### Introduction

This reference guide documents the Dell OpenManage Server Administrator Common Information Model (CIM) provider contained in the Management Object File (MOF) dccim32.mof.

CIM provides a conceptual model for describing manageable objects in a systems management environment. CIM is a modeling tool rather than a programming language. CIM provides the structure for organizing objects into a model of a managed environment. For modeling a managed environment, CIM makes available a set of abstract and concrete classes of objects. These classes model the basic characteristics of systems, networks, and applications, as well as groupings of management-related data.

For more information about CIM, see the Distributed Management Task Force (DMTF) website at **dmtf.org** and the Microsoft website at **microsoft.com**.

#### Server Administrator

Server Administrator provides a suite of systems management information for keeping track of your networked systems. In addition to providing systems management agents that are independent of the management console, Server Administrator supports these systems management standards: CIM and Simple Network Management Protocol (SNMP).

In addition to supporting systems management industry standards, Server Administrator provides additional systems management information about the specific components of your Dell system.

#### What's New in This Release

The release highlights of 6.5 are:

 New enumeration value (NIC Capabilities) to the Dell\_NetworkPort class. For a list of platforms, Operating Systems, and Browsers support added and deprecated, refer to the *Dell OpenManage Server Administrator Version 6.5 User's Guide* and *Dell Systems Software Support Matrix Version 6.5* at support.dell.com/manuals.

#### **Documenting CIM Classes and Their Properties**

The Dell CIM provider extends support to Dell-specific software and hardware components. The Dell MOF defines the classes for the Dell CIM provider. All of the supported classes and properties in the MOF are documented in this guide.

The following subsections define some of the basic building blocks of CIM classes that are used in describing the dccim32 provider name. These subsections also explain how the elements used in describing these classes are organized. This section does not document the entire CIM schema, but only those classes and properties supported by the dccim32 provider. The list of properties for each supported class varies greatly.

The property values being presented could be NULL or empty string on some systems, although in general, some non-empty values can be expected. Key properties (listed below) always carry non-empty values. It is recommended that you use only the following properties as key attributes:

- CIM\_PhysicalElement: CreationClassName, Tag
- CIM\_System: CreationClassName, Name
- CIM\_LogicalDevice: SystemCreationClassName, SystemName, CreationClassName, DeviceID
- CIM Dependency: Antecedent, Dependent
- CIM\_SoftwareElement: Name, Version, SoftwareElementState, SoftwareElementID, TargetOperatingSystem
- CIM\_SoftwareFeature: IdentifyingNumber, ProductName, Vendor, Version, Name
- CIM\_IRQ: CSCreationClassName, CSName, CreationClassName, IRQNumber
- CIM\_MemoryMappedIO: CSCreationClassName, CSName, CreationClassName, StartingAddress

ı

- CIM\_DMA: CSCreationClassName, CSName, CreationClassName, DMAChannel
- CIM\_RedundancyGroup: CreationClassName, Name
- DELL EsmLog: RecordNumber
- DELL PostLog: RecordNumber
- DELL BIOSExtensions: systemBIOSCharacteristics
- DELL BIOSSettings: DisplayName
- CIM\_ServiceAccessPoint: SystemCreationClassName, SystemName, CreationClassName, Name

#### **Base Classes**

The classes listed in the Server Administrator CIM provider class hierarchy do not have a parent property. These base classes do not derive from another class. The base classes are:

- CIM ManagedSystemElement
- CIM Dependency
- DELL EsmLog
- DELL PostLog
- DELL\_CMApplication
- DELL\_CMDevice
- DELL\_CMDeviceApplications
- DELL\_CMInventory
- DELL CMOS
- DELL CMProductInfo

The CIM\_ManagedSystemElement class is the base class for the system element hierarchy from which all other CIM classes are derived. As a result, CIM\_ManagedSystemElement has no parent. Examples of managed system elements include software components such as files, devices such as hard drives and controllers, and physical subcomponents of devices such as chip sets and cards. For the CIM\_ManagedSystemElement properties, see Caption, CreationClassName, Description, Name, and Status in Table 1-1.

The Dell-defined classes are not defined in the official schema by the DMTF, the industry group that defines the standards for CIM, and hence do not have parent classes. CIM\_Dependency does not have a parent class because it is a relationship or association between two managed system elements.

#### **Parent Classes**

Most classes in the dccim32 provider document both a Class Name and a Parent Class property. The parent class is the class from which any given class inherits its core properties. For example, the CIM\_Controller class has the CIM\_LogicalDevice class as its parent, and has various types of controllers (CIM\_ParallelController, CIM\_SerialController) as its children.

#### **Classes That Describe Relationships**

Classes that derive from CIM\_Dependency have CIM\_Dependency as their parent class, but they are documented in terms of *antecedent* and *dependent* elements in a relationship rather than in terms of common properties. Consider the following relationship between two CIM ManagedSystemElements:

Antecedent CIM PackageCurrentSensor

Dependent CIM\_PhysicalPackage

The CIM\_PackageCurrentSensor class monitors an entire physical package, such as all the components contained in a given system chassis. The CIM\_PhysicalPackage class is dependent on the CIM\_PackageCurrentSensor class for this monitoring function.

#### **Dell-Defined Classes**

Server Administrator has extended some CIM classes and has created new classes to assist in managing systems and their components. In the diagrams that appear in the documentation for each class, those classes created and populated by Dell are designated by the gold (lighter gray) triangle occ.

1

## **Common Properties of Classes**

Many classes have properties such as Caption, Description, and CreationClassName. Table 1-1 defines properties that have the same meaning in every class that has this property and are defined more than once in this guide.

Table 1-1. Common Properties of Classes

Property	Description	Data Type
Caption	Describes the object using a short textual description (one-line string).	string
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.	string
CSCreationClassName	Indicates the computer system's creation class name.	string
CSName	Indicates the computer system's name.	string
CurrentReading	Indicates the actual current value indicated by the sensor in amperes.	sint32
Description	Provides a textual description of the object.	string
LowerThresholdNonCritical	If current reading is between lower threshold noncritical and upper threshold noncritical, the current state is normal. See Figure 3-2.	sint32
LowerThresholdCritical	If the current reading is between upper threshold critical and upper threshold fatal, the current state is critical. See Figure 3-2.	sint32
IsLinear	Indicates that the sensor is linear over its dynamic range.	Boolean

Table 1-1. Common Properties of Classes (continued)

Property	Description	Data Type
Manufacturer	Provides the name of the organization responsible for producing the CIM_PhysicalElement or CIM_SoftwareElement. This may be the entity from whom the element is purchased, but not necessarily. Purchase information is contained in the Vendor property of CIM_Product.	string
Name	Defines the label by which the object is known. When subclassed, the Name property can be overridden to be a Key property.	string
Status	Provides a string indicating the status of the component. Status values include:	string
	Operational Status Values:	
	<b>OK</b> indicates that the object is functioning normally.	
	Degraded means that the item is functioning, but not optimally.	
	Stressed indicates that the element is functioning, but needs attention. Examples of Stressed states are overloaded, overheated, and so on.	
	Nonoperational Status Values:	
	Non-recover means that a nonrecoverable error has occurred.	
	Error means that an element has encountered an operational condition that is severe as compared to its normal mode of operation.	
SystemCreationClassName	Indicates the system's creation class name.	string

Table 1-1. Common Properties of Classes (continued)

Property	Description	Data Type
UnitModifier	Provides the unit multiplier for the values returned by this sensor. All the values returned by this sensor are represented in units of 10 raised to the power of the unit modifier. If the unit modifier is –6, then the units of the values returned are microvolts. The units apply to all numeric properties of the sensor, unless explicitly overridden by the units' qualifier.	sint32
UpperThresholdCritical	If the current reading is between upper threshold critical and upper threshold fatal, the current status is critical. See Figure 3-2.	sint32
UpperThresholdNonCritical	If the current reading is between lower threshold noncritical and lower threshold critical, the current status is noncritical. See Figure 3-2.	sint32
Version	Version should be in the form <major>.<minor>.<revision> or <major>.<minor><letter><revision>; for example, 1.2.3 or 1.2a3.</revision></letter></minor></major></revision></minor></major>	string

#### **Other Documents You May Need**

Besides this *Dell OpenManage Server Administrator CIM Reference Guide*, you can find the following documents on the Dell Support website at support.dell.com/manuals:

- Dell OpenManage Server Administrator User's Guide documents the features, installation, and uninstallation of Server Administrator.
- Dell OpenManage Server Administrator Installation Guide contains instructions to help you install Dell OpenManage Server Administrator.
- Dell OpenManage Management Station Software Installation Guide contains instructions to help you install Dell OpenManage management station software that includes Baseboard Management Utility, DRAC Tools, and Active Directory Snap-In.

- Dell OpenManage Server Administrator Command Line Interface User's Guide explains how to perform tasks using the text-based command line interface.
- Dell OpenManage Server Administrator Messages Reference Guide lists the messages that you can receive on your systems management console or on your operating system's event viewer. This guide explains the text, severity, and cause of each message that the Server Administrator issues.
- Dell OpenManage Server Administrator SNMP Reference Guide documents the SNMP management information base (MIB). The SNMP MIB defines variables that cover the capabilities of Server Administrator systems management agents.
- The *Glossary* for information on terms used in this document.

#### **Typographical Conventions**

The following example shows how most of the classes in the Dell CIM provider are documented. Table 1-2 shows a partial class description for the DELL\_DMA class. (For a full class description, see Table 3-38)

Class Name appears in Courier typeface and provides the string that names the class in the MOF.

**Parent Class** appears in Courier typeface and provides the name of the class from which the present class is derived.

Property denotes the name of the attribute that is being defined for this class.

**Description** includes text that defines the property.

**Data Type** stipulates the format that the values of this property must take. Common data types include Boolean, string, and various types of integer. Boolean indicates that the property must be expressed as one of two alternatives.

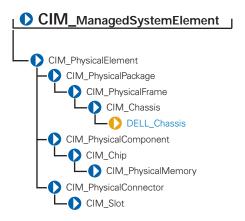

Table 1-2. CIM\_DMA Properties

Class Name:	CIM_DMA	
Parent Class:	CIM_SystemResource	
Property	Description	Data Type
DMAChannel	A part of the object's key value, the DMA channel number.	uint32
Availability	Availability of the DMA. Availability values are defined as follows:	uint16
	1 - Other	
	2 - Unknown	
	3 - Available	
	4 - In Use/Not Available	
	5 - In Use and Available/Shareable	

# CIM\_PhysicalElement

CIM\_PhysicalElement is a CIM-defined class. The CIM PhysicalElement class contains the subclasses shown in Figure 2-1.

Figure 2-1. CIM\_PhysicalElement Class Structure

## **CIM\_PhysicalElement**

Subclasses of the CIM\_PhysicalElement class listed in Table 2-1 define any component of a system that has a distinct physical identity. Physical elements are tangible managed system elements (usually actual hardware items) that have a physical manifestation of some sort. By contrast, processes, files, and logical devices are not classified as physical elements. A managed system element is not necessarily a discrete component. A single card (which is a type of physical element) can host more than one logical device.

One card, for example, could implement both a modem and a local area network (LAN) adapter. In this case, the card would be represented by a single physical element associated with multiple logical devices.

