Command Line Reference Guide for iDRAC6 1.5, iDRAC6 3.0, and CMC 3.1

Notes and Cautions

NOTE: A NOTE indicates important information that helps you make better use of your computer.

CAUTION: A CAUTION indicates potential damage to hardware or loss of data if instructions are not followed.

Introduction

This document provides information about the RACADM subcommands, supported RACADM interfaces, and property database groups and object definitions for the following:

- iDRAC6 Enterprise on Blade Servers
- iDRAC6 Enterprise or Express on Rack and Tower Servers
- Dell Chassis Management Controller (CMC)

Supported RACADM Interfaces

The RACADM command-line utility provides a scriptable interface that allows you to locally or remotely configure your Remote Access Controller (RAC). The utility runs on the management station and the managed system. It is available on the Dell OpenManage Systems Management and Documentation DVD or at support.dell.com.

The RACADM utility supports the following interfaces:

- Local Supports executing RACADM commands from the managed server's Operating System. You must install the OpenManage software on the managed server to run local racadm commands.
- SSH or Telnet Supports executing RACADM commands from a SSH or Telnet session to iDRAC.
- Remote Supports executing RACADM commands from a remote management station such as a laptop or desktop computer. You must install the OpenManage software on the remote computer to run remote RACADM commands. To execute remote RACADM commands, you must formulate the command like a local or SSH/Telnet RACADM command except that you must also use the -r -i options or the -r -u -p options. For more information on these options, see the "RACADM" Subcommand Details" on page 31.

Table 1-1 provides the supported RACADM interfaces for iDRAC6 Enterprise and iDRAC6 Express.

Table 1-1. Supported RACADM Interfaces

iDRAC Type	Local RACADM	SSH/Telnet RACADM	Remote RACADM
iDRAC6 Enterprise	<	✓	✓
iDRAC6 Express	<	✓	*
CMC	<	✓	✓

✓ = Supported;

X = Not supported

Supported RACADM Subcommands

Table 1-2 provides the list of RACADM subcommands and their corresponding interface support. For detailed information of the RACADM subcommands including syntax and valid entries, see "RACADM Subcommand Details" on page 31.

Table 1-2. RACADM Subcommands

Subcommand					C6 on Rac r Servers	СМС		
	Telnet /SSH/ Serial	Local RACADM	Remote RACADM	Telnet/ SSH/S erial	Local RACADM	Remote RACADM	Telnet /SSH/ Serial	Remote RACADM
"?" and "? <command/> "	*	*	*	*	*	×	⋖	⊘

Other Documents You May Need

In addition to this guide, you can access the following guides available on the Dell Support website at support.dell.com/manuals. On the Manuals page, click Software→ Systems Management. Click on the appropriate product link on the right-side to access the documents.

• The Integrated Dell Remote Access Controller 6 (iDRAC6) Enterprise for Blade Servers User Guide provides information about configuring and using an iDRAC6 for blade servers to remotely manage and monitor your system and its shared resources through a network.

- The Integrated Dell Remote Access Controller 6 (iDRAC6) User Guide provides complete information about configuring and using an iDRAC6 for rack and tower servers to remotely manage and monitor your system and its shared resources through a network.
- The CMC online Help provides information about using the CMC Web interface.
- The Chassis Management Controller (CMC) Secure Digital (SD) Card Technical Specification provides minimum BIOS and firmware version, installation and usage information.
- The Dell OpenManage IT Assistant User's Guide provides information about IT Assistant.
- Documentation specific to your third-party management console application.
- The Dell OpenManage Server Administrator's User's Guide provides information about installing and using Dell OpenManage Server Administrator.
- The Dell Update Packages User's Guide provides information about obtaining and using Dell Update Packages as part of your system update strategy.
- The *Glossary* provides information about the terms used in this document.

The following system documents are also available to provide more information about the system in which CMC is installed:

- The Rack Installation Guide and Rack Installation Instructions included with your rack solution describe how to install your system into a rack.
- The Hardware Owner's Manual provides information about system features and describes how to troubleshoot the system and install or replace system components.
- Documentation for any components you purchased separately provides information to configure and install these options.
- Release notes or readme files may be included to provide last-minute updates to the system or documentation or advanced technical reference material intended for experienced users or technicians.
- For more information on IOM network settings, see the Dell PowerConnect M6220 Switch Important Information document and the Dell PowerConnect 6220 Series Port Aggregator White Paper.

Updates are sometimes included with the system to describe changes to the system, software, and/or documentation. Always read the updates first because they often supersede information in other documents.

See the Safety and Regulatory information that is shipped with your system.

NOTE: Warranty information may be included within this document or as a separate document.

RACADM Subcommand Details

This section provides detailed descriptions of the RACADM subcommands including the syntax and valid entries.

latest RACADM version. You may encounter errors if you use an older version of RACADM to query iDRAC6 with the latest firmware. Install the RACADM version shipped with the Dell Systems Management Tools and Documentation DVD Version 6.3.

Guidelines to Quote Strings Containing Special Characters When Using RACADM Commands

When using strings that contain special characters, use the following guidelines:

Strings containing the following special characters must be quoted using single quotes or double quotes:

- \$ (dollar sign)
- " (double quote)
- ' (single quote)
- ` (back quote)
- \ (backslash)
- ~ (tilde)
- ; (semicolon)
- (vertical bar)
- ((left parentheses)
-) (right parentheses) & (ampersand)
- > (greater than)

- < (less than)
- # (pound)
- ASCII code 32 (space)

of whether the string is quoted.

There are different escaping rules for single quoting versus double quoting.

For double quoting:

The following characters must be escaped by prepending a backslash:

- \$ (dollar sign)
- " (double quote)
- '(single quote)
- ` (back quote)
- \ (backslash)

For example, use the following for a string that contains the special characters, \$, ",', `and \

For single quoting:

- No character escaping is necessary.
- A single quote cannot be used even with a backslash escaped.

"?" and "? <command>"

Description

? lists all of the subcommands you can use with the **racadm** command and a one-line description of each subcommand.

? < command > displays the syntax for the specified command.

Usage

racadm ?

racadm ? < command>

Example for racadm?

NOTE: The following output example shows only part of the actual output for the racadm? command. Descriptions shown in this example may vary slightly from the descriptions in your racadm session.

```
racadm ?
help
               -- list racadm subcommand description
help <subcommand> -- display usage summary for a subcommand
               -- list racadm subcommand description
? <subcommand> -- display usage summary for a subcommand
               -- display the networking arp table
arp
chassisaction -- execute chassis or switch power-up/down/cycle or
KVM powercycle
clrraclog
              -- clear the CMC log
clrsel
               -- clear the System Event Log (SEL)
cmcchangeover -- Changes the redundant state of the CMC from
active to standby and vice versa
               -- modify CMC configuration properties
config
. . .
setniccfg
               -- modify network configuration properties
               -- set the time on the CMC
setractime
setslotname
               -- sets the name of the slot in the chassis
setsysinfo
               -- set the chassis name and chassis location
sslcertview
               -- display a CA/server certificate in the CMC
               -- generate a certificate CSR from the CMC
sslcsrgen
testemail
               -- test CMC e-mail notifications
testfeature
               -- test CMC feature x
testtrap
               -- test CMC SNMP trap notifications
traceroute
               -- determine the route of a packet
traceroute6
               -- determine the route of a packet
```

Example for racadm? < command>

```
racadm ? getsysinfo
getsysinfo -- display general CMC and system information
racadm getsysinfo [-d] [-c] [-A] [-4] [-6]
_____
Valid Options:
-d : show CMC information
```

```
-c : show chassis information
-A : do not show headers or labels
-4 : show CMC IPv4 information
-6 : show CMC IPv6 information
```

help

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Subcommand	Definition
help	Lists all the subcommands available to use with RACADM and provides a short description for each.

Synopsis

racadm help racadm help <subcommand>

Description

The **help** subcommand lists all the subcommands that are available when using the racadm command along with a one-line description. You may also type a subcommand after help to get the syntax for a specific subcommand.

Output

The racadm help command displays a complete list of subcommands.

The racadm help <subcommand> command displays information for the specified subcommand only.

arp

NOTE: To use this subcommand, you must have Administrator and Execute Diagnostic Commands permission.

Subcommand	Definition
arp	Displays the contents of the Address Resolution Protocol (ARP) table. ARP table entries cannot be added or deleted.

Synopsis

racadm arp

chassisaction

IP Address	HW Type	Flags	HW Address	Mask	Device
192.168.1.1	0x1	0x2	00:00:0C:07:AC:0F	*	eth0

NOTE: To use this subcommand, you must have **Chassis Control Administrator** privilege.

Description

Executes a power action on the chassis, iKVM, or a server.

Usage

racadm chassisaction [-m <module>] <action>

35

Options

Table 2-1. chassisaction Subcommand Options

Option	Description				
-m <module></module>	Specifies the module on which you want the action carried out. <module> may be one of the following:</module>				
	• chassis - this is the default value if -m is not specified.				
	• switch- n where $n=1-6$				
	• kvm				
<action></action>	Specifies the action you want to execute on the specified module. <action> may be one of the following:</action>				
	• powerdown — (Chassis only) Powers down the chassis.				
	• powerup — (Chassis only) Powers up the chassis.				
	• powercycle — Power cycles the module.				
	 nongraceshutdown — (Chassis only) Shuts down the chassis non-gracefully. 				
	• reset — Performs a hard reset of the module.				

NOTE: When < module> = kvm or switch, < action> must be powercycle or reset.

Example

Perform a reset of switch-3.

racadm chassisaction -m switch-3 reset Module power operation successful.

clearasrscreen

NOTE: To use this subcommand, you must have **Clear Logs** permission.

Subcommand	Definition
clearasrscreen	Clears the last crash (ASR) screen that is in memory. See Configuring the Managed Server to Capture the Last Crash Screen and Disabling the Windows Automatic Reboot Option sections in the iDRAC6 Enterprise for Blade Servers User Guide.

Synopsis

racadm clearasrscreen

closessn

NOTE: To use this subcommand, you must have **Administrator** permission.

Subcommand	Definition	
closessn	Closes a communication session on the device. Use getssninfo to view a list of sessions that can be closed using this command.	

Synopsis

racadm closessn -i <session id> racadm closessn -a racadm closessn -u <username>

Options

Table 2-2 describes the closessn subcommand options.

Table 2-2. closessn Subcommand Options and Descriptions

Option	Description	
-i <session id=""></session>	The session ID of the session to close, which can be retrieved using racadm getssninfo subcommand.	
	NOTE: Session executing this command cannot be closed.	
-a	Closes all sessions.	
-u <user name=""></user>	Close all sessions for a particular user name.	
	NOTE: -u option can be used in local RACADM only if the username contains upto 16 characters. If the user name contains more than 16 characters, use one of the following options to close a session: Local RACADM: -i option Remote RACADM: -u option or -i option	

Examples:

- racadm closessn -i 1234 Closes the session 1234.
- racadm closessn -u root Closes all the sessions for root user.
- racadm closessn -a Closes all the sessions.

clrraclog

NOTE: To use this subcommand, you must have **Clear Logs** permission. .

Subcommand	Definition	
clrraclog	Removes all existing records from iDRAC6 log. A new single record is created to record the date and time when the log was cleared.	

Synopsis

racadm clrraclog

cirsel

NOTE: To use this subcommand, you must have **Clear Logs** permission.

Subcommand	Definition	
clrsel	Removes all existing records from the System Event Log (SEL).	

Synopsis

racadm clrsel

cmcchangeover

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

Changes the state of the CMC from active to standby, or vice versa, in a redundant CMC configuration. This subcommand is useful for remote debugging or testing purposes.

NOTE: This command is valid only in redundant CMC environments. For more information, see the "Understanding the Redundant CMC Environment" section of the Dell Chassis Management Controller User Guide.

Usage

racadm cmcchangeover

Output

CMC failover initiated successfully.

config

NOTE: To use this subcommand, you must have **Log In iDRAC** permission.

Synopsis

```
racadm config [-c|-p] -f <filename>
racadm config -g <groupName> -o <objectName> [-i
<index>1 <Value>
```

Description

The **config** subcommand allows you to set iDRAC6 configuration parameters individually or to batch them as part of a configuration file. If the data is different, that iDRAC6 object is written with the new value.

NOTE: The configuration file retrieved using remote racadm and local racadm are not interoperable. The configuration file retrieved using remote racadm shows the index property for some of the indexed groups as read-write, for example cfgSSADRoleGroupIndex. For the config -f <file name > command, use the configuration file retrieved from the same interface. For example, for local racadm config -f <file name>, use the file generated from the local racadm command getconfig -f <file name>.

Input

Table 2-3 describes the **config** subcommand options.

NOTE: The **-f** and **-p** options are not supported for the serial/Telnet/ssh console.

Table 2-3. config Subcommand Options and Descriptions

Option	Description
-f	The -f <iilename></iilename> option causes config to read the contents of the file specified by < filename> and configure iDRAC6. The file must contain data in the format specified in the section <i>Parsing Rules</i> in the <i>iDRAC6 User's Guide</i> available on the Dell Support website at support.dell.com/manuals .
- p	The -p, or password option, directs config to delete the password entries contained in the config file -f <filename></filename> after the configuration is complete.
-g	The -g <groupname></groupname> , or group option, must be used with the -o option. The < groupName> specifies the group containing the object that is to be set.
-0	The -o <objectname> <value></value></objectname> , or object option, must be used with the -g option. This option specifies the object name that is written with the string < value>.

Table 2-3. config Subcommand Options and Descriptions *(continued)*

Option	Description
-i	The -i <index></index> , or index option, is valid only for indexed groups and can be used to specify a unique group. The < index> is a decimal integer from 1 through n, where n can vary from 1 to maximum number of indexes a particular group supports. If -i < index> is not specified, a value of 1 is assumed for groups, which are tables that have multiple entries. The index is specified by the index value, not a named value.
-с	The -c, or check option, is used with the config subcommand and allows the user to parse the .cfg file to locate syntax errors. If errors are found, the line number and a short description of what is incorrect are displayed. Writes do not occur to iDRAC6. This option is a check only.

Output

This subcommand generates error output for any of the following reasons:

- Invalid syntax, group name, object name, index, or other invalid database members
- RACADM CLI failures

This subcommand returns an indication of the number of configuration objects that were written out of the total objects in the .cfg file.

Examples

- racadm config -g cfgLanNetworking -o cfgNicIpAddress 10.35.10.100
 - Sets the cfgNicIpAddress configuration parameter (object) to the value 10.35.10.110. This IP address object is contained in the group cfgLanNetworking.
- racadm config -f myrac.cfg
 - Configures or reconfigures iDRAC6. The myrac.cfg file may be created from the getconfig command. The myrac.cfg file may also be edited manually as long as the parsing rules are followed.

NOTE: The myrac.cfq file does not contain passwords. To include passwords in the file, you must enter them manually. If you want to remove password information from the **myrac.cfg** file during configuration, use the **-p** option.

connect

Description

Connects to the switch or server serial console.

NOTE: You cannot use this subcommand with remote RACADM.

Usage

- racadm connect [-b] <server-n>
- racadm connect [-b] <switch-n>

Options

Table 2-4. connect Subcommand Options

Option	Description	
-b	Connects to the switch or console using the binary mode. This is an optional argument; a server or a switch must be present.	
server-n or switch-n	Server or switch to connect to.	
	• server- n where $n=1-16$	
	• switch- n where $n=$ <al a2="" b1="" b2="" c1="" c2="" =""></al>	

NOTE: If you use the -b option, reset the CMC to terminate the **connect** operation.

NOTE: See the *Dell Chassis Management Controller User Guide* for examples on using the connect subcommand.

coredump

NOTE: To use this subcommand, you must have **Execute Debug Commands** permission.

Description

The **coredump** subcommand displays detailed information related to any recent critical issues that have occurred with the RAC. The coredump information can be used to diagnose these critical issues.

If available, the coredump information is persistent across iDRAC6 power cycles and remains available until either of the following conditions occur:

- The coredump information is cleared with the coredumpdelete subcommand.
- Another critical condition occurs on the RAC. In this case, the coredump information is relative to the last critical error that occurred.

See the **coredumpdelete** subcommand for more information about clearing the coredump.

Synopsis

racadm coredump

coredumpdelete

NOTE: To use this subcommand, you must have **Clear Logs** or **Execute Debug** Commands permission.

Description

The **coredumpdelete** subcommand can be used to clear any currently resident **coredump** data stored in the RAC.

NOTE: If a **coredumpdelete** command is issued and a coredump is not currently stored in the RAC, the command displays a success message. This behavior is expected.

See the **coredump** subcommand for more information on viewing a coredump.

Synopsis

racadm coredumpdelete

deploy

NOTE: To use this subcommand, you must have **Server Administrator** privilege.

Description

Configures the static IP address, subnet mask, gateway, and password for the root user on iDRAC for the specified server.

NOTE: You can also use **setniccfg** to configure static IP address, subnet mask, and gateway, as well as DHCP, speed, and duplex properties.

Usage

- racadm deploy -m <module> -u root -p <password> -s <ipaddress> <subnet> <gateway> -b <device> -o <no | yes>
- racadm deploy -m <module> -u root -p <password> -s -6 <ipv6Address> <prefixlen> <gateway> -b <device> -o <no|yes>
 - **NOTE**: < prefixlen> must be a number between 0 and 128.
- racadm deploy -m <module> -u root -p <password> -d [-6]
- racadm deploy -a -u root -p <password>

Options

Table 2-5. deploy Subcommand Options

Option	Description	
-b <device></device>	Specifies the first boot device; must be used with -o.	
	Use with -m < module > to specify for a individual server, or with -a for all servers	
	Legal values: <i>device</i> =None, PXE, HDD, CD-DVD, vFDD, vCD-DVD, iSCSI, SD, FDD	
-0 <no yes="" =""></no>	Indicates if the server should boot from the device once; must be used with -0.	
	Use with -m < module > to specify for a individual server, or with -a for all servers	

Table 2-5. deploy Subcommand Options

Option	Description
-a	Creates and enables an iDRAC root user if it does not already exist, and is executed on all the existing servers in the chassis
-u root	Indicates that the <i><password></password></i> is supplied for the root user on the server. root is a constant parameter, the only value that is valid with the -u option.
-m <module></module>	Specifies the server you want to configure.
	Legal values: server- n , where $n=1-16$
-p <password></password>	Specifies the password for the root user on the server.
-s <ipaddress gateway="" subnet=""></ipaddress>	Sets the IP address, subnet mask, and gateway for the specified server, separated by single spaces.
	 ipaddress — A string representing a valid IP address. For example, 192.168.0.20.
	• subnet — A string representing a valid subnet mask. For example, 255.255.255.0.
	• gateway — A string representing a valid gateway address. For example, 192.168.0.1.
-d	Enables DHCP for the specified server.
	NOTE: The $-s$ and $-d$ options cannot be used together in the same command.
-6	Enables IPv6 auto configuration (when used with -d)
	Sets static IPv6 addresses (when used with -s)

Example

racadm deploy -m server-8 -s 192.168.0.20 255.255.255.0 192.168.0.1

The server was deployed successfully.

NOTE: The **deploy** command generates an error when used on the extension slot of a multi-slot server.

- racadm deploy -m server-9 192.168.0.11 255.255.255.0 192.168.0.1
 - ERROR: Server in slot 9 is an extension of the server in slot 1.
- racadm deploy -m server-7 -u root -p calvin -s -6 ::/64 :: 10

feature

NOTE: To use this subcommand to deactivate FlexAddress, you must have **Chassis Configuration Administrator** privilege. A user with login privileges can view status only.

Description

Displays all active chassis features. The information displayed includes feature name, date activated, and the serial number of the SD card used to activate the feature.

Dell Feature Cards may contain more than one feature. After any feature included on a Dell Feature Card is activated on a chassis, any other features that may be included on that Dell Feature Card cannot be activated on a different chassis

NOTE: The **feature** subcommand must be run while the chassis is powered off to deactivate FlexAddress or the command returns an error.

Usage

```
racadm feature -s
racadm feature -d -c <featurename>
```

1

Options

Table 2-6. feature Subcommand Options

Option	Description
-s	Displays the status of active features.
-c	<featurename> must be one of the following:</featurename>
	• flexaddress (w/ -d)
	• flexaddressplus (w/ -d)
-d	Deactivates the feature specified in the -c option.

Example

- racadm feature -d -c flexaddress The feature FlexAddress is deactivated on the chassis successfully
- racadm feature -s

Feature Name = FlexAddress

Date/time Activated = 26 Apr 2010 - 10:16:48

Feature installed from SD-card serial number = TEST0123456789012345678

Feature Name = FlexAddressPlus

Date/time Activated = 26 Apr 2010 - 10:16:48

Feature installed from SD-card serial number = TEST0123456789012345678

featurecard

NOTE: To use this subcommand, you must have **Chassis Configuration** Administrator privilege.

Description

Verifies proper SD card installation and displays the SD card status. Table 2-7 lists the status messages returned by the command.

Table 2-7. Status Messages Returned by featurecard -s Command

Status Message	Actions
No feature card inserted.	Check the CMC to verify that the SD card was properly inserted. In a redundant CMC configuration, make sure the CMC with the SD feature card installed is the active CMC and not the standby CMC.
The feature card inserted is valid and contains the following feature(s) FlexAddress: The feature card is bound to this chassis	No action required.
No features active on the chassis	Install the SD card into the CMC.
The feature card inserted is valid and contains the following feature(s) FlexAddress: The feature card is bound to another chassis, svctag = ABC1234, SD card SN = 01122334455	Remove the SD card; locate and install the SD card for the current chassis.
The feature card inserted is valid and contains the following feature(s) FlexAddress: The feature card is not bound to any chassis	The feature card can be moved to another chassis, or can be reactivated on the current chassis. To reactivate on the current chassis, enter racadm racreset until the CMC module with the feature card installed becomes active.

Usage

racadm featurecard -s

Options

Table 2-8. featurecard Subcommand Options

Option	Description
-s	Lists active SD card features and SD card status.

Example

```
$ feature -s
Feature Name = FlexAddress
Date/time Activated = 23 Jul 2009 - 21:01:10
Feature installed from SD-card SN =
TEST0123456789012345678
```

fwupdate

NOTE: To use this subcommand for CMC you must have **Chassis Configuration** Administrator privilege and for iDRAC you must have Configure iDRAC6 permission.

Description

The **fwupdate** subcommand allows users to update the firmware on the iKVM, active CMC, standby CMC, server iDRACs, or an IOM infrastructure device. You can:

- Check the firmware update process status.
- Update iDRAC6 or CMC firmware from a TFTP server by providing an IP address and optional path.
- Update iDRAC6 or CMC firmware from the local file system using local RACADM.
- Rollback to the standby firmware.

NOTE: This subcommand performs updates to the iDRAC firmware (if CMC firmware version is 2.0 or later and iDRAC firmware version is 1.4) when the existing firmware is corrupted. There can only be a single update operation in progress at any time. In addition, the fwupdate subcommand may only update one or more devices of a single kind at a time.

Before you begin your firmware update, see the Advanced iDRAC6 Configuration section in the iDRAC6 User's Guide available on the Dell Support website at support.dell.com/manuals.

NOTE: Running the **fwupdate** subcommand to update the firmware on the active CMC resets itself causing all network connections to be dropped. During update of all other modules, including the standby CMC, the active CMC continues to run normally without resetting.

Usage for iDRAC6

```
racadm fwupdate -s
racadm fwupdate -g -u -a <TFTP_Server_IP_Address> [-d
<path>]
racadm fwupdate -r
racadm fwupdate -p -u [-d <path>]
```

Usage for CMC

For local RACADM:

```
racadm fwupdate -g -u -a <tftp server ip address or
FQDN> -d <path> [-m <module>]
racadm fwupdate -f <ftp server ip address or FQDN>
<username> <password> -d <path> [-m <module>]
racadm fwupdate -u -m iominf-<n>
racadm fwupdate -s [-m <module>]
racadm fwupdate -c [-m <module>]
For remote RACADM:
racadm fwupdate -p -u -d <firmware image>
```

NOTE: When using FTP, if you provide the full path to the image file on the CLI, then the CMC uses that path to locate that file on the host. If you do not provide a full path, then the CMC searches the home directory of the specified user for the file if the host system is running Linux or another variant of UNIX. If the host system is running Windows, then a default folder, such as **C:\ftproot** is searched.

NOTE: When attempting to run firmware update task using "racadm fwupdate" command, if the firmware image path length is greater than 64 characters, remote RACADM client exits with the error message "ERROR: Specified path is too long".

Input

Table 2-9 describes the **fwupdate** subcommand options.

Ontion Description

server.

NOTE: The **-p** option is supported on local and remote RACADM and is not supported with the serial/Telnet/ssh console. The -p option is also not supported on Linux Operating Systems.

