	64	Yes	Defines whether the built-in floppy disk controller is enabled, auto, or read-only.
BuiltinPointingDevice	nvarchar	64	Yes	Defines whether the built-in pointing device (mouse) port is enabled or disabled.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
WakeupOnLAN	nvarchar	64	Yes	Defines whether Wake-On-LAN is disabled, enabled for on-board NIC only, or enabled for add-in NIC only. If Enabled with boot to NIC option is selected, the system boots from the NIC boot-ROM upon a remote wake up.
WakeupOnLANMethod	nvarchar	64	Yes	Defines the Wake-On-LAN method supported by the system.
AutoOn	nvarchar	64	Yes	Defines the auto-on configuration: disabled, every day or week days (Monday-Friday).
AutoOnHour	nvarchar	64	Yes	Defines the hour when the system is turned on (0-23).
AutoOnMinute	nvarchar	64	Yes	Defines the minutes when the system is turned on (0-59).
BootSequence	nvarchar	64	Yes	Defines the boot sequence for the next system boot.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
ChassisIntrusionStatus	nvarchar	64	Yes	Reports the status of the system with regard to Chassis Intrusion (Detected or Not Detected) . A value of Unknown indicates either that chassis intrusion is not supported by this system, or that the chassis intrusion event reporting has been disabled by the user. If the value is Detected , you may set it to Not Detected to enable the system to receive the next event and to stop generating events for now.
IntegratedAudio	nvarchar	64	Yes	The status of the system's built-in sound device.
PCISlots	nvarchar	64	Yes	The status of the system's add-on PCI slots (enabled/disabled).
USBPorts	nvarchar	64	Yes	The status of the USB ports (on/off).
SoftwareInventory Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ComponentId	nvarchar	64	Yes	The component identifier for the software.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
InstanceId*	nvarchar	32	No	The instance identifier for the hardware.
HWDeviceId	nvarchar	16	Yes	The hardware device identifier of the PCI ID.
HWVendorId	nvarchar	16	Yes	The hardware vendor identifier of the PCI ID.
HWSubDeviceId	nvarchar	16	Yes	The hardware subdevice identifier of the PCI ID.
HWSubVendorId	nvarchar	16	Yes	The hardware subvendor identifier of the PCI ID.
SubComponentId	nvarchar	64	Yes	The subcomponent identifier for the hardware.
HWDescription	nvarchar	128	Yes	The description of the hardware.
SoftwareType	nvarchar	64	Yes	The type of software, for example, driver (DRVR), firmware (FRMW), and so on.
SoftwareVersion	nvarchar	64	Yes	The software version number.
SoftwareDescription	nvarchar	128	Yes	The description of the software.
SoftwareInventoryOS Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
OSVendor	nvarchar	64	Yes	The operating system vendor name.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
OSMajorVersion	nvarchar	16	Yes	The major version of the operating system.
OSMinorVersion	nvarchar	16	Yes	The minor version of the operating system.
OSSPMajorVersion	nvarchar	16	Yes	The Service Pack major version.
OSSPMinorVersion	nvarchar	16	Yes	The Service Pack minor version.
SwitchDevice Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
SwitchIndex*	int	4	No	The index of the switch.
SwitchAssetTag	nvarchar	255	Yes	The asset tag of the switch.
SwitchServiceTag	nvarchar	255	Yes	The service tag of the switch.
SwitchSerialNumber	nvarchar	255	Yes	The serial number of the switch.
CostOfOwnership Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
CooIndex*	int	4	No	The index of the cost of ownership.
PurchaseCost	nvarchar	64	Yes	The initial purchase cost of the system.
WayBillNumber	nvarchar	64	Yes	The way bill number.
InstallationDate	nvarchar	64	Yes	The date that the system was installed.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
PurchaseOrderNumber	nvarchar	64	Yes	The purchase order number.
PurchaseDate	nvarchar	64	Yes	The date that the system was purchased.
SigningAuthorityName	nvarchar	64	Yes	The signing authority reference.
OriginalMachineConfiguration Expensed	nvarchar	64	Yes	The original system configuration that was expensed.
OriginalMachineConfigurationVendorName	nvarchar	64	Yes	The original system configuration vendor name.
CostCenterInformationVendorName	nvarchar	64	Yes	The cost center information vendor name.
UserInformationUserName	nvarchar	64	Yes	The user name.
ExtendedWarrantyStartDate	nvarchar	64	Yes	The extended warranty start date.
ExtendedWarrantyEndDate	nvarchar	64	Yes	The extended warranty end date.
ExtendedWarrantyCost	nvarchar	64	Yes	The extended warranty cost.
ExtendedWarrantyProviderName	nvarchar	64	Yes	The extended warranty provider name.
OwnershipCode	nvarchar	64	Yes	The ownership code.
CorporateOwnerName	nvarchar	64	Yes	The owner's name.
HazardousWasteCodeName	nvarchar	64	Yes	The hazardous waste code name.
DeploymentDateLength	nvarchar	64	Yes	The deployment date length.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
DeploymentDurationUnitType	nvarchar	64	Yes	The deployment duration unit type.
TrainingName	nvarchar	64	Yes	The training name.
OutsourcingProblemDescription	nvarchar	64	Yes	The outsourcing problem description.
OutsourcingServiceFee	nvarchar	64	Yes	The outsourcing service fee.
OutsourcingSigningAuthority	nvarchar	64	Yes	The outsourcing signing authority.
OutsourcingProviderFee	nvarchar	64	Yes	The outsourcing provider fee.
OutsourcingProviderServiceLevel	nvarchar	64	Yes	The outsourcing provider service level.
InsuranceCompanyName	nvarchar	64	Yes	The insurance company's name.
BoxAssetTagName	nvarchar	64	Yes	The device's asset tag.
BoxSystemName	nvarchar	64	Yes	The device's host name.
BoxCPUSerialNumberName	nvarchar	64	Yes	The device's CPU serial number.
DepreciationDuration	nvarchar	64	Yes	The depreciation duration.
DepreciationDurationUnitType	nvarchar	64	Yes	The depreciation duration units.
DepreciationPercentage	nvarchar	64	Yes	The depreciation percentage.
DepreciationMethod	nvarchar	64	Yes	The depreciation method.
RegistrationIsRegistered	nvarchar	64	Yes	The registration is registered.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
ContactInfo Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ContactName*	nvarchar	64	No	The contact name.
ContactInformation	nvarchar	64	Yes	The information for this contact.
ContactDescription	nvarchar	64	Yes	The description for this contact.
Cluster Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
ClusterIndex*	int	4	No	The cluster index.
ClusterType	int	4	Yes	The cluster type.
ClusterTypeName	nvarchar	64	Yes	The cluster type name.
ClusterName	nvarchar	255	Yes	The cluster name.
ClusterDescription	nvarchar	255	Yes	The cluster description.
FRU Information Table				
DeviceId*	int	4	No	The device ID.
FRUChassisindex*	int	4	No	The field replaceable unit (FRU) chassis index.
FRUIndex*	int	4	No	The FRU index.
FRUDeviceName	nvarchar	255	Yes	The FRU device name.
FRUManufacturer	nvarchar	255	Yes	The FRU manufacturer name.
FRUSerialNumber	nvarchar	255	Yes	The FRU serial number.
FRUPartNumber	nvarchar	255	Yes	The FRU part number.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
FRURevision	nvarchar	255	Yes	The FRU revision number.
FRUManufacturingDate	date	8	Yes	The FRU manufacturing date.
Printer Supply Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
PrinterSupplyIndex*	int	4	No	The printer supply index.
PrinterSupplyDescription	nvarchar	64	Yes	The printer supply description.
PrinterSupplyLevel	nvarchar	16	Yes	The printer supply level.
PrinterSupplyMaxLevel	int	4	Yes	The maximum level of printer supply.
PrinterSupplyType	nvarchar	64	Yes	The printer supply type.
Printer Input Tray Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
PrinterInputTrayIndex*	int	4	No	The printer input tray index.
PrinterInputName	nvarchar	64	Yes	Name of the printer input.
PrinterInputVendorName	nvarchar	64	Yes	Name of the printer (re)seller.
PrinterInputModel	nvarchar	64	Yes	Name of the input tray model.
PrinterInputDescription	nvarchar	64	Yes	The printer input description.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
PrinterInputMaxCapacity	nvarchar	64	Yes	The maximum capacity of the printer input module.
PrinterInputCurrentCapacity	nvarchar	64	Yes	The current capacity of the printer input module.
PrinterInputMediaType	nvarchar	64	Yes	The media type.
Printer Output Tray Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
PrinterOutputIndex*	int	4	No	The printer output index.
PrinterOutputName	nvarchar	64	Yes	Name of the output unit.
PrinterOutputVendorName	nvarchar	64	Yes	Name of the printer (re)seller.
PrinterOutputModel	nvarchar	64	Yes	Name of the output tray model.
PrinterOutputDescription	nvarchar	64	Yes	The printer output description.
PrinterOutputMaxCapacity	nvarchar	64	Yes	The maximum output capacity of the printer.
Printer Cover Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
PrinterCoverIndex*	int	4	No	The printer cover index.
PrinterCoverDescription	nvarchar	64	Yes	The printer cover description.
PrinterCoverStatus	nvarchar	64	Yes	The printer cover status.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
Tape Drive Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
TapeDriveIndex*	int	4	No	The tape drive index.
TapeDriveVendor	nvarchar	64	Yes	Name of the tape drive vendor.
TapeDriveModel	nvarchar	64	Yes	Name of the tape drive model.
TapeDriveType	nvarchar	64	Yes	The tape drive type.
TapeDriveFirmwareVersion	nvarchar	32	Yes	Firmware version of the tape drive.
TapeDriveSerialNumber	nvarchar	32	Yes	Serial number of the tape drive.
TapeDriveWMN	nvarchar	32	Yes	WMN for the tape drive.
TapeDriveCleaningRequired	nvarchar	32	Yes	Specifies whether the tape drive requires cleaning.
Tape Library Table				
DeviceId*	int	4	No	The Foreign Key to the Device Table.
TapeLibraryIndex*	int	4	No	The tape library index.
TapeLibraryVendor	nvarchar	64	Yes	Name of the tape library vendor.
TapeLibraryModel	nvarchar	64	Yes	Name of the tape library model.
TapeLibraryFirmwareVersion	nvarchar	32	Yes	Firmware version of the tape library.
TapeLibraryDriveCount	int	4	Yes	The number of drives.

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
TapeLibrarySlotCount	int	4	Yes	The number of slots.
TapeLibrarySerialNumber	nvarchar	32	Yes	Serial number of the tape library.
HyperVGuestInfo Table				
DeviceId	int	4	No	The Foreign Key reference to the device table.
GuestGUID	nvarchar	256	No	The unique GUID of the guest/virtual machine.
GuestHealthState	nvarchar	512	Yes	The health state of the guest/virtual system.
GuestState	nvarchar	512	Yes	The state of the guest.
GuestName	nvarchar	512	Yes	The display name of the guest.
HyperVGuestNICInfo Table				
DeviceId	int	4	No	The Foreign Key reference to the device table.
HyperVNICGuestGUID	nvarchar	256	No	The unique GUID of the guest/virtual system.
HyperVMACAddress	nvarchar	50	No	MAC address of the virtual network adapter
HyperVNICName	nvarchar	512	Yes	The name of the virtual network adapter
HyperVNICDescription	nvarchar	1024	Yes	The description of the virtual network adapter

Table 10-3. IT Assistant Database Schema (continued)

Column Name	Data Type	Data Size	Nulls Allowed	Description
HyperVGuestMemoryInfo Table				
DeviceId	int	4	No	The Foreign Key reference to the device table.
GuestGUID	nvarchar	256	No	The unique GUID of the guest/virtual machine.
MemoryBlockSize	int	4	Yes	The block size of the memory in bytes.
NumberOfMemoryBlocks	int	4	Yes	The number of memory blocks

Ensuring a Secure Dell™ OpenManage™ IT Assistant Installation

This section discusses several specific topics useful in implementing a more secure Dell OpenManage IT Assistant installation. IT Assistant leverages HTTPS for secure communications, as well as the Microsoft® Active Directory® for role-based access.

For detailed information on security across the Dell OpenManage platform, see the *Dell OpenManage Installation and Security User's Guide*.

TCP/IP Packet Port Security

A TCP/IP packet communicates a request to a target system. Encoded within this packet is a port number that is associated with a specific application.

IT Assistant is accessed by specifying

`https://<hostname>:<portnumber>`. Using `https` requires the application being used to encrypt the data according to the Secure Socket Layer (SSL) specification so that it is not possible for an observer to pick up and read sensitive information such as passwords by watching packets on the network. User are then authenticated through the IT Assistant login page and their credentials checked against whatever role is mapped in Active Directory or the local operating system. For information on the three roles supported by IT Assistant, see "Role-Based Access Security Management."

NOTE: The IT Assistant user interface communicates with the IT Services Tier over port 2607.

