

# **Dell EMC Networking Command Line Reference Guide for the Z9100-ON System**

9.14.2.2

## Notes, cautions, and warnings

 **NOTE:** A NOTE indicates important information that helps you make better use of your product.

 **CAUTION:** A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

 **WARNING:** A WARNING indicates a potential for property damage, personal injury, or death.

<b>Chapter 1: About this Guide</b> .....	<b>40</b>

# About this Guide

This guide provides information about the Dell EMC Networking operating system (OS) command line interface (CLI). This book also includes information about the protocols and features supported in Dell EMC Networking OS.

## References

For more information about your system, go to the [Dell EMC Networking Support page](#) and refer to the following documents:

- *Dell EMC Networking OS Configuration Guide*
- *Dell EMC Networking OS Installation Guide*
- *Dell EMC Networking OS Quick Start Guide*
- *Dell EMC Networking OS Release Notes*

### Topics:

- [Objectives](#)
- [Audience](#)
- [Conventions](#)
- [Information Icons](#)

## Objectives

This information is intended as a reference guide for the Dell EMC Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

 **NOTE:** For more information about when to use the CLI commands, see the *Dell EMC Networking OS Configuration Guide* for your specific system.

## Audience

The *Dell EMC Networking OS CLI Guide* is intended for system administrators with an understanding of Layer 2 and Layer 3 networking technologies, who are responsible for configuring or maintaining networks.

## Conventions

This guide uses the following conventions to describe command syntax:

<b>Keyword</b>	Keywords are in Courier font and must be entered in the CLI as listed.
<b><i>parameter</i></b>	Parameters are in italics and require a number or word to be entered in the CLI.
<b>{X}</b>	Keywords and parameters within braces must be entered in the CLI.
<b>[X]</b>	Keywords and parameters within brackets are optional.
<b>x y</b>	Keywords and parameters separated by a bar require you to choose one option.
<b>x  y</b>	Keywords and parameters separated by a double bar allow you to choose any or all of the options.

# Information Icons

This guide uses the following information symbols:

 **NOTE:** The Note icon signals important operational information.

 **CAUTION:** The Caution icon signals information about situations that could result in equipment damage or loss of data.

 **NOTE:** The Warning icon signals information about hardware handling that could result in injury.

# CLI Basics

This chapter describes the command line interface (CLI) structure and command modes. The Dell EMC Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

## Topics:

- [Accessing the Command Line](#)
- [Multiple Configuration Users](#)
- [Obtaining Help](#)
- [Navigating the CLI](#)
- [Using the no Command](#)
- [Filtering show Commands](#)
- [Enabling Software Features on Devices Using a Command Option](#)
- [Command Modes](#)

## Accessing the Command Line

Access the CLI through a serial console port or a Telnet session.

When the system successfully boots, enter the command line in EXEC mode.

**i** **NOTE:** You must have a password configured on a virtual terminal line before you can Telnet into the system. Therefore, you must use a console connection when connecting to the system for the first time.

### Example

```
telnet 172.31.1.53
Trying 172.31.1.53...
Connected to 172.31.1.53.
Escape character is '^]'.
Login: username
Password: DellEMC>
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

Prompt	CLI Command Mode
DellEMC>	EXEC
DellEMC#	EXEC Privilege
DellEMC (conf) #	CONFIGURATION

**i** **NOTE:** For a list of all the command mode prompts, refer to the [Command Modes](#) section.

## Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell EMC Networking operating software generates an alert warning message similar to the following:

```
DellEMC#conf

% Warning: The following users are currently configuring the system:
User "" on line console0
```

```
User "admin" on line vty0 ( 123.12.1.123 )
User "admin" on line vty1 ( 123.12.1.123 )
User "Irene" on line vty3 ( 123.12.1.321 )
DellEMC#conf
```

When another user enters CONFIGURATION mode, Dell EMC Networking OS sends a message similar to the following:

```
% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration
```

In this case, the user is “admin” on vty2.

## Obtaining Help

As soon as you are in a Command mode, there are several ways to access help:

**To obtain a list of keywords at any command mode:** Type a ? at the prompt or after a keyword. There must always be a space before the ?.

**To obtain a list of keywords with a brief functional description:** Type help at the prompt.

**To obtain a list of available options:** Type a keyword, and then enter a space and a ?.

**To obtain a list of partial keywords using a partial keyword:** Type a partial keyword, and then enter a ?.

**Example** The following is an example of entering ip ? at the prompt:

```
DellEMC(conf)#ip ?
access-list          Named access-list
as-path              BGP autonomous system path filter
community-list       Add a community list entry
control-plane        Control plane configuration
dhcp                 DHCP configuration commands
domain-list          Domain name to complete unqualified host name
domain-lookup        Enable IP Domain Name System hostname translation
domain-name          Define the default domain name
ecmp                  Weighted Ecmp Configuration
ecmp-group           ECMP Group Configuration
extcommunity-list    Add a Extended community list entry
ftp                  FTP configuration commands
helper-address       DHCP relay agent configuration
host                 Add an entry to the ip hostname table
http                 HTTP configuration commands
icmp                 ICMP configuration commands
igmp                 Internet Group Management Protocol
max-frag-count       Max. fragmented packets allowed in IP re-assembly
mroute               Multicast routes and counters
msdp                 Multicast source discovery protocol
multicast-limit      Max entries in Multicast TIB
multicast-msdp       Enable IP multicast MSDP protocol
multicast-routing    Enable IP multicast forwarding
name-server          Specify address of name server to use
pim                  Protocol Independent Multicast
prefix-list          Build a prefix list
radius               Interface configuration for RADIUS
redirect-list        Named redirect-list
route                Establish static routes
route-export         Export routes
route-import         Import routes
scp                  SCP configuration commands
source-route         Process packets with source routing header options
ssh                  SSH configuration commands
tacacs               Interface configuration for TACACS+
tcp                  global tcp settings
telnet               Specify telnet options
tftp                 TFTP configuration commands
unicast-host-route   Configuration for ip unicast address-family
unknown-unicast     Enable IPv4 unknown-unicast packets to CPU
vlan-flooding        Vlan flooding
vrf                  Configure VRF instance
```

When entering commands, you can take advantage of the following timesaving features:

- Commands are not case-sensitive.
- Enter partial (truncated) command keywords. For example, you can enter `int teng 1/1/1` for the `interface tengigabitethernet 1/1/1` command.
- Use the TAB key to complete keywords in commands.
- Use the up Arrow key to display the last enabled command.
- Use either the Backspace key or Delete key to erase the previous character.
- Use the left and right Arrow keys to navigate left or right in the Dell EMC Networking OS command line.

The shortcut key combinations at the Dell EMC Networking OS command line are as follows:

<b>Key Combination</b>	<b>Action</b>
<b>CNTL-A</b>	Moves the cursor to the beginning of the command line.
<b>CNTL-B</b>	Moves the cursor back one character.
<b>CNTL-D</b>	Deletes the character at the cursor.
<b>CNTL-E</b>	Moves the cursor to the end of the line.
<b>CNTL-F</b>	Moves the cursor forward one character.
<b>CNTL-I</b>	Completes a keyword.
<b>CNTL-K</b>	Deletes all the characters from the cursor to the end of the command line.
<b>CNTL-L</b>	Re-enters the previous command.
<b>CNTL-N</b>	Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key.
<b>CNTL-P</b>	Recalls commands, beginning with the last command.
<b>CNTL-R</b>	Re-enters the previous command.
<b>CNTL-U</b>	Deletes the line.
<b>CNTL-W</b>	Deletes the previous word.
<b>CNTL-X</b>	Deletes the line.
<b>CNTL-Z</b>	Ends continuous scrolling of the command outputs.
<b>Esc B</b>	Moves the cursor back one word.
<b>Esc F</b>	Moves the cursor forward one word.
<b>Esc D</b>	Deletes all the characters from the cursor to the end of the word.

## Navigating the CLI

The Dell EMC Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is "Dell" by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell EMC Networking OS command modes, see the *command mode list* in [Accessing the Command Line](#).

The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, see [Command Modes](#).

## Using the no Command

To disable, delete or return to default values, use the `no` form of the commands.

For most commands, if you type the keyword `no` in front of the command, you disable that command or delete it from the running configuration. In this guide, the `no` form of the command is described in the Syntax portion of the command description.

## Filtering show Commands

You can filter commands using the `show` command to find specific information, display certain information only, or begin the command output at the first instance of a regular expression or phrase.

Execute a `show` command and a pipe ( `|` ), and one of the following parameters and a regular expression to show output that either excludes or includes the specified parameters.

**NOTE:** The Dell EMC Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: `command | grep gigabit |except regular-expression | find regular-expression`.

**except** Displays only the text that does not match the pattern (or regular expression).

**find** Searches for the first occurrence of a pattern.

**grep** Displays text that matches a pattern.

The `grep` command option has an `ignore-case` suboption that makes the search case-insensitive. For example, the commands:

```
show run | grep Ethernet interface TenGigabitEthernet 1/1/1.
```

```
show run | grep ethernet Does not return the previous search result because it only searches for instances containing a noncapitalized ethernet.
```

```
show run | grep Ethernet ignore-case Returns instances containing both Ethernet and ethernet.
```

**no-more** Does not paginate the display output.

**save** Copies the output to a file for future use.

## Displaying All Output

Use the `no-more` option after the pipe to display all output at once — not one screen at a time. This operation is similar to terminal `length screen-length` except that the `no-more` option affects the output of just the specified command. For example: `show running-config|no-more`.

## Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the `save` option as the last filter. For example: `command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save`.

# Enabling Software Features on Devices Using a Command Option

The capability to activate software applications or components on a device using a command is supported on this platform.

Starting with Release 9.4(0.0), you can enable or disable specific software features or applications that need to run on a device by using a command attribute in the CLI interface. This enables effective, streamlined management and administration of applications and utilities that run on a device. You can employ this capability to perform an on-demand activation, or turn-off a software component or protocol. A feature configuration file generated for each image contains feature names, and denotes if this enabling or disabling method is available. You can enable or disable the VRF application globally across the system by using this capability.

Activate the VRF application on a device by using the `feature vrf` command in CONFIGURATION mode.

**NOTE:** The `no feature vrf` command is not supported on any of the platforms.

To enable the VRF feature and cause all VRF-related commands to be available or viewable in the CLI interface, use the following command. You must enable the VRF feature before you can configure its related attributes.

```
DellEMC(conf)# feature vrf
```

Based on if the VRF feature is identified as supported in the Feature Configuration file, configuration command `feature vrf` becomes available for usage. This command is stored in the running-configuration and precedes all other VRF-related configurations.

To display the state of Dell EMC Networking OS features:

```
DellEMC# show feature
```

## Example of show feature output

For a particular target where VRF is enabled, the show output is similar to the following:

Feature	State
VRF	Enabled

## feature vrf

Enable the VRF application on a switch. Once enabled, you cannot deactivate the VRF application.

<b>Syntax</b>	<code>feature vrf</code>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.5(0.0)</b>	Introduced on the Z9500.
<b>9.4(0.0)</b>	Introduced on the S4810, S4820T, S5000, and S6000.

<b>Usage Information</b>	Activate the VRF application on a device using the <code>feature vrf</code> command in CONFIGURATION mode. The <code>no feature vrf</code> command is not supported on any platform.
--------------------------	--

# show feature

Verify the status of software applications, such as VRF, that are activated and running on a device.

**Syntax** `show feature`

**Command Modes** EXEC  
EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Updated the command to display the <code>IPV6acloptimized</code> feature on the S6100-ON and Z9100-ON.
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.4(0.0)	Introduced on the S4810, S4820T, and S6000.

**Usage Information** You can activate VRF application on a device by using the `feature vrf` command in CONFIGURATION mode. The `no feature vrf` command is not supported on any of the platforms.

### Example

