Introduction

Dell™OpenManage™ Server Administrator produces event messages stored primarily in the operating system or Server Administrator event logs and sometimes in SNMP traps. This document describes the event messages created by Server Administrator version 5.3 or later and displayed in the Server Administrator Alert log.

Server Administrator creates events in response to sensor status changes and other monitored parameters. The Server Administrator event monitor uses these status change events to add descriptive messages to the operating system event log or the Server Administrator Alert log.

Each event message that Server Administrator adds to the Alert log consists of a unique identifier called the event ID for a specific event source category and a descriptive message. The event message includes the severity, cause of the event, and other relevant information, such as the event location and the monitored item's previous state.

Tables provided in this guide list all Server Administrator event IDs in numeric order. Each entry includes the event ID's corresponding description, severity level, and cause. Message text in angle brackets (for example, <State>) describes the event-specific information provided by the Server Administrator.

What's New in this Release

The following changes have been made for this release:

- Added new Chassis Management Controller Events. For more information, see "Chassis Management Controller Messages" on page 36.
- Updated BIOS Generated System Events and added new Power and Performance Events. For more information, see "Power And Performance Events" on page 76.
- Added new Storage Management alerts. For more information, see "Alert Message Change History" on page 81.

Messages Not Described in This Guide

This guide describes only event messages created by Server Administrator and displayed in the Server Administrator Alert log. For information on other messages produced by your system, consult one of the following sources:

- Your system's Installation and Troubleshooting Guide
- Other system documentation
- Operating system documentation
- Application program documentation

Understanding Event Messages

This section describes the various types of event messages generated by the Server Administrator. When an event occurs on your system, the Server Administrator sends information about one of the following event types to the systems management console:

Table 1-1. Understanding Event Messages

Icon	Alert Severity	Component Status
v	OK/Normal	An event that describes the successful operation of a unit. The alert is provided for informational purposes and does not indicate an error condition. For example, the alert may indicate the normal start or stop of an operation, such as power supply or a sensor reading returning to normal.
A	Warning/ Non-critical	An event that is not necessarily significant, but may indicate a possible future problem. For example, a Warning/Non-critical alert may indicate that a component (such as a temperature probe in an enclosure) has crossed a warning threshold.
*	Critical/ Failure/Error	A significant event that indicates actual or imminent loss of data or loss of function. For example, crossing a failure threshold or a hardware failure such as an array disk.

Server Administrator generates events based on status changes in the following sensors:

- Temperature Sensor Helps protect critical components by alerting the
 systems management console when temperatures become too high inside
 a chassis; also monitors a variety of locations in the chassis and in any
 attached systems.
- Fan Sensor Monitors fans in various locations in the chassis and in any attached systems.
- Voltage Sensor Monitors voltages across critical components in various chassis locations and in any attached systems.
- Current Sensor Monitors the current (or amperage) output from the power supply (or supplies) in the chassis and in any attached systems.
- Chassis Intrusion Sensor Monitors intrusion into the chassis and any attached systems.
- Redundancy Unit Sensor Monitors redundant units (critical units such as fans, AC power cords, or power supplies) within the chassis; also monitors the chassis and any attached systems. For example, redundancy allows a second or *n*th fan to keep the chassis components at a safe temperature when another fan has failed. Redundancy is normal when the intended number of critical components are operating. Redundancy is degraded when a component fails, but others are still operating. Redundancy is lost when there is one less critical redundancy device than required.
- Power Supply Sensor Monitors power supplies in the chassis and in any attached systems.
- Memory Prefailure Sensor Monitors memory modules by counting the number of Error Correction Code (ECC) memory corrections.
- Fan Enclosure Sensor Monitors protective fan enclosures by detecting their removal from and insertion into the system, and by measuring how long a fan enclosure is absent from the chassis. This sensor monitors the chassis and any attached systems.
- AC Power Cord Sensor Monitors the presence of AC power for an AC power cord.
- Hardware Log Sensor Monitors the size of a hardware log.

- **Processor Sensor** Monitors the processor status in the system.
- Pluggable Device Sensor Monitors the addition, removal, or configuration errors for some pluggable devices, such as memory cards.
- Battery Sensor Monitors the status of one or more batteries in the system.

Sample Event Message Text

The following example shows the format of the event messages logged by Server Administrator.

EventID: 1000

Source: Server Administrator

Category: Instrumentation Service

Type: Information

Date and Time: Mon Oct 21 10:38:00 2002

Computer: <computer name>

Description:

Server Administrator starting

Data: Bytes in Hex

Viewing Alerts and Event Messages

An event log is used to record information about important events.

Server Administrator generates alerts that are added to the operating system event log and to the Server Administrator Alert log. To view these alerts in Server Administrator:

- **1** Select the **System** object in the tree view.
- **2** Select the Logs tab.
- **3** Select the **Alert** subtab.

You can also view the event log using your operating system's event viewer. Each operating system's event viewer accesses the applicable operating system event log.

The location of the event log file depends on the operating system you are using.

- In the Microsoft® Windows® 2000 Advanced Server and Windows Server™ 2003 operating systems, messages are logged to the system event log and optionally to a unicode text file, dcsys32.log (viewable using Notepad), that is located in the <code>install_path\omas\log</code> directory. The default <code>install_path</code> is C:\Program Files\Dell\SysMgt.
- In the Red Hat[®] Enterprise Linux and SUSE[®] Linux Enterprise Server operating system, messages are logged to the system log file. The default name of the system log file is /var/log/messages. You can view the messages file using a text editor such as vi or emacs.
- **NOTE:** Logging messages to a unicode text file is optional. By default, the feature is disabled. To enable this feature, modify the **Event Manager** section of the dcemdv32.ini file as follows:
 - In Windows, locate the file at <install_path>\dataeng\ini and set UnitextLog.enabled=True. The default install_path is C:\Program Files\Dell\SysMgt. Restart the DSM SA Event Manager service.
 - In Red Hat Enterprise Linux and SUSE Linux Enterprise Server, locate the file at <install_path>/dataeng/ini and set UnitextLog.enabled=True. The default install_path is /opt/dell/srvadmin. Issue the "/etc/init.d/dataeng restart" command to restart the Server Administrator event manager service. This will also restart the Server Administrator data manager and SNMP services.

The following subsections explain how to open the Windows 2000 Advanced Server, Windows Server 2003, and the Red Hat Enterprise Linux and SUSE Linux Enterprise Server event viewers.

Viewing Events in Windows 2000 Advanced Server and Windows Server 2003

- 1 Click the Start button, point to Settings, and click Control Panel.
- 2 Double-click Administrative Tools, and then double-click Event Viewer.
- 3 In the Event Viewer window, click the Tree tab and then click System Log.
 The System Log window displays a list of recently logged events.
- **4** To view the details of an event, double-click one of the event items.
 - **NOTE:** You can also look up the dcsys32.log file, in the install_path\omsa\log directory, to view the separate event log file. The default install_path is C:\Program Files\Dell\SysMgt.

Viewing Events in Red Hat Enterprise Linux and SUSE Linux Enterprise Server

- **1** Log in as **root**.
- 2 Use a text editor such as vi or emacs to view the file named /var/log/ messages.

The following example shows the Red Hat Enterprise Linux (and SUSE Linux Enterprise Server) message log, /var/log/messages. The text in boldface type indicates the message text.

NOTE: These messages are typically displayed as one long line. In the following example, the message is displayed using line breaks to help you see the message text more clearly.

Feb 6 14:20:51 server01 Server Administrator: Instrumentation Service EventID: 1000

Server Administrator starting

Feb 6 14:20:51 server01 Server Administrator: Instrumentation Service EventID: 1001 Server Administrator startup complete

Feb 6 14:21:21 server01 Server Administrator: Instrumentation Service EventID: 1254 Chassis intrusion detected Sensor location: Main chassis intrusion Chassis location: Main System Chassis Previous state was: OK (Normal) Chassis intrusion state: Open

Feb 6 14:21:51 server01 Server Administrator: Instrumentation Service EventID: 1252 Chassis intrusion returned to normal Sensor location: Main chassis intrusion Chassis location: Main System Chassis Previous state was: Critical (Failed) Chassis intrusion state: Closed

Viewing the Event Information

The event log for each operating system contains some or all of the following information:

- Date The date the event occurred.
- Time The local time the event occurred.
- Type A classification of the event severity: Information, Warning, or Error.
- User The name of the user on whose behalf the event occurred.
- Computer The name of the system where the event occurred.
- Source The software that logged the event.
- Category The classification of the event by the event source.
- Event ID The number identifying the particular event type.
- **Description** A description of the event. The format and contents of the event description vary, depending on the event type.

Understanding the Event Description

Table 1-2 lists in alphabetical order each line item that may appear in the event description.

Table 1-2. Event Description Reference

Description Line Item	Explanation	
Action performed was: <action></action>	Specifies the action that was performed, for example:	
	Action performed was: Power cycle	
Action requested was: <action></action>	Specifies the action that was requested, for example:	
	Action requested was: Reboot, shutdown OS first	
Additional Details: <additional details="" for<="" td=""><td>Specifies additional details available for the hot plug event, for example:</td></additional>	Specifies additional details available for the hot plug event, for example:	
the event>	Memory device: DIMM1_A Serial number: FFFF30B1	

Table 1-2. Event Description Reference (continued)

Description Line Item	Explanation
<additional power="" status<="" supply="" td=""><td>Specifies information pertaining to the event, for example:</td></additional>	Specifies information pertaining to the event, for example:
information>	Power supply input AC is off, Power supply POK (power OK) signal is not normal, Power supply is turned off
Chassis intrusion state: <intrusion< td=""><td>Specifies the chassis intrusion state (open or closed), for example:</td></intrusion<>	Specifies the chassis intrusion state (open or closed), for example:
state>	Chassis intrusion state: Open
Chassis location: <name chassis="" of=""></name>	Specifies name of the chassis that generated the message, for example:
	Chassis location: Main System Chassis
Configuration error type:	Specifies the type of configuration error that occurred, for example:
<pre><type configuration="" error="" of=""></type></pre>	Configuration error type: Revision mismatch
Current sensor value (in Amps): <reading></reading>	Specifies the current sensor value in amps, for example:
	Current sensor value (in Amps): 7.853
Date and time of action: <date and="" time=""></date>	Specifies the date and time the action was performed, for example:
	Date and time of action: Sat Jun 12 16:20:33 2004
Device location: <location chassis="" in=""></location>	Specifies the location of the device in the specified chassis, for example:
	Device location: Memory Card A
Discrete current state: <state></state>	Specifies the state of the current sensor, for example:
	Discrete current state: Good

Table 1-2. Event Description Reference (continued)