Table 2-1. CIM\_PhysicalElement Properties

Class Name:	CIM_PhysicalElement	
Parent Class:	CIM_ManagedSystemElement	
Property	Description	Data Type
CreationClassN ame	See Table 1-1.	
Manufacturer	See Table 1-1.	
Model	The name by which the physical element is generally known.	string
SerialNumber	A manufacturer-allocated number used to identify the physical element.	string
Tag	Uniquely identifies the physical element and serves as the element's key. The Tag property can contain information such as asset tag or serial number data. The key for physical element is placed very high in the object hierarchy in order to identify the hardware/entity independently, regardless of physical placement in or on cabinets, adapters, and so on. For example, a hotswappable or removable component can be taken from its containing (scoping) package and temporarily unused. The object still continues to exist and may even be inserted into a different scoping container. Therefore, the key for physical element is an arbitrary string that is defined independently of any placement or location-oriented hierarchy.	string

## CIM\_PhysicalPackage

The CIM\_PhysicalPackage class listed in Table 2-2 represents physical elements that contain or host other components. Examples are a rack enclosure or an adapter card with multiple functions.

Table 2-2. CIM\_PhysicalPackage Properties

Class Name:	CIM_PhysicalPackage	
Parent Class:	CIM_PhysicalElement	
Property	Description	Data Type
Removable	A CIM_PhysicalPackage is removable if it is designed to be taken in and out of the physical container in which it is normally found without impairing the function of the overall package.	Boolean
Replaceable	A CIM_PhysicalPackage is replaceable if it is possible to substitute a physically different element for the original element, as in a field replaceable unit (FRU). For example, some computer systems allow the microprocessor to be upgraded to one of a higher clock rating. In this case, the microprocessor is said to be replaceable.	Boolean

# **CIM\_PhysicalFrame**

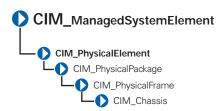

The CIM\_PhysicalFrame class described in Table 2-3 contains other frame enclosures such as racks and chassis. Properties like VisibleAlarm or AudibleAlarm, and data related to security breaches are also members of this class.

Table 2-3. CIM\_Physical Frame Properties

Class Name:	CIM_PhysicalFrame	
Parent Class:	CIM_PhysicalPackage	
Property	Description	Data Type
LockPresent	Indicates whether the frame is protected with a lock.	Boolean
AudibleAlarm	Indicates whether the frame is equipped with an audible alarm.	Boolean
VisibleAlarm	Indicates that the equipment includes a visible alarm.	Boolean
SecurityBreach	An enumerated, integer-valued property indicating that a physical breach of the frame is in progress. Values for the <b>SecurityBreach</b> property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - No breach	
	4 - Breach attempted	
	5 - Breach successful	
IsLocked	Indicates that the frame is currently locked.	Boolean

#### **CIM\_Chassis**

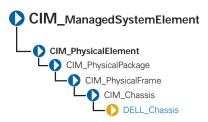

The CIM\_Chassis class described in Table 2-4 represents the physical elements that enclose physical elements such as power supplies, fans, and processors.

Table 2-4. CIM\_Chassis Parent Properties

Class Name:				
Parent Class:				
Property	Description Data Typ			
ChassisTypes	Values for the ChassisTypes property are: uint16			
	1 - Other			
	2 - Unknown			
	3 - Mini-tower			
	4 - Tower			
	5 - Space-saving			
	6 - Main system chassis			
	7 - Expansion chassis			
	8 - Subchassis			
	9 - Space-saving			
	10 - Main system chassis			
	11 - Expansion chassis			
	12 - Subchassis			
	13 - Bus expansion chassis			
	14 - Peripheral chassis			
	15 - Storage chassis			
	16 - Rack-mount chassis			

#### **DELL\_Chassis**

The DELL\_Chassis class explained in Table 2-5 defines the identifying and status properties of the chassis. DELL\_Chassis inherits from CIM-defined classes, but is populated by Dell properties.

Table 2-5. DELL\_Chassis Properties

Class Name:	DELL_Chassis		
Parent Class:	CIM_Chassis		
Property	Description	Data Type	
AssetTag	Indicates the container AssetTag string. This asset tag string is wri by the system administrator.	string	
SystemClass	Refers to the system type that is installed and running the instrumentation. Values for the <b>SystemClass</b> property are:	uint16	
	l - Other		
	2 - Unknown		
	3 - Workstation		
	4 - Server		
	5 - Desktop		
	6 - Portable		
	7 - Net PC		
SystemID	Indicates the system identifier code.	uint16	

Table 2-5. DELL\_Chassis Properties (continued)

Class Name:	DELL_Chassis	
Parent Class:	CIM_Chassis	
Property	Description	Data Type
LogFormat	Defines whether the event log data is unicode formatted or binary (raw). Values for the event <b>LogFormat</b> property are:	uint16
	1 - Formatted (event log only)	
	2 - Unformatted	
	3 - Events_and_POST_Formatted (both the event log and the power-on self-test (POST) log are unicode for matted)	
FanStatus	Indicates the global status of fan sensors.	string
TempStatus	Indicates the global status of temperature sensors.	string
VoltStatus	Indicates the global status of voltage sensors.	string
AmpStatus	Indicates the global status of current sensors.	string
PsStatus	Indicates the global status of power supplies.	string
MemStatus	Indicates the global status of memory devices.	string
ProcStatus	Indicates the global status of processor devices.	string
FanRedStatus	Indicates the global status of the cooling unit.	string
PsRedStatus	Indicates the global status of the power unit.	string
IsDefaultThrSupported	Indicates whether resetting default thresholds are supported.	Boolean
ChassisSystemProperties	Indicates chassis characteristics, such as energy smart and so on.	uint16
ChassisSystemRevision	Indicates the chassis revision.	uint16
EsmLogStatus	Indicates the global status of ESM log.	string
MemoryRedStatus	Indicates the global status of memory redundancy.	string

Table 2-5. DELL\_Chassis Properties (continued)

Class Name:	DELL_Chassis	
Parent Class:	CIM_Chassis	
Property	Description	Data Type

## CIM\_PhysicalComponent

The CIM\_PhysicalComponent class listed in Table 2-6 represents any low-level or basic component within a package. A component object either cannot or does not need to be broken down into its constituent parts. For example, an application specific integrated circuit (ASIC) cannot be broken down into smaller discrete parts.

Table 2-6. CIM\_PhysicalComponent Properties

Class Name:	CIM_PhysicalComponent
Parent Class:	CIM_PhysicalElement

## CIM\_Chip

The CIM\_Chip class listed in Table 2-7 represents any type of integrated circuit hardware, including ASICs, processors, memory chips, and so on.

Table 2-7. CIM\_Chip Properties

Class Name:	CIM_Chip		
Parent Class:	CIM_PhysicalComponent		
Property	Description	Data Type	
FormFactor	0 - Unknown	uint16	
	1 - Other		
	2 - SIP		
	3 - DIP		
	4 - ZIP		
	5 - SOJ		
	6 - Proprietary		
	7 - SIMM		
	8 - DIMM		
	9 - TSOP		
	10 - PGA		
	11 - RIMM		
	12 - SODIMM		
	13 - SRIMM		
	14 - SMD		
	15 - SSMP		
	16 - QFP		
	17 - TQFP		
	18 - SOIC		
	19 - LCC		
	20 - PLCC		
	21 - BGA		
	22 - FPBGA		
	23 - LGA		
	24 - FB-DIMM		

## **CIM\_PhysicalMemory**

The CIM\_PhysicalMemory class described in Table 2-8 is a subclass of CIM\_Chip, representing low-level memory devices, such as SIMMS, DIMMs, and so on.

Table 2-8. CIM\_PhysicalMemory Properties

Class Name:	CIM_PhysicalMemory		
Parent Class:	CIM_Chip		
Property	Description	Data Type	
FormFactor	See Table 2-7.	uint16	
MemoryType	Indicates the type of physical memory. Values for the <b>MemoryType</b> property are:	uint16	
	0 - Unknown		
	1 - Other		
	2 - DRAM		
	3 - Synchronous DRAM		
	4 - Cache DRAM		
	5 - EDO		
	6 - EDRAM		
	7 - VRAM		
	8 - SRAM		
	9 - RAM		
	10 - ROM		

Table 2-8. CIM\_PhysicalMemory Properties (continued)

Class Name:	CIM_PhysicalMemory	
Parent Class:	CIM_Chip	
Property	Description	Data Type
MemoryType	11 - Flash	
(continued)	12 - EEPROM	
	13 - FEPROM	
	14 - EPROM	
	15 - CDRAM	
	16 - 3DRAM	
	17 - SDRAM	
	18 - SGRAM	
	19 - RDRAM	
	20 - DDR	
	21 - DDR2	
	22 - DDR2 FB-DIMM	
	24 - DDR3	
	25 - FBD2	
TotalWidth	Indicates the total width, in bits, of the physical memory, including check or error correction bits. If there are no error correction bits, the value in this property should match that specified for the DataWidth property.	uint16
DataWidth	Indicates the data width, in bits, of the physical memory. A data width of 0 and a total width of 8 would indicate that the memory is solely used to provide error correction bits.	uint16
Speed	Indicates the speed of the physical memory, in nanoseconds.	uint32
SpeedAsString	Indicates the accurate speed of the physical memory, in string format (with units).	string
Capacity	Indicates the total capacity of this physical memory, in bytes.	uint64

Table 2-8. CIM\_PhysicalMemory Properties (continued)

Class Name:	CIM_PhysicalMemory	
Parent Class:	CIM_Chip	
Property	Description	Data Type
BankLabel	A string identifying the physically labeled bank where the memory is located, for example, "Bank 0" or "Bank A."	string
PositionInRow	Specifies the position of the physical memory in a "row." For example, if it takes two 8-bit memory devices to form a 16-bit row, then a value of 2 means that this memory is the second device.  0 is an invalid value for this property.	uint32
InterleavePosition	Indicates the position of this physical memory in an interleave. 0 indicates noninterleaved. 1 indicates the first position, 2 the second position, and so on. For example, in a 2:1 interleave, a value of 1 indicates that the memory is in the "even" position.	uint32

#### CIM\_PhysicalConnector

The CIM\_PhysicalConnector class explained in Table 2-9 includes physical elements such as plugs, jacks, or buses that connect physical elements. Any object that can be used to connect and transmit signals or power between two or more physical elements is a member of this class. For example, slots and D-shell connectors are types of physical connectors. See Table 2-10 for a list of valid connector type values.