```
6702#show feature
Feature                               State
-----                               -
Acloptimized                          disabled
Aclrange                               disabled
IPV6acloptimized                       enabled
UDF                                     enabled
VRF                                     disabled
```

## Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

### BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the `address-family` command.
3. Enter the protocol type:
  - For IPv4, enter the `ipv4 multicast` command. The prompt changes to include `conf-router_bgp_af` for IPv4.

## CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, see [Policy-Based QoS Commands](#).

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `class-map` command, and then enter the class map name. The prompt changes to include `config-class-map`.

You can return to CONFIGURATION mode by using the `exit` command.

## CONFIGURATION Mode

In EXEC Privilege mode, use the `configure` command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the `configure` command. The prompt changes to include `conf`.

From this mode, you can enter INTERFACE mode by using the `interface` command.

## CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, see [Control Plane Policing \(CoPP\)](#).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `control-plane-cpuqos` command. The prompt changes to include `conf-control-cpuqos`.

You can return to CONFIGURATION mode by using the `exit` command.

## DHCP Mode

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip dhcp server` command. The prompt changes to include `config-dhcp`.

You can return to CONFIGURATION mode by using the `exit` command.

## DHCP POOL Mode

To create an address pool, use DHCP POOL mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include `config-dhcp-pool-name`.

You can return to DHCP mode by using the `exit` command.

## ECMP GROUP Mode

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, see [ecmp\\_overview](#).

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include `conf-ecmp-group-ecmp-group-id`.

You can return to CONFIGURATION mode by using the `exit` command.

## EIS Mode

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the management `egress-interface-selection` command. The prompt changes to include `conf-mgmt-eis`.

You can return to CONFIGURATION mode by using the `exit` command.

## EXEC Mode

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.

When you are in EXEC mode, the `>` prompt is displayed following the host name prompt, which is "DellEMC" by default. You can change the host name prompt using the `hostname` command.

 **NOTE:** Each mode prompt is preceded by the host name.

## EXEC Privilege Mode

The `enable` command accesses EXEC Privilege mode. If an administrator has configured an "Enable" password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the `#` prompt is displayed.

## EXTENDED COMMUNITY LIST Mode

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip extcommunity-list` command then a community list name. The prompt changes to include `conf-ext-community-list`.

You can return to CONFIGURATION mode by using the `exit` command.

## FRRP Mode

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, see [Force10 Resilient Ring Protocol \(FRRP\)](#).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol frrp` command then the ring ID. The prompt changes to include `conf-frrp-ring-id`.

You can return to CONFIGURATION mode by using the `exit` command.

## INTERFACE Mode

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `interface` command and then enter an interface type and interface number that is available on the switch.

**NOTE:** In Dell EMC Networking OS, the stack unit number and interfaces start from 0. But in Dell EMC Networking OS Open Networking platforms, the stack unit number and interfaces start from 1.

The prompt changes to include the designated interface and slot/port[/subport] number. For example:

Prompt	Interface Type
<code>DellEMC (conf-if) #</code>	INTERFACE mode
<code>DellEMC (conf-if-te-1/1/1) #</code>	Ten-Gigabit Ethernet interface then slot/port/subport information
<code>DellEMC (conf-if-tf-1/1/1) #</code>	Twenty-five Gigabit Ethernet interface then slot/port/subport information
<code>DellEMC (conf-if-fo-1/1/1) #</code>	Forty-Gigabit Ethernet interface then slot/port/subport information or slot/port information, depending on the module used
<code>DellEMC (conf-if-fi-1/1/1) #</code>	Fifty-Gigabit Ethernet interface then slot/port/subport information
<code>DellEMC (conf-if-hu-1/1) #</code>	Hundred-Gigabit Ethernet interface then slot/port information
<code>DellEMC (conf-if-lo-0) #</code>	Loopback interface number
<code>DellEMC (conf-if-nu-0) #</code>	Null Interface then zero
<code>DellEMC (conf-if-po-1) #</code>	Port-channel interface number The range is from 1 to 4096.
<code>DellEMC (conf-if-vl-01) #</code>	VLAN Interface then VLAN number (range 1–4094)
<code>DellEMC (conf-if-ma-1/1) #</code>	Management Ethernet interface then slot/port information
<code>DellEMC (conf-if-tu-0) #</code>	Tunnel interface then tunnel ID.
<code>DellEMC (conf-if-range) #</code>	Designated interface range (used for bulk configuration).

## IP ACCESS LIST Mode

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` command or the `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter either the `ip access-list standard` command or the `ip access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-nacl` or `conf-ext-nacl`.

You can return to CONFIGURATION mode by using the `exit` command.

## ISIS ADDRESS-FAMILY Mode

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.

2. Enter the `address-family ipv6 unicast` command. The prompt changes to include `conf-router_isis-af_ipv6`.

## LLDP Mode

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, see [Link Layer Discovery Protocol \(LLDP\)](#).

To enter LLDP mode:

1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the `protocol lldp` command. The prompt changes to include `conf-lldp` or `conf-if-interface-lldp`.

## LLDP MANAGEMENT INTERFACE Mode

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:

1. Verify that you are logged in to LLDP mode.
2. Enter the `management-interface` command. The prompt changes to include `conf-lldp-mgmtIf`.

## LINE Mode

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `line` command. Include the keywords `console` or `vtty` and their line number available on the switch. The prompt changes to include `config-line-console` or `config-line-vty`.

You can exit this mode by using the `exit` command.

## MAC ACCESS LIST Mode

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `mac access-list standard` or `mac access-list extended` command.

To enter MAC ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `mac access-list standard` command or the `mac access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-macl` or `conf-ext-macl`.

You can return to CONFIGURATION mode by using the `exit` command.

## MONITOR SESSION Mode

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, see [Port Monitoring](#).

To enter MONITOR SESSION mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `monitor session` command, and then the session ID. The prompt changes to include `conf-mon-sessionID`.

## MULTIPLE SPANNING TREE (MSTP) Mode

To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, see [Multiple Spanning Tree Protocol \(MSTP\)](#).

To enter MULTIPLE SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree mstp` command. The prompt changes to include `conf-mstp`.

You can return to CONFIGURATION mode by using the `exit` command.

## OPENFLOW INSTANCE Mode

To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `openflow of-instance` command, and then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include `conf-of-instance of-id`.

You can return to the CONFIGURATION mode by entering the `exit` command.

## Per-VLAN SPANNING TREE (PVST+) Plus Mode

To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, see [Per-VLAN Spanning Tree Plus \(PVST+\)](#).

 **NOTE:** The protocol name is PVST+, but the plus sign is dropped at the CLI prompt.

To enter PVST+ mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree pvst` command. The prompt changes to include `conf-pvst`.

You can return to CONFIGURATION mode by using the `exit` command.

## PORT-CHANNEL FAILOVER-GROUP Mode

To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, see [Port Channel Commands](#).

To enter PORT-CHANNEL FAILOVER-GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `port-channel failover-group` command. The prompt changes to include `conf-po-failover-grp`.

You can return to CONFIGURATION mode by using the `exit` command.

## PREFIX-LIST Mode

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command and the name for the prefix list. The prompt changes to include `conf-nprefixl`.

You can return to CONFIGURATION mode by using the `exit` command.

## PROTOCOL GVRP Mode

To enable and configure GARP VLAN Registration Protocol (GVRP), use PROTOCOL GVRP mode. For more information, see [GARP VLAN Registration \(GVRP\)](#).

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include `config-gvrp`. You can return to CONFIGURATION mode by using the `exit` command.

## RAPID SPANNING TREE (RSTP) Mode

To enable and configure RSTP, use RSTP mode. For more information, see [Rapid Spanning Tree Protocol \(RSTP\)](#).

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include `conf-rstp`. You can return to CONFIGURATION mode by using the `exit` command.

## ROUTE-MAP Mode

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `route-map map-name [permit | deny] [sequence-number]` command. The prompt changes to include `config-route-map`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER BGP Mode

To enable and configure Border Gateway Protocol (BGP), use ROUTER BGP mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter ROUTER BGP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router bgp` command, and then enter the AS number. The prompt changes to include `conf-router_bgp`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER ISIS Mode

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ROUTER ISIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include `conf-router_isis`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER OSPF Mode

To configure OSPF, use ROUTER OSPF mode. For more information, see [Open Shortest Path First \(OSPFv2\)](#).

To enter ROUTER OSPF mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include `conf-router_ospf-id`.

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

## ROUTER OSPFV3 Mode

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include `conf-ipv6-router_ospf`. You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER RIP Mode

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, see [Routing Information Protocol \(RIP\)](#).

To enter ROUTER RIP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include `conf-router_rip`. You can return to CONFIGURATION mode by using the `exit` command.

## SPANNING TREE Mode

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, see [Spanning Tree Protocol \(STP\)](#).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include `conf-stp`. You can return to CONFIGURATION mode by using the `exit` command.

## SupportAssist Mode

To enable and configure the SupportAssist, use SupportAssist mode. For more information, see [SupportAssist](#).

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `support-assist` command. The prompt changes to include `conf-supportassist`. You can return to CONFIGURATION mode by using the `exit` command.

## TRACE-LIST Mode

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command, and the name of the Trace list. The prompt changes to include `conf-trace-acl`. You can exit this mode by using the `exit` command.

## VLT DOMAIN Mode

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, see [Virtual Link Trunking \(VLT\)](#).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `vlt domain` command, and then the VLT domain number. The prompt changes to include `conf-vlt-domain`. You can return to CONFIGURATION mode by entering the `exit` command.

## VRRP Mode

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, see [Virtual Router Redundancy Protocol \(VRRP\)](#).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command, and then enter the VRRP group ID. The prompt changes to include `conf-if-interface-type-slot/port-vrid-vrrp-group-id`.

# File Management

This section contains command line interface (CLI) commands needed to manage the configuration files, as well as other file management commands.

## Topics:

- [boot system](#)
- [cd](#)
- [copy](#)
- [delete](#)
- [dir](#)
- [format](#)
- [fsck flash](#)
- [mkdir](#)
- [mount nfs](#)
- [rmdir](#)
- [rename](#)
- [show boot system](#)
- [show bootvar](#)
- [show file-systems](#)
- [show os-version](#)
- [show running-config](#)
- [show startup-config](#)
- [show version](#)
- [upgrade system](#)
- [upgrade boot](#)
- [verify](#)

## boot system

Specify the location where the Dell EMC Networking OS image used to boot the system is stored.

**Syntax** `boot system {gateway ip-address | stack-unit {stack-unit-number | all} {default | primary | secondary} {ftp: | nfsmount: | system: {A: | B: | bmp-boot} | tftp: | usbflash:}}`

To return to the default boot sequence, use the `no boot system` command.

Parameters		
<b>gateway</b>		Enter the IP address of the default next-hop gateway for the management subnet.
<b><i>ip-address</i></b>		Enter an IP address in dotted decimal format.
<b>stack-unit</b>		Enter the keywords <code>stack-unit</code> to specify the stack unit number.
<b>all</b>		Enter the keyword <code>all</code> for all the stack units.
<b><i>stack-unit-number</i></b>		Enter the stack-unit number. The range is from 1 to 6.
<b>default</b>		Enter the keyword <code>default</code> to specify the default Dell EMC Networking OS image.
<b>primary</b>		Enter the keyword <code>primary</code> to specify the primary Dell EMC Networking OS image.

<b>secondary</b>	Enter the keyword <code>secondary</code> to specify the secondary Dell EMC Networking OS image.
<b>ftp:</b>	Enter the keyword <code>FTP:</code> to retrieve the image from an FTP server. <code>ftp://userid:password@hostip/filepath</code> .
<b>nfsmount</b>	Enter the keyword <code>nfsmount:</code> to retrieve the image from a mounted NFS file system. <code>nfsmount://filepath</code>
<b>system:</b>	Enter the keyword <code>system:</code> to retrieve the image from the system.
<b>usbflash</b>	Enter the keyword <code>usbflash:</code> to retrieve the image from the USB flash memory. <code>usbflash://filename</code> .
<b>tftp:</b>	Enter the keyword <code>TFTP:</code> to retrieve the image from a TFTP server. <code>tftp://hostip/filepath</code> .
<b>A:   B:</b>	Enter <code>A:</code> or <code>B:</code> to boot one of the system partitions.
<b>bmp-boot</b>	Enter the keywords <code>bmp-boot</code> to boot the system from the image present in the DHCP offer.  <b>NOTE:</b> In normal-reload, this keyword is not enabled.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced the support for <code>bmp-boot</code> on the S-Series and Z-Series switches.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

**Usage Information** To display these changes in the `show bootvar` command output, save the running configuration to the startup configuration (using the `copy` command) and reload system.

Use the `bmp-boot` keyword only when the device boots up from bare metal provisioning (BMP). For an industrial standard upgraded device, the Dell EMC Networking OS stores the image partition upgraded from the DHCP offer in the `bmp-boot` option.

## cd

Change to a different working directory.

**Syntax** `cd [flash: | usbflash:] <directory name and path>`

**Parameters** **flash:** Use the keyword `flash:` to change the current directory to internal flash and its sub directories.

**usbflash:** Use the keyword `usbflash:` to change the current directory to the inserted USB.

**directory name and path** Enter the directory name and path as follows: `directory name ([flash://]directory_path)`

 **NOTE:** The `cd` command without any arguments will change the current directory to `flash:`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added NFS mount support. Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

## copy

Copy one file to another location. Dell EMC Networking OS supports IPv4 and IPv6 addressing for FTP, HTTP, TFTP, and SCP (in the `hostip` field).

**Syntax** `copy source-file-url destination-file-url`

**Parameters**

<b>compressed-config</b>	Enter the keywords <code>compressed-config</code> to copy a file from the current system configuration.
<b>flash:</b>	Enter the keyword <code>flash:</code> to copy from the local file system ( <code>[flash://]filepath</code> ).
<b>ftp:</b>	Enter the keyword <code>ftp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>ftp://userid:password@hostip/filepath</code> ).
<b>http:</b>	Enter the keyword <code>http:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>http://hostip/filepath</code> ).
<b>nfsmount:</b>	Enter the keyword <code>nfsmount:</code> to copy from the nfs mount file system ( <code>nfsmount://&lt;mount-point&gt;/filepath</code> ).
<b>running-config</b>	Enter the keywords <code>running-config</code> to copy from the current system configuration.

<b>scp:</b>	Enter the keyword <code>scp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>scp://userid:password@hostip/filepath</code> ).
<b>startup-config</b>	Enter the keywords <code>startup-config</code> to copy from the startup configuration.
<b>tftp:</b>	Enter the keyword <code>tftp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>tftp://hostip/filepath</code> ).
<b>usbflash:</b>	Enter the keyword <code>usbflash:</code> to copy the file to or from the external USB flash.

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON. Added the <code>nfsmount:&lt;mount-point&gt;</code> parameters that allow you to mount a remote NFS file system.
<b>9.4(0.0)</b>	Added the <code>compressed-config</code> parameter.
<b>9.3(0.1)</b>	Added the <code>http</code> parameter on the S6000, Z9000, S4810, and S4820T.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.4.1.0</b>	Added IPv6 addressing support for FTP, TFTP, and SCP.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Added <code>usbflash</code> and <code>rpm0usbflash</code> commands on E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series and added the SSH port number to the SCP prompt sequence on all systems.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

**Usage Information**

Dell EMC Networking OS supports a maximum of 100 files at the root directory level on both the internal and external flash.

When copying a file to a remote location (for example, using Secure Copy [SCP]), enter only the keywords and Dell EMC Networking OS prompts you for the rest of the information. For example, when using SCP, you can enter `copy running-config scp:` where `running-config` is the source and the target is specified in the ensuing prompts. Dell EMC Networking OS prompts you to enter any required information for the named destination — remote destination, destination filename, user ID, password, and so forth.

When you use the `copy running-config startup-config` command to copy the running configuration to the startup configuration file, Dell EMC Networking OS creates a backup file on the internal flash of the startup configuration.

When you load the startup configuration or a configuration file from a network server such as TFTP to the running configuration, the configuration is added to the running configuration. This does not replace the existing running configuration. Commands in the configuration file has precedence over commands in the running configuration.

Dell EMC Networking OS supports copying the running-configuration to a TFTP server, an FTP server, or a remote NFS file system. For example:

- `copy running-config tftp:`
- `copy running-config ftp:`
- `copy running-config nfsmount://<mount-point>/filepath`

You can compress the running configuration by grouping all the VLANs and the physical interfaces with the same property. You can store the operating configuration to the startup config in Compressed mode and perform an image downgrade without any configuration loss.

#### Example

```
DelleMC#copy running-config scp:
Address or name of remote host []: 192.168.1.1
Port number of the server [22]: 22
Destination file name [startup-config]:
User name to login remote host: username
Password to login remote host:
!
4080 bytes successfully copied
DelleMC#
```

In this `copy scp: flash: example`, specifying SCP in the first position indicates that you need to specify the target in the ensuing prompts. Entering `flash:` in the second position indicates that the target is the internal flash. The source is on a secure server running secure shell (SSH), so you are prompted for the user datagram protocol (UDP) port of the SSH server on the remote host.

#### Example

```
DelleMC# copy running-config nfsmount://<mount-point>/filepath
Destination file name [test.txt]:
User name to login remote host: username
Password to login remote host:
DelleMC#
```

#### Example

```
DelleMC# copy scp: flash:
Address or name of remote host []: 10.11.199.134
Port number of the server [22]: 99
Source file name []: test.cfg
User name to login remote host: admin
Password to login remote host:
Destination file name [test.cfg]: test1.cfg
DelleMC#
```

#### Example

```
DelleMC# copy compressed-config compressed-cfg
!
6655 bytes successfully copied
DelleMC#
DelleMC#copy compressed-config ftp:
Address or name of remote host []: 10.11.8.12
Destination file name [startup-config]:
User name to login remote host: spbalaji
Password to login remote host:
!
6655 bytes successfully copied
DelleMC#
```

#### Example

```
DelleMC# copy http://admin:admin123@10.16.206.77/sample_file flash://
sample_file
DelleMC#
```

## Related Commands

- `cd` – changes the working directory.

# delete

Delete a file from the flash. After deletion, files cannot be restored.

**Syntax** `delete {flash: | nfsmount: | usbflash:} [no-confirm]`

### Parameters

<b>flash:</b>	To delete a file or directory on the internal flash, enter <code>flash://</code> then the filename or directory name ( <code>[flash://]filepath</code> ).
<b>nfsmount:</b>	To delete a file or directory on the NFS-mounted file system, enter <code>nfsmount://</code> then the mount point and the file path ( <code>nfsmount://filepath</code> ). <b>NOTE:</b> While deleting a file directory on a remote NFS file system, you must specify the mount-point that indicates the working directory on the NFS file system. You cannot delete the root directory of the remote NFS file system.
<b>usbflash:</b>	To delete a file or directory on the external USB flash, enter <code>usbflash://</code> then the filename or directory name ( <code>[usbflash://]filepath</code> ).
<b>no-confirm</b>	(OPTIONAL) Enter the keywords <code>no-confirm</code> to specify that the Dell EMC Networking OS does not require user input for each file prior to deletion.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON. Added support for NFS mount.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

# dir

Display the files in a file system. The default is the current directory.

**Syntax** `dir [flash: | nfsmount: | usbflash:]`

## Parameters

- flash:** For a directory on the internal Flash, enter `flash://` directory name.
- nfsmount:** For a file or directory on an NFS-mounted file system, enter `nfsmount://` then the mount point and file path.
- NOTE:** While displaying a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot display details corresponding to the root directory of the remote NFS file system.
- usbflash:** For a directory on the external USB flash, enter `usbflash://` directory name.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

## Example

```
DelleMC# dir
Directory of flash:

 1 drwx  8192 Jan  1 1980 00:00:00 +00:00 .
 2 drwx  3072 Dec 15 2014 06:27:10 +00:00 ..
 3 drwx  4096 Jan  1 1980 00:02:44 +00:00 TRACE_LOG_DIR
 4 drwx  4096 Jan  1 1980 00:02:44 +00:00 CORE_DUMP_DIR
 5 d---  4096 Jan  1 1980 00:02:44 +00:00 ADMIN_DIR
 6 drwx  4096 Jan  1 1980 00:02:44 +00:00 RUNTIME_PATCH_DIR
 7 drwx  4096 Nov  6 2014 06:57:06 +00:00 CONFIG_TEMPLATE
 8 -rwx  4625 Nov  6 2014 06:55:28 +00:00 startup-config
 9 drwx  4096 May 31 2013 02:49:46 +00:00 CONFD_LOG_DIR
flash: 2056916992 bytes total (2052784128 bytes free)
DelleMC#
```

## Example (NFS Mount)

```
DelleMC# dir nfsmount:
Directory of nfsmount:

 1 drwx          512 Jun 15 2015 02:47:57 +00:00 .
 2 drwx          512 Jun 15 2015 02:47:57 +00:00 ..
```

```
nfsmount: 1463410688 bytes total (585719808 bytes free)
DellEMC#
```

#### Related Commands

- [cd](#) — changes the working directory.

## format

Erase all existing files and reformat the file system. After the file system is formatted, files cannot be restored.

**Syntax** `format {flash: | usbflash:}`

**Defaults** **None**

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series

**Usage Information** You must include the colon (:) when entering this command.

After reformatting is complete, three empty directories are automatically created on flash: CRASH\_LOG\_DIR, TRACE\_LOG\_DIR and NVTRACE\_LOG\_DIR.

 **CAUTION:** This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the `write memory command` or `copy running-config startup-config command`).

#### Related Commands

- [copy](#) – copy the current configuration to either the startup-configuration file or the terminal.
- [show file-systems](#) – display information about the file systems on the system.

## fsck flash

Checks the flash file system for errors.

**Syntax** `fsck {flash: | usbflash:}`

**Parameters** **flash:** For a directory on the internal Flash, enter `flash://` directory name.

**usbflash:** For a directory on the external USB flash, enter `usbflash://` directory name.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.1(0.0)	Introduced on S4810 and Z9000.
8.3.19.0	Introduced on S4820T.

**Usage Information** Include the colon (:) when entering this command. This command checks the specified flash memory for errors. If errors are found, the command recommends that you format the flash.

 **CAUTION:** If you elect to format the flash, all files – including the startup configuration file – are lost. If you do decide to format the specified flash, consider saving the running configuration as the startup configuration after formatting the flash (use the `write memory command` or `copy running-config startup-config` command).

**Related Commands**

- `copy` — copy one file to another location.
- `show file-systems` — display information about the file systems on the system.

## mkdir

Creates a directory on the NFS mounted file system.

**Syntax** `mkdir nfsmount://mount-point/username`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S-Series.

#### Example

```
DellEMC# mkdir nfsmount:/nfs-mountpoint/guest
DellEMC#
```

#### Related Commands

- [rmdir](#) — remove a directory.

## mount nfs

Mounts an NFS file system to a device.

**Syntax** `mount nfs rhost:path mount-point [username password]`

**Parameters** Enter the following location keywords and information:

<b>rhost:path</b>	Enter the remote hosts's path directory.
<b>mount-point</b>	Enter the folder name in the local file system.
<b>username</b>	(OPTIONAL) Enter the user name to access the device.
<b>password</b>	(OPTIONAL) Enter the password.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

#### Example

```
DellEMC# mount nfs nfstest nfs-mount-point usrname pwd
DellEMC#
```

#### Related Commands

- [cd](#) — change the working directory.

## rmdir

Removes a directory from the NFS mounted file system.

**Syntax** `rmdir nfsmount://mount-point/username`

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

## Example

```
DellEMC# rmdir nfsmount:/nfs-mountpoint/guest
Proceed to remove the directory [confirm yes/no]: yes
```

## Related Commands

- [mkdir](#) – create a directory.

# rename

Rename a file in the local file system.

**Syntax** `rename url url`

## Parameters

**url**

Enter the following keywords and a filename:

- For a file on the internal Flash, enter `flash://` followed by the filename.
- For a file on an NFS mounted file system, enter `nfsmount://` followed by the mount point and file path.
- For a file on an external USB drive, enter `usbflash://` followed by the filename.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON. Added support for NFS mount.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on S-Series
7.5.1.0	Introduced on C-Series
E-Series	Original command

## show boot system

Displays information about boot images currently configured on the system.

**Syntax** `show boot system stack-unit{stack-unit-id | all}`

**Parameters**

- all** Enter the keyword `all` to display the boot image information for all stack units.
- stack-unit-id** Enter the `stack-unit-id` to display boot image information for a stack-unit.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series and E-Series.

### Example

```
DellEMC#show boot system stack-unit 1
Current system image information in the system:
=====
Type                Boot Type      A                B
-----
stack-unit 1      FLASH BOOT 9.8(1.0)        9.8(1.0) [boot]
DellEMC#
```

# show bootvar

Display the variable settings for the boot parameters.

**Syntax** `show bootvar`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

CURRENT CONFIG FILE 1 = variable does not exist
CURRENT CONFIG FILE 2 = variable does not exist
CONFIG LOAD PREFERENCE = local first
BOOT INTERFACE GATEWAY IP ADDRESS = variable does not exist
Reload Mode = normal-reload [Next boot : warmboot]
DelleMC#
```

# show file-systems

Display information about the file systems on the system.

**Syntax** `show file-systems`

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series
7.5.1.0	Introduced on the C-Series
E-Series	Original command

## Example

```
DellEMC#show file-systems

      Size (b)      Free (b)      Feature      Type      Flags      Prefixes
4286574592 4170424320      FAT32  USERFLASH      rw      flash:
- - - - - unformatted  USERFLASH      rw      fcmfs:

- - - - - - network      rw      http:

DellEMC#
```

## Command Fields

Field	Description
<b>size(b)</b>	Lists the size (in bytes) of the storage location. If the location is remote, no size is listed.
<b>Free(b)</b>	Lists the available size (in bytes) of the storage location. If the location is remote, no size is listed.
<b>Feature</b>	Displays the formatted DOS version of the device.
<b>Type</b>	Displays the type of storage. If the location is remote, the word <code>network</code> is listed.
<b>Flags</b>	Displays the access available to the storage location. The following letters indicate the level of access: <ul style="list-style-type: none"><li>• r = read access</li><li>• w = write access</li></ul>
<b>Prefixes</b>	Displays the name of the storage location.

## Related Commands

- [format flash](#) – erases all the existing files and reformats the file system in the internal flash memory.

# show os-version

Display the release and software image version information of the image file specified.