Table 2-9. fwupdate Subcommand Options

Uption	Description
-u	For iDRAC: The update option performs a checksum of the firmware update file and starts the actual update process. This option may be used along with the -g or -p options. At the end of the update, iDRAC6 performs a soft reset.
	For CMC: Performs the firmware update operation.
-s	For iDRAC: The status option returns the current status of where you are in the update process. This option is always used by itself.
	For CMC: Displays the current status of the firmware update.
	NOTE: Use $-m$ to display the status of the module update. Omit $-m$ to display the status of the active CMC update.
	NOTE: The all value can only be used to obtain the status of all targets to be updated.
-g	The get option instructs the firmware to get the firmware update file from the TFTP server. You must also specify the -a, -u, and -d options. In the absence of the -a option, the defaults are read from properties contained in the group cfgRemoteHosts, using properties cfgRhostsFwUpdateIpAddr and cfgRhostsFwUpdatePath.
	For CMC: Downloads the firmware update using the TFTP server.
-a	The IP Address option specifies the TFTP server IP address, used with -g option.
	For CMC: Specifies the TFTP server IP address or FQDN used for the firmware image (used with -g).
-d	For iDRAC: The -d , or directory , option specifies the directory on the TFTP server or on iDRAC6's host server where the firmware update file resides.
	For CMC: Specifies the source path where the firmware image resides.

Default: Designated TFTP default directory on that host for the file if -g option is absent. If -g is used, defaults to directory configured on the TFTP

Table 2-9. fwupdate Subcommand Options (continued)

Option	Description
-p	For iDRAC: The -p , or put , option is used to update the firmware file from the managed system to iDRAC6. The -u option must be used with the -p option.
	NOTE: This option is not applicable for CMC.
-r	The rollback option is used to rollback to the standby firmware.
	NOTE: This option is not applicable for CMC.
-c	Cancels the current firmware update of a module.
	NOTE: This option is applicable only for CMC.
-m	NOTE: This option is applicable only for CMC.
<modul e></modul 	Specifies the module or device to be updated. < module > is one of the following values:
	• cmc-active (default)
	• cmc-standby
	• kvm
	• server- n where $n = 1-16$
	• server-generation where generation = iDRAC or iDRAC6
	• iominf- n where $n = 1-6$
	NOTE: CMC version 3.00 accepts IPv4, IPv6, or fully qualified domain names (FQDN) for both FTP and TFTP servers.
	NOTE: You can specify the <code>cmc-active</code> and <code>cmc-standby</code> modules at the same time along with one or more <code>server-n</code> modules. This enables the devices to be updated together.
	NOTE: See "Updating the IOM Infrastructure Device Firmware" section of the "Using the CMC Web Interface" chapter of the <i>Dell Chassis Management Controller User Guide</i> for additional information on the IOM infrastructure device firmware update process.
	$\textbf{NOTE:} \ When you use the \verb server-generation option, the CMC updates all iDRACs of that particular generation that can be updated.$
	NOTE: Verify that the update applied to servers for a particular generation has been validated for all impacted server models.

Examples for CMC

• Upload the firmware image from the TFTP server and start the firmware update.

```
racadm fwupdate -g -u -a 192.168.0.100 -d firmimg.cmc -m cmc-active
```

TFTP firmware update has been initiated. This update process may take several minutes to complete.

• Upload the firmware image from the FTP server and start the firmware update.

```
racadm fwupdate -f 192.168.0.100 fred password123 -d firmimg.cmc -m cmc-active
```

Start IOM infrastructure firmware update.

```
racadm fwupdate -u -m iominf-1
```

• Update firmware on both the CMCs.

```
racadm fwupdate -g -u -a 192.168.0.100 -d firmimg.cmc -m cmc-active -m cmc-standby
```

• Update firmware on multiple servers.

```
racadm fwupdate -g -u -a 192.168.0.100 -d firmimg.imc -m server-1 -m server-2 -m server-3
```

• Update firmware on servers of iDRAC6 generation.

```
racadm fwupdate -g -u -a 192.168.0.100 -d firmimg.imc -m server-idrac6
```

• Update firmware on multiple IOM infrastructures.

```
racadm fwupdate -u -m iominf-4 -m iominf-5 -m iominf-6
```

• Query the current status of all firmware targets to be updated.

```
racadm fwupdate -s -m all
```

 Query the current status of the firmware update process for a particular module.

```
racadm fwupdate -s -m <module>
```

- Cancel a firmware update in progress.
 - racadm fwupdate -c
- Upload a firmware image from the client and start the firmware update.
- racadm fwupdate -p -u -d firmimg.cmc
- **NOTE:** The **fwupdate** command generates an error when used on the extension slot of a multi-slot server.

Output

Displays a message indicating the operation that is being performed.

Examples

- racadm fwupdate -g -u a 143.166.154.143 -d
 <path>
 - In this example, the **-g** option tells the firmware to download the firmware update file from a location (specified by the **-d** option) on the TFTP server at a specific IP address (specified by the **-a** option). After the image file is downloaded from the TFTP server, the update process begins. When completed, iDRAC6 is reset.
- racadm fwupdate -s
 This option reads the current status of the firmware update.
- **NOTE:** Remote RACADM firmware update through the local path is not supported on Linux Operating Systems.
- **NOTE:** For CMC, these commands specifically apply to an active-CMC update.

getassettag

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the asset tag for the chassis.

Usage

racadm getassettag [-m <module>]

Options

Table 2-10. getassettag Subcommand Options

Option	Description
-m < module >	Specifies the module whose asset tag you want to view.
	Legal value: chassis
	Because there is only one legal value, you can obtain the same output if you do not include this option.

Example

racadm getassettag -m chassis or racadm getassettag chassis 78373839-33

getchassisname

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the name of the chassis.

Usage

racadm getchassisname

Example

racadm getchassisname PowerEdge 2955

getconfig

Subcommand	Definition
getconfig	Retrieves iDRAC6 configuration parameters individually, or all iDRAC6 configuration groups may be retrieved and saved to a file.

Synopsis

```
racadm getconfig -f <filename>
racadm getconfig -g <groupName> [-i <index>]
racadm getconfig -u <username>
racadm getconfig -h
racadm getconfig -g <groupName> -o <objectName> [-i
index]
```

Input

Table 2-11 describes the **getconfig** subcommand options.

Table 2-11. getconfig Subcommand Options

Option	Description
-f	The -f < filename > option directs getconfig to write the entire iDRAC6 configuration to a configuration file. This file can be used for batch configuration operations using the config subcommand.
-g	The -g < groupName >, or group option, can be used to display the configuration for a single group. The groupName is the name for the group used in the racadm.cfg files. If the group is an indexed group, use the -i option.
-h	The -h , or help option, displays a list of all available configuration groups in alphabetical order. This option is useful when you do not remember exact group names.

Table 2-11. getconfig Subcommand Options

Option	Description
-i	The -i < index>, or index option, is valid only for indexed groups and can be used to specify a unique group. The < index> is a decimal integer from 1 through n, where n can vary from 1 to maximum number of indexes a particular group supports. If -i < index> is not specified, a value of 1 is assumed for groups, which are tables that have multiple entries. The index is specified by the index value, not a named value.
-0	The -o < object name > or object option specifies the object name that is used in the query. This option is optional and can be used with the -g option.
-u	The -u < username >, or user name option, can be used to display the configuration for the specified user. The < username > option is the login name for the user.
-v	The -v option displays additional details with the display of the properties and is used with the -g option.

Output

This subcommand generates error output upon encountering either of the following:

- Invalid syntax, group name, object name, index, or other invalid database members
- RACADM CLI transport failures

If errors are not encountered, this subcommand displays the contents of the specified configuration.

Examples

- racadm getconfig -g cfgLanNetworking
 Displays all of the configuration properties (objects) that are contained in the group cfgLanNetworking.
- racadm getconfig -f myrac.cfg
 Saves all group configuration objects from iDRAC6 to myrac.cfg.
- racadm getconfig -h
 Displays a list of the available configuration groups on iDRAC6 in an alphabetical order.

- racadm getconfig -u root Displays the configuration properties for the user named root.
- racadm getconfig -g cfgUserAdmin -i 2 -v Displays the user group instance at index 2 with verbose information for the property values.

getdcinfo

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays general I/O module and daughter card configuration information.

NOTE: Fabric verification for server DCs is performed only when the chassis is powered on. When the chassis is on standby power, iDRACs on the server modules remain powered off and thus are unable to report the server's DC fabric type. The DC fabric type may not be reported in the CMC user interface until iDRAC on the server is powered on.

Usage

racadm getdcinfo

Options

Table 2-12. getdcinfo Subcommand Options

Option	Description
-n	Displays the model names for the daughter cards in servers.

Example

The example output below is for a system with multi-slot servers.

racadm getdcinfo

Group A I/O Type : Gigabit Ethernet Group B I/O Type : Gigabit Ethernet Group C I/O Type : Gigabit Ethernet

getflexaddr

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays enabled/disabled status for the entire chassis. If used with -i, the command displays MACs/WWN on a per slot basis.

NOTE: If FlexAddress is not activated on the chassis, the command displays server-assigned MAC/WWN addresses. If the slot is empty, the command returns an error message.

Usage

racadm getflexaddr [-i <slotNum>]

Options

Table 2-13. getflexaddr Subcommand Options

Option	Description
-i <slotnum></slotnum>	Specifies the slot information to be displayed. <i><slotnum></slotnum></i> can be from 1 to 16.

Example

 Display current flex address settings for all slots and fabrics racadm getflexaddr

<slot#></slot#>	<status></status>	<server presence=""></server>

	iSCSI	00:1D:09:71:B3:63	00:1E:C9:FF:E3:28(active)
slot1-C1	Fiber Channel 4		20:01:00:1E:C9:FF:E3:29(active)
slot1-C2	Fiber Channel 4	10:00:00:00:C9:63 :51:0D	20:02:00:1E:C9:FF:E3:29(active)

getioinfo

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays general information about the I/O modules on the chassis.

NOTE: The fabric type may be any supported I/O fabric type, such as Ethernet, Fiber Channel, and Infiniband.

Usage

racadm getioinfo

Example

racadm getioinfo

<10>	<name></name>	<type></type>	<presence></presence>	<post></post>	<power></power>	<role></role>
switch-1	Dell Ethernet Passthrough	Gigabit Ethernet	Present	OK	ON	Master
switch-2	N/A	None	Not Present	N/A	N/A	N/A
switch-3	Brocade 4424	Fibre Channel 4	Present	OK	ON	Master
switch-4	N/A	None	Not Present	N/A	N/A	N/A
switch-5	N/A	None	Not Present	N/A	N/A	N/A
switch-6	N/A	None	Not Present	N/A	N/A	N/A

getkvminfo

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays iKVM module information.

Usage

racadm getkvminfo

Example

racadm getkvminfo

<FW Version> <status> <module> <module> <model> KVM Present Avocent iKVM Switch 00.05.00.04 Ready

getled

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the LED settings on a module: blinking, not blinking, or unknown (for empty slots).

Usage

racadm getled -m <module>

Table 2-14. getled Subcommand Options

Option	Description
-m < module >	Specifies the module whose LED settings you want to view.
	<pre><module> can be one of the following:</module></pre>
	• server- n where $n=1-16$
	• switch- n where $n=1-6$
	• chassis
	• cmc-active

Examples

- racadm getled -m server-10 <module> <LED state> server-10 Blinking
- racadm getled -m chassis <module> <LED state> server-10 Not blinking
- racadm getled -m server-1

```
<module>
              <LED state>
server-1
                ON
```

racadm getled -m server-9

<module> <LED state> server-9 Extension(1)

getmacaddress

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the MAC/WWN addresses for all modules or for a specified module.

Usage

```
racadm getmacaddress [-m <module>] [-t iscsi] [-x]
racadm getmacaddress [-a]
```

Options

Table 2-15. getmacaddress Subcommand Options

Option	Description	
-m < module >	> Specifies the module whose MAC address you want to view.	
	<module> may be one of the following:</module>	
	• chassis	
	• server- n where $n=1-16$	
	• switch- n where $n=1-6$	

Table 2-15. getmacaddress Subcommand Options

Option	Description			
-t	Displays the iSCSI MAC addresses for all servers or the specified server if used with -m option.			
-X	Displays the extra MACs (Ethernet or iSCSI) for servers with additional LOM MACs and must be used with -m option.			
-a	Displays the Ethernet and iSCSI MAC/WWN addresses for all iDRAC/LOMs/mezzanine cards. When FlexAddress is enabled for a particular slot, then the chassis-assigned MAC/WWN address is displayed.			

Example

- Display iSCSI MAC addresses for all servers.
 racadm getmacaddress -t iscsi
- Display iSCSI MAC for server-1.
 racadm getmacaddress -m server-1 -t iscsi
- Display extra iSCSI MACs for server-1 (if available).
 racadm getmacaddress -m server-1 -t iscsi -x
- Display MAC for server-1.
 racadm getmacaddress -m server-1

getmodinfo

NOTE: To use this subcommand, you must have CMC Login User privilege.

NOTE: The service tag field is blank for modules that do not have service tags.

Description

Displays configuration and status information for all modules or a specified module (server, switch, CMC, fan unit, power supply unit, KVM, or I2C cable) in the chassis.

Usage

racadm getmodinfo [-m <module>] [-A]

Options

Table 2-16. getmodinfo Subcommand Options

Option	Description Specifies the module whose configuration and status information you want to view. The default command (no options) displays information about all major components in the chassis.		
-m < module >			
	<module> may be any of the following values:</module>		
	• server- n where $n=1-16$		
	• switch- n where $n=1-6$		
	• CMC- n where $n=1-2$		
	• fan- n where $n=1-9$		
	• ps- n where $n=1-6$		
	• chassis		
	• kvm		
	• io-cable		
	• fpc-cable		
-A	Suppresses headers and labels in the output.		

Example

• racadm getmodinfo -m switch-1

<module></module>	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>	<pwrstate></pwrstate>	<health></health>	<svctag></svctag>

NOTE: For CMC (only) a power state of "Primary" denotes Active CMC.

getniccfg

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The getniccfg subcommand displays the current NIC settings.

Synopsis

racadm getniccfg

Sample Output

The **getniccfg** subcommand displays an appropriate error message if the operation is not successful. Otherwise, on success, the output is displayed in the following format:

IPv4 settings:

```
NIC Enabled = 1

IPv4 Enabled = 1

DHCP Enabled = 1

IP Address = 10.35.0.64

Subnet Mask = 255.255.255.0

Gateway = 10.35.0.1
```

IPv6 settings:

```
IPv6 Enabled
                    = 0
DHCP6 Enabled
                    = 1
IP Address 1
                    = ::
Gateway
                    = ::
Link Local Address = ::
IP Address 2
                    = ::
IP Address 3
                    = ::
IP Address 4
                    = ::
IP Address 5
                    = ::
IP Address 6
                    = ::
TP Address 7
                    = ::
IP Address 8
                    = ::
IP Address 9
                    = ::
IP Address 10
                    = ::
IP Address 11
                    = ::
IP Address 12
                    = ::
IP Address 13
                    = ::
IP Address 14
                    = ::
```

IP Address 15 = ::

LOM Status:

NIC Selection = Dedicated

Link Detected = Yes

= 10Mb/sSpeed

= Half Duplex Duplex Mode

NOTE: IPv6 information is displayed only if IPv6 is enabled in iDRAC6.

NOTE: LOM Status is displayed only for iDRAC6 on Rack and Tower servers and is not displayed for iDRAC6 Enterprise on Blade servers.

getpbinfo

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays power budget status information.

Usage

racadm getpbinfo

Example

racadm getpbinfo

getraclog

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The **getraclog** -i command displays the number of entries in iDRAC6 log.

Synopsis

```
racadm getraclog -i
racadm getraclog [-A] [-o] [-c count] [-s start-
record | [--more]
```

Table 2-17 lists the options that allow the **getraclog** command to read entries.

Table 2-17. getraclog Subcommand Options

Option	Description
-A	Displays the output with no headers or labels.
-c	Provides the maximum count of entries to be returned.
more	Displays one screen at a time and prompts the user to continue (similar to the UNIX more command).

Table 2-17. getraclog Subcommand Options *(continued)*

Option	Description
- 0	Displays the output in a single line.
-s	Specifies the starting record used for the display.

NOTE: If no options are provided, the entire log is displayed.

Output

The default output display shows the record number, time stamp, source, and description. The timestamp begins at midnight, January 1 and increases until the system boots. After the system boots, the system's timestamp is used.

NOTE: For iDRAC6 Enterprise on Blade Servers, iDRAC6 Log entries for *SystemBoot* displayed using the local racadm command racadm getraclog may not be correctly formatted. For example, some extra characters may be displayed in the Description field, or the Source field may be empty.

Sample Output

Record: 1

Date/Time: Dec 8 08:10:11

Source: login[433]

Description: root login from 143.166.157.103

getractime

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

With no options, the **getractime** subcommand displays the time in a common readable format.

With the **-d** option, **getractime** displays the time in the format, yyyymmddhhmmss.mmmmmms, which is the same format returned by the UNIX date command

Synopsis

racadm getractime [-d]

Output

The **getractime** subcommand displays the output on one line.

Sample Output

```
racadm getractime
Thu Dec 8 20:15:26 2005
```

```
racadm getractime -d
20051208201542.000000
```

getredundancymode

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the redundancy status (Redundant or Non-Redundant) of the CMC.

Usage

racadm getredundancymode

Example

racadm getredundancymode

Redundant

getsel

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

1

The getsel -i command displays the number of entries in the SEL.

The following getsel options (without the -i option) are used to read entries.

Synopsis

```
racadm getsel -i[-A]
racadm getsel [-s <start>] [-c <count>] [-A] [-o] [-E]
[-R] [--more]
```

NOTE: If no arguments are specified, the entire log is displayed.

Table 2-18. getsel Subcommand Options

Option	Description
-A	Specifies output with no display headers or labels.
-c	Provides the number of records to be displayed.
-o	Displays each entry in the SEL in a single line.
-s	Specifies the starting record used for the display.
-E	Displays RAW SEL data with the other data for each entry.
-R	Displays only RAW SEL data for each entry.
-i	Displays the number of entries in the SEL.
more	Displays one screen at a time and prompts the user to continue (similar to the UNIX more command).

Output

The default output display shows the record number, timestamp, severity, and description.

For example:

Record: 1

11/16/2005 22:40:43 Date/Time:

Severity: Ok

Description: System Board SEL: event log sensor for

System Board, log cleared was asserted

getsensorinfo

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays status for system sensors.

Usage

racadm getsensorinfo

Examples

racadm getsensorinfo

getslotname

NOTE: To use this subcommand, you must have **CMC Login User** privilege.

Description

Displays the name and hostname (if available) of all 16 slots, or of a specified slot (indicated by the slot number) in the chassis. Optionally, this command can be used to find if the slot name or hostname is displayed in the CMC User Interface or with the getslotname -i <slot ID> command. If the hostname is not available, the static slot name is used.

Usage

```
racadm getslotname
racadm getslotname -i <slot ID>
racadm getslotname -h
```

Options

Table 2-19. getslotname Subcommand Options

Option	Description
(None)	Displays the slot name for all 16 slots in the chassis.
-i <slot id=""></slot>	Specifies the ID of the slot.
	Legal values: 1–16
-h	Specifies whether to use the slot name or the hostname (if available).
	1=use hostnames, 0=use slotnames

Example

racadm getslotname

<slot< th=""><th>#></th><th><slot name=""></slot></th><th><host name=""></host></th></slot<>	#>	<slot name=""></slot>	<host name=""></host>
1		SLOT-01

• racadm getslotname -i 1

Webserver-1

getssninfo

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The getssninfo subcommand returns a list of users that are connected to iDRAC6. The following information is displayed:

- Session ID
- Username
- IP address (if applicable)
- Session type (for example, serial or Telnet)
- Login date and time in MM/DD/YYYY HH:MM:SS format

Based on the Session ID (SSNID) or the user name (User), the iDRAC administrator can close the respective sessions or all the sessions using the, **closessn** subcommand. See "closessn" on page 37 for more information.

Synopsis

```
racadm getssninfo [-A] [-u <username> | *]
```

Input

Table 2-20 describes the **getssninfo** subcommand options.

Table 2-20. getssninfo Subcommand Options

Option	Description
-A	The -A option eliminates the printing of data headers.
-u	The -u <username> user name option limits the printed output to only the detail session records for the given user name. If an (*) symbol is given as the user name, all users are listed. Summary information is not printed when this option is specified.</username>

Examples

racadm getssninfo

The following table provides an example of output from the getssninfo command.

SSNID	Туре	User	IP Address	Login Date/Time
6	GUI	root	192.168.0.10	04/07/2010 12:00:34

racadm getssninfo -A

```
"root" "143.166.174.19" "Telnet" "NONE"
```

• racadm getssninfo -A -u *

```
"root" "143.166.174.19" "Telnet" "NONE"
```

getsvctag

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The **getsvctag** subcommand displays the service tag of the host system.

Synopsis

racadm getsvctag

Example

Type getsvctag at the command prompt. The output is displayed as follows:

Y76TP0G

getsysinfo

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The **getsysinfo** subcommand displays information related to iDRAC, managed system, and watchdog configuration.

NOTE: The local racadm *getsysinfo* subcommand on Linux displays the *PrefixLength* on separate lines for IPv6 Address 2 – IPv6 Address 15 and the Link Local Address.

Synopsis

racadm getsysinfo [-d] [-s] [-w] [-A] [-c] [-4] [-6]

Input

Table 2-21 describes the **getsysinfo** subcommand options.

Table 2-21. getsysinfo Subcommand Options

Option	Description
-4	Displays IPv4 settings
-6	Displays IPv6 settings
-c	Displays common settings
-d	Displays iDRAC6 information
-s	Displays system information
-w	Displays watchdog information
-A	Eliminates the printing of headers/labels

If the -w option is not specified, then the other options are used as defaults.

Output

The getsysinfo subcommand displays information related to the RAC, managed system, and watchdog configuration.

Sample Output

RAC Information:

RAC Date/Time = 10/27/2009 14:38:00

Firmware Version = 1.30 Firmware Build = 20

Last Firmware Update = 10/26/2009 16:55:08

Hardware Version = 0.01

MAC Address = 00:24:e8:2e:c5:d3

Common settings:

iscsi = 00:24:e8:2e:c5:d2

Watchdog Information:

Recovery Action = None

Present countdown value = 15 seconds
Initial countdown value = 15 seconds

Examples

• racadm getsysinfo -A -s

"System Information:" "PowerEdge 2900" "A08" "1.0" "EF23VO-0023" "Hostname"

"Microsoft Windows 2000 version 5.0, Build Number 2195, Service Pack 2" "ON"

• racadm getsysinfo -w -s

System Information:

System Model = PowerEdge 2900

System Revision = I
System BIOS Version = 0.2.3
BMC Firmware Version = 0.17
Service Tag = 48192
Host Name = racdev103

OS Name = Microsoft Windows

Server 2003

Power Status = OFF

```
Watchdog Information:
Recovery Action
                         = None
Present countdown value = 0 seconds
Initial countdown value = 0 seconds
```

Limitations

The Hostname and OS Name fields in the getsysinfo output display accurate information only if Dell OpenManage Server Administrator is installed on the managed system. If it is not installed, these fields may be blank or inaccurate. An exception to this are VMware operating system names, which are displayed even if Server Administrator is not installed on the managed system.

gettracelog

NOTE: To use this subcommand, you must have **Login to iDRAC** permission.

Description

The **gettracelog** (without the **-i** option) command reads entries. The following **gettracelog** entries are used to read entries:

Table 2-22. gettracelog Subcommand options

Option	Description
-i	Displays the number of entries in iDRAC6 trace log.
more	Displays one screen at a time and prompts the user to continue (similar to the UNIX more command).
- 0	Displays each entry in a single line.
-c	Specifies the number of records to display.
-s	Specifies the starting record to display.
-A	Do not display headers or labels.

Synopsis

```
racadm gettracelog -i[-A]
racadm gettracelog [-s <start>] [-c <count>] [--more]
[-A] [-o]
```

Output

The default output display shows the record number, timestamp, source, and description. The timestamp begins at midnight, January 1 and increases until the system boots. After the system boots, the system's timestamp is used.

For example:

Record: 1

Date/Time: Dec 8 08:21:30

Source: ssnmgrd[175]

Description: root from 143.166.157.103: session

timeout sid ObeOaef4

getversion

NOTE: To use this subcommand, you must have **Login** privilege.

Description

Displays the current software version, model and generation information, and whether or not the target device can be updated.

Usage

```
racadm getversion [-b | -c] [-m <module>]
racadm getversion
```

Options

Table 2-23. getversion Subcommand Options

Option	Description
(none)	Displays the version information for all targets or devices.

1

Table 2-23. getversion Subcommand Options

Option	Description
-m <module></module>	Specifies the module or device for which you want to retrieve the version information.
	<module> is one of the following:</module>
	• server- n where $n = 1-16$. For example, server-1.
	• cmc- n where $n = 1$ or 2. For example, cmc-2.
-c	Displays the server's current CPLD version.
-b	Displays the server's current BIOS version (default is iDRAC version).

NOTE: The **-b** and **-c** options are not available for CMC modules.