Securing Managed Desktops, Laptops, and Workstations

Securing the Managed System's Operating System

The first step in promoting a secure network environment is to ensure that all managed system operating systems are running the most current service pack and/or any additional critical security hotfixes. To simplify this process, Microsoft has introduced Software Update Services. See the Microsoft website for more details. Perform similar updates for other managed systems' operating systems as well.

Session Time-out

An IT Assistant UI session can be configured to time-out after a defined period of inactivity. To configure the session time-out interval, click **Preferences** on the top IT Assistant navigation bar and choose **Web Server Properties**. You can either disable session time-out altogether, or allow for up to 30 minutes of inactivity.

NOTE: If the data communication channel between the IT Assistant user interface and the Web server is active due to any asynchronous updates such as performance monitoring tasks, discovery of devices, status polling, and so on, the user session will not time-out even if session time-out is enabled.

ASF and the SNMP Protocol

A final security consideration, starting with Dell™ OptiPlex™ GX260 systems, is the support for the Alert Standard Format (ASF) for integrated Network Interface Controller (NIC). ASF issues Platform Event Traps (PET) corresponding to system health and security issues. Since these traps are supported by the SNMP protocol, the managed system NIC must be configured with the IP address and community string of the management station running IT Assistant.

In summary, to successfully and securely manage desktops, laptops, and workstations per the security measures introduced in the paragraphs above, system administrators should adhere to the following best practices:

- Ensure that the operating system is up-to-date with the most recent operating system security patches.
- For ASF-capable desktops, either disable ASF or implement SNMP community names that cannot be easily guessed.

Securing Managed Server Systems

Securing the Managed System's Operating System

As with desktops and workstations, the first step in securing a server is to ensure that it is running with the most current service pack and appropriate critical hot fixes installed. Microsoft Software Update Services, mentioned in the previous section, also applies to Microsoft Windows® 2000 and Windows Server® 2003 and Windows Server 2008 servers. Similar services should be checked for Red Hat® Linux and SUSE® Linux Enterprise Server.

Choosing the Most Secure Managed System Server Protocol

Dell OpenManage Server Administrator, the current Dell server instrumentation software, uses the SNMP and CIM protocols, which can be configured during a custom install.

CIM Monitoring, DCOM, and Windows Authentication

The CIM protocol, which uses DCOM security, leverages Windows challenge/response (user name/password) authentication. In addition, communication with the managed system is established through the domain/user name/password accounts specified in each of the configured IT Assistant discovery ranges. The format for these accounts is

`<domain name>\<user name>` or `localhost\<user name>`.

NOTE: WMI security can be changed with utilities such as `dcomcnfg.exe`, `wmimgmt.msc`, and `wbemctrl`. However, due to the potential for undesired side effects, implementing changes through these methods is not recommended. See the Microsoft website for more information.

NOTE: Even in environments that intend to use only CIM for monitoring, SNMP is typically enabled because Server Administrator only provides error notification using SNMP traps.

Security and the SNMP Protocol

There are several actions that can be taken to better secure environments using the SNMP protocol. Although the following samples refer to Microsoft Windows operating systems, similar steps can be performed for the Red Hat Enterprise Linux and SUSE Linux Enterprise Server operating systems. By default, when SNMP is installed, the community name is set to **public**.

This character string should be treated like a password and similar rules should be used in its selection—a string of adequate length, not easily guessed, and preferably consisting of mixed letters and numbers. In Windows operating systems, the SNMP community name can be configured through the **Security** tab of the SNMP services **Property** dialog box.

As a secondary precaution, SNMP should also be set to **Read Only** to prevent unauthorized configuration and control actions. This can also be enforced by using `snmpsets=no option` when installing Server Administrator. It would still be possible to make those changes through the user interface or Command Line Interface (CLI) of Server Administrator. In addition, it is also possible to configure the SNMP service to accept requests only from a particular server (in this case, the system running IT Assistant). This too can be configured on the Windows **Security** tab referenced previously by selecting the radio button labeled **Accept SNMP packets from these hosts** and then clicking **Add** to enter the IP address or name of the system running IT Assistant. See your operating system documentation for more details.

NOTE: To ensure that all the systems are properly configured, it is recommended that you use tools such as Group Policies in Active Directory to enforce these SNMP settings.

As a final security step, Server Administrator should be configured to deny access to user and possibly power user accounts, thereby limiting access to administrator accounts only. This can be done through the Server Administrator top navigation bar by selecting **Preference** and then unchecking the **User Access** boxes.

NOTE: You can also limit user access using the Server Administrator CLI command `omconfig preferences useraccess enable=admin`.

See the *Dell OpenManage Server Administrator Command Line Interface User's Guide* on the Dell Support website at support.dell.com or on the *Dell Systems Management Tools and Documentation DVD* for more information.

In summary, to successfully and securely manage servers per the security measures introduced here, system administrators should adhere to the following best practices:

- Ensure that the operating system is up-to-date with the most recent operating system security patches.
- Implement SNMP community names that cannot be easily guessed.

- Configure SNMP to be **Read Only** to limit configuration, update, and power control to Server Administrator only.
- Configure SNMP to accept requests only from the IP address of the system running IT Assistant.
- Use tools such as Group Policies in Active Directory to enforce the SNMP settings for all servers to be managed.
- Configure Server Administrator to deny user level access.

Ensuring Database Security When Using IT Assistant

If Microsoft SQL Server® database is not detected when IT Assistant is installed, the process installs a copy of SQL Server 2005 Express Edition SP2, which is set to an authentication mode of trusted or Windows only. However, other applications that may have previously installed MSDE or SQL Server, including previous versions of IT Assistant, frequently chose either an authentication mode of SQL or mixed mode, which allows SQL Server to manage its own user IDs and passwords. In the case of early versions of IT Assistant, the supervisor account password was set to either `null` or `de11`. At a minimum, decrease the exposure to a network break-in by changing these passwords to strings that correspond to the best practices mentioned previously. A better option is to change the database authentication mode to trusted or Windows only.

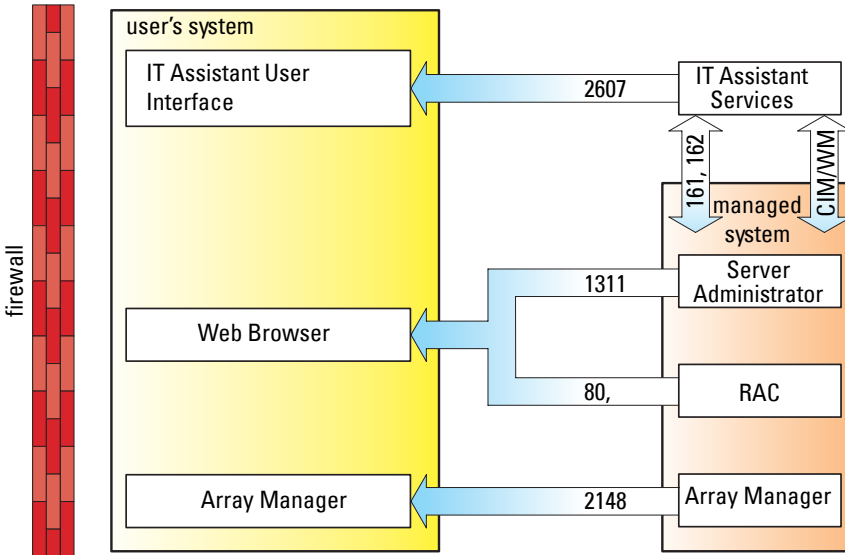

Running IT Assistant Behind a Firewall

Figure 11-1 illustrates a typical installation in which both IT Assistant and the systems being managed reside behind a firewall. The firewall denies passage to traffic on specified ports between the protected network and the rest of the world while still allowing an administrator to communicate freely with both IT Assistant and the managed system.

Typical security for the system running IT Assistant in an environment behind a firewall includes the following:

- Use trusted accounts instead of named or mixed for the database.
- Limit user interface connections to a known system.

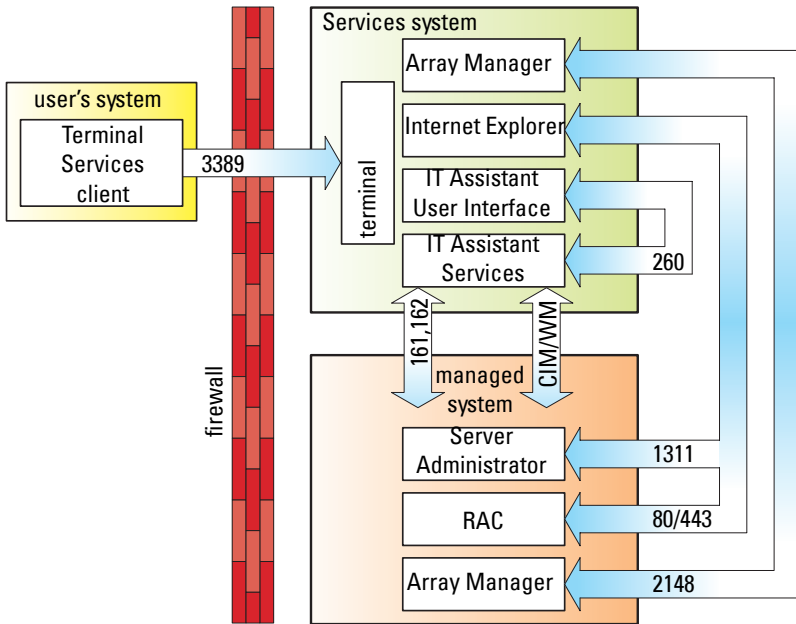

Figure 11-1. Typical Installation Behind a Firewall

Setting Up Additional Security for IT Assistant Access

So far in this section, security has been addressed with respect to the existing TCP/IP connection between IT Assistant and the managed system. In addition to these security precautions, Microsoft Terminal Services, which allows uncharted remote connection only by users with administrator accounts (administrative mode), can also be used to limit user interface connections to a system running IT Assistant user interface and Services. An example of a network which leverages Terminal Services is shown in Figure 11-2.

Figure 11-2. Using Terminal Services for Additional Security

In Figure 11-2, a user may connect to the IT Assistant management station through a locally installed Terminal Services client or Windows XP Remote Desktop connection. This connection requires a valid domain/user ID/password. See Microsoft website for more information.

The additional level of security is derived by setting up restrictions on all managed systems to only accept SNMP traffic from the IP address of the system running the IT Assistant user interface ([UI] the network management station). Terminal Services and Remote Desktop sessions emulate traffic coming directly from the network management station; therefore, access to IT Assistant is restricted only to Terminal Services clients or a local network management station user. Any other connection, such as another remote IT Assistant UI installation, would be unable to effectively communicate with properly configured managed systems in the network since traffic identified as originating from a system other than the network management station would be refused.

 **NOTE:** Terminal Services is an optional component of Microsoft Windows 2000 and Microsoft Windows Server 2003 that can be installed in either admin or application mode.

 **NOTE:** When Terminal Services is installed in administrative mode, up to two users can log in as long as they are members of the administrators group. When Terminal Services is installed in application mode, non-administrator groups can log in and more than two sessions are supported. However, application mode installation has additional licensing implications. When installing IT Assistant on a system running Terminal Services in application mode, the installation must be performed locally and not through a terminal session.

Securing Ports for IT Assistant and Other Supported Dell OpenManage Applications

Securing port 2607 of the IT Assistant Services Tier and ports 1311, 623, 161, and 162 of the managed system can be done using IP Security (IPSec). To list ports that are currently running on your server, you can use the command `netstat -an` from a command prompt to show the status of all ports on your system. The results of this command should indicate that the IT Assistant management station should only accept a connection on port 2607 from the server hosting the IT Assistant UI (which would be connected through Terminal Services). Similarly, the managed systems should be configured to accept connections through ports 1311, 161, and 162 from the management station.

IT Assistant uses ICMP (if the system is configured to use SNMP or CIM) or RMCP (if the system is configured to use IPMI) packets to ping the managed systems during discovery or status polling. Only after IT Assistant receives a ping response from the managed system, it proceeds with discovery using SNMP, CIM, or IPMI, as configured. Configure the firewall to enable incoming, as well as outgoing ICMP packets along with the other ports, as required by the protocol used for discovery.

Features such as software updates, power monitoring, and so on will work only when additional ports are opened. Table 11-1 lists the IT Assistant ports to be configured.