Table 2-9. CIM\_PhysicalConnector Properties

Class Name:	CIM_PhysicalConnector		
Parent Class:	CIM_PhysicalElement		
Property	Description	Data Type	
ConnectorPinout	A free-form string describing the pin configuration and signal usage of a physical connector.	string	
ConnectorType	An array of integers defining the type of physical connector. An array is specified to allow the description of "combinations" of connector information. For example, one array entry could specify RS-232, another DB-25, and a third entry could define the connector as male. See Table 2-10 for the values of the ConnectorType property.	uint16	

Table 2-10. Connector Type Values

0 - Unknown	30 - unused	60 - Micro-DIN	90 - On Board IDE
			Connector
1 - Other	31 - unused	61 - PS/2	91 - On Board Floppy
			Connector
2 - Male	32 - IEEE-48	62 - Infrared	92 - 9 Pin Dual Inline
3 - Female	33 - AUI	63 - unused	93 - 25 Pin Dual Inline
4 - Shielded	34 - UTP	64 - Access. bus	94 - 50 Pin Dual Inline
	Category 3		
5 - Unshielded	35 - UTP	65 - unused	95 - 68 Pin Dual Inline
	Category 4		
6 - SCSI (A)	36 - UTP	66 - Centronics	96 - On Board Sound
High-Density (50 pins)	Category 5		Connector
7 - SCSI (A)	37 - BNC	67 - Mini-Centronics	97 - Mini-jack
Low-Density (50 pins)			
8 - SCSI (P)	38 - RJ11	68 - Mini-Centronics	98 - PCI-X
High-Density (68 pins)		Type-14	
9 - SCSI SCA-I (80 pins)	<b>39</b> - RJ45	69 - Mini-Centronics	99 - Sbus IEEE
		Type-20	1396-1993 32-bit
10 - SCSI SCA-II	40 - Fiber MIC	70 - Mini-Centronics	100 - Sbus IEEE
(80 pins)		Type-26	1396-1993 64-bit

Table 2-10. Connector Type Values (continued)

11 - Fibre Channel (DB-9 Copper)	41 - unused	71 - Bus Mouse	101 - unused
12 - Fibre Channel (Fiber Optical)	42 - unused	72 - ADB	102 - GIO

#### CIM\_Slot

The CIM\_Slot class described in Table 2-11 represents connectors into which packages are inserted. For example, a physical package that is a hard drive can be inserted into a small computer system interface-single connector attachment (SCSI-SCA) slot. As another example, a card can be inserted into a 16-, 32-, or 64-bit expansion slot on a host board.

Table 2-11. CIM\_Slot Properties

Class Name:	class CIM_Slot	
Parent Class:	CIM_PhysicalConnector	
Property	Description	Data Type
ConnectorType	See Table 2-10.	uint16
SupportsHotPlug	Indicates whether the slot supports hot-plug adapter cards.	Boolean
MaxDataWidth	Indicates the maximum bus width in bits of adapter cards that can be inserted into this slot. Values for the MaxDataWidth property are as follows:	uint16
	0 - Unknown	
	1 - Other	
	8 - Bits	
	16 - Bits	
	32 - Bits	
	64 - Bits	
	128 - Bits	

Table 2-11. CIM Slot Properties (continued)

Class Name:	class CIM_Slot		
Parent Class:	CIM_PhysicalConnector		
Property	Description	Data Type	
SystemSlotType	Indicates the type of system slot. Values for the SystemSlotType property are as follows:		
	1 - Other		
	2 - Unknown		
	3 - ISA		
	4 - MCA		
	5 - EISA		
	6 - PCI		
	7 - PCMCIA

# **CIM\_LogicalElement**

CIM\_LogicalElement is a CIM-defined class containing the subclasses shown in Figure 3-1.

Figure 3-1. CIM\_LogicalElement Class Structure

### **CIM\_LogicalElement**

Table 3-1 lists the following characteristics for members of the CIM\_LogicalElement class:

- Represent abstractions used to manage and coordinate aspects of a
  physical environment such as files, processes, systems, system capabilities,
  and network components in the form of logical devices
- Represent devices, where devices are abstractions of hardware entities that
  may or may not be realized in physical hardware

Table 3-1. CIM\_LogicalElement Properties

Class Name:	CIM_LogicalElement
Parent Class:	CIM_ManagedSystemElement

### **CIM\_System**

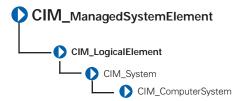

The CIM\_System class shown in Table 3-2 defines a collection of managed system elements that operates as a functional whole. An instance of the CIM\_System class contains a well-defined list of components that work together to perform a specific function.

Table 3-2. CIM\_System Properties

Class Name:	CIM_System	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
CreationClassName	See Table 1-1.	string
Name	Indicates the name of a specific system, such as a particular storage system or server.	string
PrimaryOwnerContact	Provides information on how the primary system owner can be reached, for example, a phone number or e-mail address.	string
PrimaryOwnerName	Indicates the name of the primary system owner.	string
Roles	An array of strings that specifies the roles this system plays in the IT environment. For example, for an instance of a network system, the Roles property might contain the string "storage system."	string

### **CIM\_ComputerSystem**

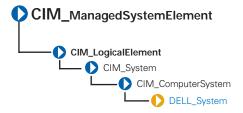

The CIM\_ComputerSystem class listed in Table 3-3 contains some or all of the following CIM\_ManagedSystemElements: file system, operating system, processor, and memory (volatile and/or nonvolatile storage). For properties, see Table 3-2.

Table 3-3. CIM\_ComputerSystem Properties

Class Name: CIM ComputerSystem

Parent Class: CIM\_System

#### DELL\_System

The DELL\_System class listed in Table 3-4 is the set of all Dell instrumented systems, including server, and storage systems. For properties, see Table 3-2.

Table 3-4. DELL\_System Properties

Class Name: DELL\_System

Parent Class: CIM\_ComputerSystem

## CIM\_LogicalDevice

The CIM\_LogicalDevice class described in Table 3-5 models a hardware entity that may be realized in physical hardware. CIM\_LogicalDevice includes any characteristics of a logical device that manages its operation or configuration. An example of a logical device is a temperature sensor's reading of actual temperature.

Table 3-5. CIM\_Logical Device Properties

Class Name:	CIM_LogicalDevice	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
SystemCreationClassName	See Table 1-1.	string
SystemName	Indicates the scoping system's name.	string
CreationClassName	See Table 1-1.	string
DeviceID	Identifies an address or other identifying information to uniquely name the logical device.	string

#### CIM\_FRU

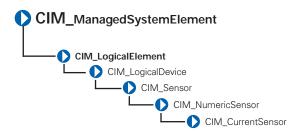

The CIM\_FRU class described in Table 3-6 contains manufacturing information related to the Field Replaceable Units (FRU) of a system such as a system planar or I/O riser card.

Table 3-6. CIM\_FRU Properties

Class Name:	CIM_FRU	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
FRUInformationState	Indicates the state and availability of FRU information.	uint 16
FRUDeviceName	Indicates the device name of the FRU.	string
FRUManufacturingDateName	Indicates the manufacturing date of the FRU in ticks.	datetime
FRUManufacturerName	Indicates the name of the manufacturer.	string
FRUPartNumberName	Indicates the FRU part number.	string
FRUSerialNumberName	Indicates the FRU serial number.	string
FRURevisionName	Indicates the FRU Revision number.	string

#### CIM\_Sensor

The CIM\_Sensor class explained in Table 3-7 contains hardware devices capable of measuring the characteristics of some physical property, for example, the temperature or voltage characteristics of a computer system.

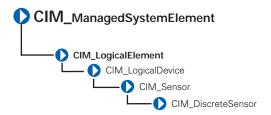

Table 3-7. CIM\_Sensor Properties

Class Name:	CIM_Sensor	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
SensorType	The type of the sensor, for example, voltage or temperature sensor.	uint16
	Values for the SensorType property are:	
	0 - Unknown	
	1 - Other	
	2 - Temperature sensors measure the environmental temperature.	
	3 - Voltage sensors measure electrical voltage.	
	4 - Current sensors measure current readings.	
	5 - Tachometers measure speed/revolutions of a device. For example, a fan device can have an associated tachometer that measures its speed.	
	<b>6</b> - Batteries maintain the time and date and save the system's BIOS configuration when the system is switched off.	
OtherSensorType Description	The type of sensor when the SensorType property is set to <b>Other</b> .	string

Table 3-7. CIM\_Sensor Properties (continued)

Class Name:	CIM_Sensor	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
PossibleStates	Enumerates the string outputs of the sensor. For example, a NumericSensor can report states based on threshold readings.	string
CurrentState	Indicates the current state of the sensor. This value is always one of the Possible States.	string
PollingInterval	Indicates the polling interval, in nanoseconds, that the sensor hardware or instrumentation uses to determine the current state of the sensor.	uint64

## **CIM\_DiscreteSensor**

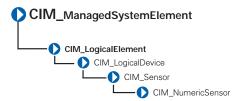

The CIM\_DiscreteSensor class described in Table 3-8 has a set of legal string values that it can report. The CIM\_DiscreteSensor always has a current reading that corresponds to one of the enumerated values.

Table 3-8. CIM\_DiscreteSensor Properties

Class Name:	CIM_DiscreteSensor	
Parent Class:	CIM_Sensor	
Property	Description	Data Type
CurrentReading	See Table 1-1.	sint32
PossibleValues	Enumerates the string outputs that can be reported by the sensor.	sint32

## CIM\_NumericSensor

The CIM\_NumericSensor class described in Table 3-9 returns numeric settings and may also support threshold settings. Figure 3-2 shows the relationship among upper and lower critical and upper and lower non-critical threshold values. The normal range falls between upper and lower non-critical thresholds.

Figure 3-2. Ranges for Threshold Values

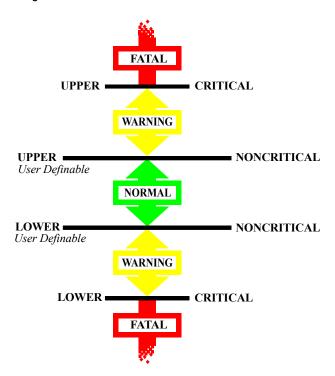

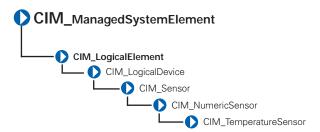

Table 3-9. CIM\_NumericSensor Properties

Class Name:	CIM_NumericSensor	
Parent Class:	CIM_Sensor	
Property	Description	Data Type
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
Lower Threshold Non Critical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32

Table 3-9. CIM\_NumericSensor Properties (continued)

Class Name:	CIM_NumericSensor	
Parent Class:	CIM_Sensor	
Property	Description	Data Type
UpperThresholdCritical	See Table 1-1.	sint32
SupportedThresholds	An array representing the thresholds supported by this sensor. The supported values are as follows:	uint16
	$\ l-Lower Threshold Non Critical$	
	2 - UpperThresholdNonCritical	
	3 - LowerThresholdCritical	
	4 - UpperThresholdCritical	
EnabledThresholds	An array representing the thresholds that are currently enabled for this sensor.	uint16
	Enabled threshold values are as follows:	
	l - LowerThresholdNonCritical	
	2 - UpperThresholdNonCritical	
	3 - LowerThresholdCritical	
	4 - UpperThresholdCritical	
SettableThresholds	An array representing the writable thresholds supported by sensor.	uint16
	Settable threshold values are:	
	1 - LowerThresholdNonCritical	
	2 - UpperThresholdNonCritical	

## **CIM\_TemperatureSensor**

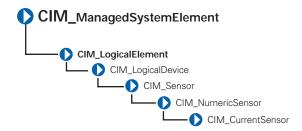

The CIM\_TemperatureSensor class listed in Table 3-10 contains sensors that sample ambient temperature and return a value in degrees Celsius.

Table 3-10. CIM\_TemperatureSensor Properties

Class Name:	CIM_TemperatureSensor	
Parent Class:	CIM_NumericSensor	
Property	Description	Data Type
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32
UpperThresholdCritical	See Table 1-1.	sint32

## **CIM\_CurrentSensor**

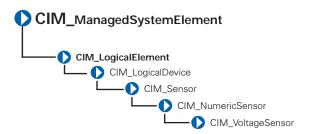

The CIM\_CurrentSensor class listed in Table 3-11 contains sensors that measure amperage and returns a value in amperes and watts.