Example

racadm getversion -m server-15

```
<server> <iDRAC version> <model name> <Gen> <Updatable>
server-15
           2.00(Build 10) PowerEdgeM605 iDRAC
                                                 Ν
racadm getversion
```

<server></server>	<idrac version=""></idrac>	<blade type=""></blade>	<gen></gen>	<updatable></updatable>
server-2	1.50	PowerEdgeM600	iDRAC	Y
server-3	2.10	PowerEdgeM610	iDRAC6	Y
server-4	1.50	PowerEdgeM605	iDRAC	Y
<cmc></cmc>	<cmc version=""></cmc>			<updatable></updatable>
cmc-1	2.10.X06.200906 080825			Y

• racadm getversion -c

<server></server>	<cpld version=""></cpld>	<blade type=""></blade>
server-1		PowerEdgeM600
server-2		PowerEdgeM805
server-5	1.0.0	PowerEdgeM710

racadm getversion -b

<server></server>	<bios version=""></bios>	<blade type=""></blade>
server-1	2.0.0	PowerEdgeM605
server-2	1.1.0	PowerEdgeM805
server-5	1.1.0	PowerEdgeM710

ifconfig

NOTE: To use this subcommand, you must have Execute Diagnostic Commands or Configure iDRAC permission.

Subcommand	Definition
ifconfig	Displays the contents of the network interface table.

Synopsis

racadm ifconfig

Example

```
$ racadm ifconfig
        Link encap: Ethernet HWaddr 00:1D:09:FF:DA:23
        inet addr:10.35.155.136 Bcast:10.35.155.255

Metric:1
          RX packets:2550665 errors:0 dropped:0
overruns:0 frame:0
          TX packets:0 errors:0 dropped:0 overruns:0
carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:272532097 (259.9 MiB) TX bytes:0
(0.0 B)
```

krbkeytabupload

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description
krbkeytabupload	Uploads a Kerberos keytab file.

Synopsis

racadm krbkeytabupload [-f <filename>]

< filename > is the name of the file including the path.

Options

Table 2-24 describes the **krbkeytabupload** subcommand options.

Table 2-24. kerbkeytabupload Subcommand Options

Option	Description
-f	Specifies the file name of the keytab to be uploaded. If the file is not specified, the keytab file in the current directory is selected.

The krbkeytabupload command returns 0 when successful and returns a non-zero number when unsuccessful.

Example

racadm krbkeytabupload -f c:\keytab\krbkeytab.tab

localConRedirDisable

NOTE: Only a local RACADM user can execute this command.

Subcommand	Description
localConRedirDisable	Disables Virtual Console to the management station.

Synopsis

racadm localConRedirDisable <option> If <option> is set to 1, Virtual Console is disabled. If <option> is set to 0, Virtual Console is enabled.

netstat

NOTE: To use this subcommand, you must have **Execute Diagnostic Commands** permission.

Subcommand	Definition
netstat	Displays the routing table and the current connections.

Synopsis

racadm netstat

ping

NOTE: To use this subcommand, you must have **Execute Diagnostic Commands** or Configure iDRAC permission.

Subcommand	Definition
ping	Verifies that the destination IP address is reachable from iDRAC6 with the current routing-table contents. A destination IP address is required. An ICMP echo packet is sent to the destination IP address based on the current routing-table contents.

Synopsis

racadm ping <ipaddress>

ping6

NOTE: To use this subcommand for CMC you must have **Administrator** privelege for CMC and for iDRAC you must have Execute Diagnostic Commands or Configure iDRAC6 permission.

Subcommand	Definition
ping6	Verifies that the destination IPv6 address is reachable from iDRAC6 or CMC or with the current routing-table contents. A destination IPv6 address is required. An ICMP echo packet is sent to the destination IPv6 address based on the current routing-table contents.

Synopsis

racadm ping6 < ipv6address>

Examples

racadm iping6 10.9.72.254

IPING6 10.9.72.254 (10.9.72.254): 56 data bytes 64 bytes from 10.9.72.254: icmp seq=0 ttl=121 time=2.9 ms

```
--- 10.9.72.254 ping statistics ---
1 packets transmitted, 1 packets received, 0 percent
packet loss
round-trip min/avg/max = 2.9/2.9/2.9 ms
```

racdump

NOTE: To use this subcommand for CMC you must have **Administrator** privilege and for iDRAC you must have **Debug** permission.

Description

The racdump subcommand provides a single command to get dump, status, and general iDRAC6 board information.

For CMC, this subcommand displays the comprehensive chassis status and configuration state information, as well as historic event logs. Used for post deployment configuration verification and during debugging sessions.

The following information is displayed when the **racdump** subcommand is processed:

- General system/RAC information
- Coredump
- Session information
- Process information
- Firmware build information

Racdump includes the following subsystems and aggregates the following RACADM commands:

Subsystem	RACADM Command
General System/RAC information	getsysinfo
Session information	getssinfo
Sensor information	getsensorinfo
Switches information (IO Module)	getioinfo
Mezzanine card information (Daughter card)	getdcinfo
All modules information	getmodinfo
Power budget information	getpbinfo
KVM information	getkvminfo
NIC information (CMC module)	getniccfg
Redundancy information	getredundancymode
Trace log information	gettracelog
RAC event log	getraclog
System event log	getsel

Synopsis

racadm racdump

racreset

NOTE: To use this subcommand for CMC you must have **Chassis Administrator** privilege and for iDRAC you must have Configure iDRAC permission.

NOTE: When you issue a racreset subcommand, iDRAC6 may require up to two minutes to return to a usable state.

Description

The racreset subcommand issues a reset to iDRAC6. The reset event is written into iDRAC6 log.

NOTE: You must reboot your system after performing a hard reset of iDRAC6 as described in Table 2-25.

Table 2-25 describes the racreset subcommand options.

Table 2-25. racreset Subcommand Options

Option	Description
hard	A hard reset performs a deep reset operation on the remote access controller. A hard reset should only be used as a last case resort of resetting iDRAC6 controller for recovery purposes.
soft	A soft reset performs a graceful reboot operation on the RAC.

Synopsis

racadm racreset [hard | soft]

Examples

- racadm racreset Start the iDRAC6 soft reset sequence.
- racadm racreset hard Start the iDRAC6 hard reset sequence.

racresetcfg

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Description

The racresetofg command removes all user-configured database property entries. The database has default properties for all entries that are used to restore iDRAC6 to the default settings. After resetting the database properties, iDRAC6 resets automatically.

NOTE: The racresetcfg subcommand does not reset the cfgDNSRacName object.

NOTE: This command deletes your current iDRAC6 configuration and resets iDRAC6 and serial configuration to the default settings. After reset, the default name and password is **root** and **calvin**, respectively, and the IP address is 192.168.0.120. Only for iDRAC6 Enterprise on Blade servers, it is IP address plus the number of the slot the server inhabits in the chassis. If you issue racresetcfg from a network client (for example, a supported Web browser, Telnet/ssh, or remote RACADM), you must use the default IP address.

NOTE: Certain iDRAC6 firmware processes need to be stopped and restarted for reset to defaults to complete. iDRAC6 becomes unresponsive for about 30 seconds while this operation completes.

Synopsis

racadm racresetcfg

remoteimage

NOTE: To use this subcommand, you must have **Administrator** permission.

Description

Connects, disconnects, or deploys a media file on a remote server.

Synopsis

racadm remoteimage <options>

Table 2-26 describes the **remoteimage** subcommand options.

Table 2-26. remoteimage Subcommand Options and Descriptions

Option	Description
-c	Connect the image.
-d	Disconnect image.
-u	Username to access the network share.
- p	Password to access the network share.
-l	Image location on the network share; use double quotes around the location.
-s	Display current status; -a is assumed if not specified

serveraction

NOTE: To use this subcommand, you must have **Execute Server Control Commands** permission.

Description

The serveraction subcommand enables users to perform power management operations on the host system. Table 2-27 describes the serveraction power control options.

Table 2-27. serveraction Subcommand Options

String	Definition		
<action></action>	> Specifies the action. The options for the <i><action></action></i> string are:		
	• powerdown — Powers down the managed system.		
	 powerup — Powers up the managed system. 		
	• powercycle — Issues a power-cycle operation on the managed system. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.		
	• powerstatus — Displays the current power status of the server (ON or OFF)		
	 hardreset — Performs a reset (reboot) operation on the managed system. 		

Synopsis

racadm serveraction <action>

Output

The serveraction subcommand displays an error message if the requested operation could not be performed, or a success message if the operation completed successfully.

setassettag

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

Sets the N-byte ASCII asset tag for the chassis.

Usage

racadm setassettag -m chassis <asset tag>

Options

Table 2-28. setassettag Subcommand Options

Option	Command
-m <module></module>	Specifies the module whose asset tag you want to set.
	Legal value: chassis
	NOTE: Because there is only one legal value, you can obtain the same output if you do not include this option.
	NOTE : <assettag> is a maximum of 64 non-extended ASCII characters.</assettag>

Example

Input:

racadm setassettag -m chassis 783839-33

or

racadm setassettag 783839-33 The asset tag was changed successfully.

setchassisname

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

Sets the name of the chassis in the LCD.

Usage

racadm setchassisname <name>

NOTE: Chassisname is a maximum of 64 non-extended ASCII characters

Example

racadm setchassisname dellchassis-1 The chassis name was set successfully.

setflexaddr

NOTE: To use this subcommand, you must have **Chassis Configuration** Administrator privilege.

Description

Enables/disables FlexAddress on a particular slot/fabric.

NOTE: If the fabric type is determined to be Infiniband, the operation is canceled and the command returns an error. If the FlexAddress feature is not activated, the command returns an error.

NOTE: The server must be powered off to change the slot state. All servers must be powered off to change the fabric state.

Usage

```
racadm setflexaddr [-i <slot#> <state>]
[-f <fabricName> <state>]
\langle slot \# \rangle = 1 \text{ to } 16
<fabricName> = A, B, C
\langle state \rangle = 0 \text{ or } 1
```

where 0 is disable and 1 is enable

Options

Table 2-29. setflexaddr Subcommand Options

Option	Description
-i <slot#> <state></state></slot#>	Enables/disables FlexAddress for the specified slot.
-f <fabricname> <state></state></fabricname>	Enables/disables FlexAddress for the specified fabric.

Example

- racadm setflexaddr -i 1 0 Slot 1 FlexAddress state set successfully
- racadm setflexaddr -f A 1 Fabric A FlexAddress state set successfully
- racadm setflexaddr -f idrac 1

setled

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

Sets the state (blinking or not blinking) of the LED on the specified module.

Usage

racadm setled -m <module> -l <ledState>

ı

Options

Table 2-30. setled Subcommand Options

Option	Description
-m <module></module>	Specifies the module whose LED you want to configure.
	<module> can be one of the following:</module>
	• server- n where $n=1-16$
	• switch- n where $n=1-6$
	• cmc-active
	• chassis
-l <ledstate></ledstate>	Specifies whether the LED should blink.
	< ledstate > can be one of the following:
	• 0 — no blinking
	• 1 — blinking

Example

- racadm setled -m server-1 -1 1
 LED state was set successfully.
- **NOTE:** The **setled** command generates an error when used on the extension slot of a multi-slot server.
- racadm setled -m server-9 -1 1
 ERROR: Server in slot 9 is an extension of the server in slot 1.

setniccfg

Description

The setniccfg subcommand sets iDRAC6 IP address.

- The -d option enables DHCP for the NIC (default is DHCP disabled).
- The -d6 option enables AutoConfig for the NIC. It is enabled by default.

The -s option enables static IP settings. The IPv4 address, netmask, and gateway can be specified. Otherwise, the existing static settings are used. <IPv4Address>, <netmask>, and <qateway> must be typed as dotseparated strings.

```
racadm setniccfg -s 192.168.0.120 255.255.255.0
192,168,0,1
```

- The -s6 option enables static IPv6 settings. The IPv6 address, Prefix Length, and the IPv6 Gateway can be specified.
- The **-o** option disables the NIC completely.

NOTE: The terms NIC and Ethernet management port may be used interchangeably.

Synopsis

```
racadm setniccfq -d
racadm setniccfg -d6
racadm setniccfg -s <IPv4Address> <netmask> <IPv4
gateway>
racadm setniccfg -s6 <IPv6 Address> <IPv6 Prefix
Length> <IPv6 Gateway>
```

Output

The setnicefg subcommand displays an appropriate error message if the operation is not successful. If successful, a message is displayed.

setractime

racadm setniccfg -o

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

1

Sets the date and time on the CMC.

Usage

racadm setractime -d <yyyymmddhhmmss.mmmmmmsoff>
racadm setractime -l <yyyymmddhhmmss> [-z <zone>]

Options

Table 2-31. setractime Subcommand Options

Option	Description
-d	Sets the time in the string yyyymmddhhmmss.mmmmmsoff where:
	• yyyy is a the year
	• mm is the month
	• dd is the day
	• <i>hh</i> is the hour
	• mm is the minutes
	• ss is the seconds
	• mmmmmm is the number of microseconds
	\bullet s is a + (plus) sign or a - (minus) sign, which indicates the sign of the offset
	• off is the offset in minutes
	NOTE: The off is the offset in minutes from GMT and must be in 15-minute increments.
-z <zone></zone>	Sets the time zone by name or index, or lists possible time zones.
	For example, PST8PDT (Western United States), 279 (Seoul), 329 (Sydney).
	<zone> may be:</zone>
	• ? - lists the major timezone names/prefixes
	• * - lists every time zone index and name
	• prefix* - lists every time zone index and name that matches the prefix
	• index - sets the time zone to the given time zone index
	• name - sets the time zone to the given time zone name

Table 2-31. setractime Subcommand Options

Option	Description	
-l	Sets the local date and time in the string yyyymmddhhmmss where:	
	• yyyy is a the year	
	• mm is the month	
	• dd is the day	
	• <i>hh</i> is the hour	
	• mm is the minute	
	• ss is the second	
	NOTE: Setting the time using the -I and -z options is recommended. This command format allows the CMC to fully support local time zones, including the ability to automatically adjust the CMC time to the local Daylight Savings Time.	

Example

The setractime subcommand supports dates ranging from 1/1/1970 00:00:00 through 12/31/2030 23:59:59. To set the date to October 24, 2007 at 3:02:30 PM PST:

racadm setractime -1 20071024150230 -z PST8PDT The time was set successfully.

setslotname

NOTE: To use this subcommand, you must have **Administrator** privilege.

NOTE: See the "Editing Slot Names" section in the *Dell Chassis Management* Controller User Guide for rules for selecting slot names.

Description

Displays the name and hostname (if available) of all 16 slots, or of a specified slot (indicated by the slot number) in the chassis. Optionally, this command can be used to set whether the slot name or hostname is displayed in the CMC User Interface or with the getslotname -i <slot ID> command. If the hostname is not available, the static slot name is used.

NOTE: The OMSA server agent must be present and running on the server to use the Display Hostname feature. If the agent is not running, the setting is ignored. For more information, see the *Dell OpenManage Server Administrator User's Guide* at support.dell.com/manuals.

Usage

racadm setslotname -i <slotID> <slotname> racadm setslotname -h <enabled>

Options

Table 2-32. setslotname Subcommand Options

Option	Description
<slotid></slotid>	Displays the location of the slot in the chassis.
	Legal values: 1–16
<slotname></slotname>	The new name to assign to the slot.
<enabled></enabled>	Sets whether the server's hostname is used for display purposes. 1 = enabled.
	Legal values: 0, 1

Example

racadm setslotname -i 3 mserver3 The slot name was set successfully.

setsysinfo

NOTE: To use this subcommand, you must have **Administrator** privilege.

Description

Sets the name or location of the chassis

Usage

racadm setsysinfo [-c chassisname|chassislocation] <string>

Option

Table 2-33. setsysinfo Subcommand Options

Option	Description
<string></string>	Indicates a maximum of 64 non-extended ASCII chassis name or location.
-c	Sets the chassis name or location.

Example

racadm setsysinfo -c chassisname "Dell Rack System" The chassis name was set successfully.

sshpkauth

Description

Enables you to upload and manage up to 4 different SSH public keys *per user*. You can upload a key file or key text, view keys, or delete keys. This command has three mutually exclusive modes—upload, view, and delete that are determined by the options (see Table 2-34) provided to the command.

Synopsis

racadm sshpkauth

Upload

The upload mode allows you to upload a keyfile or to copy the key text on the command line. You cannot upload and copy a key at the same time.

Local and Remote RACADM:

```
racadm sshpkauth -i <2 to 16> -k <1 to 4> -f
<filename>
racadm sshpkauth -i <2 to 16> -k <1 to 4> -t
<key-text>
```

1

Telnet/ssh/serial RACADM:

```
racadm sshpkauth -i <2 to 16> -k <1 to 4> -t <key-text>
```

View

The view mode allows the user to view a key specified by the user or all keys.

racadm sshpkauth
$$-i$$
 <2 to 16> $-v$ $-k$ <1 to 4> racadm sshpkauth $-i$ <2 to 16> $-v$ $-k$ all

Delete

The delete mode allows the user to delete a key specified by the user or all keys.

```
racadm sshpkauth -i <2 to 16> -d -k <1 to 4> racadm sshpkauth -i <2 to 16> -d -k all
```

Options

Table 2-34. sshpkauth Subcommand Options

Option	Description
-i <user index=""></user>	Index for the user. <user index=""> must be between 2 to 16 on iDRAC6.</user>
-k [<key index=""> all]</key>	Index to assign the PK key being uploaded. all only works with the -v or -d options. <key index=""> must be between 1 to 4 or all on iDRAC6.</key>
-t <pk key="" text=""></pk>	Key text for the SSH Public key.
-f <filename></filename>	File containing the key text to upload. The -f option is not supported on Telnet/ssh/serial RACADM.
-v	View the key text for the index provided.
-d	Delete the key for the index provided.

Examples

```
Upload an invalid key to iDRAC6 User 2 in the first key space using a string:
$ racadm sshpkauth -i 2 -k 1 -t "This is invalid key
Text."
ERROR: Key text appears to be corrupt
Upload a valid key to iDRAC6 User 2 in the first key space using a file:
$ racadm sshpkauth -i 2 -k 1 -f pkkey.key
Key file successfully uploaded.
Get all keys for User 2 on iDRAC6:
$ racadm sshpkauth -v -i 2 -k all
Key ID 1:
ssh-rsa
AAAAB3NzaC1yc2EAAAABIwAAAIEAzzy+k2npnKqVEXGXIzo0sbR6J

Ea6LHUslAXFqXmOdlThd
wilU2VLw/iRH1ZymUFnut8qqbPQqqV2L8bsUaMqb5PooIIvV6hy4i
sCNJU= 1024-bit RSA, converted from OpenSSH by
xx xx@xx.xx
Key ID 2:
Key ID 3:
Key ID 4:
```

ssicertdownload

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description	
sslcertupload	Downloads an SSL certificate from iDRAC6 to the client's file system.	

Synopsis

racadm sslcertdownload -t <type> [-f <filename>]

Options

Table 2-35 describes the sslcertdownload subcommand options.

Table 2-35. sslcertdownload Subcommand Options

Option	Description
-t	Specifies the type of certificate to download, either the CA certificate for Directory Service or the server certificate.
	1 = server certificate
	2 = CA certificate for Directory Service
-f	Specifies the file name of the certificate to be uploaded. If the -f option or the filename is not specified, the sslcert file in the current directory is selected.

The sslcertdownload command returns 0 when successful and returns a nonzero number when unsuccessful.

Example

racadm sslcertdownload -t 1 -f c:\cert\cert.txt

sslcertupload

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description
sslcertupload	Uploads a custom SSL server or CA certificate for Directory Service from the client to iDRAC6.

Synopsis

racadm sslcertupload -t <type> [-f <filename>]

Options

Table 2-36 describes the **sslcertupload** subcommand options.

Table 2-36. sslcertupload Subcommand Options

Option	Description
-t	Specifies the type of certificate to upload, either the CA certificate for Directory Service or the server certificate.
	l = server certificate
	2 = CA certificate for Directory Service
-f	Specifies the file name of the certificate to be uploaded. If the file is not specified, the sslcert file in the current directory is selected.

The sslcertupload command returns 0 when successful and returns a nonzero number when unsuccessful.

Example

racadm sslcertupload -t 1 -f c:\cert\cert.txt

sslcertview

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description	
sslcertview	Displays the SSL server or CA certificate that exists on iDRAC6.	

Synopsis

racadm sslcertview -t <type> [-A]

Options

Table 2-37 describes the sslcertview subcommand options.

Table 2-37. sslcertview Subcommand Options

Option	Description
-t	Specifies the type of certificate to view, either the CA certificate or server certificate.
	1 = server certificate
2 = CA certificate for Directory Service	2 = CA certificate for Directory Service
-A	Prevents printing headers/labels.

Sample Output

racadm sslcertview -t 1

Serial Number : 00

sslcsrgen

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Description

The sslcsrgen subcommand can be used to generate a CSR and download the file to the client's local file system. The CSR can be used for creating a custom SSL certificate that can be used for SSL transactions on iDRAC6.

Synopsis

```
racadm sslcsrgen [-q] [-f <filename>]
racadm sslcsrgen -s
```

Options

Table 2-38 describes the sslcsrgen subcommand options.

NOTE: The **-f** option is not supported for the serial/Telnet/ssh console.

Table 2-38. sslcsrgen Subcommand Options

Option	Description
-g	Generates a new CSR.
-s	Returns the status of a CSR generation process (generation in progress, active, or none).
-f	Specifies the filename of the location, <i><filename></filename></i> , where the CSR is downloaded.

NOTE: If the **-f** option is not specified, the filename defaults to **sslcsr** in your current directory.

If no options are specified, a CSR is generated and downloaded to the local file system as sslcsr by default. The -g option cannot be used with the -s option, and the -f option can only be used with the -g option.

The sslcsrgen -s subcommand returns one of the following status codes:

- CSR was generated successfully.
- CSR does not exist.
- CSR generation in progress.

NOTE: Before a CSR can be generated, the CSR fields must be configured in the RACADM cfgRacSecurity group. For example:

racadm config -g cfgRacSecurity -o cfgRacSecCsrCommonName MyCompany

NOTE: In telnet/ssh console, you can only generate and not download the CSR file.

Examples

racadm sslcsrgen -s or racadm sslcsrgen -g -f c:\csr\csrtest.txt

sslkeyupload

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description
sslkeyupload	Uploads SSL key from the client to iDRAC6.

Synopsis

racadm sslkeyupload -t <type> -f <filename>

Options

Table 2-39 describes the sslkeyupload subcommand options.

Table 2-39. sslkeyupload Subcommand Options

Option	Description
-t	Specifies the key to upload.
	1 = SSL key used to generate the server certificate
-f	Specifies the file name of the SSL key to be uploaded.

The sslkeyupload command returns 0 when successful and returns a nonzero number when unsuccessful

Example

racadm sslkeyupload -t 1 -f c:\sslkey.txt

sslresetcfq

NOTE: To use this subcommand, you must have **Chassis Configuration** Administrator privilege.

Description

Regenerates the self-signed certificate used by the CMC Web GUI. The certificate takes effect 30 seconds after the command is entered.

Usage

racadm sslresetcfq

Example

racadm sslresetcfq Certificate generated successfully and webserver restarted.

NOTE: For more information on managing SSL certificates, see the "Securing CMC" Communications Using SSL and Digital Certificates" section in the Dell Chassis Management Controller User Guide.

testemail

Description

Sends a test e-mail from iDRAC6 to a specified destination. Prior to executing the test e-mail command, ensure that the SMTP server is configured and the specified index in the RACADM cfgEmailAlert group is enabled and configured properly. See "cfgEmailAlert" on page 160 for more information

Synopsis

racadm testemail -i <index>

Table 2-40 provides a list and associated commands for the cfgEmailAlert group.

Table 2-40. testemail Configuration

Action	Command
Enable the alert	racadm config -g cfgEmailAlert -o cfgEmailAlertEnable -i 1 1
Set the destination e-mail address	racadm config -g cfgEmailAlert -o cfgEmailAlertAddress -i 1 userl@mycompany.com
Set the custom message that is sent to the destination e-mail address	racadm config -g cfgEmailAlert -o cfgEmailAlertCustomMsg -i 1 "This is a test!"
Ensure that the SMTP IP address is configured properly	racadm config -g cfgRemoteHosts -o cfgRhostsSmtpServerIpAddr 192.168.0.152
View the current e-mail alert settings	racadm getconfig -g cfgEmailAlert -i <index></index>
	where <index> is a number from 1 to 4</index>

Options

Table 2-41 describes the testemail subcommand options.

Table 2-41. testemail Subcommands

Option	Description
-i	Specifies the index of the e-mail alert to test.

Output

ı

Success: Test e-mail sent successfully Failure: Unable to send test e-mail

testfeature

Description

Generic test command consisting of several sub-commands that allow you to verify the configuration and operation of specific features.

Options

Table 2-42. testfeature Subcommand Options

Option	Description
-f <feature></feature>	Specifies the feature name. testfeature supports the following features:
	 ad — Tests Active Directory configuration using simple authentication (user name and password)
	 adkrb — Tests Active Directory configuration using Kerberos authentication
	• Idap — Tests LDAP configuration and operation (requires user name and password)
-u <username></username>	The user name specified in an appropriate format for the selected authentication method. That is, Active Directory users are specified as user_name@domain_name.
-p <password></password>	The password for the indicated user account.
-d <bitmask></bitmask>	A bitmask (specified as a hexadecimal value) to select various diagnostic messaging levels. This option is optional.
	NOTE: -d option is not supported with the remote racadm interface.