Table 11-1. IT Assistant UDP/TCP Default Ports

Port #	Protocol	Port Type	Version	Maximum Encryption Level	Direction	Usage	Configurable
22	SSH	TCP	7.x	128-bit	In/Out	IT Assistant contextual application launch—SSH client Remote software updates to Server Administrator—for systems supporting Linux operating systems Performance monitoring in Linux systems	Yes
23	Telnet	TCP	7.x	None	In/Out	IT Assistant contextual application launch—Telnet to Linux device	No
25	SMTP	TCP	7.x	None	In/Out	Optional e-mail alert action from IT Assistant	No
68	UDP	UDP	7.x	None	Out	Wake-on-LAN	Yes
80	HTTP	TCP	7.x	None	In/Out	IT Assistant contextual application launch—PowerConnect™ console	No

Table 11-1. IT Assistant UDP/TCP Default Ports (continued)

Port #	Protocol	Port Type	Version	Maximum Encryption Level	Direction	Usage	Configurable
135	RPC	TCP	7.x	None	In/Out	Event reception through CIM from Server Administrator—for systems supporting Windows® operating systems	No
135	RPC	TCP/UDP	7.x	None	In/Out	Remote software update transfer to Server Administrator—for systems supporting Windows operating systems Remote Command Line—for systems supporting Windows operating systems	No
161	SNMP	UDP	7.x	None	In/Out	SNMP query management	No
162	SNMP	UDP	7.x	None	In	Event reception through SNMP	No
162	SNMP	UDP	7.x	None	Out	SNMP trap forwarding action from IT Assistant	No
389	LDAP	TCP	7.x	128-bit	In/Out	Domain authentication for IT Assistant log on	No
1433	Proprietary	TCP	7.x	None	In/Out	Optional remote SQL server access	Yes

Table 11-1. IT Assistant UDP/TCP Default Ports (continued)

Port #	Protocol	Port Type	Version	Maximum Encryption Level	Direction	Usage	Configurable
2606	Proprietary	TCP	7.x	None	In/Out	Network monitoring service communication port	Yes
2607	HTTPS	TCP	7.x	128-bit SSL	In/Out	IT Assistant Web GUI	Yes
3389	RDP	TCP	7.x	128-bit SSL	In/Out	IT Assistant contextual application launch—Remote desktop to Windows terminal services	Yes
443	Proprietary	TCP	8.0	None	In/Out	EMC Storage discovery and inventory	No
623	RMCP	UDP	8.0	None	In/Out	IPMI access through LAN	No
6389	Proprietary	TCP	8.0	None	In/Out	Enables communication between a host system (through NaviCLI/NaviSec CLI or Navisphere Host Agent) and a Navisphere Array Agent on a Storage system.	No

Single Sign-On

The Single Sign-On option on Windows systems enables all logged-in users to bypass the login page and access IT Assistant by clicking the **IT Assistant** icon on the desktop. The desktop icon queries the registry to see if the **Automatic Logon with current username and password** option is enabled in Internet Explorer. If this option is enabled, then Single Sign-On is executed; otherwise, the normal login page will be displayed. NT LAN Manager (NTLM) authentication must not be disabled on the Windows network.

To enable the **Automatic Logon with current username and password** option, perform the following steps in Internet Explorer:

- 1 Click **Internet Options** on the **Tools** menu.
- 2 Click the **Security** tab
- 3 Select the security zone that the IT Assistant system falls within, that is, **Trusted sites** and click **Custom Level**.
- 4 In the **Security Setting** dialog-box, under **User Authentication**, select the **Automatic Logon with current username and password**.
- 5 Click **OK** twice, and restart Internet Explorer.

For local system access, you must have an account on the system with the correct privileges (User, Power User, or Administrator). Other users are authenticated against Microsoft Active Directory.

To launch IT Assistant using Single Sign-on authentication against Microsoft Active Directory, the following parameters must be set:

```
authType=ntlm&application=[ita]
```

For example:

```
https://localhost:2607/?authType=ntlm&application=ita
```

To launch IT Assistant using Single Sign-on authentication against the local system user accounts, the following parameters must be set:

```
authType=ntlm&application=[ita]&locallogin=true
```

For example:

```
https://localhost:2607/?authType=ntlm&application=ita&locallogin=true
```

Role-Based Access Security Management

IT Assistant provides security through role-based access control (RBAC), authentication, and encryption.

Role-Based Access Control

RBAC manages security by determining the operations that can be executed by persons in particular roles. Each user is assigned one or more roles, and each role is assigned one or more user privileges that are permitted to users in that role. With RBAC, security administration corresponds closely to an organization's structure.

User Privileges

IT Assistant grants different access rights based on the user's assigned group privileges. The three user levels are: User, Power User, and Administrator.

Users have read-only access to all IT Assistant information.

Power Users can create tasks for immediate execution. They cannot modify discovery configuration settings, modify alert management settings, or schedule or delete tasks.

Administrators can perform all IT Assistant tasks and functions.

Microsoft Windows Authentication

For supported Windows operating systems, IT Assistant authentication is based on the operating system's user authentication system using Windows NT[®] LAN Manager (NTLM) modules to authenticate. This underlying authentication system allows IT Assistant security to be incorporated in an overall security scheme for your network.

Assigning User Privileges

You do not have to assign user privileges to IT Assistant users before installing IT Assistant.

The following procedures provide step-by-step instructions for creating IT Assistant users and assigning user privileges for Windows operating system:

CAUTION: You should disable guest accounts for supported Microsoft Windows operating systems in order to protect access to your critical system components. See "Disabling Guest and Anonymous Accounts" for instructions.

Creating IT Assistant Users for Supported Windows Operating Systems

NOTE: You must be logged in with Admin privileges to perform these procedures.

Creating Users and Assigning User Privileges

NOTE: For questions about creating users and assigning user group privileges or for more detailed instructions, see your operating system documentation.

- 1 Click the **Start** button, right-click **My Computer**, and point to **Manage**.
- 2 In the console tree, expand **Local Users and Groups**, and then click **Users**.
- 3 Click **Action**, and then click **New User**.
- 4 Type the appropriate information in the dialog box, select or clear the appropriate check boxes, and then click **Create**.

CAUTION: You must assign a password to every user account that can access IT Assistant to protect access to your critical system components. Additionally, users who do not have an assigned password cannot log in to IT Assistant on a system running Windows Server 2003 due to operating system constraints.

NOTE: Do not use double or single quotes in passwords.

- 5 In the console tree, under **Local Users and Groups**, click **Groups**.
- 6 Click the group to which you want to add the new user: **Users**, **Power Users**, or **Administrators**.
- 7 Click **Action**, and then click **Properties**.
- 8 Click **Add**.

- 9 Type the user name that you are adding and click **Check Names** to validate.
- 10 Click **OK**.

New users can log in to IT Assistant with the user privileges for their assigned group.

Adding Users to a Domain

NOTE: For questions about creating users and assigning user group privileges or for more detailed instructions, see your operating system documentation.

NOTE: You must have Active Directory installed on your system to perform the following procedures.

- 1 Click the **Start** button, and then point to **Control Panel**→**Administrative Tools**→**Active Directory Users and Computers**.
- 2 In the console tree, right-click **Users** or right-click the container in which you want to add the new user, and then point to **New**→**User**.
- 3 Type the appropriate user name information in the dialog box, and then click **Next**.

CAUTION: You must assign a password to every user account that can access IT Assistant to protect access to your critical system components. Additionally, users who do not have an assigned password cannot log into IT Assistant on a system running Windows Server 2003 due to operating system constraints.

NOTE: Do not use double or single quotes in passwords.

- 4 Click **Next**, and then click **Finish**.
- 5 Double-click the icon representing the user you just created.
- 6 Click the **Member of** tab.
- 7 Click **Add**.
- 8 Select the appropriate group and click **Add**.
- 9 Click **OK**, and then click **OK** again.

New users can log in to IT Assistant with the user privileges for their assigned group and domain.

Disabling Guest and Anonymous Accounts

NOTE: You must be logged in with Administrator privileges to perform this procedure.

- 1 If your system is running Windows Server 2003, click the **Start** button, right-click **My Computer**, and point to **Manage**. If your system is running Windows 2000, right-click **My Computer** and point to **Manage**.
- 2 In the console tree, expand **Local Users and Groups** and click **Users**.
- 3 Click the **Guest** or **IUSR_ *system name*** user account.
- 4 Click **Action** and point to **Properties**.
- 5 Select **Account is disabled** and click **OK**.

A red circle with an X appears over the user name. The account is disabled.

Frequently Asked Questions

Top IT Assistant Questions

The following table lists frequently asked questions and answers.

Question	Answer
What User Datagram Protocol (UDP)/Transmission Control Protocol (TCP) ports does IT Assistant use?	See "IT Assistant UDP/TCP Default Ports" for more information.
I just did a system update; why don't I see the updated version in the IT Assistant inventory?	All the data that IT Assistant displays in the system list is stored in the data repository, which is refreshed during each inventory cycle. If you perform an update, IT Assistant reports that change after the next inventory cycle. To refresh the inventory of the device before the next scheduled inventory cycle, right-click the device with the outdated version in the Device Tree view and click Refresh Inventory . NOTE: It may take several minutes for the inventory to display the updated version, so it is recommended that you wait 5 - 10 minutes before requesting an inventory of the device.
I just shut down a system. Why does IT Assistant still show it as awake?	IT Assistant updates a system's up/down status only during a status poll of the system, during a discovery of the system, or when IT Assistant receives an event from the system.

Question	Answer
Why can't I see a status update for a device on the IT Assistant user interface (UI)?	<p>If IT Assistant detects that the global status of a device has NOT changed on a scheduled status poll, then it will not send a message to the UI. Also, IT Assistant will not send a message to the UI when it checks the status after an incoming event for that device. This behavior is to optimally use resources and to increase the processing speed of the other messages that are sent to the user.</p> <p>If you are inspecting the device summary or device details at that very moment, the information about the last status time or the individual agent status will not be automatically refreshed. Refresh the view or click another device to automatically load the latest information from the database.</p>
How do I know when IT Assistant is finished discovering systems?	<p>IT Assistant provides discovery cycle progress information. In the IT Assistant UI, go to Discovery and Monitoring→Logs. See also "Discovery and Monitoring Logs—Resolving Discovery Issues" in the <i>Dell OpenManage IT Assistant Online Help</i>.</p>
I received a message stating that IT Assistant can't communicate with the remote device. What caused this problem?	<p>IT Assistant was unable to connect to the remote agent or device. Use the Troubleshooting Tool to resolve the issue by running Ping, CIM, and SNMP Connectivity tests and the Name Resolution test. In the IT Assistant UI, go to Tools→Troubleshooting Tool. See "Troubleshooting Tools—Finding and Resolving Discovery Issues" in the <i>Dell OpenManage IT Assistant Online Help</i>.</p>
Why do I get an error message when launching applications from the right-click Device Tree ?	<p>Certain applications (for example, Dell OpenManage Server Administrator Storage Management Services and Digital KVM Console) must be installed on the system running the IT Assistant UI before they can be launched from IT Assistant.</p>

Question	Answer
Why do I get a Java out of memory exception?	<p>When managing an environment with more than 2000 devices, increase the amount of memory allocated to the Java Runtime Environment (JRE) heap.</p> <p>NOTE: The memory should be increased on the system from where you access the IT Assistant Management Station.</p> <p>To do so, close the IT Assistant browser session and go to the Java Control Panel. The panel is located under the Microsoft® Windows® Control Panel or the ControlPanel executable in the bin folder of the JRE installation on the Linux system.</p> <p>Click the Java tab and in the Java Applet Runtime section, click View... Click in the Java Runtime Parameters area and type:</p> <pre>-Xmx256M</pre>
Why do I get a host name mismatch warning when I try to access the IT Assistant user interface?	<p>This warning appears if the web address that you use to connect to IT Assistant contains a different host name than the one that was used to install IT Assistant. For example, if you installed IT Assistant using the host name sysadmin3 with an IP address of 133.143.157.30, the warning appears if you log in to IT Assistant using the IP address. However, if you log in to the remote device using the system name, sysadmin3, the warning does not appear.</p>
Why don't I get a Login prompt when I login to IT Assistant from a desktop?	<p>IT Assistant uses the operating-system credentials of the currently logged-in user and automatically logs you in to IT Assistant. See the section about Single Sign-On in the <i>Dell IT Assistant Online Help</i> for more information.</p>

Question	Answer
<p>Why does the Windows NT[®] LAN Manager (NTLM) authentication fail when I attempt to log in to IT Assistant?</p>	<p>Ensure that your Single Sign-On is enabled in your Internet Explorer browser.</p> <p>To enable Single Sign-On, launch Internet Explorer. Click Tools→Internet Options→Security tab. Select Trusted sites. (The IT Assistant system is covered within this security zone.)</p> <p>Click Custom Level. Scroll down to User Authentication and select Automatic logon with current username and password.</p>
<p>How do I disable Java caching?</p>	<p>To disable Java caching on a Windows system, go to the Windows Control Panel, click the Java icon to display the Java Control Panel, and ensure that the Enable Caching check box in the Java Applet Cache Viewer dialog box is not selected.</p> <p>To disable caching on a Linux system, run the ControlPanel executable in the bin folder of the JRE installation on the Linux system, and ensure that the Enable Caching check box in the Java Applet Cache Viewer dialog box is not selected.</p>
<p>What precautions do I need to take when I revert to an older version of IT Assistant?</p>	<p>If you have Java applet caching enabled on any of the systems where you have accessed the IT Assistant UI, then delete the jar files used by IT Assistant, from the cache of each of those systems. Go to Java Control Panel and click Settings under Temporary Internet Files. The panel is located under Microsoft Windows Control Panel or Linux ControlPanel in the bin folder. Click View Applets. Select the cached files and click Delete.</p> <p>NOTE: Failure to delete the Java applet cache may result in inconsistent behavior of the older version of IT Assistant.</p>

Question	Answer
<p>Why did the server status icon on IT Assistant not change when the hard disk was removed from a system being managed through Intelligent Platform Management Interface (IPMI)?</p>	<p>The Baseboard Management Controller (BMC) must be configured to send a particular hard disk related trap. Configure it manually, by using IPMI or any other related tool, to send the specific Platform Event Filter (PEF) trap.</p> <p>BMC will send the trap after it is configured. And on receiving the trap, IT Assistant will display it with unknown severity and degrade the system status to critical.</p>

Software Updates

Question	Answer
<p>I get a request-timeout when I try to navigate or perform any action on the IT Assistant Software Updates module. What is the workaround?</p>	<p>If you face request timeout error in software update module check the Java console log for any out of memory messages. If you find any out of memory error, you must set the Java Runtime Environment (JRE) heap size to a higher value max size being 512 MB. See "Setting the Java Runtime Parameter in Supported Windows Environment" and "Setting the Java Runtime Parameter in Supported Linux Environment" section in <i>IT Assistant User's Guide</i>, for detailed instructions.</p>

Scope and Capabilities of IT Assistant

These frequently asked questions cover the general capabilities of IT Assistant, optimizing the UI environment, and discovery configuration.