Table 3-11. CIM\_CurrentSensor Properties

Class Name:	CIM_CurrentSensor	
Parent Class:	CIM_NumericSensor	
Property	Description	Data Type
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32
UpperThresholdCritical	See Table 1-1.	sint32

## CIM\_VoltageSensor

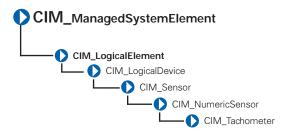

The CIM\_VoltageSensor class shown in Table 3-12 contains sensors that measure voltage and return a value in volts.

Table 3-12. CIM\_VoltageSensor Properties

Class Name:	CIM_VoltageSensor	
Parent Class:	CIM_NumericSensor	
Property	Description	Data Type
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32
UpperThresholdCritical	See Table 1-1.	sint32

## **CIM\_Tachometer**

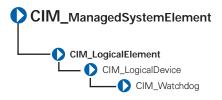

The CIM\_Tachometer class listed in Table 3-13 contains devices that measure revolutions per minute (RPM) of a fan and return the value in RPMs.

Table 3-13. CIM\_Tachometer Properties

Class Name:	CIM_Tachometer	
Parent Class:	CIM_NumericSensor	
Property	Description	Data Type
SensorType	See Table 1-1.	uint16
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32

## CIM\_WatchDog

The CIM\_WatchDog class described in Table 3-14 represents a timer that is implemented in system hardware. The watchdog feature allows the hardware to monitor the state of the operating system, BIOS, or a software component installed on the system. If the monitored component fails to rearm the timer before its expiration, the hardware assumes that the system is in a critical state and could reset the system. This feature can also be used as an application watchdog timer for a mission-critical application. In this case, the application would assume responsibility for rearming the timer before expiration.

Table 3-14. CIM\_WatchDog Properties

Class Name:	CIM_WatchDog	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
MonitoredEntity	Indicates the entity that is currently being monitored by the watchdog feature. This property is used to identify the module that is responsible for rearming the watchdog at periodic intervals. Values for the MonitoredEntity property are:	uint16
	l - Unknown	
	2 - Other	
	3 - Operating System	
MonitoredEntity Description	A string describing additional textual information about the monitored entity.	string
TimeoutInterval	Indicates the time-out interval used by the watchdog, in microseconds.	uint32
TimerResolution	Indicates the resolution of the watchdog timer. For example, if this value is 100, then the timer can expire anytime between –100 microseconds and +100 microseconds.	uint32

## **CIM\_CoolingDevice**

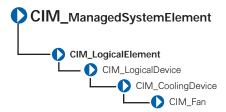

The CIM\_CoolingDevice class described in Table 3-15 contains a set of devices that work to keep the ambient internal temperature of the system at a safe value.

Table 3-15. CIM\_CoolingDevice Properties

Class Name:	CIM_CoolingDevice	
Parent Class:	CIM_LogicalDevice	
Dranarty	Description	Data Tuna
Property	Description	Data Type

#### CIM\_Fan

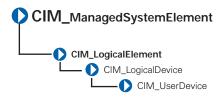

The CIM\_Fan class explained in Table 3-16 contains a set of devices that work to keep the ambient internal temperature of the system at a safe value by circulating air.

Table 3-16. CIM\_Fan Properties

Class Name:	CIM_Fan	
Parent Class:	CIM_CoolingDevice	
Property	Description	Data Type
VariableSpeed	Specifies whether the fan supports variable speeds.	Boolean
DesiredSpeed	Indicates the currently requested fan speed, defined in RPM. When the value = TRUE, the fan supports variable speeds. When a variable speed fan is supported (VariableSpeed Boolean = TRUE), the actual speed is determined using a sensor (CIM_Tachometer) that is associated with the fan.	uint64

#### **CIM UserDevice**

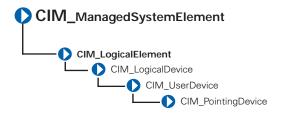

The CIM\_UserDevice class shown in Table 3-17 contains logical devices that allow a computer system's users to input, view, or hear data. Classes derived from CIM\_UserDevice include CIM\_Keyboard and CIM\_PointingDevice.

Table 3-17. CIM\_UserDevice Properties

Class Name:	CIM_UserDevice	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
IsLocked	Indicates whether the device is locked, preventing user input or output.	Boolean

## **CIM\_PointingDevice**

The CIM\_PointingDevice class described in Table 3-18 includes those devices used to point to regions of a display. Examples are a mouse or a trackball.

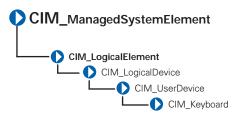

Table 3-18. CIM\_PointingDevice Properties

Class Name:	CIM_PointingDevice	
Parent Class:	CIM_UserDevice	
Property	Description	Data Type
PointingType	Indicates the type of pointing device. Values for the <b>PointingType</b> property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - Mouse	
	4 - Trackball	
	5 - Trackpoint	
	6 - Glidepoint	
	7 - Touch pad	
	8 - Touch screen	
	9 - Mouse—optical sensor	
NumberOfButtons	Indicates the number of buttons. If the CIM_PointingDevice has no buttons, a value of 0 is returned.	uint8

Table 3-18. CIM\_PointingDevice Properties (continued)

Class Name:	CIM_PointingDevice	
Parent Class:	CIM_UserDevice	
Property	Description	Data Type
Handedness	Integer indicating whether the CIM_PointingDevice is configured for right- or left-handed operation. Values for the <b>Handedness</b> property are as follows:	uint16
	0 - Unknown	
	1 - Not applicable	
	2 - Right-handed operation	
	3 - Left-handed operation	

## CIM\_Keyboard

The CIM\_Keyboard class explained in Table 3-19 includes devices that allow users to enter data.

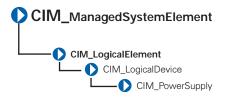

Table 3-19. CIM\_Keyboard Properties

Class Name:	CIM_Keyboard	
Parent Class:	CIM_UserDevice	
Property	Description	Data Type
NumberOfFunctionKeys	Indicates the number of function keys on the keyboard.	uint16
Layout	A free-form string indicating the format and layout of the keyboard.	string

Table 3-19. CIM\_Keyboard Properties (continued)

Class Name:	CIM_Keyboard	
Parent Class:	CIM_UserDevice	
Property	Description	Data Type
Password	An integer indicating whether a hardware-level password is enabled at the keyboard, preventing local input. Values for the <b>Password</b> property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - Disabled	
	4 - Enabled	
	5 - Not implemented	

## CIM\_PowerSupply

The CIM\_PowerSupply class described in Table 3-20 contains devices that provide current and voltage for the operation of the system and its components.

Table 3-20. CIM\_PowerSupply Properties

Class Name:	CIM_PowerSupply	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
IsSwitchingSupply	Indicates that the power supply is a switching power supply and not a linear power supply.	Boolean

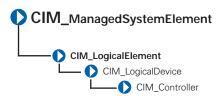

Table 3-20. CIM\_PowerSupply Properties (continued)

Class Name:	CIM_PowerSupply	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
RangelInputVoltageLow	Indicates the low voltage in millivolts of input voltage range 1 for this power supply. A value of 0 denotes unknown.	uint32
RangelInputVoltageHigh	Indicates the high voltage in millivolts of input voltage range 1 for this power supply. A value of 0 denotes unknown.	uint32
ActiveInputVoltage	Indicates which input voltage range is currently in use. Range 1, 2, or both can be specified using the values 3, 4, or 5, respectively. If the supply is not drawing power, a value of 6 (neither) can be specified. This information is necessary in the case of an uninterruptible power supply (UPS), a subclass of power supply. Values for the ActiveInputVoltage property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - Range 1	
	4 - Range 2	
	5 - Both range 1 and range 2	
	6 - Neither range 1 nor range 2	

Table 3-20. CIM\_PowerSupply Properties (continued)

Class Name:	CIM_PowerSupply	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
ActiveInputVoltage	Indicates which input voltage range is currently in use. Range 1, 2, or both can be specified using the values 3, 4, or 5, respectively. If the supply is not drawing power, a value of 6 (neither) can be specified. This information is necessary in the case of an uninterruptible power supply (UPS), a subclass of power supply. Values for the <b>ActiveInputVoltage</b> property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - Range 1	
	4 - Range 2	
	5 - Both range 1 and range 2	
	6 - Neither range 1 nor range 2	
TotalOutputPower	Represents the total output power of the power supply in milliwatts. A value of 0 denotes that the power output is unknown.	uint32
PMCapable	Indicates the Power Monitoring capability.	Boolean

#### **CIM\_Controller**

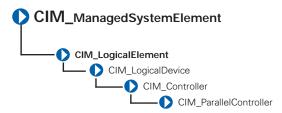

The CIM\_Controller class shown in Table 3-21 groups miscellaneous control-related devices. Examples of controllers are small computer system interface (SCSI) controllers, Universal Serial Bus (USB) controllers, and serial controllers.

Table 3-21. CIM\_Controller Properties

Class Name:	CIM_Controller	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
ProtocolSupported	The protocol used by the controller to access controlled devices. Values for the <b>ProtocolSupported</b> property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - PCI	
	4 - Parallel protocol	

### **CIM\_ParallelController**

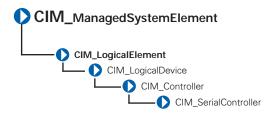

The CIM\_ParallelController class identified in Table 3-22 contains a set of objects that control parallel devices. Parallel controllers transfer 8 or 16 bits of data at a time to the devices they control, for example, a parallel port controlling a printer.

Table 3-22. CIM\_ParallelController Properties

Class Name:	CIM_ParallelController	
Parent Class:	CIM_Controller	
Property	Description	Data Type
DMASupport	Set to TRUE if the parallel controller supports DMA.	Boolean
Security	An enumeration indicating the operational security for the controller. Values for the Security property are:	uint16
	1 - Other	
	2 - Unknown	
	3 - None	
	4 - External interface locked out	
	5 - External interface enabled	
	6 - Boot bypass	

## **CIM\_SerialController**

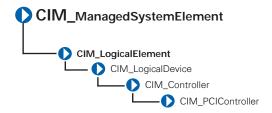

The CIM\_SerialController class explained in Table 3-23 contains controllers that transfer data one bit at a time to the devices they control, for example, a serial port controlling a modem.

Table 3-23. CIM\_SerialController Properties

Class Name:	CIM_SerialController	
Parent Class:	CIM_Controller	
Property	Description	Data Type
MaxBaudRate	Indicates the maximum baud rate in bits per second supported by the serial controller.	uint32
Security	An enumeration indicating the operational security for the controller. Values for the <b>Security</b> property are:	uint16
	l - Other	
	2 - Unknown	
	3 - None	
	4 - External interface locked out	
	5 - External interface enabled	
	6 - Boot bypass	

#### CIM\_PCIController

The CIM\_PCIController class listed in Table 3-24 contains a set of devices that follow the Peripheral Component Interconnect (PCI) protocol defined by the Personal Computer Memory Card International Association (PCMCIA). The PCI protocol defines how data is transferred between devices. The CIM\_PCIController class contains PCI adapters and bridges.