Examples

- testfeature -f ad -u user@domain -p secret
 SUCCESSFUL: User permissions are xxxxxppp
 - **NOTE**: The last three digits are the user's permissions.
- testfeature -f adkrb -u user_name@domain_name
 SUCCESSFUL: User permissions are 80000fff
- testfeature -f ldap -u harold -p barrel
 SUCCESSFUL: User permissions are 0x00000fff

Subcommands

testfeature -f ad

Usage

testfeature -f ad -u <username> -p <password> [-d
<diagnostic-message-level>]

This subcommand tests Active Directory configuration using simple authentication (user name and password). Use the optional -d switch to obtain additional diagnostic information, as needed.

This subcommand when executed performs the following:

- Checks command syntax.
- Verifies whether the required system resources are available.
- Validates Active Directory configuration.
- Verifies the SSL certificate and if the certificate signing request (key) exists.
- Acquires LDAP and Global Catalog Service records from DNS.
- Acquires user privileges from the Active Directory server.
- Checks the time to acquire user privileges with the allotted time to login.
- **NOTE:** In the event of an error, the command displays the test that failed and all the the tests performed earlier to the test that failed, including all the error messages.

testfeature -f adkrb

Usage

testfeature -f adkrb -u <username> [-d <diagnosticmessage-level>1

This subcommand tests the Active Directory configuration using Kerberos authentication (single sign-on or Smart Card login). Use the optional -d switch to obtain additional diagnostic information, as needed. This subcommand when executed performs the following:

- Checks command syntax.
- Verifies if the required system resources are available.
- Validates Active Directory configuration.
- Verifies if the SSL certificate and certificate signing request (key) exists.
- Acquires LDAP and Global Catalog Service records from DNS.
- Verifies if the CMC can acquire CMC, LDAP and Global Catalog servers FQDN through reverse IP lookups.
- Verifies that the CMC principal name matches the principal name in the uploaded Keytab file.
- Verifies that the CMC acquires a Kerberos TGT.
- Acquires user privileges from the Active Directory server.
- Checks the time to acquire user privileges with the allotted time to login.

NOTE: In the event of an error, the command outputs all tests performed up to and including the test that failed, as well as all error messages.

testfeature -f Idap

Usage

testfeature -f ldap -u <username> -p <password> [-d <diagnostic-message-level>]

This subcommand tests LDAP configuration and operation, and reports success as each stage of the authentication process proceeds. On successful completion, this command prints the CMC privileges assumed by the specified <username>.

If a failure occurs, the command terminates with an error message that displays the required corrective action. Use the optional -d switch to obtain additional diagnostic information, as needed.

testtrap

NOTE: To use this subcommand, you must have **Test Alerts** permission.

Description

The testtrap subcommand tests the RAC's SNMP trap alerting feature by sending a test trap from iDRAC6 to a specified destination trap listener on the network.

Before you execute the **testtrap** subcommand, ensure that the specified index in the RACADM cfgIpmiPet group is configured properly. For more information, see "cfgIpmiPet" on page 222.

Table 2-43 provides a list and associated commands for the **cfgIpmiPet** group.

Table 2-43. cfgEmailAlert Commands

Action	Command
Enable the alert	racadm config -g cfgIpmiPet -o cfgIpmiPetAlertEnable -i 1 1
Set the destination e-mail IP address	racadm config -g cfgIpmiPet -o cfgIpmiPetAlertDestIpAddr -i 1 192.168.0.110
View the current test trap settings	racadm getconfig -g cfgIpmiPet -i <index></index>
	where <index> is a number from 1 to 4</index>

Synopsis

1

racadm testtrap -i <index>

Input

Table 2-44 describes the testtrap subcommand options.

Table 2-44. testtrap Subcommand Options

Option	Description	
-i	Specifies the index of the trap configuration to use for the test Valid values are from 1 to 4.	

traceroute

NOTE: To use this subcommand, you must have **Administrator** permission.

Subcommand	Definition
traceroute	Traces the network path of routers that packets take as they are forwarded from your system to a destination IPv4 address.

Synopsis

racadm traceroute <IPv4 address>

racadm traceroute 192.168.0.1

traceroute to 192.168.0.1 (192.168.0.1), 30 hops max, 40 byte packets

1 192.168.0.1 (192.168.0.1) 0.801 ms 0.246 ms 0.253 ms

traceroute6

NOTE: To use this subcommand, you must have **Administrator** permission.

Subcommand	Definition
traceroute6	Traces the network path of routers that packets take as they are forwarded from your system to a destination IPv6 address.

Synopsis

```
racadm traceroute6 < IPv6 address>
racadm traceroute fd01::1
traceroute to fd01::1 (fd01::1) from fd01::3, 30 hops
max, 16 byte packets
1 fd01::1 (fd01::1) 14.324 ms 0.26 ms 0.244 ms
```

usercertupload

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description
usercertupload	Uploads a user certificate or a user CA certificate from the client to iDRAC6.

Synopsis

racadm usercertupload -t <type> [-f <filename>] -i <index>

Options

Table 2-45 describes the usercertupload subcommand options.

Table 2-45. usercertupload Subcommand Options

Option	Description
-t	Specifies the type of certificate to upload, either the CA certificate or server certificate.
	l = user certificate
	2 = user CA certificate
-f	Specifies the file name of the certificate to be uploaded. If the file is not specified, the sslcert file in the current directory is selected.
-i	Index number of the user. Valid values 1-16.

The usercertupload command returns 0 when successful and returns a nonzero number when unsuccessful.

Example

racadm usercertupload -t 1 -f c:\cert\cert.txt -i 6

usercertview

NOTE: To use this subcommand, you must have **Configure iDRAC** permission.

Subcommand	Description
usercertview	Displays the user certificate or user CA certificate that exists on iDRAC6.

Synopsis

racadm sslcertview -t <type> [-A] -i <index>

Options

Table 2-46 describes the sslcertview subcommand options.

Table 2-46. sslcertview Subcommand Options

Option	Description
-t	Specifies the type of certificate to view, either the user certificate or the user CA certificate.
	1 = user certificate
	2 = user CA certificate
-A	Prevents printing headers/labels.
-i	Index number of the user. Valid values are 1-16.

version

Subcommand	Description
version	Displays the RACADM version information.

Synopsis

racadm version

vflashsd

NOTE: To use this subcommand, you must have **Access Virtual Media** privilege.

Description

The vflashsd subcommand allows you to initialize or get the status of the vFlash SD card. The initialize operation removes all existing partitions and resets the card. The status operation displays the status of the last operation performed on the card.

Synopsis

racadm vflashsd initialize racadm vflashsd status

ı

vflashpartition

NOTE: To use this subcommand, you must have **Access Virtual Media** privilege.

Description

The **vflashpartition** subcommand allows you to perform the following:

- Create an empty partition
- Create a partition using an image file
- Format a partition
- View available partitions
- Delete existing partitions
- Get the status of partitions
- **NOTE:** Create partition using image file is not supported in local RACADM.

Synopsis

```
racadm vflashpartition create <options>
racadm vflashpartition delete <options>
racadm vflashpartition status <options>
racadm vflashpartition list <options>
```

Options

Table 2-47 describes the sslcertview subcommand options.

Table 2-47. vflashpartition Subcommand Options

Option	Description
-i <index></index>	Index of the partition for which this command applies. <index> must be an integer from 1 to 16.</index>
	NOTE: For the standard SD card, the index value is 1 because only one partition of size 256 MB is supported.

Options valid only with create action

Table 2-47. vflashpartition Subcommand Options (continued)

-o <label> Label that is displayed when the partition is mounted on the operating system.

<label> must be a string up to six alphanumeric characters.

-e <type> Emulation type for the partition. <type> must be floppy, cddvd, or HDD.

Option Description

- -t <type> Create a partition of type <type>. <type> must be:
 - empty Create an empty partition. The following options are valid with the empty type:
 - -s <size> Partition size in MB.
 - -f <type> Format type for the partition based on the type of file system. Valid options are RAW, FAT16, FAT32, EXT2, or EXT3.
 - image Create a partition using an image relative to iDRAC. The following options are valid with the image type:
 - -l <path> Specifies the remote path relative to iDRAC. The path can be on a mounted drive:
 - SMB path: //<ip or domain>/<share_name> /<path_to_image> NFS path: <ipaddress>:/<path_to_image>
 - -u <user> Username for accessing the remote image.
 - -p <password> Password for accessing the remote image.

Options valid only with status action

a Displays the status of operations on all existing partitions.

Examples

- To create a 20MB empty partition:
 - racadm vflashpartition create -i 1 -o drive1 -t empty -e HDD -f fat16 -s 20
- To create a partition using an image file on a remote system:
 - racadm vflashpartition create -i 1 -o drive1 -e
 HDD -t image -l //myserver/sharedfolder/foo.iso -u
 root -p mypassword

- To delete a partition:
 racadm vflashpartition delete -i 1
- To delete all partitions, re-initialize the vFlash SD card.

 racadm vflashsd initialize
- To get the status of operation on partition 1:
 racadm vflashpartition status -i 1
- To get the status of all existing partitions: racadm vflashpartition status -a
- To list all existing partitions and its properties: racadm vflashpartition list
- To get the partition size:
 racadm getconfig -g cfgvflashpartition -o cfgvflashpartitionsize -i 1
- To display the emulation type:
 racadm getconfig -g cfgvflashpartition -I 1 -o
 cfgvflashpartitionemulatiotype
- To display the label for the partition that is visible to the operating system: racadm getconfig -g cfgvflashpartition -i 1 -o cfgvflashPartitionlabel
- To display the format type of the partition:
 racadm getconfig -g cfgvflashpartition -i 1 -o cfgvflashPartitionFormatType
- To change a read-only partition to read-write:
 racadm config -g cfgvflashpartition -i 1 -o cfgvflashPartitionAccessType 1
- To attach a partition to the host operating system:
 racadm config -g cfgvflashpartition -i 1 -o cfgvflashPartitionAttachState 1

vmdisconnect

NOTE: To use this subcommand, you must have **Access Virtual Media** permission.

Description

The **vmdisconnect** subcommand allows a user to disconnect another user's Virtual Media session. Once disconnected, the Web-based interface reflects the correct connection status.

The vmdisconnect subcommand enables a iDRAC6 user to disconnect all active Virtual Media sessions. The active Virtual Media sessions can be displayed in iDRAC6 Web-based interface or by using the RACADM subcommands such as remoteimage or getssninfo.

Synopsis

racadm vmdisconnect

vmkey

NOTE: To use this subcommand, you must have **Access Virtual Media** permission.

Description

When a custom Virtual Media key image is uploaded to the RAC, the key size becomes the image size. The vmkey subcommand can be used to reset the key back to its original default size, which is 256 MB on iDRAC6.

Synopsis

racadm vmkev <action>

If <action> is configured as reset, the vFlash memory is reset to the default size of 256 MB and removes all data from it.

NOTE: This command is deprecated from iDRAC6 1.5 and iDRAC6 3.0 releases onwards. The functionality of this command is now covered by vflashsd initialize. While execution of the vmkey reset command is successful, it is recommended to use the vflashsd initialize command. For more information, see "vflashsd" on page 130.

iDRAC6 and CMC Property **Database Group and Object Definitions**

The iDRAC6 and CMC property database contains the configuration information for iDRAC6 and CMC. Data is organized by associated object, and objects are organized by object group. The IDs for the groups and objects that the property database supports are listed in this section for iDRAC6 Enterprise on Blade Servers, iDRAC6 Enterprise or Express on Rack and Tower Servers and CMC.

Use the group and object IDs with the RACADM subcommands to configure iDRAC6 and CMC.

Table 3-1 provides an overview of the object groups applicable for iDRAC6 Enterprise on Blade Servers, iDRAC6 on Rack and Tower Servers and CMC.

CAUTION: Racadm sets the value of objects without performing any functional validation on them. For example, RACADM allows you to set the Certificate Validation object to 1 with the Active Directory object set to 0, even though Certificate Validation can happen only if Active Directory is enabled. Similarly, the cfgADSSOEnable object can be set to 0 or 1 even if the cfgADEnable object is 0, but it takes effect only if Active Directory is enabled.

All string values are limited to displayable ASCII characters, except where otherwise noted

Displayable Characters

Displayable characters include the following set:

```
abcdefqhijklmnopgrstuvwxwz
ABCDEFGHIJKLMNOPQRSTUVWXYZ
0123456789~`!@#$%^&*()_+-={}[]|\:";'<>,.?/
```

idRacInfo

This group contains display parameters to provide information about the specifics of iDRAC6 or CMC being queried. One instance of the group is allowed.

NOTE: For CMC, use this object with the **getconfig** subcommand.

NOTE: To use this object for CMC, you must have **CMC Login User** privilege.

The following sections provides information about the objects in the idRACInfo group.

idRacProductInfo (Read Only)

Description A text string that identifies the product.

Legal Values A string of up to 63 ASCII characters.

Default for iDRAC Integrated Dell Remote Access Controller.

Default for CMC Chassis Management Controller.

idRacDescriptionInfo (Read Only)

Description A text description of the RAC type.

A string of up to 255 ASCII characters. Default This system component provides a complete set of remote

management functions for Dell PowerEdge servers.

idRacVersionInfo (Read Only)

Legal Values

Description String containing the current product firmware version.

Legal Values A string of up to 63 ASCII characters.

Default The current version number.

idRacBuildInfo (Read Only)

Description String containing the current RAC firmware build version.

Legal Values A string of up to 16 ASCII characters. **Description** String containing the current RAC firmware build version.

Default for iDRAC The current iDRAC6 firmware build version. **Default for CMC** The current CMC firmware build version.

idRacName (Read Only)

Description A user-assigned name to identify this controller.

Legal Values A string of up to 15 ASCII characters.

Default for iDRAC iDRAC

Default for CMC CMC

idRacType (Read Only)

Description Identifies the remote access controller type as iDRAC6.

Legal Values Product ID

Default For iDRAC6 on Rack and Servers: 10

For iDRAC6 Enterprise on Blade Servers: 8

Example

racadm getconfig -g idRacInfo

- # idRacType=8
- # idRacProductInfo=Chassis Management Controller
- # idRacDescriptionInfo=This system component provides
- a complete set of remote management functions for blade servers
- # idRacVersionInfo=P21
- # idRacBuildInfo=200708301525
- # idRacName=CMC-1

cfgLanNetworking

This group contains parameters to configure iDRAC6 or CMC NIC.

One instance of the group is allowed. Some objects in this group may require iDRAC6 NIC to be reset, which may cause a brief loss in connectivity. Objects that change iDRAC6 NIC IP address settings closes all active user sessions and require users to reconnect using the updated IP address settings.

NOTE: To use this object property for CMC, you must have Chassis Configuration Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

NOTE: For any network property changes on iDRAC6 to be successfully executed through RACADM, you must first enable iDRAC6 NIC.

The following sections provides information about the objects in the cfgLanNetworking group.

cfgNicIPv4Enable (Read/Write)

Description Enables or disables iDRAC6 or CMC IPv4 stack.

 $\textbf{Legal Values} \quad 1 \ (TRUE)$

0 (FALSE)

Default 1

cfgNicSelection (Read/Write)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Specifies the current mode of operation for the RAC network interface

controller (NIC). Table 3-2 describes the supported modes.

Legal Values 0 = Shared

1 = Shared with Failover LOM2

2 = Dedicated

3 = Shared with Failover All LOMs (iDRAC6 Enterprise only)

Default 0 (iDRAC6 Express)

2 (iDRAC6 Enterprise)

Table 3-2. cfgNicSelection Supported Modes

Mode	Description
Shared	Used if the host server integrated NIC is shared with the RAC on the host server. This mode enables configurations to use the same IP address on the host server and the RAC for common accessibility on the network.
Shared with Failover: LOM 2	Enables teaming capabilities between host server LOM2 integrated network interface controllers.
Dedicated	Specifies that the RAC NIC is used as the dedicated NIC for remote accessibility.

Table 3-2. cfgNicSelection Supported Modes (continued)

Mode	Description (continued)
Shared with Failover All LOMs	Enables teaming capabilities between all LOMs on the host server integrated network interface controllers.
	The remote access device network interface is fully functional when the host operating system is configured for NIC teaming. The remote access device receives data through NIC 1 and NIC 2, but transmits data only through NIC 1.
	Failover occurs from NIC 2 to NIC 3 and then to NIC 4. If NIC 4 fails, the remote access device fails over all data transmission back to NIC 1, but only if the original NIC 1 failure has been corrected.

cfgNicVLanEnable (Read/Write)

NOTE: For iDRAC6 Enterprise on Blade Servers, this object is read-only and VLAN settings can be configured through CMC Web Interface. iDRAC6 displays only the current VLAN settings and you cannot modify the settings from iDRAC6.

Description	Enables or disables the VLAN capabilities of the RAC/BMC.		
	NOTE : For iDRAC6 Enterprise on Blade Servers, this object enables or disables the VLAN capabilities of iDRAC6 from CMC.		
	All chassis management traffic, including the CMC and all iDRACs, resides on this external VLAN when enabled. No iDRAC configuration change is required to use this external management network VLAN.		
Legal Values	1 (TRUE)		
	0 (FALSE)		
Default	0		
Example	racadm config -g cfgLanNetworking -o cfgNicVLanEnable 1		
	racadm config -g cfgLanNetworking -o cfgNicVLanEnable 0		

ı

cfgNicVLanId (Read/Write)

Description Specifies the VLAN ID for the network VLAN configuration (in

CMC for iDRAC6 Enterprise on Blade Servers). This property is only

valid if cfgNicVLanEnable is set to 1 (enabled).

Legal Values 1 - 4000 and 4021 - 4094

Default 1

Example racadm config -g cfgLanNetworking -o

cfgNicVlanID 1

cfgNicVLanPriority (Read/Write)

Description Specifies the VLAN Priority for the network VLAN configuration

(in CMC for iDRAC6 Enterprise on Blade Servers). This property is

only valid if cfgNicVLanEnable is set to 1 (enabled).

Legal Values 0-7

Default 0

Example racadm config -g cfgLanNetworking -o

cfgNicVLanPriority 7

cfgDNSDomainNameFromDHCP (Read/Write)

Description Specifies that iDRAC or CMC DNS domain name should be

assigned from the network DHCP server.

 $\begin{tabular}{ll} \textbf{Legal Values} & 1 \ (TRUE) \\ \end{tabular}$

0 (FALSE)

Default 0

For CMC, this property is used only if cfgNicUseDhcp is set to 1 (true), or if both cfgIPv6Enable and cfgIPv6AutoConfig are set to 1 (true).

The CMC can obtain its DNS domain name from either a DHCP or DHCPv6 server, if all of the following properties are set to 1 (true):

- cfgNicIPv4Enable
- cfgNicUseDhcp

- cfgIPv6Enable
- cfgIPv6AutoConfig
- cfgDNSDomainNameFromDHCP
- cfgDNSDomainName (Read/Write)

The network administrator must ensure that these DHCP servers are configured to provide the same DNS domain name to the CMC, otherwise the domain name becomes unpredictable

Description This is the DNS domain name. This parameter is only valid if

cfgDNSDomainNameFromDHCP is set to 0 (FALSE).

Legal Values A string of up to 254 ASCII characters. At least one of the

characters must be alphabetic. Characters are restricted to

alphanumeric, '-', and '.'.

NOTE: Microsoft Active Directory only supports Fully Qualified

Domain Names (FQDN) of 64 bytes or fewer.

Default <blank>

cfgDNSRacName (Read/Write)

Description Displays the iDRAC6 or CMC name, which is rac-service tag by

default. This parameter is only valid if cfgDNSRegisterRac is set to

1 (TRUE).

Legal Values A string of up to 63 ASCII characters. At least one character must

be alphabetic.

NOTE: Some DNS servers only register names of 31 characters or

fewer.

Default For iDRAC: idrac-<service tag>

For CMC: cmc-<service tag>

cfgDNSRegisterRac (Read/Write)

Description Registers the iDRAC6 or CMC name on the DNS server.

NOTE: When you set this parameter, the CMC registers its DNS name

for its IPv4 and IPv6 addresses with the DNS server.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

Example:

```
racadm getconfig -g cfgLanNetworking
cfqNicEnable=1
cfqNicIPv4Enable=1
cfqNicIpAddress=192.168.22.101
cfqNicNetmask=255.255.255.0
cfqNicGateway=192.168.22.101
cfqNicUseDhcp=1
# cfgNicMacAddress=00:00:00:00:00:01
cfqNicVLanEnable=0
cfqNicVLanID=1
cfqNicVLanPriority=0
cfqDNSServersFromDHCP=1
cfgDNSServer1=192.168.0.5
cfgDNSServer2=192.168.0.6
cfqDNSRacName=cmc-frankly
cfgDNSDomainName=fwad.lab
cfqDNSDomainNameFromDHCP=1
cfqDNSReqisterRac=1
```

NOTE: For IPv6 addresses, only the DHCPv6 address or static address is registered.

cfgDNSServersFromDHCP (Read/Write)

Description Specifies if the DNS server IPv4 addresses should be assigned from

the DHCP server on the network.

For CMC, this property is used only if cfgNicUseDhcp is set to 1

(true).

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgDNSServer1 (Read/Write)

Description Specifies the IPv4 address for DNS server 1. This property is only

valid if cfgDNSServersFromDHCP is set to 0 (FALSE).

NOTE: cfgDNSServer1 and cfgDNSServer2 may be set to identical

values while swapping addresses.

Legal Values String representing a valid IPv4 address. For example: 192.168.0.20.

Default 0.0.0.0

cfgDNSServer2 (Read/Write)

Description Retrieves the IPv4 address for DNS server 2. This parameter is only

valid if cfgDNSServersFromDHCP is set to 0 (FALSE).

NOTE: cfgDNSServer1 and cfgDNSServer2 may be set to identical

values while swapping addresses.

Legal Values String representing a valid IPv4 address. For example:

192.168.0.20.

Default 0.0.0.0

cfgNicEnable (Read/Write)

Description Enables or disables iDRAC6 or CMC network interface controller.

> If the NIC is disabled, the remote network interfaces to iDRAC6 or CMC are no longer accessible and iDRAC6 or CMC are only

available through the local or serial RACADM interface.

Legal Values 1 (TRUE)

0 (FALSE)

Default

cfgNiclpAddress (Read/Write)

NOTE: This parameter is only configurable if the **cfgNicUseDhcp** parameter is set to 0(FALSE).

Description Specifies the static IPv4 address to be assigned to the RAC or CMC.

This property is only valid if cfgNicUseDhcp is set to 0 (FALSE).

Legal Values String representing a valid IPv4 address. For example: 192.168.0.20.

Default For iDRAC6 on Rack and Tower Servers: 192,168,0,120

For iDRAC6 Enterprise on Blade Servers: 192.168.0.n, where n is 120

plus the server slot number.

For CMC: 192.168.0.120

cfgNicNetmask (Read/Write)

NOTE: This parameter is only configurable if the **cfgNicUseDhcp** parameter is set to 0 (FALSE).

The subnet mask used for iDRAC6 or CMC IP address. Description

This property is only valid if cfgNicUseDhcp is set to 0 (FALSE).

Legal Values String representing a valid subnet mask. For example:

255.255.255.0.

Default 255.255.255.0

cfgNicGateway (Read/Write)

NOTE: This parameter is only configurable if the **cfgNicUseDhcp** parameter is set to 0 (FALSE).

Description iDRAC6 or CMC gateway IPv4 address.

> The gateway IPv4 address used for static assignment of the RAC IP address. This property is only valid if cfgNicUseDhcp is set to 0

(FALSE).

Legal Values String representing a valid gateway IPv4 address. For example:

192.168.0.1.

Default 192.168.0.1

cfgNicUseDhcp (Read/Write)

Description Specifies whether DHCP is used to assign the iDRAC6 or CMC

> IPv4 address. If this property is set to 1 (TRUE), then iDRAC6 or CMC IPv4 address, subnet mask, and gateway are assigned from the DHCP server on the network. If this property is set to 0 (FALSE), the user can configure the cfgNicIpAddress,

cfgNicNetmask, and cfgNicGateway properties.

Legal Values 1 (TRUE)

0 (FALSE)

Default

cfgNicMacAddress (Read Only)

Description The iDRAC6 or CMC NIC MAC address in the format:

dd:dd:dd:dd:dd:dd, where d is a hexadecimal digit in range 0 - 9, A -

F

Legal Values String representing iDRAC6 or CMC NIC MAC address.

Default The current MAC address of iDRAC6 or CMC NIC. For example,

00:12:67:52:51:A3.

cfaRemoteHosts

This group provides properties that allow configuration of the SMTP server for e-mail alerts.

For CMC, this group enables/disables and configures firmware updates, NTP, remote syslogging, and SMTP email alerting. Use the -m option to apply this setting to iDRAC.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

The following sections provides information about the objects in the cfgRemoteHosts group.

cfgRhostsFwUpdateTftpEnable (Read/Write)

Description Enables or disables iDRAC6 or CMC firmware update from a

network TFTP server.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgRhostsFwUpdatelpAddr (Read/Write)

Description Specifies the network TFTP server IPv4 or IPv6 address that is used

for TFTP iDRAC6 or CMC firmware update operations.