Question	Answer
Why does IT Assistant show that my discovered system is down during a status poll when it is up?	For networks where Dynamic Host Configuration Protocol (DHCP) is prevalent, IT Assistant may show a system as down when it is actually up due to another system obtaining its IP Address. During a discovery round, when IT Assistant discovers a particular managed system, it looks for other systems in its database with the same IP address as the one under discovery. If any other system shares that address, its IP address is marked as invalid. When the system whose IP address was marked as invalid is eventually rediscovered, its IP address entries are updated and marked as valid again. Until these IP address entries are updated, any status poll that runs will mark that system as down due to not having any valid IP address entries to check against.
Why doesn't IT Assistant show my system as up after I changed the name?	When IT Assistant discovers a particular managed system through its IP address during a discovery round, IT Assistant attempts to resolve the managed system's address to a name, either through instrumentation or DNS. If DNS is the preferred name resolution method and the name of the managed system under discovery has recently changed, it may take several discovery rounds for the name to update in IT Assistant due to Windows caching DNS entries on the local system. For more information on how to clear the cache faster, see the Microsoft documentation for your operating system.
Why can't I discover my desktop system?	Use the IT Assistant Troubleshooting Tool to help resolve this issue. In the UI, go to Tools → Troubleshooting Tool . See "Troubleshooting Tool—Finding and Resolving Discovery Issues" in the <i>Dell OpenManage IT Assistant Online Help</i> .

Question	Answer
Does IT Assistant manage only Dell systems?	Yes. IT Assistant only manages Dell systems that have Dell instrumentation installed and running. However, starting with IT Assistant 8.0, devices that are configured with IPMI 1.5 or later can also be discovered with IT Assistant.
Do I have to install IT Assistant on a Dell system?	<p>No. Although IT Assistant is tested for installation on Dell systems, the IT Assistant UI is designed to operate on a system running the supported operating systems. Therefore, IT Assistant should work without incident on non-Dell systems that run these operating systems and that meet the minimum hardware specifications.</p> <p>See "Planning Your Dell™ OpenManage™ IT Assistant Installation" for more details.</p> <p>However, Dell does not provide warranty or free support for non-Dell systems.</p>
How many users can run IT Assistant at the same time?	Multiple users can run IT Assistant to connect to IT Assistant services. The number of users is limited by the resources available on the management station.
Can I install IT Assistant on top of Client Administrator?	Client Administrator is not currently a supported configuration on the same system as IT Assistant.
How many systems can I manage?	<p>IT Assistant is designed and tested to <i>manage</i> up to several thousand systems on a suitably configured system.</p> <p>NOTE: CPU-intensive tasks like the performance monitoring can, however, be performed only on a hundred systems and software deployment can be attempted only on about 20 systems at a time.</p>
Can I use IT Assistant over the Internet?	IT Assistant is a local area network (LAN)-oriented tool for monitoring and managing systems in an IP network. You can monitor and manage systems over the Internet using IT Assistant, but Dell does not recommend it unless you have a way of securing your data, which you must provide. IT Assistant does provide security suitable for use over a corporate intranet.

IT Assistant User Interface

Question	Answer
I know that the IT Assistant UI is set to automatically log me out after 30 minutes of being idle. So, why am I able to continue to change menus and views after being logged into IT Assistant after 30 minutes?	IT Assistant caches some data and validates the time-out only when gathering new data is required.
Why don't I see all the alerts on the Alerts tab?	The IT Assistant UI displays alerts in the Alert Logs view. You can specify that you want to view all alerts by selecting All Alerts in the Filter drop-down menu. See "Alert Logs — Working With Alerts" for additional information.
I cannot log into IT Assistant. Even before logging in, I get the session expiry message.	<p>You will receive this message if you have enabled IP version 6 on your operating system.</p> <p>NOTE: By default, IP version 6 is enabled on Windows Vista® and Windows Server® 2008.</p> <p>To rectify this issue in Windows, perform the following steps:</p> <ol style="list-style-type: none">1 Click the Start button. Point to Settings→Control Panel→Java.2 In the Java tab, click View in the Java Applet Runtime Settings section.3 Pass this parameter to Java Runtime Parameters: <code>-Djava.net.preferIPv6Addresses=true</code> <p>To rectify this issue in Linux, perform the following steps:</p> <ol style="list-style-type: none">1 Navigate to the Java home directory. The default path is /usr/java/jre1.6.0_03/bin/.2 Run <code>./ControlPanel</code>.3 In the Java tab, click View in the Java Applet Runtime Settings section.4 Pass this parameter to Java Runtime Parameters: <code>-Djava.net.preferIPv6Addresses=true</code>

Question	Answer
Why don't I see all the alerts on the Alerts tab?	The IT Assistant UI displays alerts in the Alert Logs view. You can specify that you want to view all alerts by selecting All Alerts in the Filter drop-down menu. See "Alert Logs—Working With Alerts" in the <i>Dell OpenManage IT Assistant Online Help</i> .
Why is the power state for a system that I shut down not shown as shut down in IT Assistant?	The power state is dependent on the most recent status poll, which is dependent on the status polling interval. The power state will be updated when the next status poll occurs.
What do I do if a system does not wake up?	To wake up a device, IT Assistant uses the MAC addresses and subnet mask that were discovered for that device. If NIC teaming is configured on the device, only one MAC is advertised by the operating system. For Wake-on-LAN (WOL) to work, WOL must be enabled for all NICs in that team. For a WOL packet to reach its intended destination, directed broadcasting (also known as subnet broadcasting) must be enabled on the intermediate routers. Directed broadcasting is typically disabled on the routers, so you must configure this feature on the routers to enable it.
Why don't I see new alerts displayed in the Alert Logs view?	To see new alerts, click Show New Alerts in the Alert Logs window.
Why don't I see a detailed description of my network adapter manufacturer on the IT Assistant Device Details Summary page?	Due to the implementation of MIB2 on Red Hat Linux, the Network section of the IT Assistant Device Details Summary page does not have a detailed description of the network adapter manufacturer. For example, "eth0" or a similar string appears under Product Name .
Why is the IP address on the NIC information page displayed in a wrong row.	This issue has been fixed by a Red Hat patch to the net-snmp package.

Question	Answer
When I export my report to CSV format, Excel doesn't display the report in a correct view. How can I fix this problem?	The reporting system generates all of its output in Unicode format (www.unicode.org). To open the CSV reports, start Microsoft Excel and run the File Open command, which displays the Import Wizard. Select the comma delimited option to open the report with the data in the correct columns.
Why do I get a registry error when I attempt to open the IT Assistant UI?	A registry editor error occurs while opening the IT Assistant UI on a system with less than the required space. The IT Assistant client requires 25 MB of available hard-drive space.

Alert Management

Question	Answer
Why is the Alert Log for a managed system empty when I receive alerts and see them displayed in the Alert Logs view?	<p>When IT Assistant receives an event with an IP address stored in the event, IT Assistant resolves the event to a name accordingly by using its database of discovered systems (if instrumentation name resolution is preferred) or by using DNS (if DNS resolution is preferred). SNMP traps and CIM indications will always have an IP address to resolve from.</p> <p>If the IP address is already resolved to a name, IT Assistant does not attempt to resolve it again because this action could lead to differences in the name stored in the event versus the name under which IT Assistant discovered the system and sent the event, if instrumentation name resolution is preferred in IT Assistant. This issue may result in event actions not being performed due to the selection of system names in the Event Filters creation dialog that do not match the name contained in the event.</p> <p>In addition, all of the events received from that system may not be displayed in that system's Alerts view in IT Assistant. To avoid this behavior, it is recommended to choose DNS resolution as the preferred resolution in IT Assistant if DNS or WINS exist in the network environment in which IT Assistant is performing discovery.</p>

IT Assistant Services

Question	Answer
How does IT Assistant resolve the names of discovered systems?	See "Name Resolution" in the <i>Dell OpenManage IT Assistant Online Help</i> .
Why am I experiencing a slow logon process after rebooting my system? Are IT Assistant Services causing these performance issues?	Ensure that your system meets the minimum system requirements as described in the "Planning Your Dell™ OpenManage™ IT Assistant Installation."
Why does the SQL server process appear to consume a large amount of the management station's memory when viewing memory consumption from the Task Manager?	The Task Manager may not be reporting the actual amount of memory that is being consumed. To better gauge the SQL server's memory usage, go to www.microsoft.com and search for the knowledge base article KB321363, which describes how SQL Server consumes and releases memory.
Why do command line tasks fail when the log on credentials of IT Assistant services are changed?	If the Log On account of DSM IT Assistant Connection Service or DSM IT Assistant Network Monitor services are changed, the following user rights must be assigned for the Log On account: <ul style="list-style-type: none">• Adjust memory quota for a process• Replace a process level token For more information, see the Dell <i>OpenManage IT Assistant User's Guide</i> on the Dell support site at support.dell.com .

IT Assistant Discovery

Question	Answer
Why did the server status icon on IT Assistant not change when the hard disk was removed from a system being managed through Intelligent Platform Management Interface (IPMI)?	<p>The Baseboard Management Controller (BMC) must be configured to send a particular hard disk related trap. Configure it manually, by using IPMI or any other related tool, to send the Platform Event Filter (PEF) trap.</p> <p>After configuration, BMC will send the trap. And on receiving the trap, IT Assistant will display it with unknown severity and degrade the system status to critical.</p>
Why did the iDRACs on my system get listed under servers on the IT Assistant user interface (UI)?	<p>On Dell <i>xx0x</i> modular systems, iDRAC and BMC functionality is integrated. Therefore, during IT Assistant discovery, the BMC information is displayed under servers.</p> <p>On Dell <i>xx1x</i> systems, if the out-of-band discovery is done through IPMI, the information is displayed under servers whereas if discovery is done through SNMP, the device information is displayed under the RAC group.</p>
I have discovered a system that supports CIM indications. In the past I was able to receive indications from the system, but am now no longer receiving them through IT Assistant. I am seeing the indications locally on the managed system.	<p>In order for CIM indications to be sent to the management station, the management station must register with the managed system. The registration is broken every time the management station or the managed system is restarted.</p> <p>When IT Assistant discovers a system, it registers that system with the CIM indication provider. If the managed system is restarted, IT Assistant does not reregister it until the next discovery cycle. To force a reregistration with the indication provider, force discovery of the managed system in IT Assistant by right-clicking the system in the Device Tree view and clicking Refresh Status.</p>

Question	Answer
How do I qualify CIM user names?	<p>CIM is enabled/disabled only by discovery range and requires each CIM user to be qualified with a domain or local host if no trusted domain is configured.</p> <p>It is critical to provide this qualification when configuring CIM through a discovery range (for example: <domain>\<user name> or localhost\<user name>) to authenticate and use the CIM protocol.</p> <p>To upgrade from IT Assistant version 6.x to version 7.x, qualify your user name correctly by editing the discovery ranges.</p>
How does the IT Assistant UI determine the times that it displays?	<p>Dates and times are reported according to the time zone configured on the management station.</p>
Why can't IT Assistant discover systems on the configured discovery range?	<p>Use the IT Assistant Troubleshooting Tool to help resolve this issue. In the UI, go to Tools→Troubleshooting Tool. See also "Troubleshooting Tool—Finding and Resolving Discovery Issues" in the <i>Dell OpenManage IT Assistant Online Help</i>.</p>
Why does IT Assistant report some attribute values as blank or empty values?	<p>IT Assistant will show blank or empty data values for those attributes which are queried from, but are not returned by, the agent. These blank fields may indicate that the feature is not supported by the device or reported by the device's agent(s), or that the device's current configuration disables the feature. In addition, blank values can also indicate empty fields that are returned by the agent.</p>
What ports do the IT Assistant services use to communicate? How can I change the port assignments?	<p>Port 2607 enables the IT Assistant UI to communicate with the IT Assistant Connection Service. Port 2606 enables the IT Assistant Connection Service to communicate with the IT Assistant Network Monitoring Service. You can change these port assignments when installing IT Assistant using customized settings. If you do not change the port assignments during customized installation, you must use the registry to reassign port numbers. See also "Ports Used by IT Assistant and Associated Agent Application" in the <i>Dell OpenManage Security and Installation Guide</i>.</p>