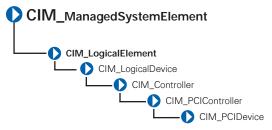

Table 3-24. CIM\_PCIController Properties

Class Name:	CIM_PCIController	
Parent Class:	CIM_Controller	
Property	Description	Data Type
CommandRegister	The current contents of the register that provide basic control over the device's ability to respond to, and/or perform PCI accesses. The data in the capabilities array is gathered from the PCI status register and the PCI capabilities list as defined in the PCI specification.	uint16

Table 3-24. CIM\_PCIController Properties (continued)

Class Name:	CIM_PCIController	
Parent Class:	CIM_Controller	
Property	Description	Data Type
CommandRegister	Values for the CommandRegister property are:	
(continued)	0 - Unknown	
	1 - Other	
	2 - Supports 66 MHz	
	3 - Supports user-definable features	
	4 - Supports fast back-to-back transactions	
	5 - PCI-X capable	
	6 - PCI power management supported	
	7 - Message signaled interrupts supported	
	8 - Parity error recovery capable	
	9 - AGP supported	
	10 - Vital product data supported	
	11 - Provides slot identification	
	12 - Hot swap supported	

#### CIM\_PCIDevice

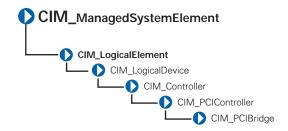

The CIM\_PCIDevice class shown in Table 3-25 describes the capabilities and management of a PCI device controller on an adapter card.

Table 3-25. CIM\_PCIDevice Properties

Class Name:	CIM_PCIDevice	
Parent Class:	CIM_PCIController	
Property	Description	Data Type
BaseAddress	Identifies an array of up to six doubleword base memory addresses.	uint32
SubsystemID	Identifies a subsystem identifier code.	uint16
SubsystemVendorID	Identifies a subsystem vendor ID. ID information is reported from a PCI device via protocol-specific requests. This information is also present in the CIM_PhysicalElement class (the manufacturer property) for hardware, and the CIM_Product class (the vendor property) for information related to product acquisition.	uint16
ExpansionROMBaseAddress	Identifies a double-word expansion ROM base memory address.	uint32

### CIM\_PCIBridge

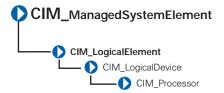

The CIM\_PCIBridge class shown in Table 3-26 describes the capabilities and management of a PCI controller providing bridge-to-bridge capability. An example is a PCI to Industry-Standard Architecture (ISA) bus bridge.

Table 3-26. CIM\_PCIBridge Properties

Class Name:	CIM_PCIBridge
Parent Class:	CIM PCIController

Parent Class:	CIM_PCIController	
Property	Description	Data Type
BaseAddress	Identifies an array of double-word base memory addresses.	uint32
BridgeType	Indicates the type of bridge. A bridge is PCI to <value>, except for the Host, which is a host-to-PCI bridge. Values for the BridgeType property are as follows:</value>	uint16
	0 - Host	
	1 - ISA	
	128 - Other	
BaseAddress	Identifies an array of double-word base memory addresses.	uint32

## **CIM\_Processor**

The CIM\_Processor class described in Table 3-27 contains devices that interpret and execute commands, for example, the Intel Xeon microprocessor.

Table 3-27. CIM\_Processor Properties

Class Name:	CIM_Processor	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
Role	A string describing the role of the microprocessor, for example, central microprocessor or math processor.	string
UpgradeMethod	Provides microprocessor socket information including data on how this microprocessor can be upgraded (if upgrades are supported). This property is an integer enumeration. Values for the UpgradeMethod property are as follows:	uint16
	1 - Other	
	2 - Unknown	
	3 - Daughter board	
	4 - ZIF socket	
	5 - Replacement/piggy back	
	6 - None	
	7 - LIF socket	
	8 - Slot 1	
	9 - Slot 2	
	10 - 370-pin socket	
	19 - Socket mPGA604	
	20 - Socket LGA771	
	21 - Socket LGA775	
	22 - Socket S1	
	23 - Socket AM2	
	24- Socket F (1207)	
	25- Socket LGA1366	
MaxClockSpeed	Indicates the maximum speed (in MHz) of this microprocessor.	uint32
Core count	Indicates the number of core processors detected.	uint16
CoreEnabledCount	Indicates the number of core processors enabled.	uint16

Table 3-27. CIM\_Processor Properties (continued)

Class Name:	CIM_Processor	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
CurrentClockSpeed	Indicates the current speed (in MHz) of this microprocessor.	uint32
DataWidth	Indicates the processor data width in bits.	uint16
AddressWidth	Indicates the processor address width in bits.	uint16
Stepping	Indicates the revision level of the processor within the microprocessor family.	string
UniqueID	Identifies a globally unique identifier for the microprocessor. This identifier may only be unique within a microprocessor family.	string
Brand	Indicates the brand name of the processor.	string
Model	Indicates the model name of the processor.	string
ExtendedCharacteri stics	Indicates the extended capabilities of the processor. This attribute is a bit field. The following are the definitions of a bit when set to one:	uint16
	Bit 0 — Virtualization Technology (VT) supported	
	Bit 1 — Demand-Based Switching (DBS) supported	
	Bit 2 — eXecute Disable (XD) supported	
	Bit 3 — Hyper Threading (HT) supported	
ExtendedStates	Indicates the setting of the extended capabilities of the processor. This attribute is a bit field. The following are the definitions of a bit when set to one:	uint16
	Bit $0$ — Virtualization Technology (VT) enabled	
	Bit 1 — Demand-Based Switching (DBS) enabled	
	Bit 2 — eXecute Disable (XD) enabled	
	Bit 3 — Hyper Threading (HT) enabled	
CPUStatus	Indicates the current status of the microprocessor.	uint16
	For example, it may be disabled by the user through	

Table 3-27. CIM\_Processor Properties (continued)

## CIM\_StorageExtent

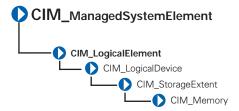

CIM\_StorageExtent identified in Table 3-28 contains devices that manage data storage, for example, hard drives or microprocessor memory.

Table 3-28. CIM\_StorageExtent Properties

Class Name:	CIM_StorageExtent
Parent Class:	CIM_LogicalDevice

### **CIM\_Memory**

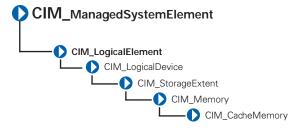

The CIM\_Memory class identified in Table 3-29 describes the capabilities and management of storage extent devices, for example, cache memory or system memory.

Table 3-29. CIM\_Memory Properties

Class Name: CIM\_Memory

Parent Class: CIM\_StorageExtent

#### CIM\_CacheMemory

The CIM\_CacheMemory class explained in Table 3-30 describes the capabilities and management of cache memory. Cache memory allows a microprocessor to access data and instructions faster than normal system memory.

Table 3-30. CIM\_CacheMemory Properties

**Class Name:** CIM CacheMemory **Parent Class:** CIM Memory **Property Data Type** Description Level Defines whether this is the primary, secondary, or mint16 tertiary cache. Values for the Level property are as follows: 1 - Other 2 - Unknown 3 - Primary 4 - Secondary 5 - Tertiary 6 - Not applicable WritePolicy Either defines whether this cache is a write-back or uint16 write-through cache or whether this information varies with address or is defined individually for each input/output (I/O). Values for the WritePolicy property are as follows: 1 - Other 2 - Unknown 3 - Write-back 4 - Write-through 5 - Varies with address 6 - Determination per I/O CacheType Defines whether this cache is for instruction caching, data caching, or both (unified). Values for the CacheType property are as follows: 1 - Other 2 - Unknown 3 - Instruction 4 - Data 5 - Unified

Table 3-30. CIM\_CacheMemory Properties (continued)

Class Name:	CIM_CacheMemory	
Parent Class:	CIM_Memory	
Property	Description	Data Type
LineSize	Indicates the size, in bytes, of a single cache bucket or line.	uint32
ReadPolicy	Defines the policy used by the cache for handling read requests. Values for the <b>ReadPolicy</b> property are as follows:	uint16
	1 - Other	
	2 - Unknown	
	3 - Read	
	4 - Read-ahead	
	5 - Read and read-ahead	
	6 - Determination per I/O	

### CIM\_SoftwareElement

The CIM\_SoftwareElement class described in Table 3-31 is used to define CIM\_SoftwareFeature. The CIM\_SoftwareElement class consists of individually manageable or deployable parts for a particular platform. A software element's platform is uniquely identified by its underlying hardware architecture and operating system (for example, a system running Microsoft Windows Server 2003 on an Intel microprocessor). A software element's implementation on a particular platform depends on the platform's operating system.

Table 3-31. CIM\_SoftwareElement Properties

<del>-</del>	•	
Class Name:	CIM_SoftwareElement	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
Name	Indicates the name that identifies this software element.	string
Version	Provides the version in the form <major>.<minor>.<revision> or <major>.<minor><letter><revision>; for example, 1.2.3 or 1.2a3.</revision></letter></minor></major></revision></minor></major>	string
Manufacturer	See Table 1-1.	string
BuildNumber	Indicates the internal identifier for this build of the software element.	string
IdentificationCode	Provides the manufacturer's identifier for this software element. Often this is a stock keeping unit (SKU) or a part number.	string
SoftwareElementType	Indicates the type of software element. Values for SoftwareElementType are:	uint16
	1 - Other	
	2 - Unknown	
	3 - BIOS	
	4 - ESM	
	5 - PSPB	
	6 - System Backplane	
	7 - Hendrix (PV20x) Kernel	
	8 - Hendrix (PV20x) Application	
	9 - Front Panel	
	10 - BMC	
	11 - Hot Plug PCI	
	12 - SDR	
	13 - Peripheral Bay Backplane	

Table 3-31. CIM\_SoftwareElement Properties (continued)

Class Name:	CIM_SoftwareElement	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
SoftwareElementType	14 - Slimfast Secondary Backplane	uint16
(continued)	15 - Generic Secondary Backplane (ESM 3&4)	
	16 - RAC4	
	17 - iDRAC	
	18 - iDRAC6	
	19 Lifecycle Controller	
	20 Unified Server Configurator	

### **CIM\_BIOSElement**

The CIM\_BIOSElement class listed in Table 3-32 describes the BIOS for the system. The BIOS controls the following:

- Communications between the microprocessor and peripheral devices, such as the keyboard and the video adapter.
- Miscellaneous functions, such as system messages.
- Miscellaneous functions, such as system messages.

Table 3-32. CIM\_BIOSElement Properties

Class Name:	CIM_BIOSElement	
Parent Class:	CIM_SoftwareElement	
Property	Description	Data Type
Version	Provides the product version information.	string
Manufacturer	See Table 1-1	string
PrimaryBIOS	Specifies whether a given BIOS is the primary BIOS for the system. When the value = TRUE, the BIOS is the primary BIOS.	Boolean

#### **CIM\_SoftwareFeature**

The CIM\_SoftwareFeature class shown in Table 3-33 defines a particular function or capability of a product or application system. This class is intended to be meaningful to a consumer, or user of a product, rather than to explain how the product is built or packaged. When a software feature can exist on multiple platforms or operating systems (for example, a client component of a three-tiered client/server application might run on Windows Server 2003), a software feature is a collection of all the software elements for these different platforms. The users of the model must be aware of this situation because typically they are interested in a sub-collection of the software elements required for a particular platform.