Legal Values A string representing a valid IPv4 or IPv6 address. For example,

192.168.0.61

Default For IPv4, it is 0.0.0.0

cfgRhostsFwUpdatePath (Read/Write)

Description Specifies TFTP path where iDRAC6 or CMC firmware image file

exists on the TFTP server. The TFTP path is relative to the TFTP

root path on the TFTP server.

NOTE: The server may still require you to specify the drive (for

example, C:).

Legal Values A string with a maximum length of 255 ASCII characters.

Default <blank>

cfgRhostsSmtpServerlpAddr (Read/Write)

Description The IPv4 or IPv6 address of the network SMTP server. The SMTP

server transmits e-mail alerts from iDRAC6 or CMC if the alerts

are configured and enabled.

Legal Values A string representing a valid SMTP server IPv4 or IPv6 address. For

example: 192.168.0.55.

Default For iDRAC6: For IPv4, it is 0.0.0.0

For CMC: localhost.localdomain

cfgRhostsNtpEnable

NOTE: This object is applicable only for CMC.

Description Enables or disables the use of the Network Time Protocol (NTP)

for date and time synchronization.

Legal Values 1 (true)

0 (false)

Default 0

cfgRhostsNtpServer1

NOTE: This object is applicable to CMC only.

Description Specifies the first of three possible NTP servers.

Legal Values A string representing a valid NTP server. For example,

ntpl.ntp.net. At least one NTP server must be specified and

duplicate entries are not allowed.

Default Null

cfgRhostsNtpServer2

NOTE: This object is applicable only for CMC.

Description Specifies the second of three possible NTP servers.

Legal Values A string representing a valid NTP server. For example,

ntp2.ntp.net. At least one NTP server must be specified and

duplicate entries are not allowed.

Default Null

cfgRhostsNtpServer3

NOTE: This object is applicable only for CMC.

Description Specifies the third of three possible NTP servers.

Legal Values A string representing a valid NTP server. For example,

ntp3.ntp.net. At least one NTP server must be specified and

duplicate entries are not allowed.

Default Null

cfgRhostsNtpMaxDist

NOTE: This object is applicable only for CMC.

Description Specifies the NTP maximum distance parameter used to aid in

NTP configuration.

Legal Values 1 - 128

Default 16

cfgRhostsSyslogEnable (Read/Write)

Description Enables or disables remote syslog to allow the RAC and SEL logs to

be written to up to three remote syslog servers.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgRhostsSyslogPort (Read/Write)

Description Remote syslog port number to use for writing the RAC and SEL

logs to a remote syslog server.

For CMC, this setting takes effect only if the

cfgRhostsSyslogEnable parameter is set to 1 (enabled).

10 - 65535**Legal Values**

Default 514

NOTE: For CMC, the following port numbers are reserved and cannot be used: 21, 68, 69, 123, 161, 546, 801, 4096, 5988, 5989, 6900, 9000, 60106.

cfgRhostsSyslogServer1 (Read/Write)

Description Specifies the first of three possible remote syslog servers to store the

RAC and SEL logs. This property is only valid if cfgRhostsSyslogEnable is set to 1 (enabled).

Legal Values For iDRAC6: String from 0 to 511 characters.

For CMC: Valid hostname or IPv4 or IPv6 address.

Default <blank>

cfgRhostsSyslogServer2 (Read/Write)

Description Specifies the second of three possible remote syslog servers to store

the RAC and SEL logs.. This property is only valid if

cfgRhostsSyslogEnable is set to 1 (enabled).

Legal Values For iDRAC6: String from 0 to 511 characters.

For CMC: Valid hostname or IPv4 or IPv6 address.

Default <blank>

cfgRhostsSyslogServer3 (Read/Write)

Description Specifies the third of three possible remote syslog servers to store

the RAC and SEL logs. This property is only valid if

cfgRhostsSyslogEnable is set to 1 (enabled).

Legal Values For iDRAC6: String from 0 to 511 characters.

For CMC: Valid hostname or IPv4 or IPv6 address.

Default <blank>

cfgRhostsSyslogPowerLoggingEnabled

NOTE: This object is applicable only for CMC.

Description Enables or disables power consumption logging to remote syslog

servers.

Legal Values 1 (enabled)

0 (disabled)

Default 0

NOTE: Remote syslog must be enabled and one or more remote syslog servers configured for power consumption to be logged.

cfgRhostsSyslogPowerLoggingInterval

NOTE: This object is applicable only for CMC.

Description Specifies the power consumption collection/logging interval.

Legal Values 1-1440 (minutes)

Default 5

Example

```
racadm getconfig -g cfgRemoteHosts [-m server-<n>]
cfqRhostsFwUpdateTftpEnable=1
cfqRhostsFwUpdateIpAddr=0.0.0.0
cfqRhostsFwUpdatePath=
cfgRhostsSmtpServerIpAddr=localhost.localdomain
cfgRhostsNtpEnable=0
cfqRhostsNtpServer1=
cfqRhostsNtpServer2=
cfqRhostsNtpServer3=
cfqRhostsNtpMaxDist=16
cfqRhostsSyslogEnable=0
cfqRhostsSysloqPort=514
cfqRhostsSysloqServer1=
cfqRhostsSysloqServer2=
```

cfqRhostsSysloqServer3= cfgRhostsSyslogPowerLoggingEnabled=1 cfgRhostsSyslogPowerLoggingInterval=5

cfgUserAdmin

This group provides configuration information about the users who are allowed to access iDRAC6 or CMC through the available remote interfaces.

Up to 16 instances of the user group are allowed. Each instance represents the configuration for an individual user.

NOTE: In the current CMC firmware version, the objects cfqUserAdminEnable and cfgUserAdminPrivilege are interrelated; changing the value of one property causes the value of the other property to change. For example, if a user does not have login privilege, the user is disabled by default. When you enable the user by changing the value of UserAdminEnable to 1, the right most digit of the UserAdminPrivilege also becomes 1. On the other hand, if you change the right most digit of the UserAdminPrivilege to 0, the value of UserAdminEnable becomes 0.

NOTE: Use this object with the **config** or **getconfig** subcommands. You must supply an index group number to use these commands as follows: -i <index group>

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

The following sections provide information about the objects in the cfgUserAdmin group.

cfgUserAdminIndex (Read Only)

Description The unique index of a user.

For CMC, the index number is used to specify a unique group

name. Only valid for indexed groups.

Legal Values For iDRAC6: This parameter is populated based on the existing

instances.

For CMC: The parameter is specified by a decimal integer from

1-16.

Default <index of the instance>

cfgUserAdminIpmiLanPrivilege (Read/Write)

Description The maximum privilege on the IPMI LAN channel.

Legal Values 2 (User)

3 (Operator)

4 (Administrator) 15 (No access)

Default 4 (User 2)

15 (All others)

cfgUserAdminPrivilege (Read/Write)

Description This property specifies the role-based authority privileges allowed

for the user. The value is represented as a bit mask that allows for any combination of privilege values. Table 3-3 describes the user privilege bit values that can be combined to create bit masks.

Legal Values For iDRAC6: 0x000000000 to 0x0000001ff, and 0x0

For CMC: 0x0000000-0x0000fff, and 0x0

Default 0x00000000

Example

racadm getconfig -g cfgUserAdmin -i 1

cfgUserAdminIndex=1
cfgUserAdminEnable=1

cfgUserAdminUserName=root

cfgUserAdminPassword=****** (Write-Only)

cfgUserAdminPrivilege=0x00000fff

Table 3-3. Bit Masks for User Privileges

iDRAC Specific User Privilege	Privilege Bit Mask
Login to iDRAC	0x00000001
Configure iDRAC	0x00000002
Configure Users	0x00000004

Table 3-3. Bit Masks for User Privileges (continued)

Clear Logs	0x00000008
Execute Server Control Commands	0x00000010
Access Virtual Console	0x00000020
Access Virtual Media	0x00000040
Test Alerts	0x00000080
Execute Debug Commands	0x00000100
CMC Specific User Privelege	
CMC Login User	0x0000001
Chassis Configuration Administrator	0x0000002
User Configuration Administrator	0x0000004
Clear Logs Administrator	0x0000008
Chassis Control Administrator	0x0000010
Super User	0x0000020
Server Administrator	0x0000040
Test Alert User	0x0000080
Debug Command Administrator	0x0000100
Fabric A Administrator	0x0000200
Fabric B Administrator	0x0000400
Fabric C Administrator	0x0000800

Examples

Table 3-4 provides sample privilege bit masks for users with one or more privileges.

Table 3-4. Sample Bit Masks for User Privileges

User Privilege(s)	Privilege Bit Mask
The user is not allowed to access iDRAC or CMC.	0x00000000
The user may only login to iDRAC or CMC and view iDRAC or CMC and server configuration information.	0x0000001
The user may login to iDRAC or CMC and change configuration.	0x00000001 + 0x00000002 = 0x00000003
The user may login to iDRAC, access Virtual Media, and access Virtual Console.	0x00000001 + 0x00000040 + 0x00000080 = 0x0000000C1

cfgUserAdminUserName (Read/Write)

-	writing a string into this name field if the index is empty. Writing a
	string of double quotes ("") deletes the user at that index. You
	cannot change the name. You must delete and then recreate the
	name. The string cannot contain / (forward slash), \ (backslash), .
	(period), @ (at symbol) or quotation marks.

NOTE: This property value must be unique among user names.

The name of the user for this index. The user index is created by

Legal Values A string of up to 16 ASCII characters.

Default root (User 2)

Description

dll others)

cfgUserAdminPassword (Write Only)

Description The password for this user. User passwords are encrypted and

cannot be seen or displayed after the property is written.

Legal Values A string of up to 20 ASCII characters.

***** Default

cfgUserAdminEnable (Read/Write)

Enables or disables an individual user. Description

Legal Values 1 (TRUE)

0 (FALSE)

Default For iDRAC6: 1 (User 2), 0 (All others)

For CMC: 0

cfqUserAdminSolEnable (Read/Write)

Description Enables or disables Serial Over LAN (SOL) user access for the user.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgUserAdminIpmiSerialPrivilege (Read/Write)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description The maximum privilege on the IPMI LAN channel.

Legal Values 2 (User)

3 (Operator)

4 (Administrator) 15 (No access)

Default 4 (User 2)

15 (All others)

cfgEmailAlert

This group contains parameters to configure iDRAC6 or CMC e-mail alerting capabilities. Up to four instances of this group are allowed.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privileges.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

The following sections provides information about the objects in the cfgEmailAlert group.

cfgEmailAlertIndex (Read Only)

Description The unique index of an alert instance.

Legal Values 1-4

Default <instance>

cfgEmailAlertEnable (Read/Write)

Enables or disables the alert instance. **Description**

Legal Values 1 (TRUE)

0 (FALSE)

Default

cfgEmailAlertAddress (Read/Write)

Description Specifies the destination email address for email alerts, for

example, userl@company.com.

Legal Values E-mail address format, with a maximum length of 64 ASCII

characters

Default <black>

cfgEmailAlertCustomMsg (Read/Write)

Description Specifies a custom message that forms the subject of the alert.

Legal Values A string of up to 32 characters

Default <blank>

cfgEmailAlertEmailName

NOTE: This object property is specific to CMC.

Description Specifies name or other identifier associated with the destination e-

mail address. The e-mail name can refer to an individual, group,

location, department, etc.

Legal Values A string of up to 32 characters

Default <black>

Example

```
racadm getconfig -g cfgEmailAlert -i 2
# cfqEmailAlertIndex=1
cfgEmailAlertEnable=1
cfgEmailAlertAddress=kfulton@dell.com
cfgEmailAlertName=Kevin Fulton
```

cfgSessionManagement

This group contains parameters to configure the number of sessions that can connect to iDRAC6. One instance of the group is allowed. Displays current settings for and configures idle timeout properties for Web server, Telnet, SSH, and RACADM sessions. Changes to idle timeout settings take effect at the next login. To disable idle timeout for a connection, set this property to 0. Use the -m option to apply this setting to iDRAC.

The following sections provides information about the objects in the cfgSessionManagement group.

cfgSsnMgtRacadmTimeout (Read/Write)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

Description Defines the idle timeout in seconds for the Remote RACADM

interface. If a remote RACADM session remains inactive for more

than the specified sessions, the session closes.

Legal Values 10 - 1920

Default 60

Example

racadm getconfig -g cfgSessionManagement [-m server-<n>] -o <object name> <object value> cfqSsnMqtWebserverTimeout=0 cfqSsnMqtTelnetIdleTimeout=0 cfqSsnMqtSshIdleTimeout=300 cfgSsnMgtRacadmTimeout=0

cfgSsnMqtConsRedirMaxSessions (Read/Write)

NOTE: This object is applicable only for iDRAC6.

Description Specifies the maximum number of Virtual Console sessions

allowed on iDRAC6

For iDRAC6 on Rack and Tower Servers: 1 – 4. **Legal Values**

For iDRAC6 Enterprise on Blade Servers: 1-2

Default For iDRAC6 on Rack and Tower Servers: 4

For iDRAC6 Enterprise on Blade Servers: 2

cfgSsnMgtWebserverTimeout (Read/Write)

Description Defines the Web server timeout. This property sets the amount of

> time in seconds that a connection is allowed to remain idle (there is no user input). The session is cancelled if the time limit set by this property is reached. Changes to this setting do not affect the current session; you must log out and log in again to make the new

settings effective.

An expired Web server session logs out the current session.

Legal Values 60 - 10800

Default 1800

cfgSsnMgtSshldleTimeout (Read/Write)

Description

Defines the secure shell idle timeout. This property sets the amount of time in seconds that a connection is allowed to remain idle (there is no user input). The session is cancelled if the time limit set by this property is reached. Changes to this setting do not affect the current session; you must log out and log in again to make the new settings effective.

An expired secure shell session displays the following error message:

• In case of iDRAC6 on Rack and Tower Servers:

Connection timed out

• In case of iDRAC6 Enterprise on Blade Servers:

Session timed out. Closing the session...

After the message is displayed, the system returns you to the shell that generated the Secure Shell session.

Legal Values 0 (No timeout)

0 - 10800

Default For iDRAC6 on Rack and Tower Servers: 300

For iDRAC6 Enterprise on Blade Servers and CMC: 1800

NOTE: If 0 (no timeout), the network connection does not send keep alive packets to probe the client. Otherwise, keep alive packets are sent to guarantee that the client is responding.

cfgSsnMgtTeInetIdleTimeout (Read/Write)

Description

Defines the Telnet idle timeout. This property sets the amount of time in seconds that a connection is allowed to remain idle (there is no user input). The session is cancelled if the time limit set by this property is reached. Changes to this setting do not affect the current session (you must log out and log in again to make the new settings effective).

An expired Telnet session displays the following error message:

- In case of iDRAC6 on Rack and Tower Servers:
 - Connection timed out
- In case of iDRAC6 Enterprise on Blade Servers:

Session timed out. Closing the session...

After the message is displayed, the system returns you to the shell that generated the Telnet session.

Legal Values

0 (No timeout)

0 - 10800

For CMC: 60 - 10800

Default

For iDRAC6 on Rack and Tower Servers: 300

For iDRAC6 Enterprise on Blade Servers and CMC: 1800

NOTE: If 0 (no timeout), the network connection does not send keep alive packets to probe the client. Otherwise, keep alive packets are sent to guarantee that the client is responding.

cfgSerial

This group contains configuration parameters for iDRAC6 or CMC services. One instance of the group is allowed.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

The following sections provides information about the objects in the cfgSerial group.

NOTE: The **cfgSerial** object group is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

cfgSerialBaudRate (Read/Write)

Description Sets the baud rate on iDRAC6 or CMC serial port.

Legal Values For iDRAC6: 9600, 28800, 57600, 115200

For CMC: 2400, 4800, 9600, 19200, 28800, 38400, 57600,115200

Default For iDRAC6: 57600

For CMC: 115200

cfgSerialConsoleEnable (Read/Write)

Enables or disables the RAC or CMC serial console interface. Description

Legal Values 1 (TRUE)

0 (FALSE)

Default For iDRAC6: 0

For CMC: 1

cfgSerialConsoleQuitKey (Read/Write)

Default

For iDRAC6:

This key or key combination terminates Virtual Console text for iDRAC when using the **console com2** command.

The cfgSerialConsoleQuitKey value can be represented by one of the following:

- Decimal value For example, 95
- Hexadecimal value For example, 0x12
- Octal value For example, 007
- ASCII value For example, ^a

ASCII values may be represented using the following Escape Key codes:

- ^ followed by any alphabetic (a-z, A-Z)
- ^ followed by the listed special characters: [] \ ^ _

For CMC:

This key specifies the character that aborts the serial text console connect (or racadm connect) command.

NOTE: The CTRL key is represented by using the ^ (carat) character.

NOTE: The CTRL key does not generate a character by itself, but must be struck simultaneously with another key to generate a character.

For example, striking both the CTRL key and the \ key simultaneously (rather than sequentially) is denoted as ^\.

Configuration options: The value must start with the ^ character, and be followed by one of the characters:

- a-z
- A-Z
- [
-]
- \

Legal value:

1

String of up to 4 characters

Default: For iDRAC: <Ctrl><\>

Fo CMC: ^\

NOTE: For information on using RACADM commands for special characters, see "Guidelines to Quote Strings Containing Special Characters When Using RACADM Commands" on page 31.

cfgSerialConsoleIdleTimeout (Read/Write)

Description The maximum number of seconds to wait before an idle serial

session is disconnected.

Legal Values 0 = No timeout

60 - 1920

Default For iDRAC6: 300

For CMC: 1800

cfgSerialConsoleNoAuth (Read/Write)

Description Enables or disables the RAC or CMC serial console login

authentication.

Legal Values 0 (enables serial login authentication)

1 (disables serial login authentication)

Default 0

cfgSerialConsoleCommand (Read/Write)

Description Specifies a serial command that is executed after a user logs into

the serial console interface.

Legal Values For iDRAC6: A string of up to 128 characters.

For CMC: A string representing a valid serial command. For

example, connect server-1.

Default

cfgSerialConsoleColumns

NOTE: This object property is applicable only for CMC.

Description Specifies the number of columns in the terminal window command

line connected to the serial port.

Legal Values 0 - 256

Default 0 (equivalent to 80)

NOTE: The prompt counts as two characters.

NOTE: The terminal emulator must be configured with the line wrap mode ON, if a terminal emulator is used.

NOTE: You must log out, then log in again for the changes to take effect.

cfgSerialHistorySize (Read/Write)

Description Specifies the maximum size of the serial history buffer.

Legal Values 0 - 8192Default 8192

cfgSerialCom2RedirEnable (Read/Write)

Description Enables or disables the console for COM 2 port redirection.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgSerialSshEnable (Read/Write)

Description Enables or disables the secure shell (SSH) interface on iDRAC6 or

CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

Example

```
racadm getconfig -g cfgSerial
cfqSerialBaudRate=115200
cfgSerialConsoleEnable=1
cfgSerialConsoleQuitKey=^\
cfgSerialConsoleIdleTimeout=1800
cfqSerialConsoleNoAuth=0
cfqSerialConsoleCommand=
cfqSerialConsoleColumns=0
cfgSerialHistorySize=8192
cfgSerialTelnetEnable=0
cfgSerialSshEnable=1
```

cfgSerialTelnetEnable (Read/Write)

Description Enables or disables the Telnet console interface on iDRAC6 or

CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfg0obSnmp

This group contains parameters to configure the SNMP agent and trap capabilities of iDRAC6 or CMC. One instance of the group is allowed.

The CMC SNMP agent supports the standard RFC1213 mib-2, and the Dell enterprise-specific MIB.

NOTE: For CMC, use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the **-o** option.

The following sections provides information about the objects in the cfgOobSnmp group.

cfgOobSnmpAgentCommunity (Read/Write)

Description Specifies the SNMP Community Name (identical to community

string) used for SNMP traps. The community string acts as a password shared between different hosts over the network. This community string value must match with that of the other hosts for

any kind of communication through SNMP.

Legal Values A string of up to 31 characters.

Default public

Example

racadm getconfig -g cfgOobSnmp
cfgOobSnmpTrapsEnable=1

cfgOobSnmpAgentCommunity=public

cfgOobSnmpAgentEnable (Read/Write)

Description Enables or disables the SNMP agent in iDRAC6 or CMC.

 $\textbf{Legal Values} \qquad 1 \; (TRUE)$

0 (FALSE)

Default 0

cfgTraps

NOTE: To use this object property, you must have **Chassis Configuration Administrator** privilege.

NOTE: You can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the **-o** option.

Description

Displays information for and configures delivery of SNMP traps for a specific user.

cfgTrapsIndex (Read Only)

Indicates the unique index of an alert instance.

cfgTrapsEnable

Description Enables or disables event traps on the CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default None

cfgTrapsAlertDestlpAddr

Description Sets the IP address that receives the alert.

Legal Values A string representing a valid IP address. For example, 192.168.0.20.

Default None

Sets the IP address that receives the alert.

Configuration options: A string representing a valid IP address. For example, 192.168.0.20.

cfgTrapsCommunityName

Description Sets the community string (identical to the community name) used

for authentication. The community string acts as a password shared between different hosts over the network. This community string value must match with that of the other hosts for any kind of

communication through SNMP.

Legal Values A string representing the community name.

Default None

Example

racadm getconfig -g cfgTraps -i 2 # cfqTrapsIndex=2 cfgTrapsEnable=1 cfgTrapsAlertDestIpAddr= cfgTrapsCommunityName=public

cfqRacTuning

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

Use the -m option to apply this setting to iDRAC.

This group is used to configure various iDRAC6 or CMC configuration properties, such as valid ports and security port restrictions.

The following sections provides information about the objects in the cfgRacTuning group.

cfgRacTuneConRedirPort (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description Specifies the port to be used for keyboard, mouse, video, and

Virtual Media traffic to iDRAC6.

1 - 65535**Legal Values**

cfgRacTuneRemoteRacadmEnable (Read/Write)

Enables or disables the Remote RACADM interface in iDRAC or Description

CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgRacTuneCtrlEConfigDisable

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Enables or disables the ability to disable the ability of the local user

to configure iDRAC from the BIOS POST option-ROM.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgRacTuneHttpPort (Read/Write)

Description Specifies the port number to use for HTTP network

communication with iDRAC6 or CMC.

Legal Values 10 - 65535

Default 80

NOTE: For CMC, the following port numbers are reserved and cannot be used: 21, 68, 69, 123, 161, 546, 801, 4096, 5988, 5989, 6900, 9000, 60106.

cfgRacTuneHttpsPort (Read/Write)

Description Specifies the port number to use for HTTPS network

communication with iDRAC6 or CMC.

Legal Values 10 - 65535

Default 443

NOTE: For CMC, the following port numbers are reserved and cannot be used: 21, 68, 69, 123, 161, 546, 801, 4096, 5988, 5989, 6900, 9000, 60106.

cfgRacTunelpRangeEnable (Read/Write)

Description Enables or disables the IPv4 Address Range validation feature of

iDRAC6 or CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgRacTunelpRangeAddr (Read/Write)

Description Specifies the acceptable IPv4 address bit pattern in positions

determined by the "1"s in the range mask property

(cfgRacTuneIpRangeMask).

For CMC, a login from the incoming IP address is allowed only if

the following are identical:

cfgRacTuneIpRangeMask bit-wise and with incoming IP address

cfgRacTuneIpRanbeMask bit-wise and with

cfgRacTuneIpRangeAddr

Legal Values An IPv4 address formatted string, for example, 192.168.0.44.

Default 192.168.1.1

cfgRacTunelpRangeMask (Read/Write)

Description Standard IP mask values with left-justified bits. For example,

255.255.255.0.

For CMC, a login from the incoming IP address is allowed only if both of the following are identical:

cfgRacTuneIpRangeMask bit-wise and with incoming IP address

 cfgRacTuneIpRanbeMask bit-wise and with cfgRacTuneIpRangeAddr

Legal Values An IPv4 address formatted string, for example, 255.255.255.0.

Standard IP mask values with left-justified bits.

Default 255.255.255.0

cfgRacTunelpBlkEnable (Read/Write)

Description Enables or disables the IPv4 address blocking feature of iDRAC6 or

CMC.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgRacTunelpBlkFailCount (Read/Write)

Description The maximum number of login failures to occur within the window

(cfgRacTuneIpBlkFailWindow) before login attempts from the IP

address are rejected.

Legal Values 2-16

cfgRacTunelpBlkFailWindow (Read/Write)

Description Defines the time span in seconds that the failed attempts are

counted. When failure attempts age beyond this limit, they are

dropped from the count.

For iDRAC6: 10 - 655356 **Legal Values**

For CMC: 2 - 655356

Default 60

cfgRacTunelpBlkPenaltyTime (Read/Write)

Description Defines the time span in seconds that session requests from an IP

address with excessive failures are rejected.

Legal Values For iDRAC6: 10 - 655356

For CMC: 2 - 655356

Default 300

cfgRacTuneSshPort (Read/Write)

Description Specifies the port number used for iDRAC6 or CMC SSH

interface.

Legal Values For iDRAC6: 1 - 65535

For CMC: 10 - 65535

Default 22

cfgRacTuneTelnetPort (Read/Write)

Description Specifies the port number used for iDRAC6 or CMC Telnet

interface.