Description Line Item	Explanation	
Discrete temperature state: <state></state>	Specifies the state of the temperature sensor, for example:	
	Discrete temperature state: Good	
Discrete voltage state: <state></state>	Specifies the state of the voltage sensor, for example:	
	Discrete voltage state: Good	
Fan sensor value: <reading></reading>	Specifies the fan speed in revolutions per minute (RPM) or On/Off, for example:	
	Fan sensor value (in RPM): 2600	
	Fan sensor value: Off	
Log type: <log type=""></log>	Specifies the type of hardware log, for example:	
	Log type: ESM	
Memory device bank location: <bank in<="" name="" td=""><td>Specifies the name of the memory bank in the system that generated the message, for example:</td></bank>	Specifies the name of the memory bank in the system that generated the message, for example:	
chassis>	Memory device bank location: Bank_1	
Memory device location: <device in<="" name="" td=""><td colspan="2">Specifies the location of the memory module in the chassis, for example:</td></device>	Specifies the location of the memory module in the chassis, for example:	
chassis>	Memory device location: DIMM_A	
Number of devices required for full redundancy: <number></number>	Specifies the number of power supply or cooling devices required to achieve full redundancy, for example:	
	Number of devices required for full redundancy: 4	
Possible memory module event cause: <list of<="" td=""><td>Specifies a list of possible causes for the memory module event, for example:</td></list>	Specifies a list of possible causes for the memory module event, for example:	
causes>	Possible memory module event cause: Single bit warning error rate exceeded	

Table 1-2. Event Description Reference (continued)

Description Line Item	Explanation	
Power Supply type:	Specifies the type of power supply, for example:	
<type of="" power="" supply=""></type>	Power Supply type: VRM	
Previous redundancy state was: <state></state>	Specifies the status of the previous redundancy message, for example:	
	Previous redundancy state was: Lost	
Previous state was: <state></state>	Specifies the previous state of the sensor, for example:	
	Previous state was: OK (Normal)	
Processor sensor status: <status></status>	Specifies the status of the processor sensor, for example:	
	Processor sensor status: Configuration error	
Redundancy unit: <pre><redundancy in<="" location="" pre=""></redundancy></pre>	Specifies the location of the redundant power supply or cooling unit in the chassis, for example:	
chassis>	Redundancy unit: Fan Enclosure	
Sensor location: <location chassis="" in=""></location>	Specifies the location of the sensor in the specified chassis, for example:	
	Sensor location: CPU1	
Temperature sensor value: <reading></reading>	Specifies the temperature in degrees Celsius, for example:	
	Temperature sensor value (in degrees Celsius): 30	
Voltage sensor value (in Volts): <reading></reading>	Specifies the voltage sensor value in volts, for example:	
	Voltage sensor value (in Volts): 1.693	

Event Message Reference

The following tables lists in numerical order each event ID and its corresponding description, along with its severity and cause.

NOTE: For corrective actions, see the appropriate documentation.

Miscellaneous Messages

Miscellaneous messages in Table 2-1 indicate that certain alert systems are up and working.

Table 2-1. Miscellaneous Messages

Event ID	Description	Severity	Cause
0000	Log was cleared	Information	User cleared the log from Server Administrator.
0001	Log backup created	Information	The log was full, copied to backup, and cleared.
1000	Server Administrator starting	Information	Server Administrator is beginning to initialize.
1001	Server Administrator startup complete	Information	Server Administrator completed its initialization.
1002	A system BIOS update has been scheduled for the next reboot	Information	The user has chosen to update the flash basic input/output system (BIOS).
1003	A previously scheduled system BIOS update has been canceled	Information	The user decides to cancel the flash BIOS update, or an error occurs during the flash.

Table 2-1. Miscellaneous Messages (continued)

Event ID	Description	Severity	Cause
1004	Thermal shutdown protection has been initiated	Error	This message is generated when a system is configured for thermal shutdown due to an error event. If a temperature sensor reading exceeds the error threshold for which the system is configured, the operating system shuts down and the system powers off. This event may also be initiated on certain systems when a fan enclosure is removed from the system for an extended period of time.
1005	SMBIOS data is absent	Warning	The system does not contain the required systems management BIOS version 2.2 or higher, or the BIOS is corrupted.
1006	Automatic System Recovery (ASR) action was performed Action performed was: <action> Date and time of action: <date and="" time=""></date></action>	Error	This message is generated when an automatic system recovery action is performed due to a hung operating system. The action performed and the time of action are provided.
1007	User initiated host system control action Action requested was: <action></action>	Information	User requested a host system control action to reboot, power off, or power cycle the system. Alternatively the user had indicated protective measures to be initiated in the event of a thermal shutdown.

Table 2-1. Miscellaneous Messages (continued)

Event ID	Description	Severity	Cause
1008	Systems Management Data Manager Started	Information	Systems Management Data Manager services were started.
1009	Systems Management Data Manager Stopped	Information	Systems Management Data Manager services were stopped.
1011	RCI table is corrupt	Warning	This message is generated when the BIOS Remote Configuration Interface (RCI) table is corrupted or cannot be read by the systems management software.
1012	IPMI Status Interface: <the being="" interface="" ipmi="" used="">, <additional and="" applicable="" available="" if="" information=""></additional></the>	Information	This message is generated to indicate the Intelligent Platform Management Interface (IPMI)) status of the system. Additional information, when available, includes Baseboard Management Controller (BMC) not present, BMC not responding, System Event Log (SEL) not present, and SEL Data Record (SDR) not present.

Temperature Sensor Messages

Temperature sensors listed in Table 2-2 help protect critical components by alerting the systems management console when temperatures become too high inside a chassis. The temperature sensor messages use additional variables: sensor location, chassis location, previous state, and temperature sensor value or state.

Table 2-2. Temperature Sensor Messages

Event ID	Description	Severity	Cause	
1050	Temperature sensor has failed	Information	A temperature sensor on the backplane board, system board, or the carrier in the specified system failed. The sensor location, chassis	
	Sensor location: <location chassis="" in=""></location>			
	Chassis location: <name chassis="" of=""></name>			
	Previous state was: <state></state>		location, previous	
	If sensor type is not discrete:		A temperature sensor value are provided. A temperature sensor on the backplane board, system board, or drive carrier in the specified system could not obtain a reading. The sensor location, chassis location, previous state, and a nominal temperature sensor value are provided.	
	Temperature sensor value (in degrees Celsius): <reading></reading>			
	If sensor type is discrete:			
	Discrete temperature state: <state></state>			
1051	Temperature sensor value unknown	Information		
	Sensor location: <location chassis="" in=""></location>			
	Chassis location: <name chassis="" of=""></name>			
	If sensor type is not discrete:

1053	Temperature sensor detected a warning value	Warning	A temperature sensor on the backplane
	Sensor location: <location chassis="" in=""></location>		board, system board, CPU, or drive carrier
	Chassis location: <name chassis="" of=""></name>		in the specified system exceeded its warning threshold.
	Previous state was: <state></state>		The sensor location,
	If sensor type is not discrete:		chassis location, previous state, and temperature sensor
	Temperature sensor value (in degrees Celsius): <reading></reading>		value are provided.
	If sensor type is discrete:		
	Discrete temperature state: <state></state>		

 Table 2-2.
 Temperature Sensor Messages (continued)

Event ID	Description	Severity	Cause
1054	Temperature sensor detected a failure value	Error	A temperature sensor on the backplane
	Sensor location: <location chassis="" in=""></location>		board, system board, or drive carrier in the specified system
	Chassis location: <name chassis="" of=""></name>		exceeded its failure threshold. The sensor
	Previous state was: <state></state>		location, chassis
	If sensor type is not discrete:		location, previous state, and temperature sensor
	<pre>Temperature sensor value (in degrees Celsius): <reading></reading></pre>		value are provided.
	If sensor type is discrete:		
	Discrete temperature state: <state></state>		
1055	Temperature sensor detected a non-recoverable value	Error	A temperature sensor on the backplane
	Sensor location: <location chassis="" in=""></location>		board, system board, or drive carrier in the
	Chassis location: <name chassis="" of=""></name>		specified system detected an error from which it cannot
	Previous state was: <state></state>		recover. The sensor
	If sensor type is not discrete:		location, chassis location, previous state, and
	Temperature sensor value (in degrees Celsius): <reading></reading>		temperature sensor value are provided.
	If sensor type is discrete:		•
	Discrete temperature state: <state></state>		

Cooling Device Messages

Cooling device sensors listed in Table 2-3 monitor how well a fan is functioning. Cooling device messages provide status and warning information for fans in a particular chassis.

Table 2-3. Cooling Device Messages

Event ID	Description	Severity	Cause
1100	Fan sensor has failed	Information	A fan sensor in the specified system is not functioning. The
	Sensor location: <location in<br="">chassis></location>		sensor location, chassis location, previous state, and fan sensor value are provided.
	Chassis location: <name chassis="" of=""></name>

	If sensor type is discrete:		
	Discrete voltage state: <state></state>		

Current Sensor Messages

Current sensors listed in Table 2-5 measure the amount of current (in amperes) that is traversing critical components. Current sensor messages provide status and warning information for current sensors in a particular chassis.

Table 2-5. Current Sensor Messages

Event ID	Description	Severity	Cause
1200	Current sensor has failed	Information	A current sensor in the specified system failed. The sensor location, chassis location, previous state, and current sensor value are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>

Chassis Intrusion Messages

Chassis intrusion messages listed in Table 2-6 are a security measure. Chassis intrusion means that someone is opening the cover to a system's chassis. Alerts are sent to prevent unauthorized removal of parts from a chassis.

Table 2-6. Chassis Intrusion Messages

Event ID	Description	Severity	Cause
1250	Chassis intrusion sensor has failed	Information	A chassis intrusion sensor in the specified system failed. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		
1251	Chassis intrusion sensor value unknown	Information	A chassis intrusion sensor in the specified system could not obtain a reading. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		

Table 2-6. Chassis Intrusion Messages (continued)

Event ID	Description	Severity	Cause
1252	Chassis intrusion returned to normal	Information	A chassis intrusion sensor in the specified system detected that a cover was opened while the system was operating but has
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		since been replaced. The sensor location,
	Previous state was: <state></state>		chassis location, previous state, and chassis
	Chassis intrusion state: <intrusion state=""></intrusion>		intrusion state are provided.
1253	Chassis intrusion in progress	Warning	A chassis intrusion sensor in the specified system detected that a system cover is currently being opened and the system is operating. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		

Table 2-6. Chassis Intrusion Messages (continued)

Event ID	Description	Severity	Cause
1254	Chassis intrusion detected	Error	A chassis intrusion sensor in the specified system detected that the system cover was opened while the system was operating. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		
1255	Chassis intrusion sensor detected a non-recoverable value	Error	A chassis intrusion sensor in the specified system detected an error from which it cannot recover. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		

Chassis Management Controller Messages

Alerts sent by Dell's M1000e Chassis Management Controller (CMC) are organized by severity. That is, the event ID of the CMC trap indicates the severity (informational, warning, critical, or non-recoverable) of the alert. Each CMC alert includes the originating system name, location, and event message text. The alert message text matches the corresponding Chassis Event Log message text that is logged by the sending CMC for that event. Table 2-7 lists the Chassis Management Controller messages.