Table 3-33. CIM\_SoftwareFeature Properties

Class Name:	CIM_SoftwareFeature	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
IdentifyingNumber	Provides product identification such as a serial number on software.	string
ProductName	Identifies the commonly used product name.	string
Vendor	Identifies the name of the product's supplier. Corresponds to the vendor property in the product object in the DMTF solution exchange standard.	string
Version	Identifies the product version information.  Corresponds to the version property in the product object in the DMTF solution exchange standard.	string
Name	Defines the label by which the object is known to the users. This label is a user-defined name that uniquely identifies the element.	string

#### **DELL\_SoftwareFeature**

The DELL\_SoftwareFeature described in Table 3-34 defines the universal resource locator (URL) of the systems management software and the language in which systems management information displays. Defining these properties enables users to manage a system using an Internet browser. You can access Server Administrator using the secure hypertext transfer protocol (https) and a preassigned port number of 1311, or you can specify a port number of your own choice.

Table 3-34. DELL\_SoftwareFeature Properties

Class Name:	DELL_SoftwareFeature	
Parent Class:	CIM_SoftwareFeature	
Property	Description	Data Type
OmsaURL	Defines the URL for Server Administrator.	string
Language	Sets the language for systems management information.	string
AgentVersion	Defines the version information of local CIM agent (same as ISVC version.)	string

## CIM\_SystemResource

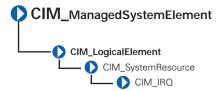

The CIM\_SystemResource class listed in Table 3-35 provides access to system resources from an operating system. SystemResources consist of interrupt requests (IRQs) and direct memory access (DMA) capabilities.

Table 3-35. CIM\_SystemResource Properties

Class Name:	CIM_SystemResource
Parent Class:	CIM_LogicalElement

### CIM\_IRQ

The CIM\_IRQ class described in Table 3-36 contains IRQ information. An IRQ is a signal that data is about to be sent to or received by a peripheral device. The signal travels by an IRQ line to the microprocessor. Each peripheral connection must be assigned an IRQ number. For example, the first serial port in your computer (COM1) is assigned to IRQ4 by default.

Table 3-36. CIM\_IRQ Properties

Class Name:	CIM_IRQ	
Parent Class:	CIM_SystemResource	
Property	Description	Data Type
CSCreationClassName	See Table 1-1.	string
CSName	See Table 1-1.	string
CreationClassName	See Table 1-1.	string
IRQNumber	Identifies the interrupt request number.	uint32
Availability	Indicates the availability of the IRQ. Values for the Availability property are as follows:	uint16
	l - Other	
	2 - Unknown	
	3 - Available	
	4 - In use/not available	
	5 - In use and available	

Table 3-36. CIM\_IRQ Properties (continued)

Class Name:	CIM_IRQ	
Parent Class:	CIM_SystemResource	
Property	Description	Data Type
TriggerLevel	Indicates whether the interrupt is triggered by the hardware signal going high or low. Values for the TriggerLevel property are as follows:	uint16
	1 - Other	
	2 - Unknown	
	3 - Active low	
	4 - Active high	
TriggerType	Indicates whether edge (value=4) or level triggered (value=3) interrupts occur.	uint16
	1 - Other	
	2 - Unknown	
TriggerType	3 - Level	uint16
	4 - Edge	
Shareable	Indicates whether the IRQ can be shared. A value of TRUE indicates that the IRQ can be shared.	Boolean
Hardware	Indicates whether the interrupt is hardware- or software-based. (A value of TRUE indicates that the interrupt is hardware based.) On a personal computer, a hardware IRQ is a physical wire to a programmable interrupt controller (PIC) chip set through which the microprocessor can be notified of time critical events. Some IRQ lines are reserved for standard devices such as the keyboard, diskette drive, and the system clock. A software interrupt is a programmatic mechanism to allow an application to get the attention of the processor.	Boolean

# CIM\_MemoryMappedIO

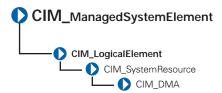

The CIM\_MemoryMappedIO class explained in Table 3-37 addresses both memory and port I/O resources for personal computer architecture memory mapped I/O.

Table 3-37. CIM MemoryMappedIO Properties

Class Name:	CIM_MemoryMappedIO	
Parent Class:	CIM_SystemResource	
Property	Description	Data Type
CSCreationClassName	See Table 1-1.	string
CSName	See Table 1-1.	string
CreationClassName	See Table 1-1.	string
StartingAddress	Identifies the starting address of memory mapped I/O.	uint64
EndingAddress	Identifies the ending address of memory mapped I/O.	uint64
MappedResource	Indicates the type of memory mapped I/O. MappedResource defines whether memory or I/O is mapped, and for I/O, whether the mapping is to a memory or a port space. Memory mapped I/O values are as follows:	uint16
	1 - Other	
	2 - Mapped memory	
	3 - I/O mapped to memory space	
	4 - I/O mapped to port space	

### CIM\_DMA

The CIM\_DMA class explained in Table 3-38 contains DMA information. A DMA channel allows certain types of data transfer between RAM and a device to bypass the microprocessor.

Table 3-38. CIM\_DMA Properties

Class Name:	CIM_DMA	
Parent Class:	CIM_SystemResource	
Property	Description	Data Type
CSCreationClassName	See Table 1-1.	string
CSName	See Table 1-1.	string
CreationClassName	See Table 1-1.	string
DMAChannel	Identifies a part of the object's key value, the DMA channel number.	uint32
Availability	Indicates the availability of the DMA. Values for the <b>Availability</b> property are as follows:	uint16
	1 - Other	
	2 - Unknown	
	3 - Available	
	4 - In use/not available	
	5 - In use and available/shareable	

### CIM\_RedundancyGroup

The CIM\_RedundancyGroup class explained in Table 3-39 is a set of components that provide more instances of a critical component than are required for the system's operation. The extra components are used in case of critical component failure. For example, multiple power supplies allow a working power supply to take over when another power supply has failed.

Table 3-39. CIM\_RedundancyGroup Properties

Class Name:	CIM_RedundancyGroup	
Parent Class:	CIM_LogicalElement	
Property	Description	Data Type
CreationClassName	See Table 1-1	string
Name	Serves as the key for the redundancy group's instance in an enterprise environment.	string
RedundancyStatus	Provides information on the state of the redundancy group. Values for the <b>RedundancyStatus</b> property are as follows:	uint16
	0 - Unknown	
	1 - Other	
	2 - Fully redundant. Fully redundant means that all of the configured redundancy is still available.	
	3 - Degraded redundancy. Degraded redundancy means that some failures have been experienced but some reduced amount of redundancy is still available.	
	4 - Redundancy lost. Redundancy lost means that a sufficient number of failures have occurred so that no redundancy is available and the next failure experienced causes overall failure.	

### CIM\_ExtraCapacityGroup

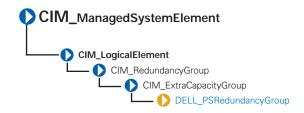

The CIM\_ExtraCapacityGroup class explained in Table 3-40 applies to systems that have more capability and components than are required for normal operation, for example, systems that have extra fans or power supplies.

Table 3-40. CIM\_ExtraCapacityGroup Properties

Class Name:	CIM_ExtraCapacityGroup	
Parent Class:	CIM_RedundancyGroup	
Property	Description	Data Type
MinNumberNeeded	Specifies the smallest number of elements that must be operational in order to have redundancy. For example, in an N+1 redundancy relationship, the MinNumberNeeded property should be set to N.	uint32

### DELL\_PSRedundancyGroup

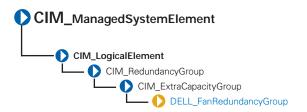

The DELL\_PSRedundancyGroup described in Table 3-41 is a Dell-specific extension of the CIM\_PowerSupply class. The DELL\_PSRedundancyGroup class defines what constitutes power supply redundancy in a system.

Table 3-41. DELL\_PSRedundancyGroup Properties

Class Name: DELL\_PSRedundancyGroup

Parent Class: CIM\_ExtraCapacityGroup

### DELL\_FanRedundancyGroup

The DELL\_FanRedundancyGroup described in Table 3-42 defines what constitutes fan redundancy in a system.

Table 3-42. DELL\_FanRedundancyGroup Properties

Class Name: DELL\_FanRedundancyGroup

Parent Class: CIM\_ExtraCapacityGroup

### CIM\_EnabledLogicalElementGroup

The CIM\_EnabledLogicalElementGroup class described in Table 3-43 extends the CIM\_LogicalElementGroup class to abstract the concept of an element that is enabled or disabled, such as a LogicalDevice or ServiceAccessPoint.

Table 3-43. CIM\_EnabledLogicalElementGroup Properties

Class Name: CIM EnabledLogicalElementGroup

Parent Class: CIM LogicalElementGroup

#### CIM ServiceAccessPoint

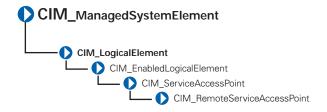

The CIM\_ServiceAccessPointGroup class described in Table 3-44 represents the ability to utilize or invoke a service. Access points indicate that a service is available to other entities for use.

Table 3-44. CIM\_ServiceAccessPointGroup Properties

Class Name: CIM\_ServiceAccessPointGroup

Parent Class: CIM EnabledLogicalElement

# CIM\_RemoteServiceAccessPoint

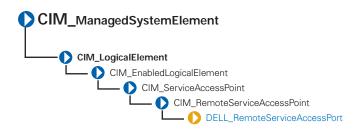

The CIM\_RemoteServiceAccessPointGroup class identified in Table 3-45 describes the accessing and addressing of information for a remote connection that is known to a *local* network element. This information is contained in the *local* network element since this is the context in which it is

remote. The relevance of the remote service access point and information on its use are described by subclassing or associating to the CIM RemoteServiceAccessPointGroup class.

Table 3-45. CIM\_RemoteServiceAccessPointGroup Properties

Class Name:	CIM_RemoteServiceAccessPointGroup	
Parent Class:	CIM_ServiceAccessPointGroup	
Property	Description	Data Type
AccessInfo	Describes accessing or addressing of information for a remote connection. This can be a host name, network address, and other similar information.	string
InfoFormat	Indicates an enumerated integer describing the format and interpretation of the AccessInfo property. This property can have the following values:	uint16
	1 - Other	
	2 - Host Name	
	3 - IPv4 Address	
	4 - IPv6 Address	
	5 - IPX Address	
	6 - DECnet Address	
	7 - SNA Address	
	8 - Autonomous System Number	
	9 - MPLS Label	
	1099 - DMTF Reserved	
	100 - Dial String	
	101 - Ethernet Address	
	102 - Token Ring Address	
	103 - ATM Address	
	104 - Frame Relay Address	
	105199 - DMTF Reserved	
	200 - URL	
	<b>3276865535</b> - Vendor Specific	

### **DELL\_RemoteServiceAccessPort**

The DELL\_RemoteServiceAccessPortGroup class described in Table 3-46 is an extended class of the CIM\_RemoteServiceAccessPointGroup class. The DELL\_RemoteServiceAccessPortGroup class provides information about Dell implementation-specific attributes.

Table 3-46. DELL\_RemoteServiceAccessPortGroup Properties

Class Name:	DELL_RemoteServiceAccessPortGroup	
Parent Class:	CIM_RemoteServiceAccessPointGroup	
Property	Description	Data Type
PortName	Displays the name of the service access port.	string
VersionString	Indicates the version of the access point service.	string
RemoteAccessType	Indicated the type of remote access service. This property can have the following values:	uint16
	0 - BMC	
	8 - IMC	
	9 - CMC	
	10 - iDRAC6	
	11 - iDRAC6 for modular systems	
	13 - BMC	

# **Dell-Defined Classes**

The Dell-defined classes are defined and populated by Dell rather than by CIM. None of these classes have a parent class and are on the same level as CIM\_ManagedSystemElement. For information on how the logs are formatted, see Table 2-5.