Legal Values For iDRAC6: 1 - 65535

For CMC: 10 - 65535

Default 23

NOTE: For CMC, the following port numbers are reserved and cannot be used: 21, 68, 69, 123, 161, 546, 801, 4096, 5988, 5989, 6900, 9000, 60106.

cfgRacTuneConRedirEnable (Read/Write)

NOTE: This object property is applicable only to iDRAC6.

Description Enables or disables Virtual Console.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgRacTuneConRedirEncryptEnable (Read/Write)

NOTE: This object property is applicable only to iDRAC6.

Description Encrypts the video in a Virtual Console session.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgRacTuneAsrEnable (Read/Write)

NOTE: This object property is applicable only to iDRAC6.

NOTE: This object requires an iDRAC6 reset before it becomes active.

Description Enables or disables iDRAC6 last crash screen capture feature.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgRacTuneDaylightOffset (Read/Write)

Description Specifies the daylight savings offset (in minutes) to use for the

RAC Time. This value is 0 if the time zone is not a Daylight Saving

time zone.

Legal Values 0 - 60

Example

```
racadm getconfig -g cfqRacTuning [-m server-<n>] -o
<object name> <object value>
cfgRacTuneRemoteRacadmEnable=1
cfgRacTuneWebserverEnable=1
cfgRacTuneHttpPort=80
cfqRacTuneHttpsPort=443
cfgRacTuneTelnetPort=23
cfqRacTuneSshPort=22
cfgRacTuneIpRangeEnable=0
cfgRacTuneIpRangeAddr=192.168.1.1
cfgRacTuneIpRangeMask=255.255.255.0
cfgRacTuneIpBlkEnable=0
cfgRacTuneIpBlkFailCount=5
cfgRacTuneIpBlkFailWindow=60
cfgRacTuneIpBlkPenaltyTime=300
# cfgRacTuneTimezoneOffset=-18000
# cfgRacTuneDaylightOffset=3600
```

cfgRacTuneTimezoneOffset (Read/Write)

Description

Specifies the time zone offset (in minutes) from Greenwich Mean Time (GMT)/Coordinated Universal Time (UTC) to use for the RAC Time. Some common time zone offsets for time zones in the United States are:

- -480 (PST—Pacific Standard Time)
- -420 (MST—Mountain Standard Time)
- -360 (CST—Central Standard Time)
- -300 (EST—Eastern Standard Time)

For CMC: This object property is read only. Specifies the difference in number of seconds, from the (UTC)/ (GMT). This value is negative if the current time zone is west of Greenwich.

Legal Values -720 - 7800

cfgRacTuneLocalServerVideo (Read/Write)

This object property is applicable only to iDRAC6.

Description Enables (switches on) or disables (switches off) the local server

video.

Legal Values 1 (TRUE - Enables)

0 (FALSE- Disables)

Default 1

cfgRacTuneLocalConfigDisable (Read/Write)

NOTE: This object property is applicable only to iDRAC6.

Description Disables write access to iDRAC6 configuration data by setting to 1.

> **NOTE:** Access can be disabled using the local RACADM or iDRAC6 Web interface; however, once disabled, access can be re-enabled

only through iDRAC6 Web interface.

Legal Values 0 (TRUE-Enables)

1 (FALSE-Disables)

Default 0

cfgRacTuneWebserverEnable (Read/Write)

Description Enables or disables iDRAC6 or CMC web server. If this property is

> disabled, iDRAC6 or CMC is not accessible using client web browsers. This property has no effect on the Telnet/SSH or

RACADM interfaces.

Legal Values 1 (TRUE)

0 (FALSE)

cfgRacTuneVirtualConsoleAuthorizeMultipleSessions (Read/Write)

NOTE: This object property is applicable only to iDRAC6.

NOTE: To modify this property, you must have **Configure iDRAC** permission. This object can be used only with remote or firmware (SSH or Telnet) RACADM and not with local RACADM or with earlier DRAC products.

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

Description If a first user is already using the Virtual Console, the value of this

object effects the privileges granted to the subsequent user's shared

request after the timeout of 30 seconds.

Legal Values 0 (If the user of the first session has not responded for session sharing request by subsequent user, the next session user gets an

access denied error after the default timeout value of 30 seconds.)

1 (If the user of the first session has not responded for session sharing request by subsequent user, the next session user gets a read only access after the default timeout value of 30 seconds.)

2 (If the user of the first session has not responded for session sharing request by subsequent user, the next session user gets administrator access after default timeout value of 30 seconds.)

Default

ifcRacManagedNodeOs

NOTE: This object is applicable only to iDRAC6.

This group contains properties that describe the managed server operating system. One instance of the group is allowed.

The following sections provides information about the objects in the ifcRacManagedNodeOs group.

ifcRacMnOsHostname (Read Only)

Description The host name of the managed server.

Legal Values A string of up to 255 characters.

Default <black>

ifcRacMnOsOsName (Read Only)

Description The operating system name of the managed server.

Legal Values A string of up to 255 characters.

Default <black>

cfgRacSecurity

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property, you must have **Chassis Configuration** Administrator privilege.

This group is used to configure settings related to iDRAC6 or CMC SSL certificate signing request (CSR) feature. The properties in this group must be configured before generating a CSR from iDRAC6 or CMC.

For more information on generating certificate signing requests, see the subcommand "sslcsrgen" on page 119.

The following sections provides information about the objects in the cfgRacSecurity group.

cfgRacSecCsrCommonName (Read/Write)

Description Specifies the CSR Common Name (CN) that must be an IP or

iDRAC or CMC name as given in the certificate.

Legal Values A string of up to 254 characters.

Default <blank>

cfgRacSecCsrOrganizationName (Read/Write)

Description Specifies the CSR Organization Name (O).

Legal Values A string of up to 254 characters.

Default
 <blank>

cfgRacSecCsrOrganizationUnit (Read/Write)

Description Specifies the CSR Organization Unit (OU).

Legal Values A string of up to 254 characters.

Default <blank>

cfgRacSecCsrLocalityName (Read/Write)

Description Specifies the CSR Loyalty (L).

Legal Values A string of up to 254 characters.

Default

 lank>

cfgRacSecCsrStateName (Read/Write)

Description Specifies the CSR State Name (S).

Legal Values A string of up to 254 characters.

Default <blank>

1

cfgRacSecCsrCountryCode (Read/Write)

Description Specifies the CSR Country Code (CC).

Legal Values A string of up to 2 characters.

Default <blank>

cfgRacSecCsrEmailAddr (Read/Write)

Description Specifies the CSR email address. **Legal Values** A string of up to 254 characters.

Default
 <blank>

Example

racadm config -g cfgRacSecurity

cfgRacSecCsrKeySize=1024 cfgRacSecCommonName= cfgRacSecOrganizationName= cfgRacSecOrganizationUnit= cfgRacSecLocalityName= cfgRacSecStateName= cfgRacSecCountryCode= cfgRacSecEmailAddr=

cfgRacSecCsrKeySize (Read/Write)

Description Specifies the SSL asymmetric key size for the CSRs.

Legal Values For iDRAC6: 1024, 2048

For CMC: 512, 1024, 2048

Default 1024

cfgRacVirtual

NOTE: This object is applicable only to iDRAC6.

This group contains parameters to configure the iDRAC6 Virtual Media feature. One instance of the group is allowed.

The following sections provides information about the objects in the cfgRacVirtual group.

cfgRacVirMediaAttached (Read/Write)

Description This object is used to attach virtual devices to the system via the

> USB bus. When the devices are attached the server recognizes valid USB mass storage devices attached to the system. This is equivalent to attaching a local USB CDROM/floppy drive to a USB port on the system. When the devices are attached they can be connected to the virtual devices remotely using iDRAC6 Web interface or the CLI. Setting this object to 0 causes the devices to detach from the

USB bus.

Legal Values 0 = Detach

1 = Attach

2 = Auto-Attach

Default 0

cfgVirMediaBootOnce (Read/Write)

Description Enables or disables the Virtual Media Boot Once feature of

iDRAC6.

If this property is enabled when the host server is rebooted, this feature attempts to boot from the virtual media devices—if the

appropriate media is installed in the device.

Legal Values 1 (TRUE)

0 (FALSE)

Default

0

cfgVirtualFloppyEmulation (Read/Write)

NOTE: Virtual Media has to be reattached (using cfgRacVirMediaAttached) for this change to take effect.

Description When set to 0, the virtual floppy drive is recognized as a removable

> disk by Windows operating systems. Windows operating systems assigns a drive letter that is C: or higher during enumeration. When set to 1, the Virtual Floppy drive is seen as a floppy drive by Windows operating systems. Windows operating systems assigns a

drive letter of A: or B:.

Legal Values 1 (TRUE)

0 (FALSE)

Default

cfgVirMediaKeyEnable (Read/Write)

Description Enables or disables the Virtual Media key feature of the RAC.

> **NOTE:** This command is deprecated from 1.5 and 3.0 releases onwards. The functionality of this command is now covered by

cfgVFlashSDEnable. While execution of the

cfgVirMediaKeyEnable command is successful, it is recommended to use the cfqVFlashSDEnable command. For more information, see "cfgVFlashSDEnable (Read/Write)" on page 262.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgSDWriteProtect (Read only)

Description Displays if the physical write protect latch on the SD card is enabled or disabled.

> **NOTE:** This command is deprecated from 1.5 and 3.0 releases onwards. The functionality of this command is now covered by cfgVFlashSDWriteProtect. While execution of the cfgSDWriteProtect command is successful, it is recommended to use the cfgVFlashSDWriteProtect command. For more information, see "cfqVFlashSDWriteProtect (Read Only)" on page 264.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgLCDriveEnable (Read/Write)

Description Enable/disable the USC-LCE device from showing up in the

> operating system. It must be disabled in ESXi operating system. Allows proper operation of operating system and drivers interfacing

with the iDRAC/USC-LCE USB devices

Legal Values 1 (Enabled)

0 (Disabled)

Default

cfqServerInfo

This group allows you to select the BIOS first boot device and to boot the selected device only once.

For CMC, this group allows you to displays information for and configure a server in the chassis.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option

The following sections provides information about the objects in the cfgServerInfo group.

cfgServerInfoIndex (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the index name of the server.

Legal Values None Default None

cfgServerSlotNumber (Read only)

NOTE: This object is applicable only to CMC.

Description Specifies the location of the specified server (1–16) in the chassis.

Legal Values None Default None

cfgServerServiceTag (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the service tag of the specified server.

Legal Values None Default None

cfgServerName (Read only)

NOTE: This object is applicable only to CMC.

Displays the name of the specified server. **Description**

Legal Values Maximum of 15 non-extended ASCII characters, (ASCII codes 32

> through 126). For more information, see "Guidelines to Quote Strings Containing Special Characters When Using RACADM

Commands" on page 17.

Default SLOT-<slot number>

cfqServerFW (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the server's iDRAC management firmware revision.

Legal Values None Default None

cfgServerBIOS (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the server's BIOS revision.

Legal Values None Default None

cfgServerBmcMacAddress (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the BMC MAC address of the specified server.

Legal Values None Default None

cfgServerNic1MacAddress (Read only)

NOTE: This object is applicable only to CMC.

Displays the MAC address of the server NIC 1. Description

Legal Values None Default None

cfgServerNic2MacAddress (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the MAC address of the server NIC 2.

Legal Values None Default None

cfgServerNic3MacAddress (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the MAC address of the server NIC 3.

Legal Values None **Default** None

cfgServerNic4MacAddress (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the MAC address of the server NIC 4.

Legal Values None Default None

Read only. Displays the MAC address of the server NIC 4.

cfgServerPriority (Read only)

NOTE: This object is applicable only to CMC.

Description Sets the priority level allotted to the server in the chassis for power

budgeting purposes.

Legal Values 1–9 in descending priority, where 1 holds the highest priority

Default

cfgServerNicEnable (Read only)

NOTE: This object is applicable only to CMC.

Description Enables or disables LAN channel.

Legal Values 1 (enable)

0 (disable)

Default None

cfgServerIPMIOverLanEnable (Read only)

NOTE: This object is applicable only to CMC.

Enables or disables IPMI LAN channel. **Description**

Legal Values 1 (enable)

0 (disable)

Default None

cfgServerPowerBudgetAllocation (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the current power allocation for the server.

Legal Values 1 (enable)

0 (disable)

Default None

cfgServerDNSRegisterIMC (Read only)

NOTE: This object is applicable only to CMC.

Description Enables or disables DNS name registration for the Integrated

Management Controller (iDRAC).

Legal Values 1 (enable)

0 (disable)

Default None

cfgServerDNSIMCName (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the DNS domain name for the integrated Remote Access

Controller, iDRAC.

Legal Values None Default None

cfgServerRootPassword (Write only)

NOTE: This object is applicable only to CMC.

Description Displays the password for iDRAC as a series of asterisks (*). It

cannot be seen or displayed after this property is written.

Legal Values None **Default** None

cfgServerFirstBootDevice (Read/Write)

NOTE: For CMC, this object is Write only.

Description Sets or displays the first boot device.

For iDRAC6, you can also set a vFlash partition that is attached as

a bootable device. For more information, see

"cfgVFlashPartitionOSVolLabel (ReadOnly)" on page 265.

No-Override **Legal Values**

PXE

HDD

DIAG

CD-DVD

BIOS

vFDD

VCD-DVD

iSCSI

VFLASH

FDD

SD

Default No-Override

1

cfqServerBootOnce (Read/Write)

NOTE: For CMC, this object is Write only.

Description Enables or disables the server boot once feature.

Legal Values 1 = TRUE

0 = FALSE

Default

cfqActiveDirectory

This group contains parameters to configure iDRAC6 or CMC Active Directory feature.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

The following sections provides information about the objects in the cfgActiveDirectory group.

cfgADRacDomain (Read/Write)

Description Active Directory Domain in which iDRAC6 or CMC resides.

Legal Values Any printable text string of up to 254 characters, with no white

space.

Default <blank>

cfgADRacName (Read/Write)

Description Name of iDRAC6 or CMC as recorded in the Active Directory

forest.

Legal Values Any printable text string of up to 254 characters, with no white

space.

Default <black>

cfqADRootDomain

NOTE: This object is applicable only to CMC.

Description Specifies the root domain of the domain forest.

Legal Values Any printable text string of up to 254 characters, with no white

space.

Default <blank>

cfgADEnable (Read/Write)

Description Enables or disables Active Directory user authentication on

iDRAC6 or CMC. If this property is disabled, only local iDRAC6 or

CMC authentication is used for user logins.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfqADSCLEnable

NOTE: This object is applicable only to CMC.

Description Enables you to log on to the CMC without enabling the Smart

Card login

Legal Values 1 (Enable)

0 (Disable)

Default 0

cfgADSS0Enable (Read/Write)

Description Enables or disables Active Directory single sign-on authentication

on iDRAC6.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgADDomainController

NOTE: This object is applicable only to CMC.

Description Specifies the LDAP server from which you want the CMC to obtain

user names. Must be used with cfgADSpecifyServerEnable.

Legal Values Valid IP address or fully qualified domain name (FQDN).

Default None

cfgADDomainController1 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the LDAP server for user

names.

Legal Values A string of up to 254 ASCII characters representing a valid IP

address or a fully qualified domain name (FQDN).

Default None

cfgADDomainController2 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the LDAP server for user

names

Legal Values A string of up to 254 ASCII characters representing a valid IP

address or a fully qualified domain name (FQDN).

Default None

cfqADDomainController3 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the LDAP server for user

names

Legal Values A string of up to 254 ASCII characters representing a valid IP

address or a fully qualified domain name (FQDN).

Default None

cfgADAuthTimeout (Read/Write)

NOTE: To modify this property, you must have **Configure iDRAC** permission.

Specifies the number of seconds to wait for Active Directory Description

authentication requests to complete before timing out.

Legal Values 15 - 300 seconds

Default 12.0

cfgADType (Read/Write)

Description Determines the schema type to use with Active Directory.

Legal Values 1 (Enables Active Directory with the extended schema)

2 (Enables Active Directory with the standard schema)

Default 1

cfgADSpecifyServerEnable

NOTE: This object is applicable only to CMC.

Description Allows you to enable or disable and specify an LDAP server or a

global catalog server. Use cfgADDomainController or

cfgADGlobalCatalog to specify the IP address

Legal Values 1 (enabled)

0 (disabled)

Default 0

cfgADGlobalCatalog

NOTE: This object is applicable only to CMC.

Description Specifies the global catalog server from which you want the CMC to

obtain user names. Must be used with cfgADSpecifyServerEnable.

Legal Values Valid IP address or FQDN.

Default None

Example

racadm getconfig -g cfgActiveDirectory

cfgADEnable=1

cfqADSCLEnable=0

cfgADSSOEnable=0

cfgADRacDomain=

cfgADRootDomain=help

cfqADRacName=

cfgADRacAuthTimeout=300

cfgADType=0x4

cfgADSpecifyServerEnable=1

cfqADDomainController=192.168.1.1

cfgADGlobalCatalog=127.0.0.1

cfgADGlobalCatalog1 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the Global Catalog

server for user names.

Legal Values A string of up to 254 ASCII characters representing a valid IP

address or a fully qualified domain name (FQDN).

Default None

cfgADGlobalCatalog2 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the Global Catalog

server for user names

Legal Values A string of up to 254 ASCII characters representing a valid IP

address or a fully qualified domain name (FQDN).

Default None

cfgADGlobalCatalog3 (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description iDRAC6 uses the value specified to search the Global Catalog

server for user names.

A string of up to 254 ASCII characters representing a valid IP **Legal Values**

address or a fully qualified domain name (FQDN).

Default None

cfgADCertValidationEnable (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description Enables or disables Active Directory certificate validation as a part

of the Active Directory configuration process.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

cfgADDcSRVLookupEnable (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description Configures iDRAC6 to use pre-configured domain controllers or to

> use DNS to find the domain controller. If using pre-configured domain controllers, then the domain controllers to use are specified under cfgAdDomainController1, cfgAdDomainController2, and cfgAdDomainController3. iDRAC6 does not fail over to the specified domain controllers when DNS lookup fails or none of the

servers returned by the DNS lookup works.

Legal Values 1 (TRUE)—use DNS to look up domain controllers

0 (FALSE)—use pre-configured domain controllers

Default 0

cfgADDcSRVLookupbyUserdomain (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description Chooses the way the user domain is looked up for Active Directory.

Legal Values 1 (TRUE)—use user domain as the search domain to look up DCs.

The user domain is chosen from the user domain list or entered by

the login user.

0 (FALSE)—use the configured search domain cfgADDcSrvLookupDomainName to look up DCs.

Default 1

cfgADDcSRVLookupDomainName (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description This is the Active Directory Domain to use when

cfgAddcSrvLookupbyUserDomain is set to 0.

Legal Values String. Maximum length = 254

Default Null

cfgADGcSRVLookupEnable (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description Determines how the global catalog server is looked up. If using

pre-configured global catalog servers, then iDRAC6 uses the values

cfgAdGlobalCatalog1, cfgAdGlobalCatalog2, and

cfgAdGlobalCatalog3.

Legal Values 0(FALSE)—use pre-configured Global Catalog Servers (GCS)

1(TRUE)—use DNS to look up GCS

Default 0

cfgADGcRootDomain (Read/Write)

NOTE: This object is applicable only to iDRAC6.

Description The name of the Active Directory root domain used for DNS look

up, to locate Global Catalog servers.

Legal Values String. Maximum length = 254

Default Null

cfqLDAP

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option

This group allows you to configure settings related to the Lightweight Directory Access Protocol (LDAP).

The following sections provides information about the objects in the cfgLDAP group.

cfgLdapEnable (Read/Write)

Description Turns LDAP service on or off.

If this property is disabled, local CMC authentication is used for

user logins.

Legal Values 1 (TRUE)—Enable LDAP Services

0 (FALSE)—Disable LDAP Services

Default 0

NOTE: For CMC, enabling this option turns off **cfgADEnable**.

cfgLdapServer (Read/Write)

Description Configures the address of the LDAP Server. IPv4 and IPv6 are

supported.

Legal Values String.

> For iDRAC6: Maximum length = 1024For CMC: Maximum length = 254

Default Null

NOTE: You can specify multiple servers by separating each server with a comma. For example, example.com, sub1.example.com

cfgLdapPort (Read/Write)

Description Port of LDAP over SSL. Non-SSL port is not supported.

Legal Values 1 - 65535

Default 636

cfgLdapBasedn (Read/Write)

Description The Domain Name of the branch of the directory where all searches

should start from.

Legal Values String. Maximum length = 254

Default Null

cfgLdapUserAttribute (Read/Write)

Description Specifies the user attribute to search for. If not configured, the

default used is **uid**. It is recommended to be unique within the chosen baseDN, otherwise a search filter must be configured to ensure the uniqueness of the login user. If the user DN cannot be

uniquely identified, login fails with error.

Legal Values String. Maximum length = 254

Default Null

uid if not configured.

cfgLdapGroupAttribute (Read/Write)

Description Specify which LDAP attribute is used to check for group

membership. This should be an attribute of the group class. If not specified, then iDRAC6 or CMC uses the member and unique

member attributes.

Legal Values String. Maximum length = 254

Default Null

cfgLdapGroupAttributeIsDN (Read/Write)

Description When it is set to 1, iDRAC6 compares the userDN retrieved from

the directory to compare to the members of the group; if it is set to 0, the user name provided by the login user is used to compare to the members of the group. This does not impact the search algorithm for the bind. iDRAC6 always searches the userDN and

uses the userDN to bind.

For CMC, if enabled, the CMC performs DN matching, otherwise the CMC uses the user name provided at login for matching.

Legal Values 1 (TRUE)—Use the *userDN* from the LDAP Server

0 (FALSE)—Use the userDN provided by the login user

Default 1

1

cfgLdapBinddn (Read/Write)

Description The distinguished name of a user used to bind to the server when

> searching for the login user's DN. If not provided, an anonymous bind is used. This is optional but is required if anonymous bind is

not supported.

Legal Values String. Maximum length = 254

Default Null

NOTE: If **cfgLDAPBindDN** is [null] and **cfgLDAPBindPassword** is [null], then the CMC attempts an anonymous bind.

cfgLdapBindpassword (Write only)

Description A bind password to use in conjunction with the bindDN. The bind

> password is sensitive data, and should be properly protected. This is optional but is required if anonymous bind is not supported.

Legal Values String. Maximum length = 254

Default Null

cfgLdapSearchFilter (Read/Write)

Description A valid LDAP search filter. This is used if the user attribute cannot

> uniquely identify the login user within the chosen baseDN. The search filter only applies to userDN search and not the group

membership search.

Legal Values For iDRAC6: String of maximum length = 254 characters

For CMC: String of maximum length = 1024 characters

Default (objectclass=*)

Searches for all objects in tree.

cfgLDAPCertValidationEnable (Read/Write)

Description Controls certificate validation during SSL handshake.

Legal Values 1 (TRUE)—iDRAC6 or CMC uses the CA certificate to validate

the LDAP server certificate during SSL handshake.

0 (FALSE)—iDRAC6 or CMC skips the certificate validation step

of SSL handshake.

Default

cfgLDAPNetworkTimeout

NOTE: This object is applicable only to CMC.

Description Configures the network timeout in seconds.

Legal Values Positive integer **Default** 30 seconds

cfgLDAPSearchTimeout

NOTE: This object is applicable only to CMC.

Description Configures the search timeout in seconds.

Legal Values Positive integer Default 120 seconds

cfgLDAPSRVLookupEnable

NOTE: This object is applicable only to CMC.

Description Configures the CMC to query a DNS server for SRV records.

Legal Values 1 (true)

0 (false)

Default 0

cfgLDAPSRVLookupDomainName

NOTE: This object is applicable only to CMC.

Description Configures the domain name to be used in the SRV lookup.

Legal Values String of maximum length of 254 alphanumeric characters and

hyphens. The string must begin with a letter.

Default [null]

cfgLDAPSRVLookupServiceName

NOTE: This object is applicable only to CMC.

Description Configures the service name to be used in the SRV lookup.

Legal Values String of maximum length of 254 characters.

Default ldap

cfgLdapRoleGroup

This group allows the user to configure role groups for LDAP.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator prtvilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the -o option.

For CMC, this object configures Generic LDAP Role group definitions and defines the CMC privileges that LDAP-authenticated users are granted.

cfgLDAPRoleGroup is indexed, containing instances numbered from 1 to 5. Each object instance consists of a pair of properties:

- cfgLDAPRoleGroupDN: an LDAP distinguished name (DN)
- cfgLDAPRoleGroupPrivilege: a CMC privilege map

Each LDAP-authenticated user assumes the total set of CMC privileges assigned to the matching LDAP distinguished names that the user belongs to.

That is, if the user belongs to multiple role group DNs, the user receives all associated privileges for those DNs.

The following sections provides information about the objects in the cfgLdapRoleGroup group.

cfgLdapRoleGroupIndex (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description This is the index value of the Role Group Object.

Legal Values An integer between 1 and 5

Default <instance>

cfgLdapRoleGroupDN (Read/Write)

Description This is the Domain Name of the group in this index.

For CMC, configure the LDAP distinguished name (DN) for the

role group instance.