Table 2-7. Chassis Management Controller Messages

EventID	Description	Severity	Cause
2000	CMC generated a test trap	Informational	A user-initiated test trap was issued, through the CMC GUI or racadm CLI.
2002	CMC reported a return-to-normal or informational	Informational	CMC informational event, as described in the drsCAMessage variable binding supplied with the alert.
2003	CMC reported a warning	Warning	CMC warning event, as described in the drsCAMessage variable supplied with the alert.
2004	CMC reported a critical event	Critical	CMC critical event, as described in the drsCAMessage variable binding supplied with the alert.
2005	CMC reported a non-recoverable event	Non-Recoverable	CMC non-recoverable event, as described in the drsCAMessage variable binding supplied with the alert.

Redundancy Unit Messages

Redundancy means that a system chassis has more than one of certain critical components. Fans and power supplies, for example, are so important for preventing damage or disruption of a computer system that a chassis may have "extra" fans or power supplies installed. Redundancy allows a second or *n*th fan to keep the chassis components at a safe temperature when the primary fan has failed. Redundancy is normal when the intended number of critical components are operating. Redundancy is degraded when a component fails but others are still operating. Redundancy is lost when the number of components functioning falls below the redundancy threshold. Table 2-8 lists the redundancy unit messages.

The number of devices required for full redundancy is provided as part of the message, when applicable, for the redundancy unit and the platform. For details on redundancy computation, see the respective platform documentation.

Table 2-8. Redundancy Unit Messages

Event ID	Description	Severity	Cause
1300	Redundancy sensor has failed	Information	A redundancy sensor in the specified system failed.
	Redundancy unit: <redundancy location<br="">in chassis></redundancy>		The redundancy unit location, chassis location, previous redundancy state, and the
	Chassis location: <name chassis="" of=""></name>		number of devices required for full redundancy are provided.
	Previous redundancy state was: <state></state>		-

Table 2-8. Redundancy Unit Messages (continued)

Event ID	Description	Severity	Cause
1301	Redundancy sensor value unknown	Information	A redundancy sensor in the specified system could not
	Redundancy unit: <redundancy location<br="">in chassis></redundancy>		obtain a reading. The redundancy unit location, chassis location, previous redundancy state, and the
	Chassis location: <name chassis="" of=""></name>		number of devices required for full redundancy
	Previous redundancy state was: <state></state>		are provided.
1302	Redundancy not applicable	Information	A redundancy sensor in the specified system detected
	Redundancy unit: <redundancy location<br="">in chassis></redundancy>		that a unit was not redundant. The redundancy location, chassis location, previous redundancy state, and the
	Chassis location: <name chassis="" of=""></name>		number of devices required for full redundancy are
	Previous redundancy state was: <state></state>		provided.
1303	Redundancy is offline	Information	A redundancy sensor in the
	Redundancy unit: <redundancy location<br="">in chassis></redundancy>		specified system detected that a redundant unit is offline. The redundancy unit location, chassis location,
	Chassis location: <name chassis="" of=""></name>		previous redundancy state, and the number of devices
	Previous redundancy state was: <state></state>		required for full redundancy are provided.

Table 2-8. Redundancy Unit Messages (continued)

Event ID	Description	Severity	Cause
1304	Redundancy regained Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Information	A redundancy sensor in the specified system detected that a "lost" redundancy device has been reconnected or replaced; full redundancy is in effect. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1305	Redundancy degraded Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Warning	A redundancy sensor in the specified system detected that one of the components of the redundancy unit has failed but the unit is still redundant. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1306	Redundancy lost Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Error	A redundancy sensor in the specified system detected that one of the components in the redundant unit has been disconnected, has failed, or is not present. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.

Power Supply Messages

Power supply sensors monitor how well a power supply is functioning. Power supply messages listed in Table 2-9 provide status and warning information for power supplies present in a particular chassis.

Table 2-9. Power Supply Messages

Event ID	Description	Severity	Cause
1350	Power supply sensor has failed Sensor location: <location chassis="" in=""></location>	Information	n A power supply sensor in the specified system failed. The sensor location, chassis location, previous state, and additional power supply status information are provided.
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Power Supply type: <type of="" power="" supply=""></type>		
	<additional information="" power="" status="" supply=""></additional>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Table 2-9. Power Supply Messages (continued)

Event ID	Description	Severity	Cause
1351	Power supply sensor value unknown	Information	A power supply sensor in the specified system could not obtain a reading. The sensor location, chassis location,
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		previous state, and additional power supply
	Previous state was: <state></state>		status information are provided.
	Power Supply type: <type of="" power="" supply=""></type>		A power supply has been reconnected or replaced. The sensor location,
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	<pre>Configuration error type: <type configuration="" error="" of=""></type></pre>		
1352	Power supply returned to normal Sensor location: <location chassis="" in=""></location>	Information	
	Chassis location: <name chassis="" of=""></name>		chassis location, previous state, and additional power supply status
	Previous state was: <state></state>		information are provided.
	Power Supply type: <type of="" power="" supply=""></type>		
	<additional information="" power="" status="" supply=""></additional>		
	If in configuration error state:		
	<pre>Configuration error type: <type configuration="" error="" of=""></type></pre>		

Table 2-9. Power Supply Messages (continued)

Event ID	Description	Severity	Cause
1353	Power supply detected a warning Sensor location: <location chassis="" in=""></location>	Warning	A power supply sensor reading in the specified system exceeded
	Chassis location: <name chassis="" of=""></name>		a user-definable warning threshold. The sensor location, chassis location, previous state, and additional power supply
	Previous state was: <state></state>		
	Power Supply type: <type of="" power="" supply=""></type>		status information are provided.
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
If in configuration error state:			
	<pre>Configuration error type: <type configuration="" error="" of=""></type></pre>		
1354	Power supply detected a failure	Error	A power supply has been disconnected or has failed. The sensor location, chassis location, previous state, and
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>	e add	additional power supply status information
	Previous state was: <state></state>		are provided.
	Power Supply type: <type of="" power="" supply=""></type>		
	<additional information="" power="" status="" supply=""></additional>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Table 2-9. Power Supply Messages (continued)

Event ID	Description	Severity	Cause
1355	Power supply sensor detected a non-recoverable value	Error	A power supply sensor in the specified system detected an error from
	Sensor location: <location chassis="" in=""></location>		which it cannot recover. The sensor location, chassis location, previous
	Chassis location: <name chassis="" of=""></name>		state, and additional power supply status
	Previous state was: <state></state>		information are provided.
	Power Supply type: <type of="" power="" supply=""></type>		
	<additional information="" power="" status="" supply=""></additional>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Memory Device Messages

Memory device messages listed in Table 2-10 provide status and warning information for memory modules present in a particular system. Memory devices determine health status by monitoring the ECC memory correction rate and the type of memory events that have occurred.

NOTE: A critical status does not always indicate a system failure or loss of data. In some instances, the system has exceeded the ECC correction rate. Although the system continues to function, you should perform system maintenance as described in Table 2-9.

NOTE: In Table 2-9, <status> can be either critical or non-critical.

Table 2-10. Memory Device Messages

Event ID	Description	Severity	Cause
1403	1403 Memory device status is Wa <status> Memory device location: <location in<br="">chassis></location></status>	Warning	A memory device correction rate exceeded an acceptable value. The memory device status and location are
	Possible memory module event cause: <pre>causes></pre>		provided.
1404	Memory device status is <status> Memory device location: <location in<br="">chassis></location></status>	Error	A memory device correction rate exceeded an acceptable value, a memory spare bank was activated, or a multibit ECC
	Possible memory module event cause: <list causes="" of=""></list>		error occurred. The system continues to function normally (except for a multibit error). Replace the memory module identified in the message during the system's next scheduled maintenance. Clear the memory error on multibit ECC error. The memory device status and location are provided.

Fan Enclosure Messages

Some systems are equipped with a protective enclosure for fans. Fan enclosure messages listed in Table 2-11 monitor whether foreign objects are present in an enclosure and how long a fan enclosure is missing from a chassis.

Table 2-11. Fan Enclosure Messages

Event ID	Description	Severity	Cause
1450	Fan enclosure sensor has failed	Information	The fan enclosure sensor in the specified system failed.
	Sensor location: <location chassis="" in=""></location>		The sensor location and chassis location are provided.
	Chassis location: <name chassis="" of=""></name>		
1451	Fan enclosure sensor value unknown	Information	The fan enclosure sensor in the specified system could not
	Sensor location: <location chassis="" in=""></location>		obtain a reading. The sensor location and chassis location are provided.
	Chassis location: <name chassis="" of=""></name>		are provided.
1452	Fan enclosure inserted into system	Information	inserted into the specified
	Sensor location: <location chassis="" in=""></location>		system. The sensor location and chassis location are provided.
	Chassis location: <name chassis="" of=""></name>		provided.
1453	Fan enclosure removed from system	Warning	A fan enclosure has been removed from the specified
	Sensor location: <location chassis="" in=""></location>		system. The sensor location and chassis location are provided.
	Chassis location: <name chassis="" of=""></name>		provided.

Table 2-11. Fan Enclosure Messages (continued)

Event ID	Description	Severity	Cause
1454	Fan enclosure removed from system for an extended amount of time	Error	A fan enclosure has been removed from the specified system for a user-definable length of time. The sensor
	Sensor location: <location chassis="" in=""></location>		location and chassis location are provided.
	Chassis location: <name chassis="" of=""></name>		
1455	Fan enclosure sensor detected a non-recoverable value	sp	A fan enclosure sensor in the specified system detected an error from which it cannot
	Sensor location: <location chassis="" in=""></location>		recover. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.

AC Power Cord Messages

AC power cord messages listed in Table 2-12 provide status and warning information for power cords that are part of an AC power switch, if your system supports AC switching.

Table 2-12. AC Power Cord Messages

Event ID	Description	Severity	Cause
1500	AC power cord sensor has failed Sensor location: <location in<br="">chassis></location>	Information	An AC power cord sensor in the specified system failed. The AC power cord status cannot be monitored. The
	Chassis location: <name chassis="" of=""></name>		sensor location and chassis location information are provided.
1501	AC power cord is not being monitored	Information	The AC power cord status is not being monitored. This
	Sensor location: <location chassis="" in=""></location>		occurs when a system's expected AC power configuration is set to
	Chassis location: <name chassis="" of=""></name>		nonredundant. The sensor location and chassis location information are provided.
1502	AC power has been restored	Information	An AC power cord that did not have AC power has had
	Sensor location: <location chassis="" in=""></location>		the power restored. The sensor location and chassis location information
	Chassis location: <name chassis="" of=""></name>		are provided.

Table 2-12. AC Power Cord Messages (continued)

Event ID	Description	Severity	Cause
1503	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Warning	An AC power cord has lost its power, but there is sufficient redundancy to classify this as a warning. The sensor location and chassis location information are provided.
1504	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Error	An AC power cord has lost its power, and lack of redundancy requires this to be classified as an error. The sensor location and chassis location information are provided.
1505	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Error	An AC power cord sensor in the specified system failed. The AC power cord status cannot be monitored. The sensor location and chassis location information are provided.