Question	Answer
<p>If I have multiple protocols bound to one network card, IT Assistant displays multiple entries for that network card under Network Data on the Summary tab of the systems window. This leads me to believe that I have more network cards installed on the system than are actually there. Why does IT Assistant display these multiple entries?</p>	<p>This situation is most likely to occur when using pure SNMP to communicate with the managed system. Most of the summary information shown is taken out of tables across the appropriate MIB file. In this case, network information is taken from the MIB2 Interfaces table. Binding multiple protocols to a single network card adds a row to the MIB file interfaces table for each protocol. IT Assistant then pulls all rows from this table. Because there is only one physical address per network card, you can use the physical media access control (MAC) address to ascertain how many network cards are actually installed.</p>
<p>Why does DCOM generate event log messages when it fails to establish communication with managed systems?</p>	<p>This problem is a known issue with the Microsoft WBEM implementation. DCOM logs an error every time a remote connection fails. If CIM is enabled, IT Assistant tries to connect to every CIM agent that resides at an address that can be contacted using the ping command. If the user name and password do not work or if there is no CIM agent, DCOM adds an error message to the event log.</p>
<p>Why are IT Assistant services unstable on my system running Windows 2000?</p>	<p>IT Assistant services may exhibit instability on Windows 2000 SP3. See the Microsoft Knowledge Base Article 813648: "Random Access Violations When Multithreaded Applications Call the setlocale Function."</p>
<p>Why is there a delay in the display of discovery feedback in the Discovery and Monitoring Logs window?</p>	<p>If a discovery task is already running and another discovery range is entered, the new range may not immediately show in the Discovery and Monitoring Logs window. This behavior is also dependent on the number of systems that are being discovered.</p>

Question	Answer
Why does discovery hang on my CIM-enabled IT Assistant installation?	If IT Assistant has CIM enabled and is discovering managed systems with Dell OpenManage Server Agent version 4.4 or earlier that are configured for CIM, discovery may hang. You must upgrade the instrumentation for these systems. In the IT Assistant UI, go to Discovery and Monitoring → Discovery Configuration to resolve this issue. See "Discovery Configuration—Configuring IT Assistant to Discover New Devices" in the <i>Dell OpenManage IT Assistant Online Help</i> .
A memory leak has occurred in the IT Assistant Network Monitoring Service. What caused the problem?	If IT Assistant is installed on a device that is running Windows 2000 SP4, a known issue with the Microsoft WMI API results in a memory leak in the IT Assistant Network Monitoring Service when using the CIM protocol. The leak occurs when the remote device is passed incorrect authentication credentials during a discovery cycle or status poll.
Why can't I discover my ERA/MC device?	Before you can discover your ERA/MC you must have it properly configured. (For configuration information, see your ERA/MC documentation.) After you configure your ERA/MC, ensure that the IP address assigned to the device is included in the IT Assistant discovery range.
Why does the device status display Unknown when I attempt to discover it using the SNMP and CIM protocol combinations?	IT Assistant discovers various ranges asynchronously and one range will be overwritten by the other. Provide consistent credentials for discovering the device. For example, if you have enabled SNMP and CIM with particular credentials for the first range, enter the same SNMP and CIM credentials for the second range for the device to be discovered.
I have discovered a device by specifying the IP address in the range. The system rebooted and received a new IP address. Though the IP address is in the range, why is the Status displaying the system as down?	IT Assistant uses the IP address supplied only during discovery for all operations, such as, Status , Troubleshooting , Tasks , and so on. If the IP addresses used for discovery is unavailable or changed (due to Dynamic Host Configuration Protocol re-allocation), the Status will display the system as down. Discover the device again from the range that contains the updated IP address for the device.

Performance Monitoring

Question	Answer
I have scheduled my performance monitoring tasks with an interval of 2 minutes. The task, however, does not fetch all samples at equal intervals.	The delay in fetching samples can be caused due to various reasons, such as, low memory or high processor utilization on the IT Assistant management station.
I am unable to see the information about the memory attribute in Execution Results pane of the task.	If an attribute is not supported on the remote device (managed system), information about the attribute will not display in the Execution Results pane of the task and the Performance tab on the Device view. Also, this attribute is not considered for status calculations.
I stopped the Windows Management Interface (WMI) service. When I restart this service, why do I see the "Unable to connect to device using CIM/SSH" message?	This is a normal situation. Data collection will start after fifteen to thirty minutes, as the connections are released once every fifteen minutes.

IPMI Discovery Support

Question	Answer
I have given my system IP address and credentials for Intelligent Platform Management Interface (IPMI) discovery, but the discovery still fails.	<p>Provide the managed system's BMC IP address and the BMC credentials (user name, password, and KG Key)</p> <p>NOTE: KG Key is available only on Dell™ x9xx and later systems.</p>
I have configured BMC on my managed systems. However, I am still unable to discover these systems.	<p>Ensure that you have a LAN connection to the BMC.</p>
I am using the IPMI discovery feature to discover the Dell x9xx systems. However, I am unable to get the software and hardware inventory of these systems.	<p>IPMI discovery feature communicates with the BMC of the managed systems to get the status of the systems. The BMC provides data such as:</p> <ul style="list-style-type: none">• power and chassis status• hardware log• service tag• host name• operating system• system type <p>BMC does not provide any other information about the managed systems.</p> <p>NOTE: If you want more information about your managed systems, you can use the Software Deployment feature of IT Assistant to deploy Dell agent (Server Administrator) on your managed systems. For more information, see "Using Server Software Deployment."</p>

Miscellaneous

Question	Answer
I want to run another application on the port on which the IT Assistant Netmon Service is installed. Do I have to uninstall and reinstall IT Assistant?	The port number for the DSM IT Assistant Network Monitor service is defined using the Microsoft Windows registry key <code>HKLM\Dell Computer Corporation\Dell OpenManage IT Assistant\Network Monitoring Service\PortNumber</code> . Change the value of this key and restart the DSM IT Assistant Connection Service and the DSM IT Assistant Network Monitor services.
What are the names of the various IT Assistant services?	The names of the IT Assistant services are: <ul style="list-style-type: none">• DSM IT Assistant Network Monitor• DSM IT Assistant Connection Service
I have redundant entries for Dell™ PowerConnect™ switches—one under the Unknown category and the other under Network Devices as Switch Object .	When IT Assistant discovers the PowerConnect switch with its IP address configured, but SNMP not configured, it classifies this object under the Unknown group as an Unknown device. However, when you configure SNMP on the switch, and click Refresh Inventory , IT Assistant reclassifies the switch as a Switch Object under the Network Devices category, but does not delete the Unknown entry. You must delete the redundant Unknown entry manually.
The RAC Console Application Launch is not available for my systems.	If you have discovered your systems using CIM instead of SNMP, then the RAC Console Application Launch will not be available.
I am unable to receive traps from the Dell OpenManage Server Administrator Storage Management Service from my Linux systems.	Ensure that the <code>snmpd.conf</code> file is <i>not</i> set to send SNMP traps in version 2 format. IT Assistant does not recognize the SNMP version 2 format. Ensure that the trap format is set to <code>trapsink hostname <community string></code> . NOTE: <code>trapsink</code> sends SNMP version 1 traps <code>trap2sink</code> sends SNMP version 2 traps.

Question	Answer
I am not able to receive Array Manager and Storage Management Service events.	Storage Management Services and Array Manager do not support CIM. Therefore, IT Assistant does not receive events from storage devices using CIM. To receive storage events, configure Array Manager and Storage Management Service to send SNMP-based events.
I am unable to see the latest data on the Tasks tree.	If you are seeing outdated data or if the data is missing, press F5 to manually refresh the IT Assistant user interface.
I am unable to receive VMware® ESX Server® traps.	Check the management station and the VMware ESX Server settings. Management station settings: <ul style="list-style-type: none"> • Unblock firewall for the SNMP service. • Ensure that the community name is set correctly. • Ensure that the Accept SNMP packet from any host or Accept SNMP packet from this host is set with the VMware ESX Server. • Ensure that the SNMP and the SNMP trap services are running. VMware ESX Server settings: <ul style="list-style-type: none"> • Unblock firewall for the SNMP service. • Ensure <code>/etc/snmp/snmpd.conf</code> is configured correctly on the host. <pre>trapcommunity <management console trap community name> trapsink <Mgmt console IP> <Mgmt console community name></pre> <ul style="list-style-type: none"> • Ensure that the path to the VMware SNMP agent is set and is valid on the host. <pre>dlmod SNMPEsx /usr/lib/vmware/snmp/libSNMPEsx.so</pre> <ul style="list-style-type: none"> • Ensure that the VMware MIBs are in the expected path on the host, or copy the MIB from cp

Question	Answer
<p>I am unable to receive VMware® ESX Server® traps. (continued)</p>	<p><code>/usr/lib/vmware/snmp/mibs/*.mib</code> to <code>/usr/share/snmp/mibs/</code></p> <ul style="list-style-type: none"> • Ensure that the SNMP and the VMware services are running correctly by using the following commands: <pre>service snmpd status service snmpd start service mgmt-vmware status service mgmt-vmware start</pre> • Run the following command to start the hosted service of VMware and to view the list of virtual machines that are registered with the host device: <pre>vmware-cmd -l</pre>

Configuring Protocols to Send Information to Dell™ OpenManage™ IT Assistant

Dell OpenManage IT Assistant uses three systems management protocols — Simple Network Management Protocol (SNMP), Common Information Model (CIM), and Intelligent Platform Management Interface (IPMI) over LAN. This appendix provides configuration information for these protocols. SNMP and CIM allow IT Assistant to get status for the Dell™ systems using server agents or Dell OpenManage Client Instrumentation (OMCI). IPMI, however, does not require agents to retrieve the status of the devices. It communicates with the baseboard management controller (BMC) for information about devices.

This appendix includes procedures for configuring the systems management protocols that support the discovery, status, and trap information. The following table summarizes the availability of supported operating systems and corresponding systems management protocols for systems that can be managed by IT Assistant.

NOTE: The choice of protocols that you specify for discovering and managing the devices can result in varying levels of manageability of the devices on your network. For example, if you choose to manage devices on your network using only the CIM protocol, the devices that have only SNMP agent (for example, DRAC) are classified under **Unknown**. Consequently, you may not get the application launch functionality (example RAC console) for these devices. To avoid such issues, make a careful choice of the protocols, depending on the devices (and protocols supported by agents running on those devices) that you will manage.

Table A-1. Supported Operating Systems and Systems Management Protocols on Managed Systems

Operating System	SNMP	CIM
Microsoft® Windows® operating system	Available from the operating system installation media.	Available from the operating system installation media
Red Hat® Linux operating system	You must install the SNMP package provided with the operating system.	Unavailable
SUSE® Linux Enterprise Server operating system	You must install the SNMP package provided with the operating system.	Unavailable
VMware® ESX Server®	Installed by default during operating system installation	Unavailable

 **NOTE:** IPMI over LAN is available by default on all Dell 8 and later systems that have the baseboard management controller (BMC).

Configuring the SNMP Service

In order for IT Assistant to install and function properly, it must be installed on a supported Microsoft operating system that has the SNMP service installed and running. Unless it has been modified after installation, the Microsoft operating system SNMP service should require no additional configuration. Although the SNMP service on IT Assistant system does not require special configuration, the SNMP service on the systems that it will be managing does. Furthermore, whereas IT Assistant can be installed only on supported Microsoft operating systems, it can manage systems that are running supported Microsoft, SUSE® Linux Enterprise Server, and Red Hat Enterprise Linux operating systems. This section explains how to configure SNMP on these managed systems.

Each of the managed systems that use the SNMP protocol to communicate with IT Assistant must have read/write and read-only community names assigned. If you want IT Assistant to be able to receive traps from these managed systems, you must also configure an SNMP trap destination, defined either by host name or by IP address.

 **NOTE:** In a mixed IPv4 and IPv6 network, post SNMP discovery IT Assistant displays only the IPv4 addresses.

SNMP Community Names in IT Assistant and Server Administrator

For IT Assistant to successfully read information, modify information, and perform actions on a system running Dell OpenManage Server Administrator (the Dell recommended server agent) and/or other supported agents, the community names used by IT Assistant must match the corresponding community read-only (Get) and read/write (Set) community names on the managed system. Also, for IT Assistant to receive traps (asynchronous event notifications) from a system running Server Administrator, the system must be configured to send traps to the system running IT Assistant. For more information, see "Configuring SNMP for System Manageability."