Legal Values String. Maximum length = 1024

Default None

Example

racadm getconfig -g cfgLDAPRoleGroup -o cfgLDAPRoleGroupDN -i 1 cn=everyone,ou=groups,dc= openldap,dc=com

cfgLdapRoleGroupPrivilege (Read/Write)

Description A bit-mask defining the privileges associated with this particular

group.

0x0000000000 to 0x000001ff**Legal Values**

Default 0x000

Example

racadm getconfig -g cfgLDAPRoleGroup -o cfgLDAPRoleGroupPrivilege -i 1 0x0

cfgStandardSchema

This group contains parameters to configure the Active Directory standard schema settings.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration** Administrator privilege.

NOTE: For CMC, you can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the **-o** option.

The following sections provides information about the objects in the cfgStandardSchema group.

cfgSSADRoleGroupIndex (Read Only)

Description Index of the Role Group as recorded in the Active Directory.

Legal Values An integer between 1 and 5

Default <instance>

cfgSSADRoleGroupName (Read/Write)

Description Name of the Role Group as recorded in the Active Directory forest.

Legal Values Any printable text string of up to 254 characters with no white

space.

Default <blank>

cfgSSADRoleGroupDomain (Read/Write)

Description Active Directory Domain in which the Role Group resides.

Legal Values Any printable text string of up to 254 characters, with no white

space.

Default <blank>

cfgSSADRoleGroupPrivilege (Read/Write)

Description Use the bit mask numbers in Table 3-5 to set role-based authority

privileges for a Role Group.

Legal Values For iDRAC6: 0x00000000 to 0x000001ff

For CMC: 0x00000000-0x00000fff

Default <blank>

Example

racadm getconfig -g cfgStandardSchema

cfgSSADRoleGroupIndex=1
cfgSSADRoleGroupName=blsys-1
cfgSSADRoleGroupDomain=
cfgSSADRolGroupPrivilege=3081

Table 3-5. Bit Masks for Role Group Privileges

Role Group Privilege	Bit Mask
Login to iDRAC	0x00000001
Configure iDRAC	0x00000002
Configure Users	0x00000004
Clear Logs	0x00000008
Execute Server Control Commands	0x00000010
Access Virtual Console	0x00000020
Access Virtual Media	0x00000040
Test Alerts	0x00000080
Execute Debug Commands	0x00000100

cfgChassisPower

This group is applicable only to CMC and contains parameters to display or configure power for the chassis.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property, you must have **Chassis Configuration Administrator** privilege.

NOTE: You can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the **-o** option.

The following sections provides information about the objects in the cfgChassisPower group.

cfgChassisInPower (Read Only)

Indicates the cumulative input power consumption data (in watts and BTU/hr) captured from all healthy and functional PSUs in the chassis.

cfgChassisPeakPower (Read Only)

The maximum system input power consumption (in watts) since the value was last cleared by a user.

cfgChassisPeakPowerTimestamp (Read Only)

The timestamp recorded when the peak input power consumption value occurred.

cfgChassisMinPower (Read Only)

The minimum system input power consumption value (in watts) over the time since the value was last cleared.

cfgChassisMinPowerTimestamp (Read Only)

The timestamp recorded when the minimum system power occurred.

cfgChassisPowerStatus (Read Only)

Description Indicates the power status of the chassis.

 $\textbf{Legal Values} \qquad 1 \; (other)$

2 (unknown)

3 (OK)

4 (non-critical) 5 (critical)

6 (non-recoverable)

Default None

cfgChassisRedundantState (Read Only)

Description Enables or disables power redundancy for the chassis.

 $\textbf{Legal Values} \qquad 0 \; (none) \\$

1 (full)

Default None

cfgChassisPowerCap

Description Indicates the maximum power consumption limit (in watts) for the

entire chassis. The command generates an error if server throttling is necessary to achieve the power goal based on the value for this

setting.

Legal Values 2715–11637 watts

Default 11637 watts

cfgChassisPowerCapF

Description Indicates the maximum power consumption limit (in watts) for the

entire chassis. Use cfgChassisPowerCapF when power consumption is to be changed regardless of whether server

throttling is required. This command generates an error if the value for this setting is lower than the minimum power required for the

chassis configuration.

Legal Values 2715–11637 watts

Default 11637 watts

cfgChassisPowerCapBTU

Description Indicates the maximum power consumption limit (in BTU/hr) for

the entire chassis. The command generates an error if server throttling is necessary to achieve the power goal based on the value

for this setting.

Legal Values 9264 - 39707 BTU/hr

Default 39707 BTU/hr

cfgChassisPowerCapFBTU

Description Indicates the maximum power consumption limit (in BTU/hr) for

the entire chassis. Use **cfgChassisCapFBTU** when power consumption is to be changed regardless of whether server

throttling is required. The command generates an error if the value for this setting is lower than the minimum power required for the

chassis configuration.

9264 - 39707 BTU/hr

Default 39707 BTU/hr

Legal Values

cfgChassisPowerCapPercent

Description Indicates the power consumption limit as a percentage. The

percentage is computed mathematically as the minimum power + (percent * (maximum power - minimum power)). The command generates an error if server throttling is necessary to achieve the

power goal based on the value for this setting.

Legal Values 23 -100

Default 100

cfg Chass is Power Cap FP ercent

Description Indicates the power consumption limit as a percentage. The

percentage is computed mathematically as the minimum power +

(percent * (maximum power - minimum power)). Use

cfgChassisPowerCapFPercent when power consumption is to be changed regardless of whether server throttling is required.

Legal Values 23 -100

Default 100

1

cfgChassisRedundancyPolicy

Description Sets the redundancy policy of the chassis.

Legal Values 0 (no redundancy)

1 (AC redundancy)

2 (power supply redundancy)

Default 0 (no redundancy)

cfgChassisDynamicPSUEngagementEnable

Description Enables or disables dynamic engagement.

Legal Values 0 (disabled)

1 (enabled)

Default 0 (disabled)

cfgChassisAllow110VACOperation

Description Enables or disables normal chassis power allocations when any

power supply unit is connected to 110V AC service. If disabled and 110V power supplies are detected, all subsequent server power allocation requests are denied. In this mode additional servers

cannot be powered on, regardless of server priority.

Legal Values 0 (disabled)

1 (enabled)

Default 0 (disabled)

cfg Chassis Max Power Conservation Mode

Description Enables or disables max power conservation mode. When enabled,

all servers are immediately reduced to their minimum power levels, and all subsequent server power allocation requests are denied. In this mode performance of powered on servers may be degraded, and

additional servers cannot be powered on, regardless of server

priority.

Legal Values 0 (disabled)

1 (enabled)

Default 0 (disabled)

cfgChassisPerformanceOverRedundancy

Description Enables or disables server performance over power redundancy.

When enabled, this option favors server performance and server powerup, over maintaining power redundancy. When disabled, the system favors power redundancy over server performance. When disabled, then if the power supplies in the chassis do not provide sufficient power, both for redundancy, as well as full performance, then some servers may not be granted sufficient power for full performance, or may not be powered on, in order to maintain

redundancy.

Legal Values 0 (disabled)

1 (enabled)

Default 1 (enabled)

cfgChassisInMaxPowerCapacity (Read Only)

Indicates the total chassis power budget (in watts) available for chassis operation.

cfgChassisInRedundancyReserve (Read Only)

Indicates the amount of redundant power (in watts) in reserve that can be utilized in the event of an AC grid or PSU failure. This value is 0 if the Redundancy Policy is set to 0 (no redundancy).

cfgChassisInPowerServerAllocation (Read Only)

Indicates (in watts) the cumulative power allocated to servers. There is no default as this parameter is very specific to the particular customer configuration.

cfgChassisInfrastructureInPowerAllocation (Read Only)

Indicates the estimated cumulative DC output power consumption (in watts), determined from a field replaceable unit (FRU) on the hardware modules in the chassis.

cfgChassisTotalInPowerAvailable (Read Only)

Indicates the amount of power (in watts) available for use by the chassis.

cfgChassisStandbyInPowerCapacity (Read Only)

Indicates the amount of power (in watts) available for powering up any hardware modules that are either added to the chassis or powered up (if they are already present in the chassis).

cfgChassisPowerClear (Write Only)

To reset cfgChassisMinPower and cfgChassisMaxPowerCapacity, set this object to 1.

cfgChassisPowerClearTimestamp (Read Only)

Time stamp when cfgChassisMinPower and cfgChassisMaxPowerCapacity were reset.

cfgChassisPowerButtonEnable

Description Indicates if the chassis power button is enabled or disabled.

Legal Values 0 (disabled)

1 (enabled).

Default None

cfgSystemEnergyConsumptionClear (Write Only)

To reset energy statistics, set this value to 1.

Examples

```
racadm getconfig -g cfgChassisPower
# cfgChassisInPower=0 W | 0 BTU/hr
# cfqChassisPeakPower=0 W
# cfgChassisPeakPowerTimestamp=06:32:55 01/26/2009
# cfgChassisMinPower=0 W
# cfgChassisMinPowerTimestamp=06:32:55 01/26/2009
# cfqChassisPowerStatus=5
# cfqChassisRedundantState=0
cfqChassisPowerCap=11637 W
cfgChassisPowerCapF=11637 W
cfgChassisPowerCapBTU=39707 BTU/hr
cfgChassisPowerCapFBTU=39707 BTU/hr
cfqChassisPowerCapPercent =100%
cfqChassisPowerCapFPercent =100%
cfqChassisRedundancyPolicy=0
cfgChassisDynamicPSUEngagementEnable=0
# cfgChassisInMaxPowerCapacity=0 W
# cfgChassisInRedundancyReserve=0 W
# cfgChassisInPowerServerAllocation=0 W
# cfgChassisInfrastructureInPowerAllocation=51 W
# cfgChassisTotalInPowerAvailable=0 W
# cfgChassisStandbyInPowerCapacity=0 W
# cfgChassisPowerClear=****** (Write-Only)
# cfgChassisPowerClearTimestamp=18:00:00
12/31/1969
cfgChassisPowerButtonEnable=1
cfgChassisAllow110VACOperation=0
cfqChassisMaxPowerConservationMode=0
cfgChassisPerformanceOverRedundancy=1
cfgSystemEnergyConsumptionClear = ****(Write-Only)
racadm config -g cfgChassisPower
-o cfgChassisPowerClear 1
```

Clears cfgChassisMinPower and cfgChassisPeakPower.

cfglpmiSol

This group is applicable only for iDRAC6 and is used to configure the Serial Over LAN (SOL) capabilities of the system.

The following sections provides information about the objects in the cfgIpmiSol group.

cfglpmiSolEnable (Read/Write)

Description Enables or disables SOL.

 $\textbf{Legal Values} \qquad 1 \; (TRUE)$

0 (FALSE)

Default 1

cfglpmiSolBaudRate (Read/Write)

Description The baud rate for serial communication over LAN.

Legal Values 9600, 19200, 57600, 115200

Default 115200

cfglpmiSolMinPrivilege (Read/Write)

Description Specifies the minimum privilege level required for SOL access.

Legal Values 2 (User)

3 (Operator)

4 (Administrator)

Default 4

cfglpmiSolAccumulateInterval (Read/Write)

Description Specifies the typical amount of time that iDRAC6 waits before

transmitting a partial SOL character data packet. This value is 1-

based 5ms increments.

Legal Values 1 - 255

cfglpmiSolSendThreshold (Read/Write)

Description The SOL threshold limit value. Specifies the maximum number of

bytes to buffer before sending an SOL data packet.

Legal Values 1-255

Default 255

cfglpmiLan

This group is applicable only for iDRAC6 and is used to configure the IPMI over LAN capabilities of the system.

The following sections provides information about the objects in the cfgIpmiLan group.

cfglpmiLanEnable (Read/Write)

Description Enables or disables the IPMI over LAN interface.

 $\textbf{Legal Values} \qquad 1 \; (TRUE)$

0 (FALSE)

Default 0

cfglpmiLanPrivLimit (Read/Write)

Description Specifies the maximum privilege level allowed for IPMI over LAN

access.

Legal Values 2 (User)

3 (Operator)

4 (Administrator)

Default 4

1

cfglpmiLanAlertEnable (Read/Write)

Description Enables or disables global e-mail alerting. This property overrides

all individual e-mail alerting enable/disable properties.

Legal Values 1 (TRUE)

0 (FALSE)

Default 0

cfgIpmiEncryptionKey (Read/Write)

Description The IPMI encryption key.

Legal Values A string of hexadecimal digits from 0 to 40 characters with no

spaces. Only an even amount of digits is allowed.

cfglpmiPetCommunityName (Read/Write)

Description The SNMP community name for traps.

Legal Values A string of up to 18 characters.

Default public

cfglpmiPetlpv6

This group is applicable only for iDRAC6 and is used to configure IPv6 platform event traps on the managed server.

The following sections provides information about the objects in the cfgIpmiPetIpv6 group.

cfglpmiPetIPv6Index (Read Only)

Description Unique identifier for the index corresponding to the trap.

Legal Values 1-4

Default <index value>

cfglpmiPetIPv6AlertDestIpAddr

Description Configures the IPv6 alert destination IP address for the trap.

Legal Values IPv6 address

Default

Slank>

cfglpmiPetIPv6AlertEnable (Read/Write)

Description Enables or disables the IPv6 alert destination for the trap.

 $\textbf{Legal Values} \qquad 1 \; (TRUE)$

0 (FALSE)

Default 0

cfglpmiPef

This group is applicable only for iDRAC6 and is used to configure the platform event filters available on the managed server.

The event filters can be used to control policy related to actions that are triggered when critical events occur on the managed server.

The following sections provides information about the objects in the cfgIpmiPef group.

cfglpmiPefName (Read Only)

Description Specifies the name of the platform event filter.

Legal Values A string of up to 255 characters.

Default The name of the index filter.

cfglpmiPefIndex (Read/Write)

Description Specifies the index of a specific platform event filter.

Legal Values For iDRAC6 on Rack and Tower Servers: 1 - 22

For iDRAC6 Enterprise on Blade Servers: 1-9

Default The index value of a platform event filter object.

cfgIpmiPefAction (Read/Write)

Description Specifies the action that is performed on the managed server when

the alert is triggered.

NOTE: For iDRAC6 on Rack and Tower servers, this object is read-

only for indexes 20, 21, and 22.

 $\begin{tabular}{ll} \textbf{Legal Values} & 0 \ (None) \\ \end{tabular}$

l (Power Down)

2 (Reset)

3 (Power Cycle)

Default 0

cfglpmiPefEnable (Read/Write)

Description Enables or disables a specific platform event filter.

Legal Values 1 (TRUE)

0 (FALSE)

cfglpmiPet

This group is applicable only for iDRAC6 and is used to configure platform event traps on the managed server.

The following sections provides information about the objects in the cfgIpmiPet group.

cfglpmiPetIndex (Read Only)

Description Unique identifier for the index corresponding to the trap.

Legal Values 1-4

Default The index value of a specific platform event trap.

cfglpmiPetAlertDestlpAddr (Read/Write)

Description Specifies the destination IPv4 address for the trap receiver on the

network. The trap receiver receives an SNMP trap when an event is

triggered on the managed server.

Legal Values A string representing a valid IPv4 address. For example,

192.168.0.67.

Default 0.0.0.0

cfglpmiPetAlertEnable (Read/Write)

Description Enables or disables a specific trap.

Legal Values 1 (TRUE)

0 (FALSE)

cfgUserDomain

This group is applicable only for iDRAC6 and is used to configure the Active Directory user domain names. A maximum of 40 domain names can be configured at any given time.

The following sections provides information about the objects in the cfgUserDomain group.

cfgUserDomainIndex (Read Only)

Description Represents a specific domain.

Legal Values 1 - 40

Default The index value.

cfgUserDomainName (Read Only)

Description Specifies the Active Directory user domain name.

Legal Values A string of up to 255 ASCII characters.

Default <blank>

cfqServerPower

This group provides several power management features.

The following sections provides information about the objects in the cfgServerPower group.

cfgServerPowerStatus (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Represents the server power state, either ON or OFF.

Legal Values 1 (ON)

0 (OFF)

cfgServerPowerAllocation (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC. For iDRAC6 on Rack and Tower Servers the object is available only under Modular FW and Remote RACADM, and not in Local RACADM.

Description Represents the available allocated power supply for server usage.

NOTE: In case of more than one power supply, this object represents

the minimum capacity power supply.

Legal Values A string of up to 32 characters.

<black> Default

cfgServerActualPowerConsumption (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Represents the power consumed by the server at the current time.

Legal Values A string of up to 32 characters.

Default <blank>

cfgServerPowerCapEnable (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Enables or disables the user specified power budget threshold.

Legal Values 0 - Disables the user specified power budget threshold

1- Enables the user specified power budget threshold

cfgServerMinPowerCapacity (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Represents the minimum server power capacity.

Legal Values A string of up to 32 characters.

<blank> Default

cfgServerMaxPowerCapacity (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Represents the maximum server power capacity.

Legal Values A string of up to 32 characters.

Default <blank>

cfgServerPeakPowerConsumption (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Represents the maximum power consumed by the server until the

current time.

Legal Values A string of up to 32 characters.

Default <current server peak power consumption>

cfgServerPeakPowerConsumptionTimestamp (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Time when the maximum power consumption was recorded.

Legal Values A string of up to 32 characters.

Default Maximum power consumption timestamp.

cfgServerPowerConsumption (Read only)

NOTE: This object is applicable only to CMC.

Description Displays the current power consumption for a server

Legal Values None Default None

Read only. Displays the current power consumption for a server.

Example

```
racadm getconfig -g cfgServerInfo -i 8
# cfqServerInfoIndex=8
# cfqServerSlotNumber=8
# cfgServerServiceTag=
cfgServerName=SLOT-08
# cfqServerFW=3.0
# cfqServerBIOS=
# cfgServerBmcMacAddress=00:21:9B:FE:5F:58
# cfqServerNic1MacAddress=00:0D:56:B8:69:63
# cfgServerNic2MacAddress=00:0D:56:B8:69:65
# cfgServerNic3MacAddress=00:0D:56:B8:69:CB
# cfqServerNic4MacAddress=00:0D:56:B8:69:CD
cfgServerPriority=1
cfgServerNicEnable=1
cfgServerIPMIOverLANEnable=1
# cfgServerPowerBudgetAllocation=0
cfgServerDNSRegisterIMC=0
cfgServerDNSIMCName=iDRAC-
# cfgServerRootPassword=****** (Write-Only)
# cfgServerFirstBootDevice=******* (Write-Only)
# cfqServerBootOnce=****** (Write-Only)
# cfgServerPowerConsumption=0
```

```
racadm getconfig -g cfgServerInfo -i 1
# cfqServerInfoIndex=1
# cfgServerSlotNumber=1
# cfqServerServiceTag=1S0M0G1
cfgServerName=SLOT-01
# cfgServerFW=1.40 (Build 12)
# cfqServerBIOS=4.0.2
# cfgServerBmcMacAddress=00:18:8B:FF:41:43
# cfqServerNic1MacAddress=00:1A:A0:FF:D9:F4
# cfqServerNic2MacAddress=00:1A:A0:FF:D9:F6
cfqServerPriority=1
cfgServerNicEnable=1
cfqServerIPMIOverLANEnable=1
# cfqServerPowerBudgetAllocation=0
cfgServerDNSRegisterIMC=0
cfgServerDNSIMCName=iDRAC-1S0M0G1
# cfgServerRootPassword=****** (Write-Only)
# cfgServerFirstBootDevice=****** (Write-Only)
# cfqServerBootOnce=******* (Write-Only)
# cfgServerPowerConsumption=0
```

cfgServerPowerConsumptionClear (Write Only)

NOTE: This object is applicable only for iDRAC6.

Description Resets the cfgServerPeakPowerConsumption (Read/Write)

property to 0 and the cfgServerPeakPowerConsumptionTimestamp

property to the current iDRAC time.

Legal Values 1 (TRUE)

0 (FALSE)

Default None

cfgServerPowerCapWatts (Read/Write)

NOTE: This object is applicable only for iDRAC6.

Description Represents the server power threshold in Watts.

Legal Values A string of up to 32 characters. **Default** Server power threshold in Watts.

cfgServerPowerCapBtuhr (Read/Write)

NOTE: This object is applicable only for iDRAC6.

Description Represents the server power threshold in BTU/hr.

Legal Values A string of up to 32 characters.

Default Server power threshold in BTU/hr.

cfgServerPowerCapPercent (Read/Write)

NOTE: This object is applicable only for iDRAC6.

Description Represents the server power threshold in percentage.

Legal Values A string of up to 32 characters.

Default Server power threshold in percentage.

cfgServerPowerLastMinAvg (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the average power value during the last minute.

Legal Values A string of up to 32 characters.

Default Average power value during the last minute.

cfgServerPowerLastHourAvg (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the average power value during the last hour.

Legal Values A string of up to 32 characters.

Default Average power value during the last hour.

cfgServerPowerLastDayAvg (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the average power value during the last day.

Legal Values A string of up to 32 characters.

Default Average power value during the last day.

cfgServerPowerLastWeekAvg (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the average power value during the last week.

Legal Values A string of up to 32 characters.

Default Average power value during the last week.

cfgServerPowerLastHourMinPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the minimum power value during the last hour.

Legal Values A string of up to 32 characters.

Default Minimum power value during the last hour.

cfgServerPowerLastHourMinTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of minimum power value during the last

minute.

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where.

• DD= Day of the week

• MM= Month

• Date=Date

YYYY = Year

HH = hour

MM=Minutes

SS = Seconds

Default Minimum power value during the last minute.

cfgServerPowerLastHourMaxPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the maximum power value during the last hour.

Legal Values A string of up to 32 characters.

Default Maximum power value during the last hour.

cfgServerPowerLastHourMaxTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Displays the timestamp of maximum power value during the last Description

hour

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where,

• DD= Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

SS = Seconds

Default Maximum power value during the last hour.

cfgServerPowerLastDayMinPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the minimum power value during the last day.

Legal Values A string of up to 32 characters.

Default Minimum power value during the last day.

cfgServerPowerLastDayMinTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of minimum power value during the last

day.

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where,

• DD = Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

• SS = Seconds

Default Minimum power value during the last day.

cfgServerPowerLastDayMaxPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the maximum power value during the last day.

Legal Values A string of up to 32 characters.

Default Maximum power value during the last day.

cfgServerPowerLastDayMaxTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of maximum power value during the last

day.

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where,

• DD = Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

SS = Seconds

Default Maximum power value during the last day.

cfgServerPowerLastWeekMinPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the minimum power value during the last week.

Legal Values A string of up to 32 characters.

Default Minimum power value during the last week.

cfgServerPowerLastWeekMinTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of minimum power value during the last

week

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where,

• DD = Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

SS = Seconds

Default Minimum power value during the last week

cfgServerPowerLastWeekMaxPower (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the maximum power value during the last week.

Legal Values A string of up to 32 characters.

Default Maximum power value during the last week.

cfgServerPowerLastWeekMaxTime (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of maximum power value during the last

week

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where,

• DD = Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

SS = Seconds

Default Maximum power value during the last week.

cfgServerPowerInstHeadroom (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

Description Displays the difference between the available power and the

current power consumption.

Legal Values A string of up to 32 characters.

Difference between the available power and the current power Default

consumption.

235

cfgServerPowerPeakHeadroom (Read Only)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

Description Displays the difference between the available power and the peak

power consumption.

Legal Values A string of up to 32 characters.

Default Difference between the available power and the peak power

consumption.

cfgServerActualAmperageConsumption (Read Only)

NOTE: This object is applicable only for iDRAC6

Description Displays the current power consumption.

Legal Values A string of up to 32 characters. Default Current power consumption.

cfgServerPeakAmperage (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the current peak power consumption.

A string of up to 32 characters. **Legal Values**

Default Current peak power consumption.

cfgServerPeakAmperageTimeStamp (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of the current peak power consumption.

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where.

• DD = Day of the week

• MM= Month

• Date=Date

• YYYY = Year

• HH = hour

• MM=Minutes

• SS = Seconds

Timestamp of the current peak power consumption. Default

cfgServerCumulativePowerConsumption (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the cumulative power consumption.

Legal Values A string of up to 32 characters.

Default Cumulative power consumption.

cfgServerCumulativePowerConsumptionTimeStamp (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description Displays the timestamp of the cumulative power consumption.

Legal Values A string of up to 32 characters.

Time in the format: DD MM Date YYYY HH:MM:SS

where.

• DD = Day of the week

• MM= Month

Date=Date

• YYYY = Year

HH = hour

MM=Minutes

SS = Seconds

Default Timestamp of the cumulative power consumption.

cfgServerCumulativePowerClear (Write Only)

NOTE: This object is applicable only for iDRAC6.

Description Clears the cfgServerCumulativePowerConsumption and

cfgServerCumulativePowerConsumptionTimeStamp values.

Legal Values A string of up to 32 characters.

Default None

cfgServerPeakPowerClear (Write Only)

NOTE: This object is applicable only for iDRAC6.

Description Clears the cfgServerPeakPowerConsumption and

cfgServerPeakPowerConsumptionTimestamp values.

A string of up to 32 characters. **Legal Values**

Default None

cfgServerPowerPCleAllocation (Read/Write)

NOTE: This object is applicable only for iDRAC6.