**Syntax** `show os-version [file-url]`

**Parameters** ***file-url*** (OPTIONAL) Enter the following location keywords and information:

- For a file on the internal flash, enter `flash://` followed by the filename.
- For a file on an FTP server, enter `ftp://user:password@hostip/filepath`.
- For a file on a TFTP server, enter `tftp://hostip/filepath`.
- For a file on the USB port, enter `usbflash://filepath`.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

```

### Usage Information

 **NOTE:** A filepath that contains a dot ( . ) is not supported.

## show running-config

Display the current configuration and display changes from the default values.

### Syntax

```
show running-config [entity] [configured] [status] [compressed]
```

### Parameters

#### entity

(OPTIONAL) To display that entity's current (non-default) configuration, enter one of the following keywords:

 **NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.

<b>aaa</b>	for the current AAA configuration
<b>acl</b>	for the current ACL configuration
<b>arp</b>	for the current static ARP configuration
<b>as-path</b>	for the current AS-path configuration
<b>bfd</b>	for the current BFD configuration
<b>bgp</b>	for the current BGP configuration
<b>boot</b>	for the current boot configuration
<b>cam-profile</b>	for the current CAM profile in the configuration
<b>class-map</b>	for the current class-map configuration
<b>community-list</b>	for the current community-list configuration
<b>ecmp-group</b>	for the current ECMP group configuration
<b>eis</b>	for the current EIS configuration
<b>ethernet</b>	for the current Ethernet CFM configuration
<b>fefd</b>	for the current FEFD configuration
<b>ftp</b>	for the current FTP configuration
<b>frrp</b>	for the current FRRP configuration
<b>fvrp</b>	for the current FVRP configuration
<b>gvrp</b>	for the current GVRP configuration
<b>host</b>	for the current host configuration

<b>hardware-monitor</b>	for hardware-monitor action-on-error settings
<b>hypervisor</b>	for the current hypervisor configuration
<b>igmp</b>	for the current IGMP configuration
<b>interface</b>	for the current interface configuration
<b>interface port-channel</b>	for the current port-channel interface configuration.
<b>interface tunnel</b>	for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383.
<b>ip</b>	for the current IP configuration
<b>isis</b>	for the current ISIS configuration
<b>line</b>	for the current line configuration
<b>lldp</b>	for the current LLDP configuration
<b>load-balance</b>	for the current port-channel load-balance configuration
<b>logging</b>	for the current logging configuration
<b>mac</b>	for the current MAC ACL configuration
<b>mac-address-table</b>	for the current MAC configuration
<b>management-eis</b>	for the current management EIS configuration
<b>management-route</b>	for the current Management port forwarding configuration
<b>mld</b>	for the current MLD configuration
<b>monitor</b>	for the current Monitor configuration
<b>mroute</b>	for the current Mroutes configuration
<b>msdp</b>	for the current MSDP configuration
<b>ntp</b>	for the current NTP configuration
<b>ospf</b>	for the current OSPF configuration
<b>pim</b>	for the current PIM configuration
<b>policy-map-input</b>	for the current input policy map configuration
<b>policy-map-output</b>	for the current output policy map configuration
<b>po-failover-group</b>	for the current port-channel failover-group configuration
<b>prefix-list</b>	for the current prefix-list configuration
<b>privilege</b>	for the current privilege configuration
<b>qos-policy-input</b>	for the current input QoS policy configuration
<b>qos-policy-output</b>	for the current output QoS policy configuration
<b>radius</b>	for the current RADIUS configuration
<b>redirect-list</b>	for the current redirect-list configuration
<b>redundancy</b>	for the current RPM redundancy configuration

<b>resolve</b>	for the current DNS configuration
<b>rip</b>	for the current RIP configuration
<b>rmon</b>	for the current RMON configuration
<b>route-map</b>	for the current route map configuration
<b>sflow</b>	for the current sFlow configuration
<b>snmp</b>	for the current SNMP configuration
<b>spanning-tree</b>	for the current spanning tree configuration
<b>static</b>	for the current static route configuration
<b>status</b>	for the file status information
<b>support-assist</b>	for the current SupportAssist configuration
<b>tacacs+</b>	for the current TACACS+ configuration
<b>tftp</b>	for the current TFTP configuration
<b>trace-group</b>	for the current trace-group configuration
<b>trace-list</b>	for the current trace-list configuration
<b>uplink-state-group</b>	for the uplink state group configuration
<b>users</b>	for the current users configuration
<b>vlt</b>	for the current VLT configuration
<b>wred-profile</b>	for the current wred-profile configuration

<b>configured</b>	(OPTIONAL) Enter the keyword <code>configuration</code> to display line card interfaces with non-default configurations only.
<b>status</b>	(OPTIONAL) Enter the keyword <code>status</code> to display the checksum for the running configuration and the start-up configuration.
<b>compressed</b>	(Optional) Enter the keyword <code>compressed</code> to display the compressed group configuration. Displays the compressed configuration by grouping all similar configurations. The compression is done only for interface related configurations.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.2.(0.0)</b>	Added support for the tunnel and EIS interface types.

Version	Description
9.0.0.0	Added support for the VLT option.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Added the hardware-monitor option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Expanded to include the last configuration change, start-up last updated (date and time), and who made the change.
6.5.4.0	Added the status option.

### Example

```
DelleMC# show running-config
Current Configuration ...
! Version 9-0(2-0)
! Last configuration change at Thu Apr 18 10:18:39 2013 by admin

!
```

### Related Commands

- [show running-config](#) – displays the current (running) configuration.

## show version

Display the current Dell EMC Networking Operating System (OS) version information on the system.

**Syntax** `show version`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

#### Command Fields

Lines	Description
<b>Beginning With</b>	
<b>Dell EMC Real Time ...</b>	Name of the operating system
<b>Dell EMC Operating...</b>	OS version number
<b>Dell EMC Application...</b>	Software version
<b>Copyright (c)...</b>	Copyright information
<b>Build Time...</b>	Software build's date stamp
<b>Build Path...</b>	Location of the software build files loaded on the system
<b>Dell EMC Networking OS uptime is...</b>	Amount of time the system has been up
<b>System image...</b>	Image file name
<b>System Type:</b>	System name
<b>Control Processor:...</b>	Control processor information and amount of memory on processor
<b>8G Bytes ...</b>	Amount and type of memory on system
<b>1 34-port ...</b>	Hardware configuration of the system, including the number and type of physical interfaces available

#### Example (Z9100-ON)

```
DellEMC# show version
Dell EMC Real Time Operating System Software
Dell EMC Operating System Version: 2.0
Dell EMC Application Software Version: 9.13(0.0)
Copyright (c) 1999-2017 by Dell Inc. All Rights Reserved.
Build Time: Fri Dec 15 08:41:16 2017
Build Path: /build/build04/SW/SRC
Dell EMC Networking OS uptime is 33 minute(s)
```

```

System image file is "system://B"

System Type: Z9100-ON
Control Processor: Intel Rangeley with 3 Gbytes (3203289088 bytes) of
memory, core(s) 4.

16G bytes of boot flash memory.

 1 34-port TE/TF/FO/FI/HU G (Z9100-ON)
38 Ten GigabitEthernet/IEEE 802.3 interface(s)
18 Forty GigabitEthernet/IEEE 802.3 interface(s)
 5 Hundred GigabitEthernet/IEEE 802.3 interface(s)

```

## upgrade system

Upgrade the Dell EMC Networking OS image. To upgrade the boot flash or boot selector image, use the `upgrade boot` command.

**Syntax** `upgrade system {flash: | ftp: | nfsmount: | scp: | stack-unit {stack-unit-id | all} | tftp: | usbflash:} file-url {A: |B:}`

Parameters		
<b>system</b>	Enter the keyword <code>system</code> to upgrade the operating system (OS) image.	
<b>flash: <i>file-url</i></b>	Enter the keyword <code>flash:</code> and specify the location of the image file in the format <code>//<i>directory-path</i></code> or press Enter to launch a prompt sequence.	
<b>ftp: <i>file-url</i></b>	Enter the keyword <code>ftp:</code> and specify the location of the image file in the format <code>//<i>userid:password@host-ip/filepath</i></code> or press Enter to launch a prompt sequence.	
<b>nfsmount:// &lt;<i>mount-point</i>&gt;/ <i>filepath</i></b>	Enter the keyword <code>nfsmount:</code> and specify the location of the image file in the format <code>//&lt;<i>mount-point</i>&gt;/<i>filepath</i></code> .	
<b>scp: <i>file-url</i></b>	Enter the keyword <code>scp:</code> and specify the location of the image file in the format <code><i>userid:password@host-ip/filepath</i></code> or press Enter to launch a prompt sequence.	
<b>stack-unit all</b>	Enter the keyword <code>stack-unit</code> followed by the keyword <code>all</code> to sync the image on all stack-units.	
<b>tftp: <i>file-url</i></b>	Enter the keyword <code>tftp:</code> and specify the location of the image file in the format <code>//<i>host-ip/filepath</i></code> or press Enter to launch a prompt sequence.	
<b>usbflash: <i>file-path</i></b>	Enter the keyword <code>usbflash:</code> and specify the location of the source file in the format <code>//<i>directory-path</i></code> to upgrade from an external flash device or press Enter to launch a prompt sequence.	
<b>A:   B:</b>	Specify the flash partition of the operating-system image to be upgraded.	

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.13(0.0)</b>	Enhanced to specify the MD5, SHA1, or SHA256 hash of the OS image that the system uses to validate the image during reboot.
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for NFS mount.
9.2(1.0)	Introduced on the Z9500.
9.0(0.0)	Added support for IPv6 for the <code>file-url</code> parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for TFTP and SCP.
7.6.1.0	Introduced on the S-Series.

## Usage Information

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:X:X:X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, using the `upgrade system` command, specify the default boot location using the `boot system` command. Save the configuration to the startup configuration file using the `write memory` command and reload the system using the `reload` command to use the new Dell EMC Networking OS software.

If you enable the verified boot feature using the `verified boot` command, the `upgrade system` command prompts you to enter the hash value of the Dell EMC Networking OS image. This is applicable only for the local partitions such as A: or B:. You can get the hash from the iSupport page.

- i NOTE:** You can apply a set of configurations, available only in the new version to which you want to upgrade the system to, without having to re-boot the system twice. In order to accomplish this seamless upgrade, perform the following tasks:
1. Upgrade the system image to the new image and configure the primary partition to boot from the new image using the `boot system` command.
  2. Update the startup configuration file with the new set of configurations and then reload the device using the `reload` command.

The new set of configurations are parsed from the startup configuration file and applied to the NVRAM. During the system boot up, the new set of configurations are applied to the system from the updated NVRAM configurations.

The following commands require NVRAM write to take effect in a single reload:

- Forwarding CLIs:
  - `hardware forwarding-table mode {scaled-12-switch | scaled-13-routes | scaled-13-hosts}`
  - `cam-ipv6 extended-prefix {1024 | 2048 | 3072}`
  - `ip ecmp-group maximum-paths 2-64`
- ACL CAM carving related CLIs:
  - `cam-acl cli`
  - `cam-acl-vlan cli`
  - `cam-acl-egress cli`
  - `cam-sharing`
- Feature keyword CLIs:

- o feature udf-acl
- o feature aclrange
- o feature ipv6acloptimized
- o feature acloptimized

### Example

```
DellEMC# upgrade system tftp://10.11.8.12/dv-rainier-13 a:
00:39:32 : Discarded 1 pkts. Expected block num : 51.
Received block num: 50
!00:39:36 : Discarded 1 pkts. Expected block num : 65.
Received block num: 64
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
.....!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
93924044 bytes successfully copied
System image upgrade completed successfully.
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Image upgraded to all
DellEMC#
```

The following example shows that the system prompts for the hash value of the OS image with the OS image verification feature enabled:

```
Dell# upgrade system tftp://10.16.127.35/FTOS-SE-9.11.0.1 A:
Hash Value: e42e2548783c2d5db239ea2fa9de4232
!!!!!!!!!!!!!!!!!!!!!!!!!!!!
```

## upgrade boot

Upgrade the bootflash image or bootselector image.

### Syntax

```
upgrade boot {all | bootflash-image | bootselector-image}stack-unit {stack-unit-id | all}{booted | flash: | ftp: | scp: | tftp: | usbflash:}
```

### Parameters

- all** Enter the keyword `all` to change both the bootflash and bootselector images.
- bootflash-image** Enter the keyword `bootflash-image` to change the bootflash image..
- bootselector-image** Enter the keyword `bootselector-image` to upgrade the BIOS system image.
- stack-unit-id** Enter the `stack-unit-id` to upgrade only the mentioned stack-unit .
- all** Enter the keywords `all` to upgrade the member stack-units.
- booted** Enter the keyword `booted` to upgrade from the current image on the device.
- ftp:** Enter the keyword `ftp` to follow it with the location of the source file in this form: `//userid:password@hostip/filepath`, or press **Enter** to launch a prompt sequence.
- tftp:** Enter the keyword `tftp` to follow it with the location of the source file in this form: `//hostlocation/filepath`, or press **Enter** to launch a prompt sequence.
- flash:** Enter the keyword `flash` to follow it with the location of the source file in this form: `//filepath`, or press **Enter** to launch a prompt sequence.
- usbflash:** Enter the keyword `flash` to follow it with the location of the source file in this form: `//filepath`, or press **Enter** to launch a prompt sequence.
- A:** Enter the keyword `A` to upgrade the bootflash partition A:.
- B:** Enter the keyword `B` to upgrade the bootflash partition B:.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0(0.0)</b>	Added support for IPv6 for the <code>file-url</code> parameter.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.7.1.0</b>	Added support for TFTP and SCP.
<b>7.6.1.0</b>	Introduced on the S-Series.

**Usage Information** You must reload Dell EMC Networking OS after executing this command.

**Example**

```
DellEMC#upgrade boot ?
all          Upgrade both boot flash image and selector image
bootflash-image  Upgrade boot flash image
bootselector-image Upgrade boot selector image
DellEMC#
```

## verify

Validate the software image on the flash drive after the image has been transferred to the system, but before the image has been installed.

**Syntax** `verify { md5 | sha256 } [ flash:// ] img-file [ hash-value ]`

<b>Parameters</b>	<b>md5</b>	Enter the <code>md5</code> keyword to use the MD5 message-digest algorithm.
	<b>sha256</b>	Enter the <code>sha256</code> keyword to use the SHA256 Secure Hash Algorithm
	<b>flash://</b>	(Optional). Enter the <code>flash://</code> keyword. The default is to use the flash drive. You can just enter the image file name.
	<b>img-file</b>	Enter the name the Dell EMC Networking software image file to validate.
	<b>hash-value</b>	(Optional). Enter the relevant hash published on i-Support.

**Defaults** flash drive

**Command Modes** EXEC mode

**Command History** Version 9.5.(0.0)

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.5(0.0)</b>	Introduced on the Z9000, S6000, S4820T, S4810, and MXL.

## Usage Information

You can enter this command in the following ways:

- **verify md5 flash:***//img-file*
- **verify md5 flash:***//img-file <hash-value>*
- **verify sha256 flash:***//img-file*
- **verify sha256 flash:***//img-file <hash-value>*

## Example

### Without Entering the Hash Value for Verification using SHA256

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
SHA256 hash for FTOS-SE-9.5.0.0.bin:
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
```

### Entering the Hash Value for Verification using SHA256

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
SHA256 hash VERIFIED for FTOS-SE-9.5.0.0.bin
```

# Control and Monitoring

This section contains command information to configure and monitor the system, including Telnet, file transfer protocol (FTP), and trivial file transfer protocol (TFTP).

## alias

Configure shorter alias names for single-line command input.

### Syntax

```
alias alias-name command
```

To undo the configuration, use the `no alias alias-name command` command.

### Parameters

**alias *alias-name*** Enter the keyword `alias` then the alias-name.

**i** **NOTE:** The *alias-name* length is limited to 32 characters starting with alphanumeric and are not case-sensitive. Special characters are not allowed except hyphen— `-`. You cannot use the reserved keywords such as `configure`, `show`, `reload`, `reboot`, `exit`, `end`, `quit`, `do`, `no`, `enable`, `alias`, `alias-definition`, and `malias` to create the alias name.

***command***

Enter the original command syntax for which you want to configure the alias-name.

**i** **NOTE:** You can enter the arguments with white spaces and must be enclosed within double quotes— `" "`.

### Defaults

None.

### Command Modes

CONFIGURATION

ALIAS-DEFINITION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

#### Version

#### Description

**9.12(0.0)**

Introduced on all the Dell EMC Networking OS platforms.

### Usage Information

- Users with privilege level 15 only can configure the alias-name. You can configure a maximum of 128 aliases.
- Single-line aliases accept a maximum of 128 bytes.

- User can configure up to nine arguments to the aliases—1 to 9. Repetition of arguments are allowed and the system does not allow discontinuous arguments.

### Example

The following example shows how to configure single-line alias-name:

```
DelleMC#configure terminal
DelleMC(conf)# alias-definition
DelleMC(conf-alias-definition)# alias showipbr10 show ip interface brief
```

The following example shows how to configure aliases with arguments in EXEC mode:

```
DelleMC#configure terminal
DelleMC(conf)# alias-definition
DelleMC(conf-alias-definition)# alias procpu show processes cpu
management-unit | grep $1
DelleMC(conf-alias-definition)# alias intbr show ip interface brief |
grep "$1"
DelleMC(conf)# end
DelleMC#
```

The following example shows how to configure aliases without arguments in EXEC mode:

```
DelleMC#configure terminal
DelleMC(conf)# alias-definition
DelleMC(conf-alias-definition)# alias ver show version
DelleMC(conf-alias-definition)# alias intst show interface status
DelleMC(conf)# end
DelleMC#
```

The following example shows how to configure aliases with arguments in CONFIGURATION mode:

```
DelleMC#configure terminal
DelleMC(conf)# alias-definition
DelleMC(conf-alias-definition)# alias ifvl interface vlan $1
DelleMC(conf)# end
DelleMC#
```

The following example shows how to configure aliases without arguments in CONFIGURATION mode:

```
DelleMC#configure terminal
DelleMC(conf)# alias-definition
DelleMC(conf-alias-definition)# alias facl feature aclrange
DelleMC(conf)# end
DelleMC#
```

### Related Commands

- [show alias](#)—display list of all the aliases with alias definition.

## banner exec

Configure a message that is displayed when your enter EXEC mode.

### Syntax

```
banner exec c line c
```

To delete a banner, use the `no banner exec` command.

### Parameters

- |                    |   |
|--------------------|---|
| <b><i>c</i></b>    | Enter the keywords <code>banner exec</code> , then enter a character delineator, represented here by the letter <i>c</i> . Press <b>ENTER</b> .   |
| <b><i>line</i></b> | Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (%); the banner message is “testing, testing”. |

### Defaults

No banner is displayed.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original Command

## Usage Information

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

## Example

```
DellEMC(conf)# banner exec ?
LINE c banner-text c, where 'c' is a delimiting character
DellEMC(conf)# banner exec %
Enter TEXT message. End with the character '%'.
This is the banner%
DellEMC(conf)# end
DellEMC# exit
2d18h1m: %STKUNIT1-M:CP %SEC-5-LOGOUT: Exec session is terminated on
console

This is the banner

Dell con0 now available

Press RETURN to get started.
2d18h2m: %STKUNIT1-M:CP %SEC-5-LOGIN_SUCCESS: Login successful on console

This is the banner
DellEMC>
```

## Related Commands

- [line](#) — enables and configures the console and virtual terminal lines to the system.

# banner login

Set a message of the day banner to appear after logging on to the system.

- Syntax** `banner login {acknowledgement | keyboard-interactive | c line c}`
- Enter `no banner login` to delete the banner text. Enter `no banner login keyboard-interactive` to automatically go to the banner message prompt (does not require a carriage return).
- Parameters**
- |                             |  |
|-----------------------------|--|
| <b>keyboard-interactive</b> | Enter the <code>keyboard-interactive</code> keyword and then press Enter (carriage return) to retrieve the message banner prompt.            |
| <b>acknowledgement</b>      | Enter the <code>acknowledgement</code> keyword to require a positive acknowledgement from the user while logging in to the system.           |
| <b>c</b>                    | Enter a delineator character to specify the start and end of the text banner. You cannot use the delineator character in the banner message. |
| <b>line</b>                 | Enter text string for your text banner message, with a maximum of 50 lines and up to 255 characters per line.                                |
- Defaults** No banner is configured and a carriage return (CR) is required when creating a banner.
- Command Modes** CONFIGURATION
- Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced the <code>acknowledgement</code> keyword.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced the keyword <code>keyboard-interactive</code> .
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

**Usage Information** Enter the `banner login` command, type one or more spaces and a delineator character, type the banner text, and then type the second delineator character. The message of the day banner displays first when you are connected to the router; otherwise the login banner and prompt appear. After you have logged in, the banner EXEC (if configured) displays.

**Example**

```
DellEMC(conf)#banner login ?
acknowledgement      Require positive acknowledgment after login
prompt
```

```

keyboard-interactive      Press enter key to get prompt
LINE                      c banner-text(max length 255) c, where 'c' is a
delimiting character
DellEMC(conf)#no banner  login ?
acknowledgement          Disable positive acknowledgment required after
login prompt
keyboard-interactive      Prompt will be displayed by default

```

If you configure the `acknowledgement` keyword, the system requires a positive acknowledgement from the user while logging in to the system.