Hardware Log Sensor Messages

Hardware logs provide hardware status messages to systems management software. On certain systems, the hardware log is implemented as a circular queue. When the log becomes full, the oldest status messages are overwritten when new status messages are logged. On some systems, the log is not circular. On these systems, when the log becomes full, subsequent hardware status messages are lost. Hardware log sensor messages listed in Table 2-13 provide status and warning information about the noncircular logs that may fill up, resulting in lost status messages.

Table 2-13. Hardware Log Sensor Messages

Event ID	Description	Severity	Cause
1550	Log monitoring has been disabled Log type: <log type=""></log>	Information	A hardware log sensor in the specified system is disabled. The log type information is provided.
1551	Log status is unknown Log type: <log type=""></log>	Information	A hardware log sensor in the specified system could not obtain a reading. The log type information is provided.
1552	Log size is no longer near or at capacity Log type: <log type=""></log>	Information	The hardware log on the specified system is no longer near or at its capacity, usually as the result of clearing the log. The log type information is provided.
1553	Log size is near or at capacity Log type: <log type=""></log>	Warning	The size of a hardware log on the specified system is near or at the capacity of the hardware log. The log type information is provided.
1554	Log size is full Log type: <log type=""></log>	Error	The size of a hardware log on the specified system is full. The log type information is provided.
1555	Log sensor has failed Log type: <log type=""></log>	Error	A hardware log sensor in the specified system failed. The hardware log status cannot be monitored. The log type information is provided.

Processor Sensor Messages

Processor sensors monitor how well a processor is functioning. Processor messages listed in Table 2-14 provide status and warning information for processors in a particular chassis.

Table 2-14. Processor Sensor Messages

Event ID	Description	Severity	Cause
1600	Processor sensor has failed	Information	A processor sensor in the specified system is not functioning. The sensor location, chassis location, previous state and processor sensor status are provided.
	Sensor Location: <location chassis="" in=""></location>		
	Chassis Location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		
1601	Ol Processor sensor value Information unknown Sensor Location: <location chassis="" in=""></location>	Information	A processor sensor in the specified system could not obtain a reading. The sensor location, chassis location, previous state and processor sensor status are provided.
	Chassis Location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		

Table 2-14. Processor Sensor Messages (continued)

Event ID	Description	Severity	Cause
1602	Processor sensor returned to a normal value	Information	A processor sensor in the specified system transitioned back to a normal state. The sensor location, chassis location, previous state and processor sensor status are provided.
	Sensor Location: <location chassis="" in=""></location>		
	Chassis Location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		
1603	Processor sensor detected a warning value		A processor sensor in the specified system is in a throttled state. The sensor
	Sensor Location: <location chassis="" in=""></location>		location, chassis location, previous state and processor sensor status are provided.
	Chassis Location: <name chassis="" of=""></name>		sensor status are provided.
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		

 Table 2-14.
 Processor Sensor Messages (continued)

Event ID	Description	Severity	Cause
1604	Processor sensor detected a failure value	Error	A processor sensor in the specified system is disabled, has a configuration error, or
	Sensor Location: <location chassis="" in=""></location>		experienced a thermal trip. The sensor location, chassis location, previous state and
	Chassis Location: <name chassis="" of=""></name>		processor sensor status are provided.
	Previous state was: <state></state>		·
	Processor sensor status: <status></status>		
1605	Processor sensor detected a non- recoverable value	Error	A processor sensor in the specified system has failed. The sensor location, chassis
<pre><location chassis="" in=""></location></pre>	location, previous state and processor sensor status		
	Chassis Location: <name chassis="" of=""></name>		are provided.
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		

Pluggable Device Messages

The pluggable device messages listed in Table 2-15 provide status and error information when some devices, such as memory cards, are added or removed.

Table 2-15. Pluggable Device Messages

Event ID	Description	Severity	Cause
1650	<pre><device event="" plug="" type="" unknown=""></device></pre>	Information	A pluggable device event message of unknown type was received.
	<pre></pre>	The device location, chassis location, and additional event details, if available, are provided.	
1651	Device added to system	Information	A device was added in the specified system. The device
	Device location: <location chassis="" in=""></location>		location, chassis location, and additional event details, if available, are provided.
	Chassis location: <name chassis="" of=""></name>		
	Additional details: <additional details<br="">for the events></additional>		

Table 2-15. Pluggable Device Messages *(continued)*

Event ID	Description	Severity	Cause
1652	Device removed from system	Information	A device was removed from the specified system. The device
	<pre></pre> <pre><location additional="" ev<="" in="" pre=""></location></pre>	location, chassis location, and additional event details, if available, are provided.	
	Chassis location: <name of<br="">chassis></name>	f > nal details: onal details	
	Additional details: <additional details<br="">for the events></additional>		
1653	Device configuration error detected	detected for a plugg	A configuration error was detected for a pluggable device in the specified system. The
	Device location: <location chassis="" in=""></location>		device may have been added to the system incorrectly.
	Chassis location: <name chassis="" of=""></name>		
	Additional details: <additional details<br="">for the events></additional>		

Battery Sensor Messages

Battery sensors monitor how well a battery is functioning. Battery messages listed in Table 2-16 provide status and warning information for batteries in a particular chassis.

Table 2-16. Battery Sensor Messages

Event ID	Description	Severity	Cause
1700	Battery sensor has failed	Information	A battery sensor in
	<pre>Sensor location: <location chassis="" in=""></location></pre>		the specified system is not functioning. The sensor location,
	Chassis location: <name chassis="" of=""></name>		chassis location, previous state, and
	Previous state was: <state></state>		battery sensor status
	Battery sensor status: <status></status>		are provided.
1701	Battery sensor value unknown	Information	A battery sensor in
	<pre>Sensor Location: <location chassis="" in=""></location></pre>		the specified system could not retrieve a reading. The sensor
	Chassis Location: <name chassis="" of=""></name>		location, chassis location, previous
	Previous state was: <state></state>		state, and battery
	Battery sensor status: <status></status>		sensor status are provided.
1702	Battery sensor returned to a normal value	Information	the specified system
	<pre>Sensor Location: <location chassis="" in=""></location></pre>		detected that a battery transitioned back to a normal
	Chassis Location: <name chassis="" of=""></name>		state. The sensor location, chassis
	Previous state was: <state></state>		location, previous
	Battery sensor status: <status></status>		state, and battery sensor status are provided.

Table 2-16. Battery Sensor Messages (continued)

Event ID	Description	Severity	Cause
1703	Battery sensor detected a warning value	Warning	A battery sensor in the specified system detected that a battery is in
	<pre>Sensor Location: <location chassis="" in=""></location></pre>		
	Chassis Location: <name chassis="" of=""></name>		a predictive failure state. The sensor location, chassis
	Previous state was: <state></state>		location, previous
	Battery sensor status: <status></status>		state, and battery sensor status are provided.
1704	Battery sensor detected a failure value	Error	A battery sensor in the specified system detected that a battery has failed. The sensor location,
	Sensor Location: <location chassis="" in=""></location>		
	Chassis Location: <name chassis="" of=""></name>		chassis location, previous state, and
	Previous state was: <state></state>		battery sensor status
	Battery sensor status: <status></status>		are provided.
1705	Battery sensor detected a non-recoverable value	Error	A battery sensor in the specified system
	Sensor Location: <location chassis="" in=""></location>		detected that a battery has failed. The sensor location,
	Chassis Location: <name chassis="" of=""></name>		chassis location, previous state, and
	Previous state was: <state></state>		battery sensor status
	Battery sensor status: <status></status>		are provided.

System Event Log Messages for **IPMI Systems**

The following tables list the system event log (SEL) messages, their severity, and cause.

NOTE: For corrective actions, see the appropriate documentation.

Temperature Sensor Events

The temperature sensor event messages help protect critical components by alerting the systems management console when the temperature rises inside the chassis. These event messages use additional variables, such as sensor location, chassis location, previous state, and temperature sensor value or state.

Table 3-1. Temperature Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> temperature sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring. For example, "PROC Temp" or "Planar Temp."</sensor></reading></sensor></pre>	Critical	Temperature of the backplane board, system board, or the carrier in the specified system <i>Sensor Name/Location</i> exceeded the critical threshold.
Reading is specified in degree Celsius. For example 100 C.		
<pre><sensor location="" name=""> temperature sensor detected a warning <reading>.</reading></sensor></pre>	Warning	Temperature of the backplane board, system board, or the carrier in the specified system <i>Sensor Name/Location></i> exceeded the non-critical threshold.

Table 3-1. Temperature Sensor Events (continued)

Event Message	Severity	Cause
<pre><sensor location="" name=""> temperature sensor returned to warning state <reading>.</reading></sensor></pre>	Warning	Temperature of the backplane board, system board, or the carrier in the specified system <i>Sensor Name/Location</i> > returned from critical state to non-critical state.
<pre><sensor location="" name=""> temperature sensor returned to normal state <reading>.</reading></sensor></pre>	Information	Temperature of the backplane board, system board, or the carrier in the specified system <i>Sensor Name/Location</i> returned to normal operating range.

Voltage Sensor Events

The voltage sensor event messages monitor the number of volts across critical components. These messages provide status and warning information for voltage sensors for a particular chassis.

Table 3-2. Voltage Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> voltage sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring.</sensor></reading></sensor></pre>	Critical	The voltage of the monitored device has exceeded the critical threshold.
Reading is specified in volts. For example, 3.860 V.		
<pre><sensor location="" name=""> voltage sensor state asserted.</sensor></pre>	Critical	The voltage specified by < Sensor Name/Location > is in critical state.
<pre><sensor location="" name=""> voltage sensor state de-asserted.</sensor></pre>	Information	The voltage of a previously reported <pre></pre> <pre><sensor location="" name=""> is returned to normal state.</sensor></pre>

1

Table 3-2. Voltage Sensor Events (continued)

Event Message	Severity	Cause
<pre><sensor location="" name=""> voltage sensor detected a warning <reading>.</reading></sensor></pre>	Warning	Voltage of the monitored entity < Sensor Name/Location > exceeded the warning threshold.
<pre><sensor location="" name=""> voltage sensor returned to normal <reading>.</reading></sensor></pre>	Information	The voltage of a previously reported < Sensor Name/Location > is returned to normal state.

Fan Sensor Events

The cooling device sensors monitor how well a fan is functioning. These messages provide status warning and failure messages for fans for a particular chassis.

Table 3-3. Fan Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> Fan sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring. For example "BMC Back Fan" or "BMC Front Fan."</sensor></reading></sensor></pre>	Critical	The speed of the specified <i>Sensor Name/Location></i> fan is not sufficient to provide enough cooling to the system.
Reading is specified in RPM. For example, 100 RPM.		
<pre><sensor location="" name=""> Fan sensor returned to normal state <reading>.</reading></sensor></pre>	Information	The fan specified by <i>Sensor Name/Location></i> has returned to its normal operating speed.

Table 3-3. Fan Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> Fan sensor detected a warning <reading>.</reading></sensor></pre>	Warning	The speed of the specified <i>Sensor Name/Location</i> > fan may not be sufficient to provide enough cooling to the system.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy degraded.</sensor></pre>	Information	The fan specified by <i>Sensor Name/</i> Location > may have failed and hence, the redundancy has been degraded.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy lost.</sensor></pre>	Critical	The fan specified by <i>Sensor Name/</i> Location > may have failed and hence, the redundancy that was degraded previously has been lost.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy regained</sensor></pre>	Information	The fan specified by <i>Sensor Name/</i> Location > may have started functioning again and hence, the redundancy has been regained.