NOTE: This object is applicable for iDRAC6 Enterprise only for specific Blade Servers and not for iDRAC6 on Rack and Tower Servers or CMC.

NOTE: You must have Administrator privileges to modify the value for this object..

Description Amount of power allocated to the PCIe cards.

Legal Values 0W: For platforms that do not support PCIe cards.

100W - 500W: For platforms that support PCIe cards.

Default 0: For platforms that do not support PCIe cards.

500W: For platforms that support PCIe cards.

cfgKVMInfo

NOTE: This object is applicable only for CMC.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property, you must have **Chassis Configuration Administrator** privilege.

NOTE: You can configure any setting that is not preceded by the hash sign (#) in the output. To modify a configurable object, use the **-o** option.

This group is used to display information for and configure the iKVM.

cfgKVMAccessToCMCEnable

Description Enables or disables the Dell CMC Console access on the iKVM.

Legal Values 1 (enable)

0 (disable)

Default None

cfgKVMFrontPanelEnable

Description Enables or disables front panel access on the iKVM

Legal Values 1 (enable)

0 (disable)

Default None

Example

racadm getconfig -g cfgKVMInfo
cfgKVMAccessToCMCEnable=1
cfgKVMFrontPanelEnable=1

cfgAlerting

NOTE: This object is applicable only for CMC.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property, you must have **Chassis Configuration Administrator** privilege.

This group is used to enables or disable SNMP event trap alerting and set the event filter.

cfgAlertingEnable

Description Enables or disables event traps on the CMC.

Legal Values 1 (true)

0 (false)

Default None

cfgAlertingFilterMask

Sets the event filter Description

Hex values 0x0 - 0x01ffffffLegal Values

Default 0x17ff8db

cfqAlertingSourceEmailName

E-mail address used to send e-mail notifications when an event Description

occurs.

Legal Values None Default None

Examples

racadm getconfig -g cfgAlerting -o cfgAlertingEnable 1

racadm config -g cfgAlerting -o cfgAlertingEnable

Object value modified successfully.

cfgServerPowerSupply

This group is applicable only for iDRAC6 and contains information related to the power supplies. The following sections provide information about the objects in the cfgServerPowerSupply group.

NOTE: The **cfgServerPowerSupply** object group is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

NOTE: The **getconfig** subcommand always shows eight **cfgServerPowerSupply** indexes, even if two power supplies are installed in the system or the system supports a maximum of two power supply units. For the uninstalled and unsupported units, all the objects in the cfqServerPowerSupply group displays a value of 0.

cfgServerPowerSupplyIndex

Description Index of the power supply unit.

Legal Values Integer from 1-8

Default None

NOTE: Indexes from 1-8 are supported to support up to 8 power supply units. If any power supply unit is not present, cfgServerPowerSupplyOnlineStatus is absent and for all the other properties, it is 0.

cfgServerPowerSupplyMaxInputPower (Read Only)

Description Displays the AC input rated power in Watts.

Legal Values A string of up to 32 characters.

Default 0

cfgServerPowerSupplyMaxOutputPower (Read Only)

Description Displays the AC output rated power in Watts.

Legal Values A string of up to 32 characters.

Default 0

cfgServerPowerSupplyOnlineStatus (Read Only)

Description Displays the status of the power supply unit.

• 0 - Present **Legal Values**

• 1 - Absent

• 2 - Failure

• 3 - Predictive failure

Default 0

1

cfgServerPowerSupplyFwVer (Read Only)

Description Displays the firmware version of the power supply unit.

Legal Values A string up to 8 characters.

Default Null

cfgServerPowerSupplyCurrentDraw (Read Only)

Description Displays the instantaneous current consumption in 0.1 Amps.

Legal Values A string of up to 32 characters.

Default 0

cfgServerPowerSupplyType

Description Displays whether the power supply is AC or DC.

Legal Values A string of up to 32 characters.

Default 0

cfgIPv6LanNetworking

This group is used to configure the IPv6 over LAN networking capabilities.

NOTE: Use this object with the **config** or **getconfig** subcommands.

NOTE: To use this object property for CMC, you must have **Chassis Configuration Administrator** privilege.

NOTE: Use the -m option to apply this setting to iDRAC.

The following sections provides information about the objects in the cfgIPv6LanNetworking group.

cfgIPv6Enable (Read/Write)

Description Enables or disables iDRAC6 or CMC IPv6 stack.

 $\textbf{Legal Values} \qquad 1 \; (TRUE)$

0 (FALSE)

cfalPv6Address

NOTE: This object is applicable only for CMC.

Description Assigns a static IPv6 address to the CMC. This property is used

only if cfgIPv6AutoConfig is set to 0 (false).

A string representing a valid IPv6 address. For example, **Legal Values**

2001:DB8:1234:5678:9ABC:DE11:C00C:BEEF

Default

cfgIPv6Address1 (Read/Write)

Description iDRAC6 or CMC IPv6 address.

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Gateway (Read/Write)

Description iDRAC6 or CMC gateway IPv6 address.

NOTE: For CMC, this property is used only if **cfqIPv6AutoConfiq** is set

to 0 (false)

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6PrefixLength (Read/Write)

Description The prefix length for iDRAC6 or CMC IPv6 address1.

NOTE: For CMC, this property is used only if cfgIPv6AutoConfig is set

to 0 (false)

Legal Values For iDRAC6: 1-128

For CMC: 0-128

cfgIPv6AutoConfig (Read/Write)

Description Enables or disables the IPv6 Auto Configuration option.

> **NOTE:** If this value is set to 0, the CMC disables auto configuration and statically assigns IPv6 addresses. If this value is set to 1, the CMC

obtains address and route information using stateless auto

configuration and DHCPv6.

Legal Values 1 (TRUE)

0 (FALSE)

Default For iDRAC6: 0

For CMC: 1

NOTE: The CMC uses its MAC address for its DUID (DUID-LL) when communicating with a DHCPv6 server.

cfgIPv6LinkLocalAddress (Read Only)

NOTE: This object is applicable only for iDRAC6.

The iDRAC6 IPv6 link local address. Description

Legal Values A string representing a valid IPv6 entry.

Default ::

cfgIPv6Address2 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 second address

Legal Values A string representing a valid IPv6 entry.

Default ::

cfgIPv6Address3 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 third address.

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Address4 (Read Only)

NOTE: This object is applicable only for iDRAC6.

The iDRAC6 IPv6 fourth address. **Description**

String representing a valid IPv6 entry. **Legal Values**

Default

cfgIPv6Address5 (Read Only)

NOTE: This object is applicable only for iDRAC6.

The iDRAC6 IPv6 fifth address. **Description**

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Address6 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 sixth address.

Legal Values String representing a valid IPv6 entry.

cfgIPv6Address7 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 seventh address. **Legal Values** String representing a valid IPv6 entry.

Default

cfgIPv6Address8 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 eighth address.

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Address9 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 ninth address..

Legal Values String representing a valid IPv6 entry.

Default ::

cfgIPv6Address10 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 tenth address.

Legal Values String representing a valid IPv6 entry.

cfgIPv6Address11 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 eleventh address.

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Address12 (Read Only)

NOTE: This object is applicable only for iDRAC6.

The iDRAC6 IPv6 twelfth address. **Description**

String representing a valid IPv6 entry. **Legal Values**

Default

cfgIPv6Address13 (Read Only)

NOTE: This object is applicable only for iDRAC6.

The iDRAC6 IPv6 thirteenth address. **Description**

Legal Values String representing a valid IPv6 entry.

Default

cfgIPv6Address14 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 fourteenth address.

Legal Values String representing a valid IPv6 entry.

cfgIPv6Address15 (Read Only)

NOTE: This object is applicable only for iDRAC6.

Description The iDRAC6 IPv6 fifteenth address. **Legal Values** String representing a valid IPv6 entry.

Default

cfgIPv6DNSServersFromDHCP6 (Read/Write)

Description Specifies whether cfgIPv6DNSServer1 and cfgIPv6DNSServer2 are

static or DHCP IPv6 addresses.

NOTE: For CMC, this property is used only if **cfgIPv6AutoConfig** is set

to 1 (true).

Legal Values 1 (TRUE)

0 (FALSE)

Default For iDRAC6: 0

For CMC: 1

cfqIPv6DNSServer1 (Read/Write)

An IPv6 DNS server address. Description

> **NOTE:** For CMC, this property is used only if cfgIPv6DNSServersFromDHCP6 is set to 0 (false).

Legal Values A string representing a valid IPv6 entry. For example,

2001:DB8:1234:5678:9ABC:DE11:C00C:BEEF

Default ::

cfgIPv6DNSServer2 (Read/Write)

Description An IPv6 DNS server address.

NOTE: This property is only valid if cfgIPv6DNSServersFromDHCP6 is

set to 0 (false).

Legal Values A string representing a valid IPv6 entry. For example,

2001:DB8:1234:5678:9ABC:DE11:C00C:BEEF

Default ::

Example

```
$ racadm getconfig -g cfgIPv6LanNetworking [-m server-
<n>]
cfgIPv6Enable=1
cfgIPv6AutoConfig=1
cfgIPv6Address=::
cfgIPv6PrefixLength=64
cfgIPv6Gateway=::
cfgIPv6DNSServersFromDHCP6=1
cfgIPv6DNSServer1=::
cfgIPv6DNSServer2=::
```

If both IPv4 and IPv6 are enabled on the CMC, IPv6 DNS servers take priority. The order of preference for DNS servers is:

- cfgIPv6DNSServer1
- cfgIPv6DNSServer2
- cfgDNSServer1
- cfgDNSServer2

cfgCurrentLanNetworking (Read only)

NOTE: This object property is applicable only for CMC. Use this object with the getconfig subcommand.

NOTE: To use this object property, you must have **CMC Login User** privilege.

Description

Displays the current CMC NIC properties.

Synopsis

racadm getconfig -g cfgCurrentLanNetworking

cfgNicCurrentlpAddress

Displays the static IP address to the CMC.

cfgNicCurrentNetmask

Displays the static subnet mask for the CMC IP address.

cfqNicCurrentGateway

Displays the static gateway for the CMC IP address.

cfgNicCurrentDhcpWasUsed

Description Indicates whether DHCP is used to configure the NIC.

Legal Values 0 – address is static.

1– address was obtained from the DHCP server

Default None

cfqDNSCurrentServer1

Displays the IP address for DNS server 1.

cfqDNSCurrentServer2

Displays the IP address for DNS server 2.

cfgDNSCurrentDomainName

Displays the DNS domain name.

cfqNicCurrentlPv4Enabled

Indicates whether IPv4 is enabled on the CMC. If the current property value is set to 0 (false), the remote network interfaces to the CMC are not accessible over IPv4.

Example

```
racadm getconfig -g cfgCurrentLanNetworking
# cfqNicCurrentIPv4Enabled=1
# cfqNicCurrentIpAddress=143.166.152.116
# cfqNicCurrentNetmask=255.255.255.0
# cfgNicCurrentGateway=143.166.152.1
# cfqNicCurrentDhcpWasUsed=0
# cfqNicCurrentVlanEnable=0
# cfqNicCurrentVlanID=1
# cfqNicCurrentVlanPriority=0
# cfqDNSCurrentServer1=192.168.0.5
# cfqDNSCurrentServer2=192.168.0.6
# cfqDNSCurrentDomainName=MYDOMAIN
```

cfgCurrentlPv6LanNetworking (read only)

NOTE: This object property is applicable only for CMC. Use this object with the qetconfiq subcommand.

NOTE: To use this object property, you must have **CMC Login User** privilege.

Description

Displays the current CMC IPv6 properties.

cfgCurrentlPv6Enabled

Indicates whether IPv6 is enabled on the CMC. If the current property value is set to 0 (false), the remote network interfaces to the CMC are not accessible over IPv6

cfgCurrentIPv6AutoConfigWasUsed

Description Indicates whether auto configuration is used to obtain IPv6

settings, including stateless IPv6 address(es) and gateway.

Legal Values 0 (static addressing is used)

1 (address is obtained from the DHCPv6 server and/or stateless

auto configuration)

Default None

cfgCurrentLinkLocalAddress

Displays the current IPv6 link-local address of the CMC.

cfgCurrentlPv6Address1

Displays the current IPv6 addresses. This property displays up to 15 global IPv6 addresses, including stateful and stateless addresses.

cfgCurrentlPv6Gateway

Displays the current IPv6 gateway.

cfgCurrentIPv6DNSServersFromDHCP6

Indicates whether the DNS server addresses are assigned from the DHCPv6 server.

cfgCurrentlPv6DNSServer1

Displays the IPv6 address for DNS server 1.

cfgCurrentlPv6DNSServer2

Displays the IPv6 address for DNS server 2.

Example

```
$ racadm getconfig -g cfgCurrentIPv6LanNetworking
# cfgCurrentIPv6Enabled=1
# cfgCurrentIPv6AutoConfigWasUsed=1
# cfgCurrentLinkLocalAddress=
fe80::21e:4fff:fe1f:5371/64
# cfgCurrentIPv6Address1=
```

```
2009:123::e48f:9dd8:6f51:a669/64
# cfgCurrentIPv6Address2=
fd88:1::21e:4fff:fe1f:5371/64
# cfgCurrentIPv6Address3=
fd88:2::21e:4fff:fe1f:5371/64
# cfgCurrentIPv6Gateway=fe80::21c:23ff:fe77:6215
# cfgCurrentIPv6DNSServersFromDHCP6=1
# cfgCurrentIPv6DNSServer1=2009:123::1
# cfqCurrentIPv6DNSServer2=::
```

cfalPv6URL

This group specifies properties used to configure iDRAC6 IPv6 URL.

The following sections provides information about the objects in the cfgIPv6URL group.

cfgIPv6URLstring (Read Only)

Description The iDRAC6 IPv6 URL.

Legal Values A string of up to 80 characters.

Default <black>

cfqlpmiSerial

This group is applicable only for iDRAC6 and specifies properties used to configure the IPMI serial interface of the BMC.

NOTE: The **cfglpmiSerial** object group is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers or CMC.

cfqlpmiSerialBaudRate (Read/Write)

Description Specifies the baud rate for a serial connection over IPMI.

9600, 19200, 57600, 115200 **Legal Values**

cfglpmiSerialConnectionMode (Read/Write)

Description When the iDRAC6 cfgSerialConsoleEnable property is set to 0

(disabled), the iDRAC6 serial port becomes the IPMI serial port. This

property determines the IPMI defined mode of the serial port.

In Basic mode, the port uses binary data with the intent of communicating with an application program on the serial client. In Terminal mode, the port assumes that a dumb ASCII terminal is connected and allows very simple commands to be entered.

Legal Values 0 (Terminal)

1 (Basic)

Default 1

cfglpmiSerialChanPrivLimit (Read/Write)

Description Specifies the maximum privilege level allowed on the IPMI serial

channel.

Legal Values 2 (User)

3 (Operator)

4 (Administrator)

Default 4

cfglpmiSerialFlowControl (Read/Write)

Description Specifies the flow control setting for the IPMI serial port.

Legal Values 0 (None)

1 (CTS/RTS)

cfglpmiSerialHandshakeControl (Read/Write)

Description Enables or disables the IPMI terminal mode handshake control.

Legal Values 0 (FALSE)

1 (TRUE)

Default 1

cfglpmiSerialLineEdit (Read/Write)

Description Enables or disables line editing on the IPMI serial interface.

Legal Values 0 (FALSE)

1 (TRUE)

Default 1

cfglpmiSerialEchoControl (Read/Write)

Description Enables or disables echo control on the IPMI serial interface.

Legal Values 0 (FALSE)

1 (TRUE)

Default

cfglpmiSerialDeleteControl (Read/Write)

Description Enables or disables delete control on the IPMI serial interface.

Legal Values 0 (FALSE)

1 (TRUE)

Default 0

cfglpmiSerialNewLineSequence (Read/Write)

Description Specifies the newline sequence specification for the IPMI serial

interface.

Legal Values 0 (None)

1 (CR-LF) 2 (NULL)

3 (<CR>)

4 (<LF-CR>)

5 (<LF>)

Default 1

cfglpmiSerialInputNewLineSequence (Read/Write)

Description Specifies the input newline sequence specification for the IPMI

serial interface.

 $\begin{tabular}{ll} \textbf{Legal Values} & 1 \ (CR-LF) \end{tabular}$

2 (NULL)

cfgSmartCard

This group is applicable only for iDRAC6 and specifies properties used to support access to iDRAC6 using a smart card.

The following sections provides information about the objects in the cfgSmartCard group.

cfgSmartCardLogonEnable (Read/Write)

Description Enables, disables, or enables with Remote RACADM support for

access to iDRAC6 using a smart card.

NOTE: Enabling with remote RACADM is only applicable for iDRAC6

on Rack and Tower Servers.

Legal Values 0 (Disabled)

1 (Enabled)

2 (Enabled with Remote RACADM) - This is not applicable for

iDRAC6 Enterprise on Blade Servers.

Default 0

cfgSmartCardCRLEnable (Read/Write)

NOTE: This object is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

Description Enables or disables the Certificate Revocation List (CRL).

Legal Values 1 (TRUE)

0 (FALSE)

cfaNetTunina

This group enables users to configure the advanced network interface parameters for the RAC NIC or CMC. When configured, the updated settings may take up to a minute to become active.

The following sections provides information about the objects in the cfgNetTuning group.

NOTE: The **cfgNetTuning** object group is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

CAUTION: Use extra precaution when modifying properties in this group. Inappropriate modification of the properties in this group can result in your RAC NIC become inoperable.

cfgNetTuningNicSpeed

Description Specifies the speed for the CMC NIC. This property is used only if

cfgNetTuningNicAutoNeg is set to 0 (disabled).

Legal Values 10 or 100

Default 100

cfgNetTuningNicAutoneg (Read/Write)

Description Enables autonegotiation of physical link speed and duplex. If

> enabled, autonegotiation takes priority over values set in the cfgNetTuningNic100MB and cfgNetTuningNicFullDuplex

objects.

Legal Values 1 (TRUE)

0 (FALSE)

Default 1

Example

racadm getconfig -g cfgNetTuning cfqNetTuninqNicSpeed=100 cfqNetTuninqNicFullDuplex=1 cfqNetTuninqNicMtu=1500 cfqNetTuninqNicAutoneq=1

cfgNetTuningNic100MB (Read/Write)

Description Specifies the speed to use for the RAC NIC. This property is not

used if the cfgNetTuningNicAutoNeg is set to 1 (enabled).

Legal Values 0 (10 MBit)

1 (100 MBit)

Default

cfgNetTuningNicFullDuplex (Read/Write)

Description Specifies the duplex setting for the RAC or CMC NIC. This

property is used only if the cfgNetTuningNicAutoNeg is set to 0

(disabled).

Legal Values 0 (Half Duplex)

1 (Full Duplex)

Default 1

cfgNetTuningNicMtu (Read/Write)

Description The size in bytes of the maximum transmission unit used by

iDRAC6 or CMC NIC.

Legal Values 576 - 1500

Default 1500

NOTE: IPv6 requires a minimum MTU of 1280. If IPv6 is enabled, and cfqNetTuningMtu is set to a lower value, the CMC uses an MTU of 1280.

cfgSensorRedundancy

This group is applicable only for iDRAC6 and is used to set the power supply redundancy.

The following sections provides information about the objects in the cfgSensorRedundancy group.

NOTE: The **cfgSensorRedundancy** object group is applicable only for iDRAC6 on Rack and Tower Servers and not for iDRAC6 Enterprise on Blade Servers.

cfgSensorRedundancyIndex (Read Only)

Description Index for the sensor redundancy group being read. Only power

supply redundancy is supported.

Legal Values

Default None

1

cfgSensorRedundancyPolicy (Read/Write)

Description Sets the power supply redundancy policy.

Legal Values 2 - N/A, for sytems that are not supported

3 - Non Redundant

4 - 1+1 Redundant 4 - 2+1 Redundant

16 - 2+2 Redundant

Default Any legal value at that particular execution instance.

cfgSensorRedundancyCapabilities (Read Only)

Description Returns the redundancy capabilities in the form of a bitmask. This

bitmask allows the user to know which values can be set for

cfgSensorRedundancyPolicy.

Legal Values A bit mask. More than 1-bit can be set at a time to indicate

multiple redundancy support.

0- N/A, for sytems that are not supported

1- Non Redundant

2-1+1 - Redundant

4-2+1 - Redundant

8-2+2 - Redundant

Default 0

cfgSensorRedundancyStatus (Read Only)

Description Indicates the redundancy status. The status is N/A on platforms

that does not support the power supply sensor redundancy.

Legal Values String:

• N/A

Full

• Lost

Degraded

Default None

cfgVFlashSD

This group is applicable only for iDRAC6 and is used to configure the properties for the vFlash SD card.

The following sections provides information about the objects in the cfgVFlashSD group.

cfgVFlashSDEnable (Read/Write)

Description Enables or disables the vFlash SD card.

Legal Values 0 (vFlash is disabled)

1 (vFlash is enabled)

Default 1

cfgVFlashSDSize (Read Only)

Description Displays the size of the vFlash SD card in megabytes (MB).

Legal Values A string of upto 64 characters.

Default < card size >

cfgVFlashSDLicensed (Read Only)

Description Displays whether a SD card or vFlash SD card is inserted. The

vFlash SD card supports the new enhanced vFlash features and the

SD card supports only the limited vFlash features.

Legal Values 0 (SD card is inserted)

1 (vFlash SD card is inserted)

Default None

cfgVFlashSDAvailableSize (Read Only)

Description Displays the available space (in MB) on the vFlash SD card that can

be used to create new partitions.

Legal Values A string of up to 64 characters.

Default If the card is not initialized, default is 0. If initialized, displays the

unused space on the card.

cfgVFlashSDHealth (Read Only)

Description Displays the current health status of the vFlash SD card.

Legal Values String:

OK

Warning

• Critical

Unknown

Default OK

cfgVFlashSDWriteProtect (Read Only)

Description Displays whether the physical write-protect latch on the vFlash SD

card is enabled or disabled.

Legal Values 0 (vFlash is not write-protected)

1 (vFlash is write-protected)

Default None

cfgVFlashPartition

This group is applicable only for iDRAC6 and is used to configure properties for individual partitions on the vFlash SD Card. Up to 16 partitions are supported, indexed from 1 to 16.

NOTE: For SD cards, the index value is limited to 1 because only a single partition of size 256 MB is allowed.

The following sections provides information about the objects in the cfgVFlashPartition group.

cfgVFlashPartitionIndex (ReadOnly)

Description Displays the size of the partition.

Legal Values Integer from 1-16

Default None

cfgVFlashPartitionSize (ReadOnly)

Description The index value of the partition.

Legal Values 1MB to 4 GB

Default None

cfgVFlashPartitionEmulationType (ReadOnly)

Description Displays the emulation type for the partition.

Legal Values String:

• HDD

• Floppy

• CDROM

Default None

cfgVFlashPartitionOSVolLabel (ReadOnly)

Description Displays the label for the partition that is visible to the operating

system.

Legal Values An alphanumeric string of up to six characters.

Default None

cfgVFlashPartitionFormatType (ReadOnly)

Description Displays the format type of the partition.

Legal Values String:

• FAT16

• FAT32

EXT2

• EXT3

• CD

• RAW

Default None

cfgVFlashPartitionAccessType (Read/Write)

Description Indicates the partition access permissions. It configures the access

type to read-write.

Legal Values 0(Read-only)

1 (Read-write)

Default 0

cfgVFlashPartitionAttachState (Read/Write)

Description Displays whether the partition is attached or detached.

Legal Values 1 (Attached)

0 (Detached)

Default 0

Deprecated Commands, Groups, and Objects

This section provides information about the deprecated RACADM subcommands, groups, and objects in the current release. Few commands, groups, or objects are deprecated in RACADM either due to a new command or object replacing the functionality of an existing command or object, or the feature is no longer supported.

For the deprecated command or object:

- If you run the racadm help command, the deprecated command is not displayed in the command list.
- If you run the racadm help <deprecated command name>, then the following information is displayed:

ATTENTION: <command name> is a deprecated command!

While execution of this command will still be successful we strongly encourage you to use the new functionality.

The functionality of this command is now covered by <list of new functionality>.

Type "racadm help <new command name>" to learn more.

NOTE: This information is displayed only for iDRAC6 on Rack and Tower servers and is not displayed for iDRAC6 Enterprise on Blade servers.

- If you run a deprecated command, it works if the feature is supported. If the feature is not supported, an error is not returned.
- If you run the racadm getconfig -h command, the deprecated group is not displayed in the results.

- If you query a deprecated group or object, then the values are returned.
- If you try to configure a deprecated group or object, the configuration succeeds.
- If you request a group that contains a deprecated object, the deprecated object is not displayed in the results.

Table 4-1 lists the RACADM subcommands deprecated in the current release.

Table 4-1. RACADM Deprecated Subcommands

Subcommand	Replaced With
vmkey reset	vflashsd initialize

Table 4-2 lists the RACADM groups and objects deprecated in the current release.

Table 4-2. RACADM Deprecated Groups and Objects

Group/Object	Replaced With
cfgVirMediaKeyEnable	cfgVFlashSDEnable
cfgSDWriteProtect	cfgVFlashSDWriteProtect