```

$ telnet 10.11.178.16
Trying 10.11.178.16...
Connected to 10.11.178.16.
Escape character is '^]'.
THIS IS A LOGIN BANNER. PRESS 'Y' TO ACKNOWLEDGE. ACKNOWLEDGE?

[y/n]: y
Login: admin
Password:

```

**Related  
Commands**

- [banner motd](#) — sets a Message of the Day banner.
- [banner exec](#) — enables the display of a text string when you enter EXEC mode.

## banner motd

Set a message of the day (MOTD) banner.

**Syntax** `banner motd c line c`

To delete a Message of the Day banner, enter **no banner motd**.

**Parameters**

<b>c</b>	Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).
<b>line</b>	Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%).

**Defaults** No banner is configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

**Usage Information**

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

**Related Commands**

- [banner exec](#) — enables the display of a text string when you enter EXEC mode.
- [banner login](#) — sets a banner to display after successful login to the system.

## boot-type

Allows you to configure the boot-type for the next reload.

**Syntax** `boot-type bmp reload| fastboot| normal-reload| warmboot`

**Parameters**

<b>bmp-reload</b>	Reloads using the bare metal provisioning mode
<b>fastboot</b>	Reloads using the fastboot mode
<b>normal-reload</b>	Reloads using the standard, manual interactive mode
<b>warmboot</b>	Reloads using the warmboot mode

**Defaults** normal-reload

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the S6000, S6100-ON and Z9100-ON

**Usage Information**

Once you enter `reload-type`, you need to enter the `boot-type` required on the next reboot. After configuring `boot-type` you need to save the configuration with the `write cli` to make it active.

**Example**

```
DellEMC(conf-reload-type)#boot-type warmboot
DellEMC(conf-reload-type)#end
Dell#
```

## cam-acl

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

**Syntax**

`cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-qos] number {fcoeacl number} {openflow {4|8}}`

**Parameters**

<b>default</b>	Use the default CAM profile settings and set the CAM as follows: <ul style="list-style-type: none"> <li>• L2Acl : 2</li> <li>• Ipv4Acl : 2</li> </ul>
----------------	---

- Ipv6Acl : 0
- Ipv4Qos : 2
- L2Qos : 2
- L2PT : 0
- IpMacAcl : 1
- VmanQos : 0
- EtsAcl : 0
- FcoeAcl : 0
- ipv4pbr : 0
- vrfv4Acl : 0
- Openflow : 0
- fedgovacl : 0
- nlbclusteracl : 0
- ipv4udfmirracl : 0
- ipv4mirracl : 0

**cam-acl {default | l2acl number ipv4acl number ipv6acl number, ipv4qos number l2qos number l2pt number ipmacacl number ecfmac1 number [vman-qos | vman-dual-qos number]}**

Allocate space to each CAM region.

Enter the CAM profile name then the amount of CAM space to be allotted. The total space allocated must equal to 9. The ipv6acl range must be a factor of 2.

Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Added support for the <code>fcoe</code> parameter on the S4810 and S4820T.
9.1.(0.0)	Added support for OpenFlow on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Added the keywords <code>fcoeacl</code> and <code>iscsioptacl</code> on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Added the keywords <code>ecfmac1</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

## Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from .

When configuring space for IPv6 ACLs, the total number of Blocks must equal 9.

The `ipv6acl` allocation must be a factor of 3 (0,3,6,9).

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the `reload conditional nvram-cfg-change` command.

## clear average-power

Reset the average power and average power start time.

**Syntax** `clear average-power stack-unit {stack-unit-number}`

**Parameters**

<b>stack-unit-number</b>	Enter the stack unit number.
--------------------------	------------------------------

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.1P1)	Introduced on all Dell EMC Networking OS platforms

## Usage Information

This command resets the average power and average power start time to the current time. Average power and average power start time will be calculated from the reset time (i.e current time).

## Example

```
DellEMC#clear average-power stack-unit 1
Proceed to clear Average power ? Confirm [yes/no]:yes
DellEMC#
```

## clear line

Reset a terminal line.

**Syntax** `clear line {line-number | console 0 | vty number}`

**Parameters**

<b>line-number</b>	Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.
<b>console 0</b>	Enter the keywords <code>console 0</code> to reset the console port.
<b>vtty number</b>	Enter the keyword <code>vtty</code> then a number to clear a terminal line. The range is from 0 to 9.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Example

```
DellEMC# configure
DellEMC(conf)#
```

## disable

Return to EXEC mode.

<b>Syntax</b>	<code>disable [level]</code>
<b>Parameters</b>	<b>level</b> (OPTIONAL) Enter a number for a privilege level of the Dell EMC Networking OS. The range is from 0 to 15. The default is <b>1</b> .
<b>Defaults</b>	<b>1</b>
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## do

Allows the execution of most EXEC-level commands from all CONFIGURATION levels without returning to the EXEC level.

**Syntax** `do command`

**Parameters** **command** Enter an EXEC-level command.

**Defaults** none

**Command Modes**

- CONFIGURATION
- INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Usage Information** The following commands are *not* supported by the do command:

- enable

- disable
- exit
- config

### Example

```
DelleEMC(conf-if-te-1/1/1)# do clear counters
Clear counters on all interfaces [confirm]
DelleEMC(conf-if-te-1/1/1)#
DelleEMC(conf-if-te-1/1/1)# do clear logging
Clear logging buffer [confirm]
DelleEMC(conf-if-te-1/1/1)#
DelleEMC(conf-if-te-1/1/1)# do reload
System configuration has been modified. Save? [yes/no]: n
Proceed with reload [confirm yes/no]: n
```

## enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

**Syntax** enable [level]

**Parameters** *level* (OPTIONAL) Enter a number for a privilege level of Dell EMC Networking OS. The range is from 0 to 15.

**Defaults** 15

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the `enable password` command to configure a password for the `enable` command at a specific privilege level. If no privilege level is specified, the default is privilege level **15**.

 **NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an `enable password`.

## Related Commands

- `enable password` — configures a password for the `enable` command and to access a privilege level.

# enable cpu-clock-monitor

Enables Intel CPU LPC (Low Pin Count) clock-failure monitoring.

## Syntax

```
enable cpu-clock-monitor
```

To disable this feature, use the `no enable cpu-clock-monitor` command.

## Parameters

None

## Defaults

Enabled

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11(2.0P1)**

Introduced on the C9010, S3048-ON, S6100-ON and Z9100-ON.

## Usage Information

Enables Intel CPU LPC (Low Pin Count) clock-failure monitoring and issues a warning syslog to the user to take appropriate action if signal degradation is seen.

# enable optic-info-update interval

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

## Syntax

```
enable optic-info-update [interval seconds]
```

To disable optical power information updates, use the `no enable optic-info-update interval` command.

## Parameters

**interval seconds**

Enter the keyword `interval` then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is **300 seconds** (5 minutes).

## Defaults

Disabled

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### Version

### Description

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

**9.10(0.0)**

Introduced on the S6100-ON.

**9.8(2.0)**

Introduced on the S3100 series.

**9.8(1.0)**

Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Replacement command for the S4820T. Replaces the <code>enable xfp-power-updates</code> command.
8.3.11.4	Replacement command for the Z9000. Replaces the <code>enable xfp-power-updates</code> command
8.3.10.0	Replacement command for the S4810 only. Replaces the <code>enable xfp-power-updates</code> command.

### Usage Information

To enable polling and to configure the polling frequency, use this command.

## end

Return to EXEC Privilege mode from other command modes (for example, CONFIGURATION or ROUTER OSPF modes).

**Syntax** end

- Command Modes**
- CONFIGURATION
  - SPANNING TREE
  - MULTIPLE SPANNING TREE
  - LINE
  - INTERFACE
  - TRACE-LIST
  - VRRP
  - ACCESS-LIST
  - PREFIX-LIST
  - AS-PATH ACL
  - COMMUNITY-LIST
  - ROUTER OSPF
  - ROUTER RIP
  - ROUTER ISIS
  - ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.
E-Series	Original command.

#### Related Commands

- `exit` — returns to the lower command mode.

## exec-timeout

Set a time interval that the system waits for input on a line before disconnecting the session.

**Syntax** `exec-timeout minutes [seconds]`

To return to default settings, use the `no exec-timeout` command.

#### Parameters

<b><i>minutes</i></b>	Enter the number of minutes of inactivity on the system before disconnecting the current session. The range is from 0 to 35791. The default is <b>10 minutes</b> for the console line and <b>30 minutes</b> for the VTY line.
<b><i>seconds</i></b>	(OPTIONAL) Enter the number of seconds. The range is from 0 to 2147483. The default is <b>0 seconds</b> .

**Defaults** **10 minutes** for console line; **30 minutes** for VTY lines; **0 seconds**

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

### Usage Information

To remove the time interval, enter `exec-timeout 0 0`.

### Example

```
Dell con0 is now available
Press RETURN to get started.
DellEMC>
```

## exit

Return to the lower command mode.

**Syntax**            `exit`

- Command Modes**
- EXEC Privilege
  - CONFIGURATION
  - LINE, INTERFACE
  - TRACE-LIST
  - PROTOCOL GVRP
  - SPANNING TREE
  - MULTIPLE SPANNING TREE
  - MAC ACCESS LIST
  - ACCESS-LIST
  - AS-PATH ACL
  - COMMUNITY-LIST
  - PREFIX-LIST
  - ROUTER OSPF
  - ROUTER RIP
  - ROUTER ISIS
  - ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Related Commands**

- `end` — returns to EXEC Privilege mode.

## ftp-server enable

Enable FTP server functions on the system.

**Syntax** `ftp-server [vrf vrf-name] enable`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to enable the FTP server to listen to that VRF instance.

 **NOTE:** Use this attribute to specify the VRF that is used by the FTP server to accept client connections. If no VRF is specified, then the default VRF is used.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Example

```
morpheus% ftp 10.31.1.111
Connected to 10.31.1.111.

226 Transfer complete
329 bytes received in 0.018 seconds (17.95 Kbytes/s)
ftp>
```

## ftp-server topdir

Specify the top-level directory to be accessed when an incoming FTP connection request is made.

**Syntax** `ftp-server topdir directory`

**Parameters** ***directory*** Enter the directory path.

**Defaults** The internal flash is the default directory.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**

After you enable FTP server functions with the `ftp-server enable` command, Dell EMC Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell EMC Networking OS directs users to the flash directory when logging in to the FTP server.

**Related Commands**

- `ftp-server enable` — enables FTP server functions on the E-Series.
- `ftp-server username` — sets a username and password for incoming FTP connections to the E-Series.

## ftp-server username

Create a user name and associated password for incoming FTP server sessions.

**Syntax**

`ftp-server username username password [encryption-type] password`

To delete a user name and its password, use the `no ftp-server username username` command.

**Parameters**

<b>username</b>	Enter a text string up to 40 characters long as the user name.
<b>password</b> <b>password</b>	Enter the keyword <code>password</code> then a string up to 40 characters long as the password. Without specifying an encryption type, the password is unencrypted.
<b>encryption-type</b>	(OPTIONAL) After the keyword <code>password</code> , enter one of the following numbers: <ul style="list-style-type: none"> <li>• 0 (zero) for an unencrypted (clear text) password</li> <li>• 7 (seven) for a hidden text password</li> </ul>

**Defaults**

Not enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

<b>Usage Information</b>	<p>The password is listed in the configuration file; you can view the password by entering the <code>show running-config ftp</code> command.</p> <p>Use the <code>ip ftp password</code> command when you use the <code>ftp: password</code> parameter in the <code>copy</code> command.</p>
--------------------------	--

#### Related Commands

## ip ftp source-interface

Specify an interface's IP address as the source IP address for FTP connections.

<b>Syntax</b>	<pre>ip ftp source-interface <i>interface</i></pre> <p>To delete an interface, use the <code>no ip ftp source-interface <i>interface</i></code> command.</p>
---------------	--

<b>Parameters</b>	<p><b><i>interface</i></b> Enter the following keywords and the interface information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> </ul>
-------------------	---

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.2.1.0	Increased number of VLANs on ExaScale to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## ip ftp username

Assign a user name for outgoing FTP connection requests.

**Syntax** `ip ftp username username`

To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

**Parameters** *username* Enter a text string as the user name up to 40 characters long.

<b>Defaults</b>	No user name is configured.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

<b>Usage Information</b>	Configure a password with the <code>ip ftp password</code> command.
<b>Related Commands</b>	<ul style="list-style-type: none"> <li><a href="#">ip ftp password</a> — sets the password for FTP connections.</li> </ul>

## ip ftp vrf

Configures an FTP client with a VRF that is used to connect to the FTP server.

<b>Syntax</b>	<code>ip ftp [vrf {<i>vrf-name</i>   management}]</code>	
	To undo the FTP client configuration, use the <code>ip ftp [vrf <i>vrf-name</i>]</code> command.	
<b>Parameters</b>	<b><i>vrf-name</i></b>	Enter the <i>vrf-name</i> to specify the VRF that is used by the FTP client.
	<b>management</b>	Enter the keyword <code>management</code> to specify that the VRF used by the FTP client is a management VRF.
<b>Defaults</b>	Disabled	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.4(0.0)	Introduced on the S-Series and Z9000.

**Usage Information**

Use this command to make the FTP clients VRF-aware. The VRF name that you specify is used by the FTP client to reach the FTP server. If no VRF name is specified, then the default VRF is used.

## ip telnet server enable

Enable the Telnet server on the switch.

**Syntax** `ip telnet server enable`  
 To disable the Telnet server, use the `no ip telnet server enable` command.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

<b>9.5(0.0)</b>	Introduced on the Z9500.																						
<b>9.4.(0.0)</b>	Introduced on the S-Series and Z9000.																						

**Usage Information** You can enable the TELNET server on either a management VRF or a user-defined VRF but not both. If you do not specify a VRF name, then the TELNET server is enabled on the default VRF.

## Example

```
DelleMC(conf)# ip telnet server vrf vrf1
DelleMC(conf)# no ip telnet server vrf
DelleMC(conf)# ip telnet server vrf management
DelleMC(conf)# no ip telnet server vrf
DelleMC(conf)#
```

# ip telnet source-interface

Set an interface's IP address as the source address in outgoing packets for Telnet sessions.

<b>Syntax</b>	<code>ip telnet source-interface interface</code> To return to the default setting, use the <code>no ip telnet source-interface [interface]</code> command.		
<b>Parameters</b>	<table><tr><td><b>interface</b></td><td>Enter the following keywords and the interface information:</td></tr></table>	<b>interface</b>	Enter the following keywords and the interface information:
<b>interface</b>	Enter the following keywords and the interface information:		

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Related Commands** [telnet](#) — telnet to another device.

# ip tftp source-interface

Assign an interface's IP address in outgoing packets for TFTP traffic.

**Syntax** `ip tftp source-interface interface`

To return to the default setting, use the `no ip tftp source-interface interface` command.

**Parameters** *interface* Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

7.5.1.0	Introduced on the C-Series.
E-Series	Original command

# ip tftp vrf

Configures an TFTP client with a VRF that is used to connect to the TFTP server.

<b>Syntax</b>	<code>ip tftp [vrf vrf-name]</code> To undo the TFTP client configuration, use the <code>no ip tftp [vrf vrf-name]</code> command.
<b>Parameters</b>	<b>vrf vrf-name</b> Enter the keyword <code>vrf</code> and then the name of the VRF to specify the VRF that is used by the TFTP client.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.4.(0.0)	Introduced on the S-Series and Z9000.

<b>Usage Information</b>	Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.
<b>Related Commands</b>	<ul style="list-style-type: none"><li>• <a href="#">ftp-server topdir</a> — sets the directory to be used for incoming FTP connections.</li><li>• <a href="#">ftp-server username</a> — sets a username and password for incoming FTP connections.</li></ul>

# line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

<b>Syntax</b>	<code>line {console 0   vty number [end-number]}</code>
<b>Parameters</b>	<b>console 0</b> Enter the keyword <code>console 0</code> to configure the console port. The console option is <code>&lt;0-0&gt;</code> . <b>vty number</b> Enter the keyword <code>vty</code> then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions. <b>end-number</b> (OPTIONAL) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.
<b>Defaults</b>	Not configured
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command

**Usage Information**

You cannot delete a terminal connection.

**Related Commands**

- [access-class](#) — restricts the incoming connections to a particular IP address in an IP access control list (ACL).
- [password](#) — specifies a password for users on terminal lines.

## logging disable-syslog snmp auth-failure

Disable the generation of syslog messages for SNMP authentication failure events.

**Syntax**

`logging disable-syslog snmp auth-failure`

To enable syslog messages for SNMP authentication failure events, use the `no logging disable-syslog snmp auth-failure`.

**Parameters**

**Defaults**

The system generates syslog messages for SNMP authentication failure events.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.14(1.0)</b>	Introduced on the S6000, S6000-ON, S6100-ON, and Z9100-ON.

**Usage Information**

This command disables the generation of syslog messages for SNMP authentication failure events, preventing syslog files on the system from getting filled with too many messages.

This command does not disable SNMP traps for SNMP authentication failure events.

# login concurrent-session

Configures the limit of concurrent sessions for each user on console and virtual terminal lines.

**Syntax** `login concurrent-session {limit number-of-sessions | clear-line enable}`  
`no login concurrent-session {limit number-of-sessions | clear-line enable}`

**Parameters**

- limit *number-of-sessions*** Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line).
- clear-line enable** Enables you to clear your existing sessions.

**Defaults** Not configured. You can use all the available sessions.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

**Usage Information** You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

**Example** The following example shows how to limit the number of concurrent sessions that any user can have to four:

```
DellEMC(conf)# login concurrent-session limit 4
DellEMC(conf)#
```

The following example shows how to use the `login concurrent-session clear-line enable` command.