Processor Status Events

The processor status messages monitor the functionality of the processors in a system. These messages provide processor health and warning information of a system.

Table 3-4. Processor Status Events

Event Message	Severity	Cause
<pre><processor entity=""> status processor sensor IERR, where <processor entity=""> is the processor that generated the event. For example, PROC for a single processor system and PROC # for multiprocessor system.</processor></processor></pre>	Critical	IERR internal error generated by the <i><processor entity=""></processor></i> .
<pre><processor entity=""> status processor sensor Thermal Trip.</processor></pre>	Critical	The processor generates this event before it shuts down because of excessive heat caused by lack of cooling or heat synchronization.
<pre><processor entity=""> status processor sensor recovered from IERR.</processor></pre>	Information	This event is generated when a processor recovers from the internal error.
<pre><processor entity=""> status processor sensor disabled.</processor></pre>	Warning	This event is generated for all processors that are disabled.
<pre><processor entity=""> status processor sensor terminator not present.</processor></pre>	Information	This event is generated if the terminator is missing on an empty processor slot.
<pre>< Processor Entity> presence was deasserted.</pre>	Critical	This event is generated when the system could not detect the processor.
<pre><processor entity=""> presence was asserted.</processor></pre>	Information	This event is generated when the earlier processor detection error was corrected.

Table 3-4. Processor Status Events (continued)

Event Message	Severity	Cause
<pre><processor entity=""> thermal tripped was deasserted.</processor></pre>	Information	This event is generated when the processor has recovered from an earlier thermal condition.
<pre><processor entity=""> configuration error was asserted.</processor></pre>	Critical	This event is generated when the processor configuration is incorrect.
<pre><processor entity=""> configuration error was deasserted.</processor></pre>	Information	This event is generated when the earlier processor configuration error was corrected.
<pre><processor entity=""> throttled was asserted.</processor></pre>	Warning	This event is generated when the processor slows down to prevent over heating.
<pre><processor entity=""> throttled was deasserted.</processor></pre>	Information	This event is generated when the earlier processor throttled event was corrected.

Power Supply Events

The power supply sensors monitor the functionality of the power supplies. These messages provide status and warning information for power supplies for a particular system.

Table 3-5. Power Supply Events

Event Message	Severity	Cause
<pre><power name="" sensor="" supply=""> power supply sensor removed.</power></pre>	Critical	This event is generated when the power supply sensor is removed.
<power name="" sensor="" supply=""> power supply sensor AC recovered.</power>	Information	This event is generated when the power supply has been replaced.
<pre><power name="" sensor="" supply=""> power supply sensor returned to normal state.</power></pre>	Information	This event is generated when the power supply that failed or removed was replaced and the state has returned to normal.

Table 3-5. Power Supply Events (continued)

Event Message	Severity	Cause
<pre><entity name=""> PS Redundancy sensor redundancy degraded.</entity></pre>	Information	Power supply redundancy is degraded if one of the power supply sources is removed or failed.
<pre><entity name=""> PS Redundancy sensor redundancy lost.</entity></pre>	Critical	Power supply redundancy is lost if only one power supply is functional.
<pre><entity name=""> PS Redundancy sensor redundancy regained.</entity></pre>	Information	This event is generated if the power supply has been reconnected or replaced.
<pre><power name="" sensor="" supply=""> predictive failure was asserted</power></pre>	Warning	This event is generated when the power supply is about to fail.
<pre><power name="" sensor="" supply=""> input lost was asserted</power></pre>	Critical	This event is generated when the power supply is unplugged.
<pre><power name="" sensor="" supply=""> predictive failure was deasserted</power></pre>	Information	This event is generated when the power supply has recovered from an earlier predictive failure event.
<power sensor<br="" supply="">Name> input lost was deasserted</power>	Information	This event is generated when the power supply is plugged in.

Memory ECC Events

The memory ECC event messages monitor the memory modules in a system. These messages monitor the ECC memory correction rate and the type of memory events that occurred.

Table 3-6. Memory ECC Events

Event Message	Severity	Cause
ECC error correction detected on Bank # DIMM [A/B].	Information	This event is generated when there is a memory error correction on a particular Dual Inline Memory Module (DIMM).
ECC uncorrectable error detected on Bank # [DIMM].	Critical	This event is generated when the chipset is unable to correct the memory errors. Usually, a bank number is provided and DIMM may or may not be identifiable, depending on the error.
Correctable memory error logging disabled.	Critical	This event is generated when the chipset in the ECC error correction rate exceeds a predefined limit.

BMC Watchdog Events

The BMC watchdog operations are performed when the system hangs or crashes. These messages monitor the status and occurrence of these events in a system.

 Table 3-7.
 BMC Watchdog Events

Event Message	Severity	Cause
BMC OS Watchdog timer expired.	Information	This event is generated when the BMC watchdog timer expires and no action is set.
BMC OS Watchdog performed system reboot.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to reboot.

Table 3-7. BMC Watchdog Events (continued)

Event Message	Severity	Cause
BMC OS Watchdog performed system power off.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to power off.
BMC OS Watchdog performed system power cycle.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to power cycle.

Memory Events

The memory modules can be configured in different ways in particular systems. These messages monitor the status, warning, and configuration information about the memory modules in the system.

Table 3-8. Memory Events

Event Message	Severity	Cause
Memory RAID redundancy degraded.	Information	This event is generated when there is a memory failure in a RAID-configured memory configuration.
Memory RAID redundancy lost.	Critical	This event is generated when redundancy is lost in a RAID-configured memory configuration.
Memory RAID redundancy regained	Information	This event is generated when the redundancy lost or degraded earlier is regained in a RAID-configured memory configuration.
Memory Mirrored redundancy degraded.	Information	This event is generated when there is a memory failure in a mirrored memory configuration.

Table 3-8. Memory Events (continued)

Event Message	Severity	Cause
Memory Mirrored redundancy lost.	Critical	This event is generated when redundancy is lost in a mirrored memory configuration.
Memory Mirrored redundancy regained.	Information	This event is generated when the redundancy lost or degraded earlier is regained in a mirrored memory configuration.
Memory Spared redundancy degraded.	Information	This event is generated when there is a memory failure in a spared memory configuration.
Memory Spared redundancy lost.	Critical	This event is generated when redundancy is lost in a spared memory configuration.
Memory Spared redundancy regained.	Information	This event is generated when the redundancy lost or degraded earlier is regained in a spared memory configuration.

Hardware Log Sensor Events

The hardware logs provide hardware status messages to the system management software. On particular systems, the subsequent hardware messages are not displayed when the log is full. These messages provide status and warning messages when the logs are full.

Table 3-9. Hardware Log Sensor Events

Event Message	Severity	Cause
Log full detected.	Critical	This event is generated when the SEL device detects that only one entry can be added to the SEL before it is full.
Log cleared.	Information	This event is generated when the SEL is cleared.

Drive Events

The drive event messages monitor the health of the drives in a system. These events are generated when there is a fault in the drives indicated.

Table 3-10. Drive Events

Event Message	Severity	Cause
Drive <drive #=""> asserted fault state.</drive>	Critical	This event is generated when the specified drive in the array is faulty.
Drive <drive #=""> de- asserted fault state.</drive>	Information	This event is generated when the specified drive recovers from a faulty condition.
Drive <drive #=""></drive>	Informational	This event is generated when the
drive presence was asserted		drive is installed.
Drive <drive #=""></drive>	Warning	This event is generated when the
predictive failure was asserted		drive is about to fail.
Drive <drive #=""></drive>	Informational	This event is generated when the
predictive failure was deasserted		drive from earlier predictive failure is corrected.
Drive <drive #=""></drive>	Warning	This event is generated when the
hot spare was asserted		drive is placed in a hot spare.
Drive <drive #=""></drive>	Informational This event is generated w drive is taken out of hot s	
hot spare was deasserted		drive is taken out of hot spare.
Drive <drive #=""></drive>	Warning	This event is generated when the
consistency check in progress was asserted		drive is placed in consistency check.
Drive <drive #=""></drive>	Informational	This event is generated when the
consistency check in progress was deasserted		consistency check of the drive is completed.

Table 3-10. Drive Events (continued)

Event Message	Severity	Cause
Drive <drive #=""></drive>	Critical	This event is generated when the
in critical array was asserted		drive is placed in critical array.
Drive <drive #=""></drive>	Informational	This event is generated when the
in critical array was deasserted		drive is removed from critical array.
Drive <drive #=""></drive>	Critical	This event is generated when the
in failed array was asserted		drive is placed in the fail array.
Drive <drive #=""></drive>	Informational	This event is generated when the
in failed array was deasserted		drive is removed from the fail array.
Drive <drive #=""></drive>	Informational	This event is generated when the
rebuild in progress was asserted		drive is rebuilding.
Drive <drive #=""></drive>	Warning This event is generated when t drive rebuilding process is about	This event is generated when the
rebuild aborted was asserted		drive rebuilding process is aborted.

1

Intrusion Events

The chassis intrusion messages are a security measure. Chassis intrusion alerts are generated when the system's chassis is opened. Alerts are sent to prevent unauthorized removal of parts from the chassis.

Table 3-11. Intrusion Events

Event Message	Severity	Cause
<pre><intrusion name="" sensor=""> sensor detected an intrusion.</intrusion></pre>	Critical	This event is generated when the intrusion sensor detects an intrusion.
<pre><intrusion name="" sensor=""> sensor returned to normal state.</intrusion></pre>	Information	This event is generated when the earlier intrusion has been corrected.
<pre></pre>	Critical	This event is generated when the intrusion sensor detects an intrusion while the system is on.
<pre></pre>	Critical	This event is generated when the intrusion sensor detects an intrusion while the system is off.

BIOS Generated System Events

The BIOS-generated messages monitor the health and functionality of the chipsets, I/O channels, and other BIOS-related functions.

Table 3-12. BIOS Generated System Events

Event Message	Severity	Cause
System Event I/O channel chk.	Critical	This event is generated when a critical interrupt is generated in the I/O Channel.
System Event PCI Parity Err.	Critical	This event is generated when a parity error is detected on the PCI bus.
System Event Chipset Err.	Critical	This event is generated when a chip error is detected.
System Event PCI System Err.	Information	This event indicates historical data, and is generated when the system has crashed and recovered.
System Event PCI Fatal Err.	Critical	This error is generated when a fatal error is detected on the PCI bus.
System Event PCIE Fatal Err.	Critical	This error is generated when a fatal error is detected on the PCIE bus.
POST Err POST fatal error # <number> or <error description=""></error></number>	Critical	This event is generated when an error occurs during system boot. See the system documentation for more information on the error code.
Memory Spared redundancy lost	Critical	This event is generated when memory spare is no longer redundant.
Memory Mirrored redundancy lost	Critical	This event is generated when memory mirroring is no longer redundant.
Memory RAID redundancy lost	Critical	This event is generated when memory RAID is no longer redundant.
Err Reg Pointer OEM Diagnostic data event was asserted	Information	This event is generated when an OEM event occurs.