Community Names Must Be Secure

There are operating system default names for both Get and Set community names. For security reasons, these names should be changed. When selecting community names for your network, use the following guidelines:

- Change both the Get and Set names to passwords that are hard to guess.
- Avoid using strings such as your company's name or phone number or any well known personal information about yourself.
- Use an alphanumeric string that includes both letters and numbers, mixing uppercase and lowercase letters; community names are case-sensitive.
- Use strings that are at least six characters long.

Configuring the SNMP Service on a System Running a Supported Windows Operating System

For information on installing SNMP, see "Installing SNMP on the IT Assistant System".

Configuring the SNMP Service on an IT Assistant Management Station

To configure the Windows SNMP Service on the management station, perform the following steps:

- 1** Right-click the My Computer icon on the desktop and select **Manage**. The Computer Management window appears.
- 2** Expand the Services and Applications tree.

- 3 Click **Services**. The services list is displayed in the right pane.
- 4 Locate and double-click **SNMP Service**. The **SNMP Service** properties window is displayed.
- 5 Select the **Security** tab and click **Add** under **Accepted community names**. The **SNMP Service Configuration** window appears.
- 6 Select **READ ONLY** in the **Community rights** drop-down menu and type a case-sensitive string in the **Community name** field.
- 7 Click **Add**.
- 8 Select **Accept SNMP packets from these hosts**, and click **Add** again.
- 9 In the **SNMP Service Configuration** dialog box type `localhost` or the IP address of the management station in **Host name, IP or IPX address**.
- 10 Click **Add**.
- 11 Click the **Traps** tab. Enter a case-sensitive string in the **Community name** field and click **Add to list**.
 **NOTE:** You may enter the same string that you entered in step 6.
- 12 Click **Add** under the **Trap destinations** field and type `localhost` or the IP address of the management station in **Host name, IP or IPX address** and click **Add**.
- 13 Click **OK**.
- 14 Right-click **SNMP Service** and select **Restart**.
- 15 Select **SNMP Trap Service** and ensure that the status is displayed as **Started** and the **Startup Type** is **Automatic**.

Configuring the SNMP Service on an IT Assistant Managed System Running a Supported Windows Operating System

Server Administrator and certain other managed system agents, such as Dell PowerConnect™ switches, use the SNMP protocol to communicate with IT Assistant. To enable this communication, the Windows SNMP service must be properly configured to enable Get and Set operations and to send traps to a services system.

-  **NOTE:** See your operating system documentation for additional details on SNMP configuration.

NOTE: For systems running Windows Server 2003 to be discovered, Microsoft's standard SNMP configuration on Windows Server 2003 requires SNMP to be configured to accept packages from the IT Assistant host.

Change the SNMP Community Name

Configuring the SNMP community names determines which systems are able to manage your system through SNMP.

- 1 If your system is running Windows Server 2003 or later, click the **Start** button, right-click **My Computer**, and point to **Manage**. If your system is running Windows 2000, right-click **My Computer**, and point to **Manage**.

The **Computer Management** window appears.

- 2 Expand the **Computer Management** icon in the window, if necessary.
- 3 Expand the **Services and Applications** icon and click **Services**.
- 4 Scroll down the list of services until you find **SNMP Service**, right-click **SNMP Service**, and then click **Properties**.

The **SNMP Service Properties** window appears.

- 5 Click the **Security** tab to add or edit a community name.

- a To add a community name, click **Add** under the **Accepted Community Names** list.

The **SNMP Service Configuration** window appears.

- b Type the community name of a system that is able to manage your system (the default is `public`) in the **Community Name** text box and click **Add**.

The **SNMP Service Properties** window appears.

- c To change a community name, select a community name in the **Accepted Community Names** list and click **Edit**.

The **SNMP Service Configuration** window appears.

- d Make all necessary edits to the community name of the system that is able to manage your system in the **Community Name** text box, and then click **OK**.

The **SNMP Service Properties** window appears.

- 6 Click **OK** to save the changes.

Enabling SNMP Set Operations

SNMP Set operations must be enabled on the managed system to change Server Administrator attributes using IT Assistant.

- 1 If your system is running Windows Server 2003 or later, click the **Start** button, right-click **My Computer**, and point to **Manage**. If your system is running Windows 2000, right-click **My Computer**, and point to **Manage**.

The **Computer Management** window appears.

- 2 Expand the **Computer Management** icon in the window, if necessary.
- 3 Expand the **Services and Applications** icon, and then click **Services**.
- 4 Scroll down the list of services until you find **SNMP Service**, right-click **SNMP Service**, and click **Properties**.

The **SNMP Service Properties** window appears.

- 5 Click the **Security** tab to change the access rights for a community.
- 6 Select a community name in the **Accepted Community Names** list, and then click **Edit**.

The **SNMP Service Configuration** window appears.

- 7 Set the **Community Rights** to **READ WRITE** or **READ CREATE**, and click **OK**.

The **SNMP Service Properties** window appears.

- 8 Click **OK** to save the changes.

Configuring Your System to Send SNMP Traps

Managed system agents such as Server Administrator generate SNMP traps in response to changes in the status of sensors and other monitored parameters. You must configure one or more trap destinations on the managed system for these traps to be sent to an IT Assistant system.

- 1 If your system is running Windows Server 2003 or later, click the **Start** button, right-click **My Computer**, and point to **Manage**. If your system is running Windows 2000, right-click **My Computer** and point to **Manage**.

The **Computer Management** window appears.

- 2 Expand the **Computer Management** icon in the window, if necessary.
- 3 Expand the **Services and Applications** icon and click **Services**.

- 4 Scroll down the list of services until you find **SNMP Service**, right-click **SNMP Service**, and click **Properties**.

The **SNMP Service Properties** window appears.

- 5 Click the **Traps** tab to add a community for traps or to add a trap destination for a trap community.
- 6 To add a community for traps, type the community name in the **Community Name** box and click **Add to list**.
- 7 To add a trap destination for a trap community, select the community name from the **Community Name** drop-down menu and click **Add**.

The **SNMP Service Configuration** window appears.

- 8 Type the trap destination and click **Add**.
The **SNMP Service Properties** window appears.
- 9 Click **OK** to save the changes.

Configuring the SNMP Agent on Managed Systems Running Supported Linux Operating Systems

This section describes the configuration of SNMP agents on systems running Red Hat Enterprise Linux and SUSE Linux Enterprise Server operating systems.

Managed system agents such as Server Administrator use the SNMP services provided by the `ucd-snmp` or `net-snmp` SNMP agent. You can configure the SNMP agent to change the community name, enable Set operations, and send traps to an IT Assistant system. To configure your SNMP agent for proper interaction with IT Assistant, perform the procedures described in the following sections.

NOTE: See your operating system documentation for additional details on SNMP configuration.

NOTE: See the *VMware Basic Administration Guide* on the Dell Support website at support.dell.com for information on configuring SNMP agent on managed systems running ESX Server.

Changing the SNMP Community Name

Correctly configuring SNMP community names determines which IT Assistant services systems are able to communicate with managed systems in your network. The SNMP community name used by IT Assistant must match an SNMP community name configured on a managed system so that IT Assistant can successfully read from, write to, and perform actions on managed systems in your network.

To change the SNMP community name, edit the SNMP agent configuration file, `/etc/snmp/snmpd.conf`, by performing the following steps:

- 1 Find the line that reads:

```
com2sec publicsec default public
```

or

```
com2sec notConfigUser default public
```

- 2 Edit this line by replacing `public` with the new SNMP community name. When edited, the line should read:

```
com2sec publicsec default community_name
```

or

```
com2sec notConfigUser default community_name
```

To change the SNMP community name in SUSE Linux Enterprise Server, edit the SNMP agent configuration file, `/etc/snmpd.conf` by performing the following steps:

- 1 Find the line that reads:

```
rocommunity public 127.0.0.1
```

- 2 Edit this line by replacing `rocommunity` with the new SNMP community name. When edited, the line should read:

```
rwcommunity public <ITA system IP address>
```

Enabling SNMP Set Operations

SNMP Set operations must be enabled on the system running Server Administrator in order to change Server Administrator attributes using IT Assistant. To enable SNMP Set operations on the system running Server Administrator, edit the SNMP agent configuration file, `/etc/snmp/snmpd.conf` (`/etc/snmpd.conf` in SUSE Linux Enterprise Server), and perform the following steps:

- 1 Find the line that reads:

```
access publicgroup "" any noauth exact all none
none
```

or

```
access notConfigGroup "" any noauth exact all none
none
```

- 2 Edit this line, replacing the first `none` with `all`. When edited, the line should read:

```
access publicgroup "" any noauth exact all all
none
```

or

```
access notConfigGroup "" any noauth exact all all
none
```

For Red Hat Enterprise Linux (version 7.3 or later) and Red Hat Enterprise Linux AS (version 2.1 or later) operating systems, the default SNMP access for the `sysLocation` and `sysContact` variables has been changed to read-only access. IT Assistant uses the access rights for these variables to determine whether or not certain actions can be performed through SNMP. These variables must be configured with read/write access to enable "sets" or system configuration setting changes in IT Assistant. To configure the variables, it is recommended that you comment out the `sysContact` and `sysLocation` values in the Red Hat Enterprise Linux and SUSE Linux Enterprise Server SNMP configuration file.

- 1 Find the line that starts with `sysContact`.
- 2 Change the line to `#sysContact`.

- 3 Find the line that start with `sysLocation`.
- 4 Change the line to `#sysLocation`.

Configuring Your Managed Systems to Send Traps to IT Assistant

Managed system agents such as Server Administrator generate SNMP traps in response to changes in the status of sensors and other monitored parameters on a managed system. For IT Assistant to receive these traps, one or more trap destinations must be configured on the managed system.

To configure your system running Server Administrator to send traps to a Services system, edit the SNMP agent configuration file, `/etc/snmp/snmpd.conf` (`/etc/snmpd.conf` in SUSE Linux Enterprise Server), by performing the following steps:

- 1 Add the following line to the file:

```
trapsink IP_address community_name
```

where `IP_address` is the IP address of the services system and `community_name` is the SNMP community name.

- 2 Save the `snmpd.conf` file and restart the `snmpd` service.

Setting Up SNMP on SUSE Linux Enterprise Server

Retain the `trapsink` and `smuxpeer` lines in the existing `snmpd.conf` file. Delete all other content from the file.

Add the following in the `snmpd.conf`:

```
com2sec mynetwork <subnet>/24 public
```

NOTE: Substitute `<subnet>` with the subnet address of your management station. However, retain the `/24`.

```
group MyRWGroup v1 mynetwork
```

```
view all included .1 80
```

```
access MyRWGroup "" any noauth exact all all none
```

Restart `/etc/init.d/snmpd`.

Setting Up SNMP on ESX server to Send Traps to IT Assistant

Follow the steps below to configure SNMP for the ESX server to send traps to IT Assistant:

- 1 Download VMware remote command line interface tool (RCLI) from the VMware website.

- 2 Run the following command to configure the SNMP from RCLI:

```
vicfg-snmp --server <ESX_IP_addr> --username root -  
-password <password> -c <community name> -p 5567 -t  
<ITA_IP_Address>@162/<community name>
```

NOTE: Multiple IT Assistant IP Addresses can be mentioned by putting a comma (,) in between the target address that is IT Assistant IP address.

- 1 Run the following command to enable SNMP for ESX:

```
vicfg-snmp --server <ESX_IP_addr> --username root -  
-password <password> -E
```

- 2 Run the following command to show the configuration:

```
vicfg-snmp --server <ESX_IP_addr> --username root -  
-password <password> -s
```

- 3 Run the following command to send a test trap to IT Assistant:

```
vicfg-snmp --server <ESX_IP_addr> --username root -  
-password <password> -T
```

NOTE: Make sure that the SNMP ports are kept open before sending traps to the management station.

- 4 For the ESX Server traps to be properly categorized in IT Assistant, perform the following:

- a Open IT Assistant Console
- b Select Alerts-> Categories/Sources -> Virtual Machine
- c Right click **Virtual Machine** and select **New SNMP Alert Source**
- d Duplicate all existing **SNMP Alert Source** entries with the same values as the existing entries but modify the Enterprise OID to .1.3.6.1.4.1.6876.4.1

Setting Up CIM

CIM is available only on supported Microsoft Windows operating systems.

NOTE: Dell OpenManagement Server Administrator sends events to IT Assistant as SNMP traps. It does not send CIM indications for either instrumentation or storage events from a server.

Setting Up CIM on Your Managed Systems

This subsection provides steps for setting up CIM on managed systems running supported Windows operating systems. For more information, see "Configuring CIM for Manageability."

Recommendation for Creating a Domain Administrator

Although the following procedure describes how to add a local administrator to a supported Windows operating system, Dell recommends that you create a domain administrator instead of create a user on every system managed by IT Assistant. Creating a domain user account will also aid in preventing account lockouts due to failed IT Assistant logons to systems found in the entered discovery range. By example, a discovery range of 192.168.0.* would result in an attempt to log on to all 253 systems. If the credentials passed to any one of these managed systems did not authenticate, the account would become locked out. In addition, the improved security in Windows XP mandates that the client be in the same domain as the IT Assistant system. Windows XP also requires a user name with a nonblank password. For more information on creating a Windows domain user account, see your Microsoft documentation.