```
DellEMC(conf)# login concurrent-session clear-line enable
DellEMC(conf)#
```

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
```

```
Escape character is '^]'.
Login: admin
Password:

#### Related Commands

- [login statistics](#) — enable and configure user login statistics on console and virtual terminal lines.
- [show login statistics](#) — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

## login statistics

Enable and configure user login statistics on console and virtual terminal lines.

**Syntax**

```
login statistics {enable | time-period days}
no login statistics {enable | time-period days}
```

**Parameters**

- enable** Enables login statistics for the last 30 days by default.
- time-period *days*** Sets the number of days the system stores user login statistics; range is from 1 to 30.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

Version	Description
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

### Usage Information

Only the system and security administrators can configure login activity tracking and view the login activity details of other users.

If you enable user login statistics, the system displays the last successful login details of the current user, the details of any failed login attempts by others, and if the current user's permissions have changed since the last login.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

**NOTE:** Login statistics are not applicable for login sessions that do not use authentication on user names. For example, the system does not report login activity for a telnet session that prompts only a password field.

### Example

When you log into the system, it displays a message similar to the following:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 Line vty0 (
10.11.178.14 ).
There were 1 unsuccessful login attempt(s) since the last successful
login.
There were 1 unsuccessful login attempt(s) for user admin in the last 30
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.11.178.14. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 on console
There were 2 unsuccessful login attempt(s) since the last successful
login.
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

### Related Commands

- [login concurrent-session](#) — configures the limit of concurrent sessions for each user on console and virtual terminal lines.
- [show login statistics](#) — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

# motd-banner

Enable a message of the day (MOTD) banner to appear when you log in to the system.

**Syntax** `motd-banner`

To disable the MOTD banner, use the `no motd-banner` command.

**Defaults** Enabled on all lines.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

# ping

Test connectivity between the system and another device by sending echo requests and waiting for replies.

**Syntax** `ping [host | ip-address | ipv6-address] [count {number | continuous}] [datagram-size] [timeout] [source (ip src-ipv4-address) | interface] [tos] [df-bit (y|n)] [validate-reply(y|n)] [outgoing-interface] [pattern pattern] [sweep-min-size] [sweep-max-size] [sweep-interval] [ointerface (ip src-ipv4-address) | interface] [ethernet | vrf vrf-name]`

**Parameters**

- host** (OPTIONAL) Enter the host name of the devices to which you are testing connectivity.
- ip-address** (OPTIONAL) Enter the IPv4 address of the device to which you are testing connectivity. The address must be in the dotted decimal format.
- ipv6-address** (OPTIONAL) Enter the IPv6 address, in the x:x:x:x format, to which you are testing connectivity.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

<b>count</b>	Enter the number of echo packets to be sent. The default is <b>5</b> . <ul style="list-style-type: none"><li>• number: from 1 to 2147483647</li><li>• continuous: transmit echo request continuously</li></ul>
<b>datagram size</b>	Enter the ICMP datagram size. The range is from 36 to 15360 bytes. The default is <b>100</b> .
<b>timeout</b>	Enter the interval to wait for an echo reply before timing out. The range is from 0 to 3600 seconds. The default is <b>2 seconds</b> .
<b>source</b>	Enter the IPv4 or IPv6 source ip address or the source interface. For IPv6 addresses, you may enter global addresses only. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>• For a Tunnel interface, enter the keyword <code>tunnel</code> then a number from 1 to 16383.</li></ul>
<b>tos</b>	(IPv4 only) Enter the type of service required. The range is from 0 to 255. The default is <b>0</b> .
<b>df-bit</b>	(IPv4 only) Enter <code>Y</code> or <code>N</code> for the “don't fragment” bit in IPv4 header. <ul style="list-style-type: none"><li>• <code>N</code>: Do not set the “don't fragment” bit.</li><li>• <code>Y</code>: Do set “don't fragment” bit</li></ul> Default is <b>No</b> .
<b>validate-reply</b>	(IPv4 only) Enter <code>Y</code> or <code>N</code> for reply validation. <ul style="list-style-type: none"><li>• <code>N</code>: Do not validate reply data.</li><li>• <code>Y</code>: Do validate reply data.</li></ul> Default is <b>No</b> .
<b>outgoing-interface</b>	(IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.
<b>pattern pattern</b>	(IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: <b>0xABCD</b> .
<b>sweep-min-size</b>	Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.
<b>sweep-max-size</b>	Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.
<b>sweep-interval</b>	Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.
<b>interface</b>	(IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li></ul>

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**ethernet** Enter the keyword `ethernet` to test layer2 connectivity.

**vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to test connectivity to the VRF.

**Defaults** None.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)P5</b>	Introduced on the S4048-ON.
<b>9.8(0.0)P2</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T. Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4820T.
<b>8.3.12.0</b>	Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards.
<b>8.4.1.0</b>	IPv6 pinging available on management interface.
<b>8.3.1.0</b>	Introduced extended ping options.
<b>8.2.1.0</b>	Introduced on the E-Series (IPv6).
<b>8.1.1.0</b>	Introduced on the E-Series (IPv4).
<b>7.9.1.0</b>	Introduced VRF.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added support for IPv6 address on the E-Series.

## Usage Information

When you enter the `ping` command without specifying an IP/IPv6 address (Extended Ping), you are prompted for a target IP/IPv6 address, a repeat count, a datagram size (up to 1500 bytes), a timeout (in seconds), and for Extended Commands.

The following table provides descriptions for the `ping` command status response symbols displayed in the output.

Symbol	Description
!	Each exclamation point indicates receipt of a reply.
.	Each period indicates the network server timed out while waiting for a reply.
U	A destination unreachable error PDU was received.
Q	Source quench (destination too busy).
M	Could not fragment.
?	Unknown packet type.
&	Packet lifetime exceeded.

### Example (IPv4)

```
DellEMC# ping 172.31.1.255

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
::
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
DellEMC#
```

### Example (IPv6)

```
DellEMC# ping 100::1

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 100::1, timeout is 2 seconds:
!!!!
Success rate is 100.0 percent (5/5), round-trip min/avg/max = 0/0/0 (ms)
DellEMC#
```

## reload

Reboot the system.

### Syntax

```
reload [conditional nvrampcfgchange | no-confirm [discard-running] | dell-diag | onie [install | uninstall | rescue]]
```

### Parameters

<b>conditional</b>	(OPTIONAL) Reload into the Dell EMC Networking Operating System (OS) if the condition is true. A configuration change to the NVRAM requires a switch reload. To reload the switch, select <code>nvrampcfgchange</code> .
<b>nvrampcfgchange</b>	
<b>no-confirm [discard-running]</b>	Reload the chassis without prompting for further confirmation.
<b>dell-diag</b>	(OPTIONAL) Reload the system into the Dell diagnostics mode.
<b>onie</b>	(OPTIONAL) Reload the system into the ONIE mode. You can also use one of the following options to reload the system and enter the respective modes directly: <ul style="list-style-type: none"><li>• <code>install</code> — enter the Install mode and install the networking OS</li><li>• <code>uninstall</code> — enter the Uninstall mode and uninstall the networking OS</li></ul>

- `rescue` — enter the Rescue mode and access the file system

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Added the optional <code>dell-diag</code> and <code>onie</code> parameters. Introduced the <code>no-confirm</code> option.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>9.1(0.0)</b>	Added 'conditional' parameter.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

**Usage Information**

If you use only the `reload` command, the system boots into the Dell EMC Networking OS.

If there is a change in the running configuration, the system prompts you to save the new configuration when you reload the system using the `reload` command. You can also save your running configuration manually using the `copy running-config` command.

You can use the `conditional` parameter if any configuration changes made to the NVRAM, such as, stack-group and fanout configurations, must be saved.

When you use the `reload` command after making configuration changes, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

**Example**

```
DellEMC# reload
Verified startup-configuration is enabled, Hash for startup-
configuration is invalid.
Please update Hash for the startup-configuration before reload.
```

**Example**

The following example shows how to reload the system:

```
DellEMC# reload
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into Dell diagnostics mode:

```
DellEMC#reload dell-diag
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE mode:

```
DellEMC#reload onie
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE prompt and enter the install mode directly:

```
DellEMC#reload onie install
Proceed with reload [confirm yes/no]: yes
```

## reload-type

Allows you to configure the boot-type for the next reload.

<b>Syntax</b>	reload-type
<b>Parameters</b>	N/A
<b>Defaults</b>	normal-reload
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.12(0.0)	Introduced on the S6000-ON, S6100-ON and Z9100-ON

**Usage Information** Once you enter `reload-type`, you need to enter the `boot-type` required on the next reboot. The `boot-type` options are:

<b>bmp-reload</b>	Reloads using the bare metal provisioning mode
<b>fastboot</b>	Reloads using the fastboot mode
<b>normal-reload</b>	Reloads using the standard, manual interactive mode
<b>warmboot</b>	Reloads using the warmboot mode

### Example

```
DellEMC (conf) #reload-type
DellEMC (conf-reload-type) #boot-type warmboot
DellEMC (conf-reload-type) #end
Dell#
```

## send

Send messages to one or all terminal line users.

<b>Syntax</b>	send [*]   [line ]   [console]   [vty]
<b>Parameters</b>	<ul style="list-style-type: none"><li><b>*</b> Enter the asterisk character * to send a message to all tty lines.</li><li><b>line</b> Send a message to a specific line. The range is from 0 to 11.</li><li><b>console</b> Enter the keyword <code>console</code> to send a message to the primary terminal line.</li><li><b>vty</b> Enter the keyword <code>vty</code> to send a message to the virtual terminal.</li></ul>
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Introduced on the E-Series.

## Usage Information

Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use <CR>. To send the message use CTR-Z; to abort a message, use CTR-C.

# service timestamps

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date with local time zone time difference included or excluded.

## Syntax

```
service timestamps {debug | log} [datetime [localtime] [msec] [show-timezone] [utc] | uptime]
```

To disable timestamping, use the `no service timestamps [debug | log]` command.

## Parameters

<b>datetime</b>	(OPTIONAL) Enter the keyword <code>datetime</code> to have the current time and date as in local time zone added to the message.
<b>debug</b>	(OPTIONAL) Enter the keyword <code>debug</code> to add timestamps to debug messages.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to add timestamps to log messages with severity from 0 to 6.
<b>localtime</b>	(OPTIONAL) Enter the keyword <code>localtime</code> to include the local time zone time in the timestamp.
<b>msec</b>	(OPTIONAL) Enter the keyword <code>msec</code> to include milliseconds in the timestamp.
<b>show-timezone</b>	(OPTIONAL) Enter the keyword <code>show-timezone</code> to include the time zone information in the timestamp.
<b>uptime</b>	(OPTIONAL) Enter the keyword <code>uptime</code> to have the timestamp based on time elapsed since system reboot.

**utc** (OPTIONAL) Enter the keyword `utc` to include the UTC time format (ignoring local time zone) in the timestamp.

- Defaults**
- `datetime [localtime]`
  - `datetime`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.14(1.5)</b>	Added support for UTC time format.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

**Usage Information** If you do not specify parameters and enter service timestamps, it appears as service timestamps debug `datetime` in the running-configuration.

To view the current options set for the `service timestamps` command, use the `show running-config` command.

From 9.14.1.5 release, the default timestamp display format for the logs is set to local time (`service timestamps log datetime localtime`) instead of `service timestamps log datetime`.

## show alias

Display list of all the aliases with alias definition.

**Syntax** `show alias [details [alias-name]]`

**Parameters**

- details** (OPTIONAL) Enter the keyword `details` to display the detailed alias configuration.
- alias-name** (OPTIONAL) Enter the alias-name to display the details of a specific alias definition.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on all the Dell EMC Networking OS platforms.

**Usage Information**

- Alias definitions display up to 40 characters, and detailed output can be seen using the `details` option.

**Example** The following example shows the list of alias names configured and its corresponding definition:

```
DellEMC# show alias
-----
Alias Name                               Definition
-----
showipbr10                               show ip interface brief | ...
showipbr40                               show ip interface brief | ...
shboot                                   show bootvar...
cr-vlan                                  interface vlan $1 ..
-----
Total Alias Configured : 4
-----
```

The following example shows the detailed list of alias names configured on the system:

```
DellEMC# show alias details
-----
Name: showipbr10
Definition:
  show ip interface brief | grep tengig ignore-case
-----
Name: showipbr40
Definition:
  show ip interface brief | grep fortygig ignore-case
-----
DellEMC#
```

The following example shows the details of a specific alias name configured on the system:

```
DellEMC# show alias details showipbr10
-----
Name: showipbr10
Definition:
  show ip interface brief | grep tengig ignore-case
-----
DellEMC#
```

**Related Commands**

- [alias](#)—configure shorter alias names for single-line command input.

## show alarms

View alarms currently active in the system.

**Syntax** `show alarms [threshold]`

**Parameters**

<b>threshold</b>	(OPTIONAL) Enter the keyword <code>threshold</code> to display the temperature thresholds in Celsius for each level.
------------------	--

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Usage Information

On the Z9100-ON, SMF intelligent controller takes care of the LED status and alarms. If a redundant (second) PSU goes down or is removed, only a syslog message about the PSU down or removal event is generated and the front PSU LED changes to blinking amber. The system does not display any alarm in the `show alarms` command output. The presence of a single PSU is treated as a minor alarm. The front panel system status LED is not affected (solid Green).

## Example

```
MAA-Z9100-7752#show alarms
Alarm Type                                     Duration
-----
Controlling Bridge:
=====

Minor Alarms
    No minor alarms

Major Alarms
    No major alarms
```

## show cpu-traffic-stats

View the CPU traffic statistics.

**Syntax** `show cpu-traffic-stats [port number | all | cp ]`

**Parameters** *port number* (OPTIONAL) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.

- all** (OPTIONAL) Enter the keyword `all` to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic.
- cp** (OPTIONAL) Enter the keyword `cp` to display traffic statistics on the specified CPU.

**Defaults** `all`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series
<b>6.2.1.1</b>	Introduced on the E-Series.

**Usage Information** Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the `debug cpu-traffic-stats` command is executed; not from the system bootup.

 **NOTE:** After debugging is complete, use the `no debug cpu-traffic-stats` command to shut off traffic statistics collection.

**Example**

```
DelleMC# show cpu-traffic-stats
Processor : CP
-----
Received 100% traffic on TenGigabitEthernet 8/2/1 Total packets:100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----
Received 62% traffic on TenGigabitEthernet 8/2/1 Total packets:500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
Unicast:500, Multicast:0, Broadcast:0
Received 37% traffic on TenGigabitEthernet 8/1/1 Total packets:300
LLC:0, SNAP:0, IP:300, ARP:0, other:0
Unicast:300, Multicast:0, Broadcast:0
Processor : RP2
```

```
-----  
No CPU traffic statistics.  
DellEMC#
```

## show debugging

View a list of all enabled debugging processes.

**Syntax** show debugging

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series
<b>E-Series</b>	Original command.

### Example

```
DellEMC# show debug  
Generic IP:  
  IP packet debugging is on for  
    ManagementEthernet 1/1  
    Port-channel 1-2  
    Port-channel 5  
    TenGigabitEthernet 1/1/1-1/1/3,1/5/1-2,1/10/1-1/10/2,1/20/1  
    TenGigabitEthernet  
1/1/1-1/1/2,1/5/1-1/5/2,1/10/1-1/10/2,1/15/1,1/17/1,1/19/1,1/21/1  
  ICMP packet debugging is on for  
    TenGigabitEthernet  
1/1/1,1/1/2,1/1/4,1/6/1,1/8/1,1/10/1,1/12/1,1/14/3,1/16/3  
DellEMC#
```

# show environment

View system component status (for example, temperature or voltage).

**Syntax** `show environment [all | fan | pem | stack-unit unit-id | thermal-sensor ]`

- Parameters**
- all** Enter the keyword `all` to view all components.
  - fan** Enter the keyword `fan` to view information on the fans. The output of this command is chassis-dependent.
  - pem** Enter the keyword `pem` to view only information on power entry modules.
  - stack-unit *unit-id*** Enter the keywords `stack-unit` then the `unit-id` to display information on a specific stack member.
  - thermal-sensor** Enter the keywords `thermal-sensor` to view information on thermal sensors.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.1P1)	The CLI has been enhanced to show the power, average power and average power start time.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	The output of the <code>show environment fan</code> command for the S Series is changed to display fan speeds instead of showing the fan status as up or down.

**Usage Information** The following example shows the output of the `show environment` command.

**Example (all)**

```
DellEMC#show environment
-- Fan Status --
Unit Bay TrayStatus Fan0 Speed Fan1 Speed
-----
1 1 up up 6652 up 6812
1 2 up up 6582 up 6872

```

## show inventory

Display the switch type, components (including media), and Dell EMC Networking Operating System (OS), including hardware identification numbers and configured protocols.

**Syntax** `show inventory [media slot]`

**Parameters** **media slot** (OPTIONAL) Enter the keyword `media` then the stack ID of the stack member for which you want to display pluggable media inventory.

**i** **NOTE:** This parameter is available but not supported in Dell EMC Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays “Media not present or accessible” (refer to the *Usage Information* section).

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.4	Output expanded to include Piece Part ID (PPID) and eSR4 optics.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced this version of the command for S-Series. S-Series output differs from E-Series.

## Usage Information

If there are no fiber ports in the unit, just the header under *show inventory media* displays. If there are fiber ports but no optics inserted, the output displays *Media not present or accessible*.

## Example (Z9100-ON)

```
DellEMC#show inventory

DellEMC#

```

## Related Commands

- [show interfaces](#) — displays the interface configuration.

# show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

**Syntax** `show login statistics [all | [[successful-attempts | unsuccessful-attempts] [user login-id] [time-period days]] | user login-id]`

<b>Parameters</b>	<b>all</b>	(Optional)Displays the login statistics of all users in the last 30 days or the custom defined time period.
	<b>time-period days</b>	(Optional)Displays the number of failed login attempts by the current user in the specified period.
	<b>successful-attempts</b>	(Optional)Displays the number of successful login attempts by the current user in the last 30 days or the custom defined time period
	<b>unsuccessful-attempts</b>	(Optional)Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.
	<b>user login-id</b>	(Optional)Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the <code>unsuccessful-attempts</code> keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced the <code>successful-attempts</code> keyword.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

## Usage Information

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the `show login statistics` command.