Table 3-12. BIOS Generated System Events (continued)

Event Message	Severity	Cause
System Board PFault Fail Safe state asserted	Critical	This event is generated when the system board voltages are not at normal levels.
System Board PFault Fail Safe state deasserted	Information	This event is generated when earlier PFault Fail Safe system voltages returns to a normal level.
Memory Add (BANK# DIMM#) presence was asserted	Information	This event is generated when memory is added to the system.
Memory Removed (BANK# DIMM#) presence was asserted	Information	This event is generated when memory is removed from the system.
Memory Cfg Err configuration error (BANK# DIMM#) was asserted	Critical	This event is generated when memory configuration is incorrect for the system.
Mem Redun Gain redundancy regained	Information	This event is generated when memory redundancy is regained.
Mem ECC Warning transition to non- critical from OK	Warning	This event is generated when correctable ECC errors have increased from a normal rate.
Mem ECC Warning transition to critical from less severe	Critical	This event is generated when correctable ECC errors reach a critical rate.
Mem CRC Err transition to non- recoverable	Critical	This event is generated when CRC errors enter a non-recoverable state.
Mem Fatal SB CRC uncorrectable ECC was asserted	Critical	This event is generated when CRC errors occur while storing to memory.

Table 3-12. BIOS Generated System Events (continued)

Event Message	Severity	Cause
Mem Fatal NB CRC uncorrectable ECC was asserted	Critical	This event is generated when CRC errors occur while removing from memory.
Mem Overtemp critical over temperature was asserted	Critical	This event is generated when system memory reaches critical temperature.
USB Over-current transition to non- recoverable	Critical	This event is generated when the USB exceeds a predefined current level.
Hdwr version err hardware incompatibility (BMC/iDRAC Firmware and CPU mismatch) was asserted	Critical	This event is generated when there is a mismatch between the BMC and iDRAC firmware and the processor in use or vice versa.
Hdwr version err hardware incompatibility (BMC/iDRAC Firmware and CPU mismatch) was deasserted	Information	This event is generated when the earlier mismatch between the BMC and iDRAC firmware and the processor is corrected.
Hdwr version err hardware incompatibility (BMC/iDRAC Firmware and CPU mismatch) was deasserted	Information	This event is generated when an earlier hardware mismatch is corrected.
SBE Log Disabled correctable memory error logging disabled was asserted	Critical	This event is generated when the ECC single bit error rate is exceeded.

Table 3-12. BIOS Generated System Events (continued)

Event Message	Severity	Cause
CPU Protocol Err transition to non-recoverable	Critical	This event is generated when the processor protocol enters a non-recoverable state.
CPU Bus PERR transition to non-recoverable	Critical	This event is generated when the processor bus PERR enters a non-recoverable state.
CPU Init Err transition to non-recoverable	Critical	This event is generated when the processor initialization enters a non-recoverable state.
CPU Machine Chk transition to non-recoverable	Critical	This event is generated when the processor machine check enters a non-recoverable state.
Logging Disabled all event logging disabled was asserted	Critical	This event is generated when all event logging is disabled.
LinkT/FlexAddr: Link Tuning sensor, device option ROM failed to support link tuning or flex address (Mezz XX) was asserted	Critical	This event is generated when the PCI device option ROM for a NIC does not support link tuning or the Flex addressing feature.
LinkT/FlexAddr: Link Tuning sensor, failed to program virtual MAC address (<location>) was asserted.</location>	Critical	This event is generated when BIOS fails to program virtual MAC address on the given NIC device.

Table 3-12. BIOS Generated System Events (continued)

Event Message	Severity	Cause
PCIE NonFatal Er: Non Fatal IO Group sensor, PCIe error(<location>)</location>	Warning	This event is generated in association with a CPU IERR.
<pre>I/O Fatal Err: Fatal IO Group sensor, fatal IO error (<location>)</location></pre>	Critical	This event is generated in association with a CPU IERR and indicates which device caused the CPU IERR.
Unknown system event sensor	Critical	This event is generated when an unknown hardware failure is detected.
unknown system hardware failure was asserted		

R2 Generated System Events

Table 3-13. R2 Generated Events

Description	Severity	Cause
System Event: OS stop event OS graceful shutdown detected	Information	The OS was shutdown/restarted normally.
OEM Event data record (after OS graceful shutdown/restart event)	Information	Comment string accompanying an OS shutdown/restart.
System Event: OS stop event runtime critical stop	Critical	The OS encountered a critical error and was stopped abnormally.
OEM Event data record (after OS bugcheck event)	Information	OS bugcheck code and paremeters.

Cable Interconnect Events

The cable interconnect messages are used for detecting errors in the hardware cabling.

Table 3-14. Cable Interconnect Events

Description	Severity	Cause
<cable <br="" name="" sensor="">Location></cable>	Critical	This event is generated when the cable is not connected or
Configuration error was asserted.		is incorrectly connected.
<cable <br="" name="" sensor="">Location></cable>	Information	This event is generated when the earlier cable connection
Connection was asserted.		error was corrected.

Battery Events

Table 3-15. Battery Events

Description	Severity	Cause
<pre><battery location="" name="" sensor=""></battery></pre>	Critical	This event is generated when the sensor detects a failed or
Failed was asserted		missing battery.
<pre><battery location="" name="" sensor=""></battery></pre>	Information	This event is generated when the earlier failed battery was
Failed was deasserted		corrected.
<pre><battery location="" name="" sensor=""></battery></pre>	Warning	This event is generated when the sensor detects a low battery
is low was asserted		condition.
<pre><battery location="" name="" sensor=""></battery></pre>	Information	This event is generated when the earlier low battery condition
is low was deasserted		was corrected.

Power And Performance Events

The power and performance events are used to detect degradation in system performance with change in power supply.

Table 3-16. Power And Performance Events

Description	Severity	Cause
System Board Power Optimized: Performance status sensor for System Board, degraded, <description of="" why=""> was deasserted</description>	Normal	This event is generated when system performance was restored.
System Board Power Optimized: Performance status sensor for System Board, degraded, <description of="" why=""> was asserted</description>	Warning	This event is generated when change in power supply degrades system performance.

Entity Presence Events

The entity presence messages are used for detecting different hardware devices.

Table 3-17. Entity Presence Events

Description	Severity	Cause	
<device name=""></device>	Information	This event is generated when the device	
presence was		was detected.	
asserted			
<device name=""></device>	Critical	This event is generated when the device	
absent was asserted		was not detected.	

Storage Management Message Reference

The Dell™OpenManage™ Server Administrator Storage Management's alert or event management features let you monitor the health of storage resources such as controllers, enclosures, physical disks, and virtual disks.

Alert Monitoring and Logging

The Storage Management Service performs alert monitoring and logging. By default, the Storage Management Service starts when the managed system starts up. If you stop the Storage Management Service, then alert monitoring and logging stops. Alert monitoring does the following:

- Updates the status of the storage object that generated the alert.
- Propagates the storage object's status to all the related higher objects in the storage hierarchy. For example, the status of a lower-level object will be propagated up to the status displayed on the Health tab for the top-level Storage object.
- Logs an alert in the Alert log and the operating system (OS) application log.
- Sends an SNMP trap if the operating system's SNMP service is installed and enabled.
- **NOTE:** Dell OpenManage Server Administrator Storage Management does not log alerts regarding the data I/O path. These alerts are logged by the respective RAID drivers in the system alert log.

See the Storage Management Online Help and the Dell OpenManage Server Administrator Storage Management User's Guide for updated information.

Alert Message Format with Substitution **Variables**

When you view an alert in the Server Administrator alert log, the alert identifies the specific components such as the controller name or the virtual disk name to which the alert applies. In an actual operating environment, a storage system can have many combinations of controllers and disks as well as user-defined names for virtual disks and other components. Because each environment is unique in its storage configuration and user-defined names, an accurate alert message requires that the Storage Management Service be able to insert the environment-specific names of storage components into an alert message.

This environment-specific information is inserted after the alert message text as shown for alert 2127 in Table 4-1.

For other alerts, the alert message text is constructed from information passed directly from the controller (or another storage component) to the Alert Log. In these cases, the variable information is represented with a % (percent sign) in the Storage Management documentation. An example of such an alert is shown for alert 2334 in Table 4-1.

Table 4-1. Alert Message Format

Alert ID		Message Text Displayed in the Alert Log with Variable Information Supplied
2127	Background Initialization started	Background Initialization started: Virtual Disk 3 (Virtual Disk 3) Controller 1 (PERC 5/E Adapter)
2334	Controller event log %	Controller event log: Current capacity of the battery is above threshold.: Controller 1 (PERC 5/E Adapter)

The variables required to complete the message vary depending on the type of storage object and whether the storage object is in a SCSI or SAS configuration. The following table identifies the possible variables used to identify each storage object.

NOTE: Some alert messages relating to an enclosure or an enclosure component, such as a fan or EMM, are generated by the controller when the enclosure or enclosure component ID cannot be determined.

Table 4-2. Message Format with Variables for Each Storage Object

Storage Object	Message Variables		
	A, B, C and X, Y, Z in the following examples are variables representing the storage object name or number.		
Controller	Message Format: Controller A (Name)		
	Message Format: Controller A		
	Example: 2326 A foreign configuration has been detected.: Controller 1 (PERC 5/E Adapter)		
	NOTE: The controller name is not always displayed.		
Battery	Message Format: Battery X Controller A		
	Example: 2174 The controller battery has been removed: Battery $\boldsymbol{0}$ Controller $\boldsymbol{1}$		
SCSI Physical	Message Format: Physical Disk X:Y Controller A, Connector B		
Disk	Example: 2049 Physical disk removed: Physical Disk 0:14 Controller 1, Connector 0		
SAS Physical	Message Format: Physical Disk X:Y:Z Controller A, Connector B		
Disk	Example: 2049 Physical disk removed: Physical Disk 0:0:14 Controller 1, Connector 0		
Virtual Disk	Message Format: Virtual Disk X (Name) Controller A (Name)		
	Message Format: Virtual Disk X Controller A		
	Example: 2057 Virtual disk degraded: Virtual Disk 11 (Virtual Disk 11) Controller 1 (PERC 5/E Adapter)		
	NOTE: The virtual disk and controller names are not always displayed.		
Enclosure:	Message Format: Enclosure X:Y Controller A, Connector B		
	Example: 2112 Enclosure shutdown: Enclosure 0:2 Controller 1, Connector $\boldsymbol{0}$		