NOTE: IT Assistant requires the CIM user name and password with administrator rights that you established on the managed systems. If you are using a domain user, be sure to specify the correct domain in the user name field. A user name must always be qualified with a domain, or **localhost** if a domain is not present. The format is either **domain\user** or **localhost\user**.

NOTE: CIM discovery requires proper user ID and password credentials. Failure to supply proper credentials on a subnet configured for CIM discovery can result in account lockout.

For Managed Systems Running Windows 2000

NOTE: The WMI core is installed with Windows 2000 by default.

- 1 Click **Start**→**Settings**→**Control Panel**→**Administrative Tools**→**Computer Management**.
- 2 In the **Computer Management (Local)** tree, expand the **Local Users and Groups** branch and click the **Users** folder.
- 3 On the menu bar, click **Action** and then click **New User**.
 - a In the **New User** dialog box, fill in the required information fields with the user name and password – for example, **CIMUser** and **DELL**. (These are only examples for illustration; you should set user names and passwords as appropriate for your enterprise.)
 - b Ensure that you deselect the **User must change password at next logon** check box.
 - c Click **Create**.
- 4 In the right pane of the **Computer Management** dialog box, double-click **CIMUser**.

You may have to scroll through the list to locate **CIMUser**.
- 5 In the **CIMUser Properties** dialog box, click the **Member Of** tab.
- 6 Click **Add**.
- 7 Click **Administrators**, click **Add**, and then click **OK**.
- 8 Click **OK** again, and then close the **Computer Management** dialog box.
- 9 Install **Client Instrumentation 7.x** or **Server Administrator**, depending on whether the system is a client or a server.
- 10 Restart the system.

For Managed Systems Running Windows XP Professional

As mentioned previously, the improved security in Windows XP mandates that the client be in the same domain as the IT Assistant system. Also, when implementing your own user name and password, do not specify a blank password.

The following steps detail how to create a local user. Dell highly recommends that you create a domain user with administrative rights so that you do not have to manually add a user to every client. This will simplify the creation of discovery ranges in IT Assistant.

- 1 Click **Start**→**Settings**→**Control Panel**→**Administrative Tools**→**Computer Management**.
- 2 In the **Computer Management (Local)** tree, expand the **Local Users and Groups** branch and click the **Users** folder.
- 3 On the menu bar, click **Action** and then click **New User**.
 - a In the **New User** dialog box, fill in the required information fields with the user name `CIMUser` and password `DELL`.
 - b Ensure that you clear (deselect) the **User must change password at next logon** check box.
 - c Click **Create**.
- 4 In the right pane of the **Computer Management** dialog box, double-click **CIMUser**.

You may have to scroll through the list to locate **CIMUser**.
- 5 In the **CIMUser Properties** dialog box, click the **Member Of** tab.
- 6 Click **Add**.
- 7 Click **Administrators**, click **Add**, and then click **OK**.
- 8 Click **OK** again, and then close the **Computer Management** dialog box.

NOTE: IT Assistant can manage Dell client systems installed with Windows XP Professional operating system.

- 9 Install Client Instrumentation 7.x or Server Administrator, depending on whether the system is a client or a server.
- 10 Restart the system.

For Managed Systems Running Windows Server 2003 or later

- 1 Click **Start**→**Settings**→**Control Panel**→**Administrative Tools**→**Computer Management**.
- 2 In the **Computer Management (Local)** tree, expand the **Local Users and Groups** branch and click the **Users** folder.

- 3 On the menu bar, click **Action** and then click **New User**.
 - a In the **New User** dialog box, fill in the required information fields with the user name `CIMUser` and password `DELL`.
 - b Ensure that you clear (deselect) the **User must change password at next logon** check box.
 - c Click **Create**.
- 4 In the right pane of the **Computer Management** dialog box, double-click `CIMUser`.

You may have to scroll through the list to locate `CIMUser`.
- 5 In the **CIMUser Properties** dialog box, click the **Member Of** tab.
- 6 Click **Add**.
- 7 Click **Administrators**, click **Add**, and then click **OK**.
- 8 Click **OK** again, and then close the **Computer Management** dialog box.
- 9 Install Client Instrumentation 7.x or Server Administrator, depending on whether the system is a client or a server.
- 10 Restart the system.

Configuring the IPMI

For IT Assistant to be able to discover IPMI-compliant devices, you should configure the BMC on your managed system. You can also configure the BMC to send alerts to IT Assistant.

You can configure the BMC from the Dell OpenManage Server Administrator GUI or from the BIOS-POST (pre-operating system environment).

Configuring BMC From the Server Administrator

- 1 Log into the Server Administrator home page of your managed system.
- 2 On the left pane, click the **System** object.
- 3 Click the **Main System Chassis** object.

- 4 Click the **Remote Access** object.

The BMC information window is displayed.

- 5 Click the **Configuration** tab.

Under the **Configuration** tab, select **Enable NIC** and **Enable IPMI Over LAN**, and provide the **New Encryption Key**.

NOTE: The value of the **New Encryption Key** (or the KG key) is a hexadecimal value. However, KG Key is applicable only on Dell PowerEdge x9xx and later systems, which support IPMI version 2.0. By default, KG Key is disabled on the BMC.

- 6 Click the **Users** tab.

- 7 Select the User ID of the administrator.

- 8 On the **Users** page, enter the user name and password.

NOTE: The default user name and password are **root** and **calvin** respectively.

- 9 To configure the managed system to send alerts to IT Assistant, on the left pane, click the **System** object.

- 10 Click the **Alert Management** tab.

- 11 Click **Platform Events**.

- 12 Select the **Generate Alert** check box for the alerts to be sent.

NOTE: To generate an alert, you must select both **Generate Alert** and **Enable Platform Events Alerts**.

- 13 Click **Apply Changes**.

This configures the managed system for IPMI discovery and configures the BMC to send alerts to IT Assistant.

NOTE: When you configure IT Assistant to use the IPMI parameters of the BMC of your managed systems, ensure that the BMC user name, password, and the kg key values in the managed system must match those on the management station.

Configuring BMC From the BIOS POST

- 1 During system reboot, press <Ctrl><E> to enter the Remote Access Configuration Utility.
- 2 Set **IPMI Over LAN** to **On**.

- 3** Select **LAN Parameters** and press <Enter>.
 - Provide a hexadecimal value for **RMCP+ Encryption Key**.
 - Enable **LAN Alert**.
 - Provide the **Alert Destination**. This is the IP address of the management station to which you want to send alerts.
- 4** Press <Esc> to return to the Remote Access Configuration Utility.
- 5** Select **LAN User Configuration** and press <Enter>. Set this value to **On**.
- 6** Specify the user name and password.

This configures the managed system for IPMI discovery and configures the BMC to send alerts to IT Assistant.

NOTE: When you configure IT Assistant to use the IPMI parameters of the BMC of your managed systems, ensure that the BMC user name, password, and the kg key values in the managed system must match those on the management station.

Utilities in Dell™ OpenManage™ IT Assistant

IT Assistant has three utilities:

- Import Node List Utility
- Database Management Utility
- Simple Network Management Protocol (SNMP) Event Source Import Utility

IT Assistant Import Node List Utility

The **Import Node List** utility allows you to create a file that defines a discovery list comprised of managed devices, IP addresses, or IP address ranges. This utility supports any type of address that you can enter through the IT Assistant user interface. The IT Assistant import node utility uses the file to quickly import the list into IT Assistant. Using this utility provides:

- A convenient method for those users who have their network configuration already mapped-out in files and want to quickly import this configuration into IT Assistant
- A very targeted discovery, rather than specifying a general subnet for discovery, such as 10.34.56.*

To use the **Import Node List** utility, follow these general steps:

- 1 Create a file containing the list of discovery addresses and/or system names that you want to import.

For each entry in the file, you must specify the protocol settings (such as the SNMP protocol's community name). To provide this information to IT Assistant, you must use a template. A template allows you to assign protocol settings to each entry in the file.

- 2 Define a template that will be applied to one or more discovery ranges. You define the template by entering a discovery range with the host name of `default_template`. The import node list utility applies the protocol settings defined in this template to each discovery item in the file.

- 3 Run the utility from the command line. (The import node utility is located in the IT Assistant `/bin` directory.) Specify the filename for the file you created and, optionally, the template name. You can also specify the template name in the file. For example:

```
importnodelist nodelist.txt
```

The following options are available and may be specified in any order after the filename:

-delete — This option causes the template(s) used to be automatically deleted after the utility successfully imports the node list.

-default <templatename> — Allows for a different default template name to be used. The default name is **default_template**.

See sample commands for more information.

- 4 Restart IT Assistant Services.

You can use a default template to import a discovery list into IT Assistant. To import a list of nodes, perform the following steps:

- 1 Create a file by using the following format (do not include the `<begin_file>` or `<end_file>` specifiers):

```
<begin_file>
```

```
#This is a comment (a "#" sign at the beginning of  
the line means to #ignore the line).
```

```
23.45.65.34
```

```
23.45.65.35
```

```
hostname1
```

```
hostname2
```

```
23.34.55.*
```

```
12.34.56.20-30
```

```
<end_file>
```

The last line of the file must have a line feed in it. You can also use any combination of the subnet formats supported by the IT Assistant user interface. It is important to make sure that each entry is the correct format because the import node list utility does not check and validate the format for you.

- 2 Save the file and specify a filename, for example, **nodelist.txt**.

Sample Import Node List Utility Commands

Import the nodes from the file **nodelist.txt**:

```
importnodelist nodelist.txt
```

Delete the templates used after a successful import:

```
importnodelist -delete
```

Import the nodes from the file **nodelist.txt**, delete the templates used after a successful import, and use "my_template" as the default template name:

```
importnodelist nodelist.txt -delete -default  
my_template
```

Creating Templates

To create a template for import node list utility, follow these general steps:

- 1 In **Discovery and Monitoring**, select **Ranges**.
- 2 Right-click **Include Ranges** in the **Discovery Ranges** tree and select **New Include Range...**
- 3 In the **New Discovery Wizard-Step 1 of 6**, select **Host Name**.
- 4 Enter the template name in **Host Name** (for example, **template_1**).
- 5 Complete the wizard by entering the required protocol configurations.

Template_1 can be used in import node list utility.

Using Multiple Templates

The import node list utility supports the use of multiple templates, where different entries in the file may each use different protocol settings and require different templates. The following import file provides an example for using multiple templates:

```
<begin_file>
#This is a comment (a "#" sign at the beginning of the
line means to ignore #the line).
23.45.65.34,template1
23.45.65.35,template1
hostname1
hostname2,template2
23.34.55.*,template2
12.34.56.20-30
<end_file>
```

In this example, the first two entries use a template named **template1**, while entries four and five use a template named **template2**. The rest of the entries use the default template. In this example, you must enter the discovery configuration ranges (from the IT Assistant user interface) of "default_template", "template1", and "template2" and configure their protocol settings appropriately (perhaps they have different SNMP community names). Note that any name may be used for a template name, even an IP address or subnet range. However, Dell recommends that you use names that allow for easy identification as templates.

Saving Templates

If multiple templates are needed to correctly configure a file of node entries, it is possible to set up the templates in IT Assistant, then export the settings for backup or some other purpose. The database management utility, **dcdbmng.exe**, is located in IT Assistant's **/bin** directory. This utility allows you to import, export, and clear IT Assistant database tables. To export templates, perform the following steps:

- 1 Configure all required templates in IT Assistant.
- 2 Export the table that contains all entered templates. Navigate to IT Assistant's **/bin** directory and double-click **dcdbmng.exe**. The database management utility interface starts. On the left tree, navigate to the Discovery Configuration table. Right-click this tree node and select **Export Table**. Enter a name for the file to export to.

The file containing the templates can now be imported to another IT Assistant installation. You can also restore the file to a new IT Assistant installation by using the Import Table option (right click the table name in the database management utility). When the templates are imported, you can run the import node list utility on the accompanying file of node entries.

Leaving Templates in IT Assistant

If template names are addresses that are not discoverable (for example, it is unlikely that a host name such as "default_template" exists), the templates may remain in IT Assistant. IT Assistant tries to discover the item, but no results occur from the attempted discovery. If many templates are used, it is recommended that you delete the templates to avoid wasting IT Assistant discovery cycles on nondiscoverable addresses.

Database Management Utility

The Dell OpenManage IT Assistant Database Management Utility has two implementations: a graphical user interface (GUI) and a command line interface. Both versions of the utility allow users to perform operations on databases and tables that reside in the IT Assistant data repository.

 **NOTE:** The IT Assistant 6.x database schema is not directly compatible with the IT Assistant 7.x database schema. Only certain tables in the IT Assistant 6.x database schema will be migrated, such as discovery configuration, global configuration, and alert action tables. The database schema can only be migrated during an upgrade of IT Assistant.