To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

**NOTE:** By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

### Example

The following is sample output of the `show login statistics` command.

```
DellEMC#show login statistics
-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----
```

The following is sample output of the `show login statistics all` command.

```
DellEMC#show login statistics all
-----
User: admin

```

The following is sample output of the `show login statistics user user-id` command.

```
DellEMC# show login statistics user admin
-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
-----
```

```

Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----

```

The following is sample output of the `show login statistics unsuccessful-attempts` command.

```

DellEMC#show login statistics unsuccessful-attempts
There were 3 unsuccessful login attempt(s) for user admin in last 30
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts time-period days` command.

```

DellEMC# show login statistics unsuccessful-attempts time-period 15
There were 0 unsuccessful login attempt(s) for user admin in last 15
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts user login-id` command.

```

DellEMC# show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s) .

```

The following is sample output of the `show login statistics successful-attempts` command.

```

DellEMC#show login statistics successful-attempts
There were 4 successful login attempt(s) for user admin in last 30
day(s) .

```

### Related Commands

- [login statistics](#) — enable and configure user login statistics on console and virtual terminal lines.
- [login concurrent-session](#) — configures the limit of concurrent sessions for each user on console and virtual terminal lines.

## show memory

View current memory usage on the switch.

**Syntax** `show memory [stack-unit id]`

**Parameters** **stack-unit id** (OPTIONAL) Enter the keyword `stack-unit` then the stack unit ID to display memory information on the designated stack member.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced this version of the command for the S-Series.

### Usage Information

The output for `show memory` displays the memory usage of LP part (sysdip) of the system. The sysdip is an aggregate task that handles all the tasks running on the S-Series' CPU.

### Example

```
DellEMC#show memory stack-unit 1
      Statistics On Unit 1 Processor
      =====
      Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
      3177185280     2310248     3174875032   3174676264     3174875032
DellEMC#
```

## show processes cpu

Display CPU usage information based on processes running.

### Syntax

```
show processes cpu [management-unit [1-99 | details] | stack-unit id
[1-99] | summary ]
```

### Parameters

- management-unit [1-99 | details]** (OPTIONAL) Display processes running in the control processor. The 1-99 variable sets the number of tasks to display in order of the highest CPU usage in the past five (5) seconds. Add the keyword `details` to display all running processes (except sysdip). Refer to Example (management-unit).
- stack-unit id** (OPTIONAL) Enter the keyword `stack-unit` then the stack member ID.  
  
As an option of the `show processes cpu` command, this option displays CPU usage for the designated stack member. Or, as an option of the `command`, this option limits the output of memory statistics to the designated stack member.  
  
Refer to Example (stack-unit).
- summary** (OPTIONAL) Enter the keywords `summary` to view CPU utilization of processes related to stack-unit processing.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

## Related Commands

- [show hardware layer2 acl](#) — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.
- [show hardware layer3](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- [show hardware stack-unit](#) — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- [show hardware system-flow](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- [show interfaces stack-unit](#) — displays information on all interfaces on a specific S-Series stack member.
- [show processes memory \(S-Series\)](#) — displays CPU usage information based on processes running in an S-Series.

# show processes ipc flow-control

Display the single window protocol queue (SWPQ) statistics.

**Syntax** `show processes ipc flow-control [cp]`

**Parameters** **cp** (OPTIONAL) Enter the keyword `cp` to view the control processor's SWPQ statistics.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.

### Usage Information

Field	Description
<b>Source QID /Tx Process</b>	Source Service Identifier
<b>Destination QID/Rx Process</b>	Destination Service Identifier
<b>Cur Len</b>	Current number of messages enqueued
<b>High Mark</b>	Highest number of packets in the queue at any time
<b>#of to / Timeout</b>	Timeout count
<b>#of Retr /Retries</b>	Number of retransmissions
<b>#msg Sent/Msg Sent/</b>	Number of messages sent
<b>#msg Ackd/Ack Rcvd</b>	Number of messages acknowledged
<b>Retr /Available Retra</b>	Number of retries left
<b>Total/ Max Retra</b>	Number of retries allowed

#### Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue<sup>3</sup> for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the SWP-2-NOMORETIMEOUT timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

### Example

```
DellEMC#show processes ipc flow-control cp
Q Statistics on CP Processor

## show processes memory

Display memory usage information based on processes running in the S-Series or Z-Series system.

**Syntax** `show processes memory {management-unit | stack unit {unit-id | all | summary}}`

**Parameters**

- management-unit** Enter the keyword `management-unit` for CPU memory usage of the stack management unit.
- stack unit unit id** Enter the keyword `stack unit` then a stack unit ID of the member unit for which to display memory usage on the forwarding processor.
- all** Enter the keyword `all` for detailed memory usage on all stack members.
- summary** Enter the keyword `summary` for a brief summary of memory availability and usage on all stack members.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.7.1.0	Added the <code>management-unit</code> option.
7.6.1.0	Introduced on the S-Series.

**Usage Information**

show processes memory output Field	Description
<b>Total:</b>	Total system memory available
<b>MaxUsed:</b>	Total maximum memory used ever (history indicated with time stamp)
<b>CurrentUsed:</b>	Total memory currently in use

<b>show processes memory output Field</b>	<b>Description</b>
<b>CurrentFree:</b>	Total system memory available
<b>SharedUsed:</b>	Total used shared memory
<b>SharedFree:</b>	Total free shared memory
<b>PID</b>	Process ID
<b>Process</b>	Process Name
<b>ResSize</b>	Actual resident size of the process in memory
<b>Size</b>	Process test, stack, and data size
<b>Allocs</b>	Total dynamic memory allocated
<b>Frees</b>	Total dynamic memory freed
<b>Max</b>	Maximum dynamic memory allocated
<b>Current</b>	Current dynamic memory in use

The output for the `show process memory` command displays the memory usage statistics running on CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on S-Series' CP.

For the S-Series, the output of the `show memory` command and this command differ based on which Dell OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the output of this command, the memory size is equal to the size of the application processes plus the size of the system processes.

### Example

```
DelleMC# show processes memory stack-unit 1
Total: 268435456, MaxUsed: 2420244, CurrentUsed: 2420244, CurrentFree:
266015212
TaskName TotalAllocated TotalFreed MaxHeld CurrentHolding
tme      435406          397536    54434    37870

!----- output truncated -----!
DellEMC#

```

## show reload-type

Shows the reload type which occurs on the next reboot.

**Syntax** `show reload-type`

**Parameters** N/A

**Defaults** normal-reload

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Updated to include warmboot support.
8.3.11.4	Introduced on all Dell EMC Networking OS platforms.

### Example

```

DellEMC#show reload-type
Reload-Type                               : warmboot [Next boot : warmboot]
Current ISSU Version 1.0
Next boot from System A
Next ISSU Version 1.0
DellEMC#

```

## show reset-reason

Display the reason for the last system reboot.

**Syntax** `show reset-reason [stack-unit {stack-unit-number | all}]`

**Parameters**

- stack-unit unit-number** (OPTIONAL) Enter the keyword `stack-unit` and the stack unit number to view the reason for the last system reboot for that stack unit.
- all** (OPTIONAL) Enter the keyword `stack-unit` and the keyword `all` to view the reason for the last system reboot of all stack units in the stack.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the S5048F-ON.
9.13(0.0)	Introduced on the S3048-ON, S3100 series, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, C9010, MXL, M-IOA, and FN-IOM.

### Usage Information

You can use the `show reset-reason` without the `stack-unit` option to view the reason for the last system reboot of the local system.

#### Example — User-initiated reboot with the `reload` command

```
DellEMC#show reset-reason
Cause      : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

#### Example — System reboot due to the upgrade command

```
DellEMC# show reset-reason
Cause: Reboot by Software upgrade Module.
Reset Time: 8/9/2017 1:39 PM.
```

#### Example — System reboot for unknown reasons

```
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A
```

#### Example — System reboot due to power loss or pressing the power button off and on.

The example shows that the last system reboot was due to warm reset.

```
DellEMC#show reset-reason
Cause      : Warm Reset
Reset Time : N/A.
```

#### Example — System reboot due to watchdog timeout

```
DellEMC#show reset-reason
Cause: Watchdog timeout.
Reset Time: N/A
```

#### Example — System reboot due to thermal shutdown

The example shows that the last system reboot was due to thermal shutdown.

```
DellEMC#show reset-reason
Cause: Thermal Shutdown.
Reset Time: N/A.
```

#### Example — System reboot due to BIOS boot fail

The example shows the reason for the last reboot was due to BIOS boot fail.

```
DellEMC#show reset-reason
Cause: Reset on Boot Ok Fail.
Reset Time: N/A.
```

#### Example — Unknown reason

If the reason for the last system reboot is not available, the system displays the reason as N/A.

```
DellEMC# show reload-reason
Cause: N/A
Time: N/A
```

#### Example — Reset reason of a single stack unit

```
DellEMC# show reset-reason stack-unit 1
Cause      : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

#### Example — Reset reason of all stack units

```
DellEMC#show reset-reason stack-unit all
Last Reset Reason:
```

Type	Cause	Time
stack-unit 1	Reboot by Software	11/05/2017-09:04
stack-unit 2	Reboot by Software	11/05/2017-09:04
stack-unit 3	Cold Reset	N/A
stack-unit 4	N/A	N/A
stack-unit 5	N/A	N/A
stack-unit 6	N/A	N/A

## show software ifm

Display interface management (IFM) data.

**Syntax** `show software ifm {clients [summary] | ifagt number | ifcb interface | stack-unit unit-ID | trace-flags}`

<b>Parameters</b>	<p><b>clients</b> Enter the keyword <code>clients</code> to display IFM client information.</p> <p><b>summary</b> (OPTIONAL) Enter the keyword <code>summary</code> to display brief information about IFM clients.</p> <p><b>ifagt <i>number</i></b> Enter the keyword <code>ifagt</code> then the number of an interface agent to display software pipe and IPC statistics.</p> <p><b>ifcb <i>interface</i></b> Enter the keyword <code>ifcb</code> then one of the following interface IDs then the interface information to display interface control block information for that interface:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> </ul> <p><b>stack-unit <i>unit-ID</i></b> Enter the keyword <code>stack-unit</code> then the stack member number to display IFM information for that unit.</p> <p><b>trace-flags</b> Enter the keyword <code>trace-flags</code> to display IFM information for internal trace flags.</p>
-------------------	---

**Defaults** None.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
7.6.1.0	Introduced for the C-Series and S-Series.

### Example

```
DellEMC# show software ifm clients summary

DellEMC#
```

## show system

Display the status of all stack members or a specific member.

**Syntax** `show system [brief | stack-unit unit-id]`

**Parameters**

- brief** (OPTIONAL) Enter the keyword `brief` to view an abbreviated list of system information.
- stack-unit *unit-id*** (OPTIONAL) Enter the keywords `stack-unit` then the stack member ID for information on that stack member.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for the <code>disabled-ports</code> parameter .
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	The <code>brief</code> parameter no longer displays the current Reload mode. To display Reload mode, use <code>show reload-type</code> command. Modified the <code>show system stack-unit</code> command output to support Piece Part ID (PPID).
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot code displays as "Present".
7.7.1.0	Added Master Priority field.
7.6.1.0	Introduced on the S-Series.

**Example (show system brief)**

**Example (Z9100-ON)**

```
DellEMC# show system stack-unit 1

## show tech-support

Display a collection of data from other `show` commands, necessary for Dell EMC Networking technical support to perform troubleshooting.

**Syntax** `show tech-support [stack-unit unit-id | page]`

**Parameters**

- stack-unit** (OPTIONAL) Enter the keywords `stack-unit` to view CPU memory usage for the stack member designated by `unit-id`.
- page** (OPTIONAL) Enter the keyword `page` to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text.  
  
When using the pipe command ( `|` ), enter one of these keywords to filter command output. For details about filtering commands, refer to [CLI Basics](#).
- save** Enter the keyword `save` to save the command output.  
  
`flash`: Save to local flash drive (`flash://filename`). A maximum of 20 characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Updated to display the <code>show revision</code> and <code>show os-version</code> command outputs.
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced <code>save</code> to the file options.

Version	Description
7.6.1.0	Introduced on the S-Series.

### Usage Information

Without the `page` or `stack-unit` option, the command output is continuous. To interrupt the command output, use Ctrl-z.

The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `DellEMC#show tech-support |grep regular-expression |except regular-expression | find regular-expression | save flash://result`

This display output is an accumulation of the same information that is displayed when you execute one of the following `show` commands:

- `show version`
- `show os-version`
- `show revision`
- `show clock`
- `show running-config`
- `show system stack-ports`
- `show interfaces`
- `show process memory`
- `show process cpu`
- `show file system`
- `show system`
- `show environment`
- `show ip traffic`
- `show ip management route`
- `show ip route summary`
- `show Inventory`
- `show log summary`
- `show command-history (last 20 commands)`
- `show log`

### Example (options under show tech-support)

```
DellEMC# show tech-support ?
page          Page through output
stack-unit    Unit Number
|            Pipe through a command
<cr>
DellEMC#show tech-support stack-unit 1 ?
|            Pipe through a command
<cr>
DellEMC# show tech-support stack-unit 1 | ?
except        Show only text that does not match a pattern
find          Search for the first occurrence of a pattern
grep          Show only text that matches a pattern
no-more       Don't paginate output
save          Save output to a file

DellEMC# show tech-support stack-unit 1 | save ?
flash:        Save to local file system (flash://filename (max 20
chars) )

DellEMC# show tech-support stack-unit 1 | save flash://LauraSave
Start saving show command report .....
DellEMC#

## ssh-peer-stack-unit

Open an SSH connection to the peer stack-unit.

**Syntax**            ssh-peer-stack-unit [-l *username*]

**Parameters**      **-l *username***      (OPTIONAL) Enter the keyword `-l` then your user name. The default is the user name associated with the terminal.

**Defaults**      Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S-Series.

## stack-unit location-led

Toggle the stack unit location LED on or off.

**Syntax**      `stack-unit stack-unit-number location-led { off | on }`

**Parameters**      **stack-unit *stack-unit-number***      Enter the keywords `stack-unit` and the stack unit number.  
**on | off**      Turn the stack unit location LED on or off.

**Default**      None

**Command Modes**      EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100-ON and S5000.
9.8(1.0)	Introduced on the Z9100-ON.

**Example**

```
DellEMC#stack-unit 1 location-led on
```

# telnet

Connect through Telnet to a server. The Telnet client and server in Dell EMC Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

**Syntax** `telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name} [/source-interface]`

<b>Parameters</b>	<b>host</b>	Enter the name of a server.
	<b>ip-address</b>	Enter the IPv4 address in dotted decimal format of the server.
	<b>ipv6-address prefix-length</b>	Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.  <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
	<b>vrf instance</b>	(Optional) Enter the keyword <code>vrf</code> then the VRF instance name.
	<b>source-interface</b>	(OPTIONAL) Enter the keywords <code>/source-interface</code> then the interface information to include the source interface. Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For Tunnel interface types, enter the keyword <code>tunnel</code> then the slot/ port information. The range is from 1 to 16383.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>

**Defaults** Not configured.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810. Added support for <i>source-interface</i> for link-local IPv6 addressing.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced on the E-Series (IPv6). Increased the number of VLANs to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series (IPv4).
7.9.1.0	Introduced VRF.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and added support for IPv6 address on the E-Series only.

### Usage Information

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

## telnet-peer-stack-unit

Open a Telnet connection to the peer stack unit.

**Syntax** `telnet-peer-stack-unit`

**Defaults** Not configured.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S-Series.

## terminal length

Configure the number of lines displayed on the terminal screen.

**Syntax** `terminal length screen-length`

**Parameters** ***screen-length*** Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512.

**Defaults** 24 lines

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## traceroute

View a packet's path to a specific device.

**Syntax** `traceroute {host | vrf instance | ip-address | ipv6-address}`

**Parameters** ***host*** Enter the name of device.

- vrf instance** (Optional) E-Series Only: Enter the keyword `vrf` then the VRF Instance name.
  - ip-address** Enter the IP address of the device in dotted decimal format.
  - ipv6-address** Enter the IPv6 address, in the `x:x:x::x` format, to which you are testing connectivity.
-  **NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

**Defaults**

- Timeout = **5 seconds**
- Probe count = **3**
- 30 hops max
- 40 byte packet size
- UDP port = **33434**

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.2.1.0</b>	Introduced on the E-Series with IPv6.
<b>8.1.1.0</b>	Introduced on the E-Series (IPv4 only).
<b>7.9.1.0</b>	Introduced VRF.
<b>7.6.1.0</b>	Added support for the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added support for IPv6 address on the E-Series.
<b>E-Series</b>	Original command.

**Usage Information**

When you enter the `traceroute` command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is **5**), a probe count (default is **3**), minimum TTL (default is **1**), maximum TTL (default is **30**), and port number (default is **33434**). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is **1**) and a maximum hop count (default is **64**).

### Example (IPv4)

```
DellEMC# traceroute www.Dell EMC Networking.com

Translating "www.Dell EMC Networking.com"...domain server (10.11.0.1)
[OK]
Type Ctrl-C to abort.