Table 4-2. Message Format with Variables for Each Storage Object *(continued)*

Storage Object	Message Variables A, B, C and X, Y, Z in the following examples are variables representing the storage object name or number.		
SCSI Power Supply	Message Format: Power Supply X Controller A, Connector B, Target ID C		
	where "C" is the SCSI ID number of the enclosure management module (EMM) managing the power supply.		
	Example: 2122 Redundancy degraded: Power Supply 1, Controller 1, Connector 0, Target ID 6		
SAS Power Supply	Message Format: Power Supply X Controller A, Connector B, Enclosure C		
	Example: 2312 A power supply in the enclosure has an AC failure.: Power Supply 1, Controller 1, Connector 0, Enclosure 2		
SCSI Temperature	Message Format: Temperature Probe X Controller A, Connector B, Target ID C		
Probe	where "C" is the SCSI ID number of the EMM managing the temperature probe.		
	Example: 2101 Temperature dropped below the minimum warning threshold: Temperature Probe 1, Controller 1, Connector 0, Target ID 6		
SAS Temperature	Message Format: Temperature Probe X Controller A, Connector B, Enclosure C		
Probe	Example: 2101 Temperature dropped below the minimum warning threshold: Temperature Probe 1, Controller 1, Connector 0, Enclosure 2		
SCSI Fan	Message Format: Fan X Controller A, Connector B, Target ID C		
	where "C" is the SCSI ID number of the EMM managing the fan.		
	Example: 2121 Device returned to normal: Fan 1, Controller 1, Connector 0, Target ID 6		
SAS Fan	Message Format: Fan X Controller A, Connector B, Enclosure C		
	Example: 2121 Device returned to normal: Fan 1, Controller 1, Connector 0, Enclosure 2		

Table 4-2. Message Format with Variables for Each Storage Object (continued)

Storage Object	Message Variables	
	A, B, C and X, Y, Z in the following examples are variables representing the storage object name or number.	
SCSI EMM	Message Format: EMM X Controller A, Connector B, Target ID C	
	where "C" is the SCSI ID number of the EMM.	
	Example: 2121 Device returned to normal: EMM 1, Controller 1, Connector 0, Target ID 6	
SAS EMM	Message Format: EMM X Controller A, Connector B, Enclosure C	
	Example: 2121 Device returned to normal: EMM 1, Controller 1, Connector 0, Enclosure 2	

Alert Message Change History

The following table describes changes made to the Storage Management alerts from the previous release of Storage Management to the current release.

Table 4-3. Alert Message Change History

Alert Message Change History		
Storage Managem	ent 3.0	Comments
Product Versions to which Changes Apply	Storage Management 3.0 Server Administrator 5.5 Dell OpenManage 5.5	
New Alerts	2060, 2075, 2087, 2125, 2183, 2184, 2185, 2190, 2197, 2198, 2200, 2210, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230 2231, 2236, 2237, 2257, 2258, 2381	
Modified Alerts	2060, 2075, 2087	Updated the alert description, and changed the SNMP trap number to 1201.

Table 4-3. Alert Message Change History (continued)

Alert Message Cha	nge History		
Obsolete Alerts	None		
Documentation Changes	Documentation updated to reflect change in SNMP trap number and description text.		
	2060, 2075, 2087	Updated the alert description, and changed the SNMP trap number to 1201.	
Storage Manageme	ent 2.3	Comments	
Product Versions	Storage Management 2.3		
to which Changes Apply	Server Administrator 3.2		
	Dell OpenManage 5.3		
New Alerts	2369		
Modified Alerts	2095	Added SNMP traps 751 and 851.	
	2294	Removed SNMP traps 752, 802, 852, 902, 952, 1002, 1052, 1102, 1152, and 1202. Added SNMP trap 851.	
	2295	Removed SNMP traps 754, 804, 904, 954, 1004, 1054, 1104, 1154, and 1204. Remaining SNMP trap is 854.	
Obsolete Alerts	2317		
	2363		
Documentation Changes	Documentation updated to indicate related alerts and Local Response Agent (LRA) alerts.		
	2095	Changed documentation for cause.	
	2305	Changed documentation for cause and corrective action.	
		Changed SNMP trap number to 903.	

Table 4-3. Alert Message Change History (continued)

Alert Message Cha	nge History		
	2312	Changed documentation for corrective action in the Storage Management online help.	
	2367	Changed documentation for cause and corrective action.	
Storage Managemo	ent 2.2	Comments	
Product Versions	Storage Management 2.2		
to which Changes Apply	Server Administrator 3.2		
	Dell OpenManage 5.2		
Reduction of unnecessary alert generation	Enhancements to Storage Management avoid numerous redundant or inappropriate alerts posted to the Alert Log after an unexpected system shutdown.	In previous versions of Storage Management, an unexpected system shutdown may have caused the controller to repost a large number of alerts to the Alert Log when restarting the system.	
Modified Alerts	2095	Severity changed to Informational. SNMP trap changed to 901.	
	2153	Severity changed to Informational. SNMP trap changed to 851.	
	2188	Severity changed to Informational. SNMP trap changed to 1151.	
	2192	Changed documentation for cause and corrective action.	
	2202	Severity changed to Informational. SNMP trap changed to 901.	
	2204	Severity changed to Informational. SNMP trap changed to 901.	
	2205	Severity changed to Informational. SNMP trap changed to 901.	
	2266	SNMP traps changed to 751, 801, 851, 901, 951, 1001, 1051, 1101, 1151, 1201.	

Table 4-3. Alert Message Change History (continued)

Alert Message Change History	
2272	Severity changed to Critical. SNMP trap changed to 904. Changed corrective action information in the documentation.
2273	Changed alert message text and documentation for cause and corrective action.
2279	Changed alert message text.
2299	Changed corrective action information in the documentation.
2305	Changed severity to Warning. Changed SNMP trap number to 903.
2331	Changed severity to Informational. Changed SNMP trap number to 901.
2367	Changed severity to Warning. Changed SNMP trap number to 903.

	event numbers removed (see comments).	correspond to the Storage Management alerts, refer to the product documentation prior to Storage Management 2.1 or Dell OpenManage 5.1.				

Alert Descriptions and Corrective Actions

The following sections describe alerts generated by the RAID or SCSI controllers supported by Storage Management. The alerts are displayed in the Server Administrator Alert subtab or through Windows Event Viewer. These alerts can also be forwarded as SNMP traps to other applications.

SNMP traps are generated for the alerts listed in the following sections. These traps are included in the Dell OpenManage Server Administrator Storage Management management information base (MIB). The SNMP traps for these alerts use all of the SNMP trap variables. For more information on SNMP support and the MIB, see the SNMP Reference Guide.

To locate an alert, scroll through the following table to find the alert number displayed on the Server Administrator Alert tab or search this file for the alert message text or number. See "Understanding Event Messages" for more information on severity levels.

For more information regarding alert descriptions and the appropriate corrective actions, see the online help.

Table 4-4. Storage Management Messages

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2048	Device failed	Critical / Failure / Error	Cause: A storage component such as a physical disk or an enclosure has failed. The failed component may have been identified by the controller while performing a task such as a rescan or a check consistency. Action: Replace the failed component. You can identify which disk has failed by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk.	Clear Alert Number: 2121. Related Alert Number: 2095, 2201, 2203 LRA Number: 2051, 2061, 2071, 2081, 2091, 2101	754 804 854 904 954 1004 1054 1104 1154 1204

 Table 4-4.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2049	Physical disk removed	Warning / Non-critical	Cause: A physical disk has been removed from the disk group. This alert can also be caused by loose or defective cables or by problems with the enclosure. Action: If a physical disk was removed from the disk group, either replace the disk or restore the original disk. On some controllers, a removed disk has a red "X" for its status. On other controllers, a removed disk may have an Offline status or is not displayed on the user interface. Perform a rescan after replacing or restoring the disk. If a disk has not been removed from the disk group, then check for problems with the cables. See the online help for more information on checking the cables. Make sure that the enclosure is powered on. If the problem persists, check the enclosure documentation for further diagnostic information.	Clear Alert Number: 2052. Related Alert Number: 2054, 2057, 2056, 2076, 2079, 2081, 2083, 2129, 2202, 2204, 2270, 2292, 2299, 2369 LRA Number: 2070	903

		The disk is likely to fail in Number:	Related Alert Number: None.		
			Action: Replace the disk that has received the SMART alert. If the physical disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk.	LRA Number: 2071	
		NOTICE: Removing a physical disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.			

 Table 4-4.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2108	Smart warning	Warning / Non- critical	Cause: A disk has received a SMART alert (predictive failure). The disk is likely to fail in the near future.	Clear Alert Number: None.	903
			Action: Replace the disk that has received the SMART alert. If the physical disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk.	Related Alert Number: None. LRA Number: 2070	
			NOTICE: Removing a physical disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2109	SMART warning temperature	Warning / Non- critical	an unacceptable temperature and received a	Clear Alert Number: None.	903
			SMART alert (predictive failure). The disk is likely to fail in the near future.	Related Alert Number: None.	
			Action 1: Determine why the physical disk has reached an unacceptable temperature. A variety of factors can cause the excessive temperature. For example, a fan may have failed, the thermosat may be set too high, or the room temperature may be too hot or cold. Verify that the fans in the server or enclosure are working. If the physical disk is in an enclosure, you should check the thermostat settings and examine whether the enclosure is located near a heat source.	LRA Number: 2070	

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2109 contd			Make sure the enclosure has enough ventilation and that the room temperature is not too hot. See the physical disk enclosure documentation for more diagnostic information.		
			Action 2: If you cannot identify why the disk has reached an unacceptable temperature, then replace the disk. If the physical disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk.		
			NOTICE: Removing a physical disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2110	SMART warning degraded	Warning / Non- critical	Cause: A disk is degraded and has received a SMART alert (predictive failure). The disk is likely to fail in the near future. Action: Replace the disk that has received the SMART alert. If the physical disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. NOTICE: Removing a physical disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2070	903
2111	Failure prediction threshold exceeded due to test - No action needed	Warning / Non- critical	Cause: A disk has received a SMART alert (predictive failure) due to test conditions. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2070	903

 Table 4-4.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2112	Enclosure was shut down	Critical / Failure / Error	Cause: The physical disk enclosure is either hotter or cooler than the maximum or minimum allowable temperature range. Action: Check for factors that may cause overheating or excessive cooling. For example, verify that the enclosure fan is working. You should also check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot or too cold. See the enclosure documentation for more diagnostic information.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2091	854
2114	A consistency check on a virtual disk has been paused (suspended)	OK/ Normal	Cause: The check consistency operation on a virtual disk was paused by a user. Action: To resume the check consistency operation, right-click the virtual disk in the tree view and select Resume Check Consistency.	Clear Alert Number: 2115. Related Alert Number: None. LRA Number: None.	1201

2122	Redundancy degraded	Warning / Non- critical	Cause: One or more of the enclosure components has failed. For example, a fan or power supply may have failed. Although the enclosure is currently operational, the failure of additional components could cause the enclosure to fail. Action: Identify and replace the failed component. To identify the failed component, select the enclosure in the tree view and click the Health subtab. Any failed component will be identified with a red "X" on the enclosure's Health subtab. Alternatively, you can select the Storage object and click the	Clear Alert Status: 2124. Related Alert Number: 2048 LRA Number: 2090	1305
2122 contd.			Health subtab. The controller status displayed on the Health subtab indicates whether a controller has a failed or degraded component.		
			See the enclosure documentation for information on replacing enclosure components and for other diagnostic information.		