 **NOTE:** IT Assistant does not support a direct upgrade from version 6.x to version 8.3. You will be required to first upgrade to IT Assistant version 7.0 and then to version 8.3.

You must start the GUI version of the Database Management Utility separately from IT Assistant. When you start the utility, a window opens that contains database and table management functions. The command line application performs the functions of the GUI utility along with a few others.

Using the Command Line Database Management Utility

At a command prompt, change directory to `\Program Files\Dell\SysMgt\IT Assistant\bin`.

Type `dcdbmng` followed by a switch that specifies the command you want. To see a list of valid switches, type:

```
dcdbmng /h
```

OR

```
dcdbmng /H
```

OR

```
dcdbmng /?
```

 **NOTE:** Type a space between the `dcdbmng` command and the / (forward slash).

This command displays a dialog box that lists commands that you can use to do the following:

- Install the appropriate database engine (Microsoft® Data Engine (MSDE) for IT Assistant version 7.x and earlier or SQL Server 2005 Express Edition SP2 for IT Assistant version 8.2 and later).
- Start and stop the database engine.
- Attach and detach database files to and from the database engine.
- Import and export tables and databases.

NOTE: Due to the differences in the way that Microsoft encrypts data between operating system versions, exporting IT Assistant database tables with encrypted passwords from one version of a Microsoft operating system (for example, Windows 2000) and importing into another version (for example, Windows 2003) is not supported.

- Clear tables.
- Restore data for the global IT Assistant configuration or the event management system configuration only.

Help

- Command: `dcdbmng /h` or `dcdbmng /H` or `dcdbmng /?`
- Description: Displays the command line options.

Attach Database

- Command: `dcdbmng /A path` or `dcdbmng /a path`
- Description: Attaches the single database file specified by *path* to the SQL Server 2005 Express Edition SP2 or the Microsoft SQL 2005 Server.

Clear Table

- Command: `dcdbmng /Z tablename` or `dcdbmng /z tablename`
- Description: Removes all the rows from the specified table, but does not delete the table.

Detach Database

- Command: `dcdbmng /R` or `dcdbmng /r`
- Description: Detaches the attached database file from the SQL Server 2005 Express Edition SP2 or the SQL 2005 Server.

NOTE: The detached database file remains in the location from where it was attached to the SQL Server 2005 Express Edition SP2 or the SQL 2005 Server.

Export Table

- Command: `dcdbmng /E tablename filename` or `dcdbmng /e tablename filename`
- Description: Exports the data in the table specified by *tablename* to the flat text file specified by *filename*. If the flat text file does not exist, the utility creates it. If *filename* does not include path information, the utility creates the file in the local directory.

Export Database

Command: `dcdbmng /X path` or `dcdbmng /x path`

Description: Exports data from all tables in the database to flat text files in the location specified by *path*.

NOTE: The utility creates the files in the location specified by *path* in the format of **tablename.txt**.

Import Table

- Command: `dcdbmng /I tablename path [migrate]` or `dcdbmng /i tablename path [migrate]`
- Description: Imports data to the table specified by *tablename* from the flat text file specified in *path*.

Import Database

- Command: `dcdbmng /M path` or `dcdbmng /m path`
- Description: Imports data to all tables in the database from flat text files in the location specified by *path*.

Install MSDE

- Command: `dcdbmng /N` or `dcdbmng /n`
- Description: Silently installs MSDE.

NOTE: The **MSDEx85.exe** and **iss** files must be placed in the correct location.

Start Server

- Command: `dcdbmng /T` or `dcdbmng /t`
- Description: Starts the **MSSQLServer** service.

Stop Server

- Command: `dcdbmng /P` or `dcdbmng /p`
- Description: Stops the **MSSQLServer** service.

Suppress Messages

When you run the Database Management Utility as a command line application, you receive messages when commands succeed or fail. The command to suppress messages halts these notifications.

- Command: `dcdbmng /S`
- Description: Runs without displaying any messages (whether the action was successful or unsuccessful). This command is useful if you are running the utility from a batch file.

NOTE: Using **/S** with no other option causes the command to be ignored.

Simple Network Management Protocol Event Source Import Utility

You can import multiple event sources, not natively supported in IT Assistant, into the IT Assistant database.

Create a text file containing the appropriate event source information. After creation, this text file will not be available for sharing between multiple users of the product.

Run a Command Line Interface (CLI) utility (you can find the this utility in `<install folder of IT Assistant>/bin`) to import the text file data into the IT Assistant database.

Ensure that the text file format complies with the following formatting rules:

- 1 The format for the usage of the utility must be:

```
ImportEventSources.exe <fully qualified  
path\filename>
```

- 2 All values of a particular Event Source must be bar-separated.
- 3 Each Event Source entry must be on a separate line.
- 4 The format of entries for each Event Source must be:

```
<EventCategoryName>|<EventSourceName>|<Severity>|  
<Format  
String>|<SNMPEnterpriseOID>|<SNMPGenericTrapID>|<  
SNMPSpecificTrapID>|<EventPackageName>
```

- 5 The format for severity strings by value must be:

```
<ObjectId>,<ObjectValue>,<Severity>;<ObjectId1>,  
<ObjectValue1>,  
<Severity1>
```

- 6 EventSourceName cannot be NULL or an empty string.

NOTE: If the EventCategoryName is an empty string, the category is defaulted to **Other**. If the category name does not match any of the pre-defined category types in IT Assistant, a new Event Category is created with the category name that you enter.

NOTE: If the severity string entered in the input file does not match the predefined severity strings, an appropriate error message is displayed.

NOTE: A combination of EnterpriseOID, Generic TrapID, and SpecificTrapID for each event should be unique. Also, the combination of EventSourceName and EventPackageName is validated to check if the entry is unique.

NOTE: Enter two consecutive bars (" || ") to represent NULL or empty strings.

The following is a sample MIB entry.

```
-- Lower Critical threshold crossed  
asfTrapFanSpeedProblem TRAP-TYPE  
ENTERPRISE asfPetEvts  
DESCRIPTION  
"Generic Critical Fan Failure"
```

```
--#SUMMARY      "Generic Critical Fan Failure"  
--#ARGUMENTS    {}  
--#SEVERITY     CRITICAL  
::= 262402
```

The conversion process is as follows:

```
EventCategory : Environmental
```

 **NOTE:** IT Assistant has a set of pre-defined categories (Environmental, General Redundancy, Keyboard-Video-Mouse (KVM), Memory, Physical Disk, Power, Printers, Processor, Security, Storage Enclosure, Storage Peripheral, Storage Software, System Events, Tape, Virtual Disk, and Other). The event could fall under any of these categories. However, a new category can also be created.

```
EventSourceName : asfTrapFanSpeedProblem
```

```
Severity : Critical [--#SEVERITY]
```

 **NOTE:** IT Assistant categorizes events under the following categories: Ok, Warning, Critical, Information, and Unknown.

```
Format String : Generic Critical Fan Failure [--  
#SUMMARY]
```

```
EnterpriseOID : .1.3.6.1.4.1.3183.1.1 (To get the  
EnterpriseOID, compile the MIB, in this case "DcAsfSrv.mib", in MG-Soft or  
any other MIB browser.)
```

```
GenericTrapId : 6
```

```
SpecificTrapId : 262402 [::=]
```

```
EventPackageName : ASF (You can get this information from the MIB.  
Open the MIB. The EventPackageName is displayed within [--Begin  
Definition].)
```

If there is no package present under which the EventSource falls, you can provide a new category name.

The final entry in the text file will be similar to:

```
Environmental|asfTrapFanSpeedProblem|Critical|Generic  
Critical Fan  
Failure|.1.3.6.1.4.1.3183.1.1|6|262402|ASF
```

 **NOTE:** In case the import file contains a non-existing category, the category will be created.

Status Indicators

This appendix describes the indicators that display on the IT Assistant user interface (UI).

Device Group Status and Health Indicators

Table C-1. Device Group Status and Health Indicators

	Group is empty.
	Group contains only healthy systems. All systems are powered on.
	Group contains at least one system with a warning condition. All systems are powered on.
	Group contains at least one system with a critical condition. All systems are powered on.
	Group contains only healthy systems and at least one system that is powered down.
	Group contains at least one system with a warning condition and at least one system that is powered down.
	Group contains at least one system with a critical condition and at least one system that is powered down.
	Group contains at least one uninstrumented system and all systems in the group are powered on.
	Group contains at least one uninstrumented system and at least one system is powered down.

NOTE: In **Topology View**, all the above icons will be superimposed on the respective device icon and mean the same as the description in the above table.

System and Device Status and Health Indicators

Table C-2. System and Device Status and Health Indicators

	System has an unknown health condition.
	System or device is healthy.
	System or device has a warning condition.
	System or device has a critical condition.
	System or device is a VMware® ESX Server® virtual machine. System or device is powered on.
	System is powered down, last detected condition was unknown.
	System is powered down, last detected condition was healthy.
	System is powered down, last detected condition was warning.
	System is powered down, last detected condition was critical.
	System or device is a virtual machine on VMware ESX Server. System or device is powered down.

Alert Indicators

Alert Severity Indicators

Table C-3. Alert Severity Indicators

	Unknown alert
	Normal alert
	Warning alert
	Critical alert

Alert Acknowledgement Indicators

Table C-4. Alert Acknowledgement Indicators

	Alert acknowledged
---	--------------------

Alert Action Indicators

Table C-5. Alert Action Indicators

	Alert action is of type application launch.
	Alert action is of type e-mail.
	Alert action is of type trap forwarding.

Task Scheduling Indicators

Table C-6. Task Scheduling Indicators

	Schedule is enabled.
	Schedule not enabled.

Execution Logs Indicators

Task Execution Log Indicators

Table C-7. Task Execution Log Indicators

	Task is running.
	Task completed successfully.
	Task failed.

Table C-7. Task Execution Log Indicators (continued)

	(In Task Execution Summary) Task executed with no errors, but required user intervention, such as reboot, to complete the task.
	Task was stopped.

Performance and Power Monitoring Log Indicators

Table C-8. Performance and Power Monitoring Log Indicators

	Attribute value retrieved successfully.
	Unable to retrieve attribute value. This may be because device is not configured to supply data for the attributes(s).
	Failed to collect values for one or more attributes or the attribute is not supported on that system.

Application Log Indicators

Table C-9. Application Logs Indicators

	Informational message
	Warning message.
	Critical message.

Update Log Indicators

Table C-10. Update Logs Indicators

	Online Synchronization is in progress.
	Online Synchronization completed successfully.
	Online Synchronization completed with errors.

Discovery Ranges Indicators

Include Ranges Indicators

Table C-11. Include Ranges Indicators

	Scheduled discovery and inventory is enabled.
	Scheduled discovery and inventory is disabled.

Performance and Power Monitoring Indicators

Table C-12. Performance and Power Monitoring Indicators

	Task is running.
	Task is yet to start or has paused.
	Task completed successfully.
	Attribute value has exceeded its warning threshold.
	Attribute value has exceeded its critical threshold.
	Failed to collect values for one or more attributes.

Software Updates Indicators

Table C-13. Software Update Indicators

	Repository
	Read-only repository
	Customization attribute for the view.
	Update Package in the repository. In case of Online Repository, it is the package that has been downloaded during Online Repository synchronization.
	Update Package in Online Repository that has not been downloaded, but referenced in the last synchronized catalog.
	System Bundle in the Online repository, IT Assistant repository and Server Update Utility repository.
	Custom Bundle in IT Assistant repository.
	System bundle in Online Repository that has not been downloaded, but referenced in the last synchronized catalog.

Repository Comparison Results Indicators

Table C-14. Repository Comparison Results Indicators

	Source version of update package/ bundle is lower than target version.
	Source version of update package/ bundle is higher than target version.
	Exact match of the update package/bundle.
	There is no equivalent update package/ bundle in the target repository to be compared with.
	The versions of the update package/bundle are equal, but there is a mismatch between the MD5 hash of the update package/bundle.

Import Dialog

Table C-15. Import Dialog Indicators

	Package is ready to be imported into the IT Assistant repository.
	This update package/bundle will be downloaded before being imported to the IT Assistant repository.
	Download in progress.
	Import of update package/bundle in progress.
	Import successful
	Import failed

Favorite Application Indicators

Table C-16. Favorite Application Indicators

	Executable favorite application launch.
	Web address (URL) favorite application launch.

Troubleshooting Tool Indicators

Table C-17. Troubleshooting Test Result Indicators

	Test successful
	Test failed

Task Import Result Indicators

Table C-18. Task Import Result Indicators

	Selected task has been imported successfully.
	Selected task already exists.
	Task is not selected for import.
	Task selected for import.

Device Compliance Result Indicators

Table C-19. Device Compliance Result Indicators

	Device version is equal to the update package/bundle version in the repository.
	Device version is lower than the version of the update package/bundle in the repository.
	Device version is higher than the version of the update package/bundle in the repository.
	Device version does not meet the pre-requisite for the update package/bundle.