-----
Tracing the route to www.Dell EMC Networking.com (10.11.84.18),
30 hops max, 40 byte packets
-----

TTL Hostname          Probe1      Probe2      Probe3
 1  10.11.199.190 001.000 ms 001.000 ms 002.000 ms

    000.000 ms 000.000 ms 000.000 ms
DellEMC#
```

### Related Commands

- [ping](#) — tests the connectivity to a device.

## undebug all

Disable all debug operations on the system.

**Syntax** undebug all

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## virtual-ip

Configure a virtual IP address for the active management interface. You can configure virtual addresses both for IPv4 and IPv6 independently.

**Syntax** `virtual-ip {ipv4-address | ipv6-address}`  
 To return to the default, use the `no virtual-ip {ipv4-address | ipv6-address}` command.

**Parameters**

**ipv4-address** Enter the IP address of the active management interface in a dotted decimal format (A.B.C.D.).

**ipv6-address** Enter an IPv6 address of the active management interface, in the x:x:x::x format.  
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

#### Usage Information

You can configure both IPv4 and IPv6 virtual addresses simultaneously, but only one of each. Each time this command is issued, it replaces the previously configured address of the same family, IPv4 or IPv6. The `no virtual-ip` command takes an address/prefix-length argument, so that the desired address only is removed. If you enter the `no virtual-ip` command without any specified address, then both IPv4 and IPv6 virtual addresses are removed.

#### Related Commands

- [ip address](#) — assigns a primary and secondary IP address to the interface.

## warmboot-failure-action

This CLI is used to define the system behavior in the event of a warmboot failure.

**Syntax** `warmboot-failure-action fastboot| normal-reload`

**Parameters**

<b>fastboot</b>	Do a fastboot on warmboot failure
<b>normal-reload</b>	Do a normal reload on warmboot failure

**Defaults** `normal-reload`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the S6000, S6100-ON and Z9100-ON

#### Usage Information

Enter `warmboot-failure-action fastboot` to restart in fastboot mode in case there is a failure of warmboot. Enter `warmboot-failure-action normal-reload` to restart in normal mode in case there is a failure of warmboot.

## write

Copy the current configuration to either the startup-configuration file or the terminal.

**Syntax** `write [memory [compressed] | terminal]`

**Parameters**

<b>memory</b>	Enter the keyword <code>memory</code> to copy the current running configuration to the startup configuration file. This command is similar to the <code>copy running-config startup-config</code> command.
<b>compressed</b>	Enter the keyword <code>compressed</code> to write the operating configuration to the startup-config file in the compressed mode.

**terminal** Enter the keyword `terminal` to copy the current running configuration to the terminal. This command is similar to the `show running-config` command.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

**Usage Information** The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named "startup-configuration" (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.

When you use the `write memory` command to copy the running configuration to the startup configuration file with the startup configuration verification feature enabled, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

# 802.1X

802.1X is a port-based Network Access Control (PNAC) that provides an authentication mechanism to devices wishing to attach to a LAN or WLAN. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell EMC Networking OS supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

## Important Points to Remember

Dell EMC Networking OS limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

## debug dot1x

Display 802.1X debugging information.

**Syntax** `debug dot1x [all | auth-pae-fsm | backend-fsm | eapol-pdu] [interface interface]`

<b>Parameters</b>	<b>all</b>	Enable all debugs in dot1x.
	<b>auth-pae-fsm</b>	Enable Authentication PAE FSM debugs in dot1x.
	<b>backend-fsm</b>	Enable Backend Auth FSM debugs in dot1x.
	<b>eapol-pdu</b>	Enable EAPOL frame trace in dot1x.
	<b>interface interface</b>	Restricts the debugging information to an interface. The interface option is available only when the interface is either operationally up or dot1x related interface configuration exists before enabling debugging for that interface.

**Defaults** Disabled

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.4.1.0</b>	Introduced on the C-Series and S-Series.

## dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax** `dot1x auth-fail-vlan vlan-id [max-attempts number]`

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

<b>Parameters</b>	<b><i>vlan-id</i></b>	Enter the VLAN Identifier. The range is from 1 to 4094.
	<b>max-attempts <i>number</i></b>	(OPTIONAL) Enter the keywords <code>max-attempts</code> followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is <b>3</b> .
<b>Defaults</b>	<b>3</b>	attempts
<b>Command Modes</b>	CONFIGURATION ( <i>conf-if-interface-slot/port</i> )	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.4.1.0</b>	Introduced on the C-Series and S-Series.

**Usage Information** If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval (`dot1x reauthentication`).

- Related Commands**
- [dot1x port-control](#) — enable port control on an interface
  - [dot1x guest-vlan](#) — configure a guest VLAN for limited access users or for devices that are not 802.1X capable.
  - [show dot1x interface](#) — display the 802.1X configuration of an interface.

## dot1x auth-server

Configure the authentication server to RADIUS.

<b>Syntax</b>	<code>dot1x auth-server radius</code>
<b>Defaults</b>	None
<b>Command Modes</b>	CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.6.1.0</b>	Introduced on the C-Series and S-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

## dot1x auth-type mab-only

To authenticate a device with MAC authentication bypass (MAB), only use the host MAC address.

**Syntax** `dot1x auth-type mab-only`

**Defaults** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Introduced on the C-Series and S-Series.

### Usage Information

The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1x authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.

### Related Commands

- [dot1x mac-auth-bypass](#) — enable MAC authentication bypass.

## dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

### Syntax

```
dot1x authentication
```

To disable dot1x on a globally, use the `no dot1x authentication` command.

### Defaults

Disabled

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

<b>7.4.1.0</b>	Introduced on the E-Series.

**Related  
Commands**

- [dot1x authentication \(Configuration\)](#) — enable dot1x globally.

## dot1x critical-vlan

Configure critical-VLAN for users or devices when authentication server is not reachable.

**Syntax**

```
[no] dot1x critical-vlan vlan-id
```

**Parameters**

***vlan-id***

Enter the VLAN identifier. The VLAN-ID range is from 1 to 4094.

**Defaults**

Not Configured.

**Command Modes**

INTERFACE

INTERFACE (BATCH MODE)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9000 Series.

**Usage Information**

The `dot1x critical-vlan` command configures critical VLAN for the interface. If the authentication server is not reachable or not responding, the authenticator places the port or the supplicant in critical VLAN within the first attempt.

Use this command in Interface Batch mode to configure critical VLAN for users in a dual-homing setup.

**Example**

```
DellEMC(conf)#show dot1x interface twentyFiveGigE 1/41
```

```
802.1x information on Tf 1/41:
-----
Dot1x Status:           Enable
Port Control:          AUTO
Port Auth Status:      AUTHORIZED (CRITICAL-VLAN)
Re-Authentication:     Enable
Untagged VLAN id:      400
Guest VLAN:            Enable
Guest VLAN id:         400
Auth-Fail VLAN:        Enable
Auth-Fail VLAN id:     400
Auth-Fail Max-Attempts: 3
Critical VLAN:         Enable
Critical VLAN id:      400
Mac-Auth-Bypass:       Disable
Mac-Auth-Bypass Only:  Disable
Tx Period:              30 seconds
Quiet Period:          60 seconds
ReAuth Max:            2
Supplicant Timeout:    30 seconds
Server Timeout:        30 seconds
Re-Auth Interval:     60 seconds
Max-EAP-Req:           2
Host Mode:              SINGLE_HOST
Auth PAE State:        Authenticated
Backend State:         Idle
```

## dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

**Syntax**

```
dot1x guest-vlan vlan-id
```

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

**Parameters**

**vlan-id** Enter the VLAN Identifier. The range is from 1 to 4094.

**Defaults**

Not configured.

**Command Modes** CONFIGURATION (*conf-if-interface-slot/port*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

#### Usage Information

1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

**NOTE:** You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

#### Related Commands

- `dot1x auth-fail-vlan` — Configure an authentication failure VLAN.
- `dot1x reauthentication` — Enable periodic re-authentication of the client.
- `dot1x reauth-max` —

Configure the maximum number of times to re-authenticate a port before it becomes unauthorized

## dot1x host-mode

Enable single-host or multi-host authentication.

**Syntax** `dot1x host-mode {single-host | multi-host | multi-auth}`

**Parameters**

<b>single-host</b>	Enable single-host authentication.
<b>multi-host</b>	Enable multi-host authentication.
<b>multi-auth</b>	Enable multi-suplicant authentication.

**Defaults** `single-host`

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.4.1.0</b>	Added the <code>multi-auth</code> option on the C-Series and S-Series.
<b>8.3.2.0</b>	Added the <code>single-host</code> and <code>multi-host</code> options on the C-Series, E-Series, and S-Series.

## Usage Information

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-suplicant mode authenticates every device attempting to connect to the network on the authenticator port.

## Related Commands

- [show dot1x interface](#) — display the 802.1X configuration of an interface.

# mac

Configure a list of supplicant MAC addresses for dot1x profile represented with a profile-name.

**Syntax** [no] `mac {mac-address1 mac-address2... mac-address6}`

**Parameters**

<b><i>mac-address1</i></b>	Enter the keyword <code>mac</code> and type the 48-bit MAC addresses using the H.H.H
<b><i>mac-address2...</i></b>	format. A maximum of 6 MAC addresses are allowed.
<b><i>mac-address6</i></b>	

**Defaults** None

**Command Modes** DOT1X PROFILE CONFIG (conf-dot1x-profile)  
CONFIGURATION TERMINAL BATCH

<b>9.10(0.0)</b>	Introduced on the S3148.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
<b>9.9(0.0)</b>	Introduced on the C9010.

### Usage Information

The `mac` command configures a list of supplicant MAC addresses for a dot1x profile represented with a profile-name. You can configure up to 6 MAC addresses in a single `mac` command. The maximum number of MAC addresses that you can configure in a single profile is limited to 100.

Use this command in Configuration Terminal Batch mode to configure a list of supplicant MAC addresses for dot1x profile in a dual-homing setup.

### Example

```
DellEMC(conf)#dot1x profile mySupPLICANTS
DellEMC(conf-dot1x-profile)#mac 00:50:56:AA:01:10 00:50:56:AA:01:11

DellEMC(conf-dot1x-profile)#show config
dot1x profile mySupPLICANTS
 mac 00:50:56:aa:01:10
 mac 00:50:56:aa:01:11
DellEMC(conf-dot1x-profile)#
DellEMC(conf-dot1x-profile)#exit
```

## dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

**Syntax** `dot1x mac-auth-bypass`  
To disable MAC authentication bypass on a port, use the `no dot1x mac-auth-bypass` command.

**Defaults** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

**Usage Information**

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax** `dot1x max-eap-req number`  
 To return to the default, use the `no dot1x max-eap-req` command.

**Parameters** *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

**Defaults** **2**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x max-supPLICANTS

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only takes effect in Multi-auth mode.

**Syntax** `dot1x max-supPLICANTS number`

<b>Parameters</b>	<i>number</i>	Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is <b>128</b> .
<b>Defaults</b>	128 hosts can be authenticated on a single authenticator port.	
<b>Command Modes</b>	INTERFACE	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>

<b>Related Commands</b>	<ul style="list-style-type: none"> <li>• <a href="#">dot1x host-mode</a> — enable single-host or multi-host authentication.</li> </ul>	

## dot1x port-control

Enable port control on an interface.

<b>Syntax</b>	<code>dot1x port-control {force-authorized   auto   force-unauthorized}</code>	
<b>Parameters</b>	<b>force-authorized</b>	Enter the keywords <code>force-authorized</code> to forcibly authorize a port.
	<b>auto</b>	Enter the keyword <code>auto</code> to authorize a port based on the 802.1X operation result.
	<b>force-unauthorized</b>	Enter the keywords <code>force-unauthorized</code> to forcibly de-authorize a port.
<b>Defaults</b>	None	
<b>Command Modes</b>	Auto	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

#### Usage Information

The authenticator completes authentication only when you set `port-control` to `auto`.

## dot1x profile

Configure a dot1x profile to define a list of trusted supplicant MAC addresses.

<b>Syntax</b>	<code>[no] dot1x profile profile-name</code>
<b>Parameters</b>	<b>profile-name</b> Enter a dot1x <i>profile-name</i> . The profile name length is limited to 32 characters.
<b>Defaults</b>	None
<b>Command Modes</b>	CONFIGURATION CONFIGURATION TERMINAL BATCH
<b>Error Strings</b>	NONE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

#### Usage Information

The `dot1x profile` command configures a dot1x profile to define a list of trusted supplicant MAC addresses. Maximum number of dot1x profiles is limited to 10. This command launches dot1x profile mode for entering profile related commands such as the `mac` command. The `dot1x static-mab` command assigns the dot1x profile to an interface.

Use this command in Configuration Terminal Batch mode to configure the dot1x profile in a dual-homing setup.

**Related Commands**

- [dot1x static-mab](#)
- [mac](#)

## dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax** `dot1x quiet-period seconds`

To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters** **seconds** Enter the number of seconds. The range is from 1 to 65535. The default is **60**.

**Defaults** **60** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.

<b>7.4.1.0</b>	Introduced on the E-Series.

## dot1x reauthentication

Enable periodic reauthentication of the client.

**Syntax** `dot1x reauthentication [interval seconds]`

To disable periodic reauthentication, use the `no dot1x reauthentication` command.

**Parameters** **interval seconds** (Optional) Enter the keyword `interval` then the interval time, in seconds, after which reauthentication is initiated. The range is from 1 to 31536000 (one year). The default is **3600** (1 hour).

**Defaults** **3600** seconds (1 hour)

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

**Syntax** `dot1x reauth-max number`

To return to the default, use the `no dot1x reauth-max` command.

**Parameters** *number* Enter the permitted number of re-authentications. The range is from 1 to 10. The default is **2**.

**Defaults** 2

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

**Syntax** `dot1x server-timeout seconds`  
 To return to the default, use the `no dot1x server-timeout` command.

**Parameters** **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information** When you configure the `dot1x server-timeout` value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured.

Ideally, the `dot1x server-timeout` value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula: `dot1x server-timeout seconds > (radius-server retransmit seconds + 1) * radius-server timeout seconds`.

Where the default values are as follows: `dot1x server-timeout` (30 seconds), `radius-server retransmit` (3 seconds), and `radius-server timeout` (5 seconds).

### Example

```
DellEMC(conf)# radius-server host 10.11.197.105 timeout 6
DellEMC(conf)# radius-server host 10.11.197.105 retransmit 4
DellEMC(conf)# interface tengigabitethernet 2/23/1
DellEMC(conf-if-te-2/23/1)# dot1x server-timeout 40
DellEMC(conf-if-te-2/23/1)#
```

## dot1x static-mab

Enable static MAC authorization bypass (MAB) and configure static MAB profile to an interface.

**Syntax** [no] `dot1x static-mab profile profile-name`

**Parameters** **profile profile-name** Enter the keyword `profile` and the `profile-name` to configure the static MAB profile name. The profile name length is limited to 32 characters.

**Defaults** Disabled.

**Command Modes** INTERFACE  
INTERFACE (BATCH MODE)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

**Usage Information** The `dot1x static-mab` command enables static MAB (mac auth bypass) and configures the associated profile on a dot1x interface. Static MAB bypasses the authentication server for the supplicant MAC addresses configured in the associated profile.

Before you enable static MAB, you must do the following:

- Enable MAC authentication bypass on the port by configuring the `dot1x mac-auth-bypass` command.
- Ensure that no configured profile exists at the time of configuring the `static-mab` command.
- Use this command in Interface Batch Mode to enable static MAB in a dual-homing setup.

### Example

```
DellEMC(conf)#do show dot1x interface twentyFiveGigE 1/41
```

```
802.1x information on Tf 1/41:
-----
Dot1x Status:          Enable
Port Control:         AUTO
Port Auth Status:     AUTHORIZED (STATIC-MAB)
Re-Authentication:    Enable

Guest VLAN:           Enable
Guest VLAN id:        400
Auth-Fail VLAN:       Enable
Auth-Fail VLAN id:    400
```

```

Auth-Fail Max-Attempts: 3
Critical VLAN: Enable
Critical VLAN id: 400
Mac-Auth-Bypass: Disable
Mac-Auth-Bypass Only: Disable
Static-MAB: Enable
Static-MAB Profile: Sample
Tx Period: 30 seconds
Quiet Period: 60 seconds
ReAuth Max: 2
Supplicant Timeout: 30 seconds
Server Timeout: 30 seconds
Re-Auth Interval: 60 seconds
Max-EAP-Req: 2
Host Mode: SINGLE_HOST
Auth PAE State: Authenticated
Backend State: Idle

```

## dot1x supplicant-timeout

Configure the amount of time after which exchanges with the supplicant time-out.

**Syntax** `dot1x supplicant-timeout seconds`

To return to the default, use the `no dot1x supplicant-timeout` command.

**Parameters** **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>7.4.1.0</b>	Introduced on the E-Series.

# show dot1x cos-mapping interface

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

<b>Syntax</b>	<code>show dot1x cos-mapping interface interface [mac-address mac-address]</code>
<b>Parameters</b>	<b>interface</b> Enter one of the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li></ul>

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**mac-address** (Optional) MAC address of an 802.1X-authenticated supplicant.

**Defaults** None

- Command Modes**
- EXEC
  - EXEC privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.4.2.1</b>	Introduced on the C-Series and S-Series.

**Usage Information** Enter a supplicant's MAC address using the `mac-address` option to display CoS mapping information only for the specified supplicant.

You can display the CoS mapping information applied to traffic from authenticated supplicants on 802.1X-enabled ports that are in Single-Hot, Multi-Host, and Multi-Supplicant authentication modes.

**Example**

```
DellEMC# show dot1x cos-mapping interface tengigabitethernet 1/32/1
802.1p CoS re-map table on Te 1/32/1:
-----
Dot1p      Remapped Dot1p

DellEMC#
```

## show dot1x interface

Display the 802.1X configuration of an interface.

**Syntax** `show dot1x interface interface [mac-address mac-address]`

**Parameters**

***interface***

Enter one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

***mac-address***

(Optional) MAC address of a supplicant.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Added the <code>mac-address</code> option on the C-Series and S-Series.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

### Usage Information

If you enable 802.1X multi-supplicant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

### Example

```
Dell EMC# show dot1x interface tengigabitethernet 1/32/1

802.1x information on Te 1/32/1:
-----
Dot1x Status:          Enable
Port Control:          AUTO
Port Auth Status:      AUTHORIZED (MAC-AUTH-BYPASS)
Re-Authentication:     Disable
Untagged VLAN id:      400
Guest VLAN:            Enable
Guest VLAN id:         100
Auth-Fail VLAN:        Disable
Auth-Fail VLAN id:     NONE
Auth-Fail Max-Attempts: NONE
Mac-Auth-Bypass:       Enable
Mac-Auth-Bypass Only:  Enable
Tx Period:              3 seconds
Quiet Period:           60 seconds
ReAuth Max:            2
Supplicant Timeout:    30 seconds
Server Timeout:        30 seconds
Re-Auth Interval:      3600 seconds
Max-EAP-Req:           2
Host Mode:              SINGLE_HOST
Auth PAE State:         Authenticated
Backend State:          Idle
Dell EMC#
```

### Example (mac-address)

```
Dell EMC# show dot1x interface tengigabitethernet 1/32/1 mac-address
00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1x information on Te 1/32/1:
-----
Dot1x Status:          Enable
Port Control:          AUTO
Re-Authentication:     Disable
Guest VLAN:            Enable
Guest VLAN id:         100
Auth-Fail VLAN:        Disable
Auth-Fail VLAN id:     NONE
Auth-Fail Max-Attempts: NONE
Mac-Auth-Bypass:       Enable
Mac-Auth-Bypass Only:  Enable
Tx Period:              3 seconds
Quiet Period:           60 seconds
ReAuth Max:            2
Supplicant Timeout:    30 seconds
Server Timeout:        30 seconds
Re-Auth Interval:      3600 seconds
Max-EAP-Req:           2
Host Mode:              MULTI_AUTH
Max-Supplicants:       128

Port status and State info for Supplicant: 00:00:00:00:00:10
Port Auth Status:      AUTHORIZED (MAC-AUTH-BYPASS)
```

```

Untagged VLAN id:          400
Auth PAE State:           Authenticated
Backend State:            Idle
DellEMC#

DellEMC# show dot1x interface tengigabitethernet 1/32/1 mac-address
00:00:00:00:00:11
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1x information on Te 1/32/1:
-----
Dot1x Status:             Enable
Port Control:             AUTO
Re-Authentication:        Disable
Guest VLAN:               Enable
Guest VLAN id:            100
Auth-Fail VLAN:           Disable
Auth-Fail VLAN id:        NONE
Auth-Fail Max-Attempts:   NONE
Mac-Auth-Bypass:          Enable
Mac-Auth-Bypass Only:     Enable
Tx Period:                 3 seconds
Quiet Period:              60 seconds
ReAuth Max:                2
Supplicant Timeout:       30 seconds
Server Timeout:           30 seconds
Re-Auth Interval:         3600 seconds
Max-EAP-Req:               2
Host Mode:                 MULTI_AUTH
Max-Supplicants:          128