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2123	Redundancy	Warning / Non- critical	Cause: A virtual disk or an enclosure has lost data redundancy. In the case of a virtual disk, one or more physical disk, one or more physical disk included in the virtual disk have failed. Due to the failed physical disk or disks, the virtual disk is no longer maintaining redundant (mirrored or parity) data. The failure of an additional physical disk will result in lost data. In the case of an enclosure, more than one enclosure component has failed. For example, the enclosure may have suffered the loss of all fans or all power supplies.	Clear Alert Number: 2124. Related Alert Number: 2048, 2049, 2057 LRA Number: 2080, 2090	•
	:	Action: Identify and replace the failed components. To identify the failed component, select the Storage object and click the Health subtab.

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2174	The controller battery has been removed.	Warning / Non- critical	Cause: The controller cannot communicate with the battery, the battery may be removed, or the contact point between the controller and the battery may be burnt or corroded. Action: Replace the battery if it has been removed. If the contact point between the battery and the controller is burnt or corroded, you will need to replace either the battery or the controller, or both. See the hardware documentation for information on how to safely access, remove, and replace the battery.	Clear Alert Number: None. Related Alert Number: 2188, 2318 LRA Number: 2100	1153
2175	The controller battery has been replaced.	OK / Normal	Cause: This alert is for informational purposes. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number: None.	1151

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2178	The controller battery Learn cycle has timed out.	Warning/ Non- critical	Cause: The controller battery must be fully charged before the Learn cycle can begin. The battery may be unable to maintain a full charge causing the Learn cycle to timeout. Additionally, the battery must be able to maintain cached data for a specified period of time in the event of a power loss. For example, some batteries maintain cached data for 24 hours. If the battery is unable to maintain cached data for the required period of time, then the Learn cycle will timeout. Action: Replace the battery pack as the battery is unable to maintain a full charge.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2100	1153
2179	The controller battery Learn cycle has been postponed.	OK / Normal	Cause: This alert is for informational purposes. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number: None.	1151

2269	The physical disk Clear operation has completed.	OK / Normal	Cause: This alert is for informational purposes. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number:	901
2270	The physical disk Clear operation failed.	Critical / Failure / Error	Cause: A Clear task was being performed on a physical disk but the task was interrupted and did not complete successfully. The controller may have lost communication with the disk. The disk may have been removed or the cables may be loose or defective. Action: Verify that the disk is present and not in a Failed state. Make sure the cables are attached securely. See the online help for more information on checking the cables. Restart the Clear task.	None. Clear Alert Number: None. Related Alert Number: None. LRA Number: 2071	904
2271	The Patrol Read corrected a media error.	OK / Normal	Cause: This alert is for informational purposes. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number: None.	901

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2272	Patrol Read found an uncorrectabl e media error.	Critical / Failure / Error	Cause: The Patrol Read task has encountered an error that cannot be corrected. There may be a bad disk block that cannot be remapped.	Clear Alert Number: None. Related Alert Number: None.	904
	Action: Back up your data. If you are able to back up the data successfully, then fully initialize the disk and then restore from back up.	LRA Number: 2071			
2273	A block on the physical disk has been punctured by the controller.	Critical / Failure / Error	Cause: The controller encountered an unrecoverable medium error when attempting to read a block on the physical disk and marked that block as invalid. If the controller encountered the unrecoverable medium error on a source physical disk during a rebuild or reconfigure operation, it will also puncture the corresponding block on the target physical disk. The invalid block will be cleared on a write operation. Action: Back up your data. If you are able to back up the data successfully, then fully initialize the disk and then restore from back up.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2071	904

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2278	The controller battery charge level is below a normal threshold.	OK/ Normal	Cause: The battery is discharging. A battery discharge is a normal activity during the battery Learn cycle. Before completing, the battery Learn cycle recharges the battery. You should receive alert 2179 when the recharge occurs.	Clear Alert Number: None. Related Alert Number: 2199 LRA Number: None.	1154
			Action: Check if the battery Learn cycle is in progress. Alert 2176 indicates that the battery Learn cycle has initiated. The battery also displays the Learn state while the Learn cycle is in progress. If a Learn cycle is not in progress, replace the battery pack.		
2279	The controller battery charge level is operating within normal limits.	OK/ Normal	Cause: This alert is provided for informational purposes. This alert indicates that the battery is recharging during the battery Learn cycle. Action: None	Clear Alert Number: None. Related Alert Number: None. LRA Number: None.	1151

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2280	A disk media error has been corrected.	OK/ Normal	Cause: A disk media error was detected while the controller was completing a background task. A bad disk block was identified. The disk block has been remapped. Action: Consider replacing the disk. If you receive this alert frequently, be sure to replace the disk. You should also routinely back up your data.	Clear Alert Number: None. Related Alert Number: None. LRA Number: None.	1201
2281	Virtual disk has inconsistent data.	OK / Normal	Cause: This alert is for informational purposes. Action: None	Clear Alert Number: None. Related Alert Number: 2127 LRA Number: None.	1201

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2282	Hot spare SMART polling failed.	Critical / Failure / Error	Cause: The controller firmware attempted a SMART polling on the hot spare but was unable to complete it. The controller has lost communication with the hot spare. Action: Check the health of the disk assigned as a hot spare. You may need to replace the disk and reassign the hot spare. Make sure the cables are attached securely. See the Cables Attached Correctly section in the Dell OpenManage Server Administrator Storage Management User's Guide for more information on checking the cables.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2071	904
2283	A redundant path is broken.	Warning / Non- critical	Cause: The controller has two connectors that are connected to the same enclosure. The communication path on one connector has lost connection with the enclosure. The communication path on the other connector is reporting this loss. Action: Make sure the cables are attached securely. Make sure both EMMs are healthy.	Clear Alert Number: 2284. Related Alert Number: None. LRA Number: 2070	903

Table 4-4. Storage Management Messages (continued)

				Related Alert Number: None.	
				LRA Number: None.	

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2289	Multi-bit ECC error.	Critical / Failure / Error	Cause: An error involving multiple bits has been encountered during a read or write operation. The error correction algorithm recalculates parity data during read and write operations. If an error involves only a single bit, it may be possible for the error correction algorithm to correct the error and maintain parity data. An error involving multiple bits, however, usually indicates data loss. In some cases, if the multi-bit error occurs during a read operation, the data on the disk may be correct/valid. If the multi-bit error occurs during a write operation, data loss has occurred.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2061	754
	Action: Replace the dual in-line memory module (DIMM). The DIMM is a part of the controller battery pack. See your hardware documentation for information on replacing the DIMM. You may need to restore data from backup.

			a new physical disk that is the same size or larger than the disk that is being rebuilt. The new physical disk must also use the same technology (for example, SAS or SATA) as the disk being rebuilt. If the rebuild does not start automatically after you have inserted a suitable physical disk, then run the Rebuild task. See the Replacing a Failed Disk section in the Dell OpenManage Server Administrator Storage Management User's Guide for more information.	LRA Number: 2070	

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2306	Bad block table is 80% full.	Warning / Non- critical	Cause: The bad block table is used for remapping bad disk blocks. This table fills, as bad disk blocks are remapped. When the table is full, bad disk blocks can no longer be remapped, and disk errors can no longer be corrected. At this point, data loss can occur. The bad block table is now 80% full.	Clear Alert Number: None. Related Alert Number: 2307 LRA Number: 2070	903
			Action: Back up your data. Replace the disk generating this alert and restore from back up.		
2307	Bad block table is full. Unable to log block %1	Critical / Failure / Error	Cause: The bad block table is used for remapping bad disk blocks. This table fills, as bad disk blocks are remapped. When the table is full, bad disk blocks can no longer be remapped and disk errors can no longer be corrected. At this point, data loss can occur. The %1 indicates a substitution variable. The text for this substitution variable is displayed with the alert in the Alert Log and can vary depending on the situation. Action: Replace the disk generating this alert. If necessary, restore your data from backup.	Clear Alert Number: None. Related Alert Number: 2048 LRA Number: 2071	904

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2309	A physical disk is incompatible.	Warning/ Non- critical	Cause: You have attempted to replace a disk with another disk that is using an incompatible technology. For example, you may have replaced one side of a mirror with a SAS disk when the other side of the mirror is using SATA technology.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2070	903
			Action: See the hardware documentation for information on replacing disks.		
2310	A virtual disk is permanently degraded.	Critical / Failure / Error	Cause: A redundant virtual disk has lost redundancy. This may occur when the virtual disk suffers the failure of multiple physical disks. In this case, both the source physical disk and the target disk with redundant data have failed. A rebuild is not possible because there is no redundancy. Action: Replace the failed disks and restore from backup.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2081	1204

 Table 4-4.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2311	The firmware on the EMMs is not the same version. EMM0 %1 EMM1 %2	Warning / Non-critical	Cause: The firmware on the EMM modules is not the same version. It is required that both modules have the same version of the firmware. This alert may be caused if you attempt to insert an EMM module that has a different firmware version than an existing module. The %1 and %2 indicate a substitution variable. The text for these substitution variables is displayed with the alert in the Alert Log and can vary depending on the situation. Action: Upgrade to the same version of the firmware on both EMM modules.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2090	853
2312	A power supply in the enclosure has an AC failure.	Warning/ Non- critical	Cause: The power supply has an AC failure. Action: Replace the power supply.	Clear Alert Number: 2325. Related Alert Number: 2122, 2324. LRA Number: 2090	1003

Table 4-4. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2313	A power supply in the enclosure has a DC failure.	Warning/ Non- critical	Cause: The power supply has a DC failure. Action: Replace the power supply.	Clear Alert Number: 2323. Related Alert Number: 2122, 2322. LRA Number: 2090	1003
2314	The initialization sequence of SAS components failed during system startup. SAS managemen t and monitoring is not possible.	Critical / Failure / Error	Cause: Storage Management is unable to monitor or manage SAS devices. Action: Reboot the system. If problem persists, make sure you have supported versions of the drivers and firmware. Also, you may need to reinstall Storage Management or Server Administrator because of some missing installation components.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2051	104
2315	Diagnostic message %1	OK / Normal	Cause: This alert is for informational purposes. The %1 indicates a substitution variable. The text for this substitution variable is generated by the utility that ran the diagnostics and is displayed with the alert in the Alert Log. This text can vary depending on the situation. Event ID	Description	Severity	Cause and Action	Related Alert Information	SNMP Trap Numbers
2340	The BGI completed with uncorrectable errors.	Critical / Failure / Error	Cause: The BGI task encountered errors that cannot be corrected. The virtual disk contains physical disks that have unusable disk space or disk errors that cannot be corrected. Action: Replace the physical disk that contains the disk errors. Review other alert messages to identify the physical disk that has errors. If the virtual disk is redundant, you can replace the physical disk and continue using the virtual disk. If the virtual disk is non-redundant, you may need to recreate the virtual disk after replacing the physical disk, After replacing the physical disk, run Check Consistency to check the data.	Clear Alert Number: None. Related Alert Number: None. LRA Number: 2081	1204