Figure 4-1. Dell\_EsmLog

The DELL\_EsmLog class described in Table 4-1 records failure threshold violations collected by Server Administrator's embedded server management (ESM) capabilities.

Table 4-1. DELL\_EsmLog Properties

Class Name:	DELL_ESMLOG	
Parent Class:	None	
Property	Description	Data Type
recordNumber	Provides an index to the ESM table.	uint32
logRecord	Provides the ESM message content.	string
eventTime	Indicates the time that the message is generated.	datetime
status	Indicates the severity of the event that caused the log to be generated.	string

### **DELL PostLog**

The DELL PostLog identified in Table 4-2 is a record of the system's power-on self-test (POST). When you turn on a system, the POST tests various system components, such as random-access memory (RAM), the hard drives, and the keyboard.

Table 4-2. DELL\_PostLog Properties

Class Name:	DELL_PostLog
Parent Class:	None

# **DELL\_CMApplication**

**NOTE:** Dell-updateable components, such as BIOS and firmware, are considered applications.

The DELL CMApplication class identified in Table 4-3 contains information related to the Dell change management applications.

Table 4-3. Dell\_CMApplication

Class Name:	DELL_CMApplication	
Parent Class:	None	
Property	Description	Data Type

Table 4-3. Dell\_CMApplication (continued)

Class Name:	DELL_CMApplication	
Parent Class:	None	
subComponentID	Defines an application string.	string
version	Indicates the current version of the application.	string
name	Indicates the name of the application.	string
deviceKey	Indicates the device key of the application.	string

## **DELL\_CMDevice**

The DELL\_CMDevice identified in Table 4-4 contains information related to the Dell change management device.

Table 4-4. DELL\_CMDevice Properties

Class Name:	DELL_CMDevice	
Parent Class:	None	
Property	Description	Data Type
componentID	Defines a component string.	string
name	Indicates the name of the device.	string
vendorID	Defines an ID for vendor supplying the device.	string
subVendorID	Defines an ID for an additional vendor supplying the device.	string
deviceID	Indicates the ID of the device.	string
subDeviceID	Indicates the ID for additional device.	string
bus	Indicates the PCI bus number.	string

Table 4-4. DELL\_CMDevice Properties (continued)

Class Name:	DELL_CMDevice	
Parent Class:	None	
Property	Description	Data Type
device	Indicates the PCI device number.	string
function	Indicates the PCI Function number.	string

# **DELL\_CMDeviceApplication**

The DELL\_CMDeviceApplication class identified in Table 4-5 contains information related to the Dell change management association between the device and application.

Table 4-5. DELL\_CMDeviceApplication Properties

Class Name:	DELL_CMDeviceApplication	
Parent Class:	None	
Property	Description	Data Type
antecedent	Refers to the device.	string
dependent	Refers to the application.	string

### **DELL\_CMInventory**

The DELL\_CMInventory identified in Table 4-6 contains information related to the Dell Change Management inventory.

Table 4-6. DELL \_CMInventory Properties

Ol N		
Class Name:	DELL_CMInventory	
Parent Class:	None	
Property	Description	Data Type
local	Indicates the locale of the system.	string
schemaVersion	Indicates the Inventory schema implemented by the system.	string
systemID	Defines the System ID.	string

## **DELL\_CMOS**

The DELL\_CMOS class identified in Table 4-7 contains information related to the Dell change management operating system.

Table 4-7. DELL\_CMOS Properties

Class Name:	DELL_CMOS	
Parent Class:	None	
Property	Description	Data Type
architecture	Indicates the architecture of the operating system.	string
vendor	Indicates the vendor of the operating system.	string
majorVersion	Indicates the major version of the operating system.	string
minorVersion	Indicates the minor version of the operating system.	string
spMajorVersion	Indicates the current service pack number for the operating system's major version.	string
spMinorVersion	Indicates the current service pack number for the operating system's minor version.	string

# DELL\_CMProductInfo

◆ CIM\_ManagedSystemElement

The DELL\_CMProductInfo identified in Table 4-8 contains information related to the Dell change management product.

Table 4-8. DELL CMProductInfo Properties

	<del>-</del>	
Class Name:	DELL_CMProductInfo	
Parent Class:	None	
Property	Description	Data Type
name	Indicates the name of the product.	string
description	Provides a short description of the product.	string
vendor	Indicates the name of the product manufacturer.	string
version	Indicates the current version number of the product.	string

### **DELL\_BIOSExtensions**

The DELL\_BIOSExtensions identified in Table 4-9 contains information related to the specific extension of the data attributes on your system.

Table 4-9. DELL\_BIOSExtensions Properties

Class Name: DELL_BIOSExtensions			
Parent Class:	CIM_ManagedSystemElement		
Property	Description	Data Type	
systemBIOSCharacteristics	Indicates the characteristics of BIOS on your system.	uint64	
system BIOS Characteristics Ext1	Indicates the specific extension of the data attributes on your system.	uint8	
system BIOS Characteristics Ext2	Indicates the specific extension of the data attributes on your system.	uint8	
	the data attributes on your system.		

# **DELL\_BIOSSettings**

The DELL\_BIOSSettings identified in Table 4-10 contains information related to setting parameters in the Dell System Management BIOS.

Table 4-10. DELL\_BIOSSettings Properties

Class Name:	DELL_BIOSSettings	
Parent Class:	CIM_ManagedSystemElement	
Property	Description	Data Type
DellInstanceID	Defines the instance ID of this class.	uint32
TrustedPlatformModule	Enables or Disables the Trusted Platform Module (TPM). Values for the TPM property are: 0 - Other 1 - Unsupported 2 - Off 3 - On with BIOS Management 4 - On without BIOS Measurement	uint8

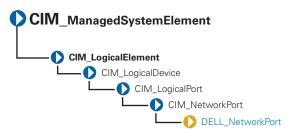

# **DELL\_SDCardDevice**

The DELL\_SDCard Devices identified in Table 4-11 contains information related to the SD card devices.

Table 4-11. DELL\_SDCardDevice Properties

Class Name:	DELL_SDCardDevice		
Parent Class:	CIM_LogicalDevice	rice	
Property	Description	Data Type	
sdType	An enumerated storage device type. The values for this property are:	uint8	
	1 - Other		
	2 - Unknown		
	3 - Hypervisor SD		
	4 - Virtual Flash SD		
sdCertified	Indicates the licensing information of SD media. The values for this property are:	uint8	
	0 - Unknown		
	1 - Unlicensed		
	2 - Licensed		
sdCardSizeMB	Indicates the size of the storage device in MB.	uint32	
sdCardFreeSizeMB	Indicates the available size of SD Media in MB.	uint32	
sdCardState	Indicates the value of the SD Card. The values for this property are:		
	<ul> <li>0 - Present</li> <li>1 and 2 - Reserved</li> <li>3 - Offline Detected</li> <li>4 - Failed Detected</li> <li>5 - Active</li> <li>6 - Bootable</li> <li>7 - Write Protected</li> </ul>		

## DELL\_NetworkPort

The Dell\_Network Port class described in Table 4-12 represents the Dell specific features of the network adapters.

Table 4-12. Dell\_NetworkPort Properties

Class Name:	DELL_NetworkPort	
Parent Class:	CIM_Network Port	
Property	Description	Data Type
NIC Capabilities	NIC Capabilities bitmask indicates the capabilities of the NIC.	uint 32
	The bitmask for the NIC Capability property are:	
	Bit 0, Value 0 - Reporting NIC capabilities via this attribute is not supported.	
	Bit 0, Value 1 - Reporting NIC capabilities via this attribute is supported.	
	Bit 1, Value 0 - NIC is not TOE capable.	
	Bit 1, Value 1 - NIC is TOE capable.	
	Bit 2, Value 0 - NIC is not iSCSI capable.	
	Bit 2, Value 1 - NIC is iSCSI capable.	
	Bit 3, Value 0 - NIC is not FCoE capable.	
	Bit 3, Value 1 - NIC is FCoE capable.	

Table 4-12. Dell\_NetworkPort Properties (continued)

Class Name: DELL_NetworkPort	
Parent Class: CIM_Network Port	
Property Description	Data Type
NIC TOE Defines the TOE capability of the NIC.	uint 32
Capability Values for the NIC TOE Capability property are:	
<ul><li>0 - NIC/driver does not support querying for capability.</li></ul>	
<ul> <li>l - NIC/driver supports querying for capability but query returned an error.</li> </ul>	
2 - NIC/driver supports querying for capability and query says it is capable.	
4 - NIC/driver supports querying for capability and query says it is not capable.	
8 - NIC/driver supports querying for capability but an error prevented querying NIC/driver.	
16 - NIC/driver supports querying for capability but NIC/driver did not respond to query.	
<b>NOTE:</b> Boolean value is defined if TOE is enabled. (Boolean is TOEEnable)	

Table 4-12. Dell\_NetworkPort Properties (continued)

Class Name:	DELL_NetworkPort	
Parent Class:	CIM_Network Port	
Property	Description	Data Type
NIC RDMA	Defines the RDMA capability of the NIC.	uint 32
Capability	Values for the NIC RDMA Capability property are:	
	0 - NIC/driver does not support querying for capability.	
	l - NIC/driver supports querying for capability but query returned an error.	
	2 - NIC/driver supports querying for capability and query says it is capable.	
	4 - NIC/driver supports querying for capability and query says it is not capable.	
	8 - NIC/driver supports querying for capability but an error prevented querying NIC/driver.	
	16 - NIC/driver supports querying for capability but NIC/driver did not respond to query.	
	<b>NOTE:</b> Boolean value is defined if RDMA is enabled. (Boolean is RDMAEnable).	

Table 4-12. Dell\_NetworkPort Properties (continued)

Class Name:	DELL_NetworkPort	
Parent Class:	CIM_Network Port	
Property	Description	Data Type
NIC iSCSI Capability	Defines the iSCSI capability of the NIC.  Values for the NIC iSCSI Capability property are:	uint 32
	0 - NIC/driver does not support querying for capability.	
	l - NIC/driver supports querying for capability but query returned an error.	
	2 - NIC/driver supports querying for capability and query says it is capable.	
	4 - NIC/driver supports querying for capability and query says it is not capable.	
	8 - NIC/driver supports querying for capability but an error prevented querying NIC/driver.	
	16 - NIC/driver supports querying for capability but NIC/driver did not respond to query.	
	<b>NOTE:</b> Boolean value is defined if iSCSI is enabled. (Boolean is iSCSIEnable).	
NIC Status	Indicates the status of the NIC or driver.	uint 32
	The values for the NIC Status property are:	
	0 - Unknown	
	l - Conencted	
	2 - Disconnected	
	3 - Driver Bad	
	4 - Driver Disabled	
	10 - Hardware Initializing	
	12 - Hardware Closing	
	13 - Hardware Not Ready	

Table 4-12. Dell\_NetworkPort Properties (continued)

Class Name:	DELL_NetworkPort	
Parent Class:	CIM_Network Port	
Property	Description	Data Type
BusNumber	Indicates the PCI bus number.	uint 8
DeviceNumber	Indicates the PCI device number.	uint 8
FunctionNumber	Indicates the PCI function number.	uint 8
DriverVersion	Indicates the NIC driver version.	string
IPAddresss	Indicates the NIC IP Address.	string
SubnetMask	Indicates the NIC subnet mask.	string
DHCPServer	Indicates the DHCP server.	string
DefaultGateway	Indicates the Default Gateway.	string
CurrentMacAddres s	Indicates the NIC current MAC address.	string
OSAdapterDescrip tion	Describes the Operating System adapter.	string
OSAdapterVendor	Describes the Operating System vendor.	string
OSProductName	Describes the product name of the Operating System.	string
ServiceName	Indicates the service name.	string

# DELL\_PowerConsumptionAmpsSensor

The DELL\_PowerConsumptionAmpsSensor identified in Table 4-13 contains information related to monitoring the power consumption.

Table 4-13. DELL\_PowerConsumptionAmpsSensor

Class Name:	DELL_PowerConsumptionAmpsSensor		
Parent Class:	CIM_Numeric Sensor		
Property	Description	Data Type	
UnitModifier	See Table 1-1.	sint32	

Table 4-13. DELL\_PowerConsumptionAmpsSensor (continued)

Class Name:	DELL_PowerConsumptionAn	npsSensor
Parent Class:	CIM_Numeric Sensor	
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32
UpperThresholdCritical	See Table 1-1.	sint32

# **DELL\_PowerConsumptionWattsSensor**

The DELL\_PowerConsumptionWattsSensor identified in Table 4-14 contains information related to monitoring the power consumption.

Table 4-14. DELL \_PowerConsumptionWattsSensor

Class Name:	DELL_PowerConsumptionWattsSensor	
Parent Class:	CIM_Numeric Sensor	
Property	Description	Data Type
UnitModifier	See Table 1-1.	sint32
CurrentReading	See Table 1-1.	sint32
IsLinear	See Table 1-1.	Boolean
LowerThresholdNonCritical	See Table 1-1.	sint32
UpperThresholdNonCritical	See Table 1-1.	sint32
LowerThresholdCritical	See Table 1-1.	sint32
UpperThresholdCritical	See Table 1-1.	sint32

# ${\bf DELL\_PowerConsumptionData}$

The DELL\_PowerConsumptionData identified in Table 4-15 contains information about the total power consumed from a start time and peak values registered during a time period.

Table 4-15. DELL \_PowerConsumptionData

Class Name:	DELL_PowerConsumptionData	
Parent Class:	CIM_Logical Device	
Property	Description	Data Type
cumulative PowerReading	Indicates the total power consumed from a start time.	uint 32
peakAmpReading	Indicates the time from which the peak amperage reading is being monitored.	uint 16
peakWattReading	Indicates the time from which the peak watt reading is being monitored.	uint 16
ResetCounters	Is the function used to reset the peak readings.	uint 32
powerCapSetting	This refers to the user configured power setting.	uint 16
instHeadroom	This refers to the instantaneous headroom.	uint 32
peakHeadRoom	Is the function used to set the power budget.	uint 32

#### DCIM\_OEM\_DataAccessModule

The DCIM\_OEM\_DataAccessModule class is derived from the CIM\_ManagedElement class. This class models hardware information in a proprietary format.

Table 4-16. DCIM\_OEM\_DataAccessModule Properties

Class Name:	DCIM_OEM_DataAccessModule	
Parent Class:	CIM_ManagedElement	
Property	Description	Data Type
InstanceID	Identifies the instance.	string
GlobalStatus	Represents the global health status of the system. This property can have the following values:	sint32
	0 - Other	
	1 - Unknown	
	2 - OK	
	3 - Warning / Non-Critical	
	4 - Critical	
	5 - Non-Recoverable	
	Reserved	
	<b>NOTE</b> : GlobalStatus property is available only for Linux systems.	
SendCmd	The SendCmd method is used to invoke proprietary hardware management operation.	string
iDRACIPv4	Provides Remote Access controller (iDRAC ) IPv4 address.	string

Table 4-16. DCIM\_OEM\_DataAccessModule Properties (continued)

Class Name:	DCIM_OEM_DataAccessModule	
Parent Class:	CIM_ManagedElement	
Property	Description	Data Type
	Provides Remote Access controller (iDRAC ) IPv6	string

### DCIM\_RegisteredProfile

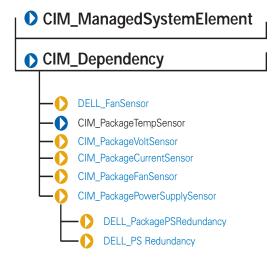

The DCIM\_RegisteredProfile class is derived from the CIM\_RegisteredProfile class. This class advertises the capabilities of DCIM\_OEM\_DataAccessModule.

# CIM\_Dependency

The CIM\_Dependency class is an association used to establish dependency relationships between two managed system elements. CIM\_Dependency shown in Figure 5-1 does not have a parent class because it is a relationship or association between two elements.

Figure 5-1. CIM\_Dependency Class Structure

Each class derived from CIM\_Dependency has an element called an antecedent that represents the independent object in this association, and another element called a dependent that represents the object that is dependent on the antecedent. For example, consider two managed system elements: Chassis1 and PowerSupply3. Chassis1 is the antecedent element because a managed power supply would always be either contained in, or grouped with, a chassis.

### **DELL\_FanSensor**

The DELL\_FanSensor class described in Table 5-1 defines a Dell-specific association between a fan and a sensor. The CIM\_PackageFanSensor class contains fans that assist in cooling the entire package as opposed to a fan dedicated to cooling only some of the components in the package.

Table 5-1. DELL\_FanSensor Properties

Class Name:	DELL_FanSensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_Tachometer refers to the tachometer (fan sensor) that measures the RPM of the fan.
Dependent	CIM_Fan refers to the fan whose revolutions are measured by the tachometer.

#### CIM\_PackageTempSensor

The CIM\_PackageTempSensor class listed in Table 5-2 contains temperature sensors that are often installed in a package such as a chassis or a rack to assist in the monitoring of the package in general. This relationship is described by the CIM\_PackageTempSensor association.

Table 5-2. CIM\_PackageTempSensor Properties

Class Name:	CIM_PackageTempSensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM TempSensor refers to the temperature sensor for the
	package.

### CIM\_PackageVoltSensor

The CIM\_PackageVoltSensor identified in Table 5-3 contains voltage sensors that are often installed in a package such as a chassis or a rack to assist in the monitoring of the package in general. This relationship is described by the CIM PackageVoltSensor association.

Table 5-3. CIM\_PackageVoltage Properties

Class Name:	CIM_PackageVoltSensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_PackageVoltSensor refers to the voltage sensor for the package.
Dependent	CIM_PhysicalPackage refers to the physical package whose voltages are being monitored.

#### CIM\_PackageCurrentSensor

The CIM\_PackageCurrentSensor shown in Table 5-4 contains amperage sensors that are often installed in a package such as a chassis or a rack to assist in the monitoring of the package in general. This relationship is described by the CIM\_PackageCurrentSensor association.

Table 5-4. CIM\_PackageCurrentSensor Properties

Class Name:	CIM_PackageCurrentSensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_CurrentSensor refers to the amperage sensor for the package.
Dependent	CIM_PhysicalPackage refers to the physical package whose amperage is being monitored.

### CIM\_PackageFanSensor

The CIM\_PackageFanSensor class described in Table 5-5 contains fan sensors that monitor the whole package.

Table 5-5. CIM\_PackageFanSensor Properties

Class Name:	CIM_PackageFanSensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_Fan refers to the cooling device for the package.
Dependent	CIM_PhysicalPackage refers to the physical package whose environment is being monitored.

### CIM\_PackagePowerSupplySensor

The CIM\_PackagePowerSupplySensor class described in Table 5-6 contains power supplies that provide power to the whole package.

Table 5-6. CIM\_PackagePowerSupplySensor Properties

Class Name:	CIM_PackagePowerSupplySensor
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_PowerSupplySensor refers to the power supply sensor that monitors wattage for the entire package.
Dependent	CIM_PhysicalPackage refers to the package whose wattage is being monitored.

#### DELL\_PackagePSRedundancy

The DELL\_PackagePSRedundancy class listed in Table 5-7 defines what constitutes power supply redundancy for an entire package.

Table 5-7. DELL\_PackagePSRedundancy Properties

Class Name:	DELL_PackagePSRedundancy
Parent Class:	CIM_Dependency
Element	Description
Antecedent	DELL_PSRedundancyGroup refers to power supplies that deliver wattage for the entire package.
Dependent	CIM_PhysicalPackage refers to the package to which the wattage is being supplied.

### **DELL\_PSRedundancy**

The DELL\_PSRedundancy class shown in Table 5-8 defines what constitutes power supply redundancy for Dell systems.

Table 5-8. DELL\_PSRedundancy Properties

Class Name:	DELL_PSRedundancy
Parent Class:	CIM_Dependency
Element	Description
Antecedent	CIM_PowerSupplySensor refers to the power supply sensor that monitors wattage for the entire package.

## DELL\_AssociatedSupplyPCAmps

The DELL\_AssociatedSupplyPCAmps identified in Table 5-9 is a PowerConsumptionAmpsSensor associated with a CIM\_PowerSupply which is defined by this class.

Table 5-9. DELL \_AssociatedSupplyPCAmps

DELL_AssociatedSupplyPCAmps	
CIM_Dependency	
Description	Data Type
Indicates the PowerSupply instance.	uint 16
Indicates the PowerConsumptionAmpsSensor associated with the CIM_PowerSupply.	uint 16
	CIM_Dependency  Description  Indicates the PowerSupply instance.  Indicates the PowerConsumptionAmpsSensor

#### DELL\_AssociatedSystemPCWatts

The DELL\_AssociatedSystemPCWatts identified in Table 5-10 a PowerConsumptionAmpsSensor associated with a Dell\_System which is defined by this class.

Table 5-10. DELL \_AssociatedSystemPCWatts

Class Name:	DELL_AssociatedSystemPCWatts	
Parent Class:	CIM_Dependency	
Property	Description	Data Type
Antecedent	Indicates the Dell_System instance.	uint 16
Dependent	Indicates the PowerConsumptionWattsSensor associated with the system.	uint 16

#### **AssociatedSystemPCData**

The AssociatedSystemPCData identified in Table 5-11 is a PowerConsumptionData associated with a Dell\_System which is defined by this class.

Table 5-11. AssocaitedSystemPCData

Class Name:	DELL_AssociatedSupplyPCAmps	
Parent Class:	CIM_Dependency	
Property	Description	Data Type
Antecedent	Indicates the Dell_System instance.	uint 16
Dependent	Indicates the PowerConsumptionData associated with the Power Supply.	uint 16

### **DELL\_PowerProfileData**

The DELL\_PowerProfileData identified in Table 5-12 contains information related to power profiling and power knob data.

Table 5-12. DELL PowerProfileData

Class Name:	DELL_PowerProfileData	
Parent Class:	CIM_LogicalDevice	
Property	Description	Data Type
chassisIndex	Indicates the chassisIndex for this power profile.	uint 8
supportedProfile	Indicates the supported profiles.	uint 16
profileSetting	Indicates the Profile setting.	uint 16
customCPUCaps	Indicates the Custom Profile CPU management capability.	uint 16
customCPUSettings	Indicates the Custom Profile CPU management setting.	uint 16
customMemCaps	Indicates the Custom Profile memory management capability.	uint 16
customMemSettings	Indicates the Custom Profile memory management capability.	uint 16
customFanSettings	Indicates the Custom Profile fan management setting.	uint 16