Port status and State info for Supplicant: 00:00:00:00:00:11

Port Auth Status:         AUTHORIZED(GUEST-VLAN)
Untagged VLAN id:         100
Auth PAE State:           Authenticated
Backend State:            Idle
DellEMC#

```

## show dot1x profile

Display all the dot1x profiles or the details of a specific profile configured in the system.

**Syntax** `show dot1x profile profile-name`

**Parameters** *profile-name* Specify a static dot1x *profile-name*. The maximum character limit for a profile name is 32 characters.

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

### Example

```

DellEMC#show dot1x profile

802.1x profile information

```

```
-----  
Dot1x Profile mySupplicants  
Profile MACs  
00:50:56:aa:01:10 00:50:56:aa:01:11
```

# Access Control Lists (ACL)

Access control lists (ACLs) are supported by the Dell EMC Networking OS.

Dell EMC Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

 **NOTE:** For ACL commands that use the Trace function, see *Trace List Commands* section in [Security](#).

 **NOTE:** For IPv6 ACL commands, see [IPv6 Access Control Lists \(IPv6 ACLs\)](#).

## Topics:

- [Commands Common to all ACL Types](#)
- [Common IP ACL Commands](#)
- [Standard IP ACL Commands](#)
- [Extended IP ACL Commands](#)
- [Common MAC Access List Commands](#)
- [Standard MAC ACL Commands](#)
- [Extended MAC ACL Commands](#)
- [IP Prefix List Commands](#)
- [Route Map Commands](#)
- [deny \(for Standard IP ACLs\)](#)
- [deny \(for Extended IP ACLs\)](#)
- [seq \(for Standard IPv4 ACLs\)](#)
- [deny tcp \(for Extended IP ACLs\)](#)
- [deny \(for Standard MAC ACLs\)](#)
- [deny \(for Extended MAC ACLs\)](#)
- [permit \(for Standard IP ACLs\)](#)
- [permit icmp \(for Extended IP ACLs\)](#)
- [permit udp \(for Extended IP ACLs\)](#)
- [permit \(for Extended IP ACLs\)](#)
- [permit \(for Standard MAC ACLs\)](#)
- [seq \(for Standard MAC ACLs\)](#)
- [permit tcp \(for Extended IP ACLs\)](#)
- [seq \(for IP ACLs\)](#)
- [seq \(for IPv6 ACLs\)](#)
- [permit udp \(for IPv6 ACLs\)](#)
- [permit tcp \(for IPv6 ACLs\)](#)
- [permit icmp \(for IPv6 ACLs\)](#)
- [permit \(for IPv6 ACLs\)](#)
- [deny udp \(for IPv6 ACLs\)](#)
- [deny tcp \(for IPv6 ACLs\)](#)

- deny icmp (for Extended IPv6 ACLs)
- deny (for IPv6 ACLs)

## Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the deny and permit commands).

### remark

Enter a description for an ACL entry.

**Syntax** `remark remark-number description`

To remove a remark, use the `no remark` command.

**Parameters** **remark-number** (Optional) Enter the remark number. The range is from 0 to 65535 for MAC ACL and 0 to 4294967290 for IP ACL.

 **NOTE:** You can use the same sequence number for the remark and an ACL rule.

**description** Enter a description of up to 80 characters.

**Defaults** Not configured.

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(1.0)	Introduced the remark number as an optional value on S4810 and S4820T.
9.14.0.0	Made the remark number as an optional value.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced on the E-Series.

### Usage Information

The `remark` command is available in each ACL mode. You can configure up to 4294967291 remarks for a given IP ACL and 65536 remarks for a given MAC ACL.

You can include a remark with or without a remark number. If you do not enter a remark number, the remark inherits the sequence number of the last ACL rule. If there is no ACL rule when you enter a remark, the remark takes sequence number 5. If you configure two remarks with the same sequence number and different strings, the second one replaces the first string. You cannot configure two or more remarks with the same string and different sequence numbers.

To remove a remark, use the `no remark` command with or without the sequence number. If there is a matching string, the system deletes the remark.

### Example

The following example shows the use of the `remark` command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The remark precedes the rule in the running configuration because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

```
DelleMC(config-std-nacl)# remark 10 Deny rest of the traffic
DelleMC(config-std-nacl)# remark 5 Permit traffic from XYZ Inc.
DelleMC(config-std-nacl)# show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 deny any
DelleMC(config-std-nacl)#
```

The following example shows adding a remark without a sequence number:

```
DELLEMC(config-ext-nacl)#permit ip any any
DELLEMC(config-ext-nacl)#remark permit any ip
DELLEMC(config-ext-nacl)#show c
!
ip access-list extended testac
seq 5 permit ip any any
remark 5 permit any ip
```

The following example shows that the system displays an error message when the same remark string is used with different remark numbers.

```
DELLEMC(config-ext-nacl)#seq 100 permit ip any any
DELLEMC(config-ext-nacl)#remark 10 permit any ip
DELLEMC(config-ext-nacl)#remark permit any ip
DELLEMC(config-ext-nacl)#% Error : Remark string already exists
```

### Related Commands

- [show config](#) — display the current ACL configuration.

## show config

Display the current ACL configuration.

**Syntax** `show config`

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST

- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

### Example

```
DellEMC(config-std-nacl)# show conf
!
ip access-list standard test
 remark 5 Permit traffic from XYZ Inc.
 seq 5 permit 1.1.1.0/24 count
 remark 10 Deny traffic from ABC
 seq 10 deny 2.1.1.0/24 count
DellEMC(config-std-nacl)#
```

## Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) section.

### access-class

Apply a standard ACL to a terminal line.

**Syntax** `access-class access-list-name [ipv4 | ipv6]`  
 To remove an ACL, use the `no access-class` command.

<b>Parameters</b>	<p><b><i>access-list-name</i></b> Enter the name of a configured Standard ACL, up to 140 characters.</p> <p><b>ipv4</b> Enter the keyword <code>ipv4</code> to configure an IPv4 access class.</p> <p><b>ipv6</b> Enter the keyword <code>ipv6</code> to configure an IPv6 access class.</p>																																								
<b>Defaults</b>	Not configured.

<b>6.2.1.1</b>	Introduced on the E-Series.																																								
<b>Usage Information</b>	<p>When you use the <code>access-class access-list-name</code> command without specifying the <code>ipv4</code> or <code>ipv6</code> attribute, both IPv4 as well as IPv6 rules that are defined in that ACL are applied to the terminal. This method is a generic way of configuring access restrictions.</p> <p>To be able to filter access exclusively using either IPv4 or IPv6 rules, use either the <code>ipv4</code> or <code>ipv6</code> attribute along with the <code>access-class access-list-name</code> command. Depending on the attribute that you specify (<code>ipv4</code> or <code>ipv6</code>), the ACL processes either IPv4 or IPv6 rules, but not both. Using this configuration, you can set up two different types of access classes with each class processing either IPv4 or IPv6 rules separately.</p> <p>However, if you already have configured generic IP ACL on a terminal line, then you cannot further apply IPv4 or IPv6 specific filtering on top of this configuration. Because, both IPv4 and IPv6 access classes are already configured on this terminal line. Before applying either IPv4 or IPv6 filtering, first undo the generic configuration using the <code>no access-class access-list-name</code> command.</p> <p>Similarly, if you have configured either IPv4 or IPv6 specific filtering on a terminal line, you cannot apply generic IP ACLs on top of this configuration. Before applying the generic ACL configuration, first undo the existing configuration using the <code>no access-class access-list-name [ipv4   ipv6]</code> command.</p>																																								

## aclrange profile-name

Create ACL range profiles for L4 ports.

**Syntax** `aclrange profile-name`  
After entering the configuration mode of the ACL range, enter the following: `type [inverse value] lower threshold upper-threshold`

**Parameters**

<b>profile-name</b>	Enter a valid name for the range profile.
<b>type</b>	Specify the type of the L4 port as source or destination.
<b>inverse</b>	Enter the keyword <code>inverse</code> followed by a value. This is used as a negative (not equal to) match.
<b>lower threshold</b>	Enter the minimum inclusive value of the range.
<b>upper-threshold</b>	Enter the maximum inclusive value of the range.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.11(0.0)	Introduced on the S6000-ON, S6100-ON, Z9100-ON.

**Usage Information** Ensure that the ACL range feature is enabled before creating the profile names for the ranges using the `feature aclrange` command. Reboot the system for the range profiles to come up.

### Example

```
DellEMC(conf)#aclrange profile-name
DellEMC(conf-aclrange-profile-name)#
```

```
DellEMC(conf)#aclrange sportrange1
DellEMC(conf-aclrange-sportrange1)# l4srcport 1024 65535
```

```
DellEMC(conf)#aclrange destportrange1
DellEMC(conf-acl-destportrange1)# l4dstport 500 500
```

```
DellEMC(conf)#aclrange inverserange
DellEMC(conf-acl-inverserange)# l4dstport inverse 1000
```

**Related Commands** [feature aclrange](#) on page 189— Enable the ACL range.

## clear counters ip access-group

Erase all counters maintained for access lists.

**Syntax** `clear counters ip access-group [access-list-name]`

**Parameters** **access-list-name** (OPTIONAL) Enter the name of a configured access-list, up to 140 characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

## feature acloptimized

Enable the acloptimized feature, and optimize ACL to increase the number of the IPv4 ACL rules.

<b>Syntax</b>	<code>feature acloptimized</code>  To remove this feature and bring the system to default, use the <code>no feature acloptimized</code> command, save the configuration, and reload the system.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	CONFIGURATION mode
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.14(0.0)	Introduced on the S5048F-ON.
9.13(0.0)	Introduced on the S6100-ON and Z9100-ON.

**Usage Information** After enabling the acloptimized feature, reboot the system.

### Example

```
DellEMC(conf)#feature acloptimized
Configuration change will be in effect after save and reload. ACL
config containing TTL, layer3 and VRF conflicts with ACL Cam optimization
feature and these keywords would be discarded while applying the ACL.
```

## feature aclrange

Enable the ACL range option.

<b>Syntax</b>	<code>feature aclrange</code> Use the <code>no feature aclrange</code> command to disable the option.				
<b>Defaults</b>	None				
<b>Command Modes</b>	CONFIGURATION				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . The following is a list of the Dell EMC Networking OS version history for this command. <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.11(0.0)</td><td>Introduced on the S6000-ON, S6100-ON, Z9100-ON.</td></tr></tbody></table>	Version	Description	9.11(0.0)	Introduced on the S6000-ON, S6100-ON, Z9100-ON.
Version	Description				
9.11(0.0)	Introduced on the S6000-ON, S6100-ON, Z9100-ON.				
<b>Usage Information</b>	After enabling the range option, create the range profiles using the <code>aclrange profile-name</code> command. Reboot the system for the range profiles to come up.				
<b>Related Commands</b>	<a href="#">aclrange profile-name</a> on page 187 — Create range profiles.				

## ip access-group

Assign an IP access list (IP ACL) to an interface.

<b>Syntax</b>	<code>[vrf vrf-name]ip access-group access-list-name {in   out} [implicit-permit [vlan vlan-id   vrf vrf-name   optimized]   vlan vlan-id   vrf vrf-name   optimized] [layer3]</code> To delete an IP access-group configuration, use the <code>no ip access-group access-list-name {in   out}</code> command.																
<b>Parameters</b>	<table><tr><td><b><i>access-list-name</i></b></td><td>Enter the name of a configured access list, up to 140 characters.</td></tr><tr><td><b><i>in</i></b></td><td>Enter the keyword <code>in</code> to apply the ACL to incoming traffic.</td></tr><tr><td><b><i>out</i></b></td><td>Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.</td></tr><tr><td><b><i>implicit-permit</i></b></td><td>(OPTIONAL) Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).</td></tr><tr><td><b><i>vlan vlan-id</i></b></td><td>(OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).</td></tr><tr><td><b><i>vrf vrf-name</i></b></td><td>(OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 511 (you can use IDs from 1 to 511). <b>NOTE:</b> When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.</td></tr><tr><td><b><i>optimized</i></b></td><td>(OPTIONAL) Enter the keyword <code>optimized</code> to enable ACL optimization</td></tr><tr><td><b><i>layer3</i></b></td><td>(OPTIONAL) Enter the keyword <code>layer3</code> to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.</td></tr></table>	<b><i>access-list-name</i></b>	Enter the name of a configured access list, up to 140 characters.	<b><i>in</i></b>	Enter the keyword <code>in</code> to apply the ACL to incoming traffic.	<b><i>out</i></b>	Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.	<b><i>implicit-permit</i></b>	(OPTIONAL) Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).	<b><i>vlan vlan-id</i></b>	(OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).	<b><i>vrf vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 511 (you can use IDs from 1 to 511). <b>NOTE:</b> When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.	<b><i>optimized</i></b>	(OPTIONAL) Enter the keyword <code>optimized</code> to enable ACL optimization	<b><i>layer3</i></b>	(OPTIONAL) Enter the keyword <code>layer3</code> to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.
<b><i>access-list-name</i></b>	Enter the name of a configured access list, up to 140 characters.																
<b><i>in</i></b>	Enter the keyword <code>in</code> to apply the ACL to incoming traffic.																
<b><i>out</i></b>	Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.																
<b><i>implicit-permit</i></b>	(OPTIONAL) Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).																
<b><i>vlan vlan-id</i></b>	(OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).																
<b><i>vrf vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 511 (you can use IDs from 1 to 511). <b>NOTE:</b> When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.																
<b><i>optimized</i></b>	(OPTIONAL) Enter the keyword <code>optimized</code> to enable ACL optimization																
<b><i>layer3</i></b>	(OPTIONAL) Enter the keyword <code>layer3</code> to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.																
<b>Defaults</b>	Not enabled.																
<b>Command Modes</b>	INTERFACE/VRF MODE																

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

## Usage Information

You can assign one ingress ACL and one egress ACL to an interface.

**NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the `vrf` attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

In the Dell EMC Networking OS versions prior to 9.13(0.0), the system does not install any of your ACL rules if the available CAM space is lesser than what is required for your set of ACL rules. Effective with the Dell EMC Networking OS version 9.13(0.0), the system installs your ACL rules until all the allocated CAM memory is used. If there is no implicit permit in your rule, the Dell EMC Networking OS ensures that an implicit deny is installed at the end of your rule. This behavior is applicable for IPv4 and IPv6 ingress and egress ACLs.

One of the usage scenarios for using the **layer3** keyword at the VLAN level, is to avoid ACL being applied on the L2 traffic which comes in via ICL.

**NOTE:** The usage scenario listed above is one of many other usage scenarios.

## Related Commands

- [ip access-list standard](#) — configure a standard ACL.
- [ip access-list extended](#) — configure an extended ACL.

## ip control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv4 CPU traffic.

**Syntax** `ip control-plane egress-filter`

**Defaults** Not enabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

## ipv6 control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv6 CPU traffic.

**Syntax** `ipv6 control-plane egress-filter`

**Defaults** Not enabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

## show aclrange

Display the list of ACL ranges configured and ACLs using the range profiles.

**Syntax** `show aclrange [access-list]`

**Parameters** **access-list** Enter the keyword `access-list` to display the ACLs that are using the range profiles config

**Default** None

**Command Modes** EXEC  
EXEC Privilege

### Command History

Version	Description
9.11(0.0)	Introduced on the S6000-ON, S6100-ON, Z9100-ON.

**Usage Information** Use the `show aclrange` to display the list of ACL ranges configured.  
Use the `show aclrange access-list` to display the ACLs associated with the configured range profiles.

**Examples** To display the list of ACL ranges:

```
DelleMC# show aclrange
```

INDEX	PROFILE_NAME	TYPE	INVERSE	LOWER THRESHOLD	UPPER THRESHOLD	REF_
1	dport1	l4dstport	No	80	89	0
2	dport2	l4dstport	No	3000	3500	2
3	dportgt5000	l4dstport	No	5001	65535	1
4	ip-mtu-782	mtu	No	782	782	1
5	sport1	l4srcport	No	1024	65535	1
6	sportinv1	l4srcport	Yes	2500	2500	1

To display the list of ACLs using the configured range profiles:

```
DelleMC# show aclrange access-list
```

Profile-name	type	Acl-name	seqno
abc	v4	abc	5
	V4	zyx	10
	V6	def	8
bgp	V6	ghi	8

## show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

**Syntax** `show ip accounting access-list [access-list-name [cam-count | interface interface [cam_count] | vrf {management | vrf-name}[cam_count] {in | out}]`

**Parameters** **access-list-name** Enter the name of the ACL to be displayed.

<b>cam_count</b>	List the count of the CAM rules for this ACL.
<b>interface</b> <b>interface</b>	Enter the keyword <code>interface</code> then the one of the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>
<b>in   out</b>	Identify whether ACL is applied on the ingress or egress side.
<b>vrf vrf-name</b>	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.11(0.0)</b>	Updated the show command output to include monitor option.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for the 4-port 40G line cards.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.2.1.1</b>	Introduced.

**Usage Information**

 **NOTE:** The `vrf` option is available only when VRF feature is enabled.

<code>show ip accounting access-lists</code> Field	Description
<b>“Extended IP...”</b>	Displays the name of the IP ACL.
<b>“seq 5...”</b>	Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line.
<b>“order 4”</b>	Displays the QoS order of priority for the ACL entry.

### Example

## Standard IP ACL Commands

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit. The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

### deny

To drop packets with a certain IP address, configure a filter.

**Syntax** `deny {source | any | host {ip-address}} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

### Parameters

<b>source</b>	Enter the IP address in dotted decimal format of the network from which the packet was sent.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address only.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.
<b>ecn</b>	(OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

 **NOTE:** For more information, see “Flow-based Monitoring” in the Port Monitoring section of the *Dell EMC Networking OS Configuration Guide*.

**fragments** Enter the keyword `fragments` to use ACLs to control packet fragments.  
**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section in the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the `count` `byte` options, only bytes increment.

**Related Commands**

- [ip access-list standard](#) — configure a standard ACL.
- [permit](#) — configure a permit filter.

## ip access-list standard

Create a standard IP access list (IP ACL) to filter based on IP address.

**Syntax** `ip access-list standard access-list-name`  
To delete an access list, use the `no ip access-list standard access-list-name` command.

**Parameters** **access-list-name** Enter a string up to 140 characters long as the ACL name.

**Defaults** All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** Dell EMC Networking OS supports one ingress and one egress IP ACL per interface.

Prior to Dell EMC Networking OS version 7.8.1.0, names are up to 16 characters long.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

### Example

```
DellEMC(conf)# ip access-list standard TestList
DellEMC(config-std-nacl)#
```

**Related Commands**

- [ip access-list extended](#) — create an extended access list.
- [show config](#) — display the current configuration.

# permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

**Syntax** `permit {source [mask] | any | host ip-address} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor ] [no-drop] [order]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address in dotted decimal format of the network from which the packet was sent.
<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.
<b>ecn</b>	(OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  <b>NOTE:</b> For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

**Related Commands**

- `deny` — assign a IP ACL filter to deny IP packets.
- `ip access-list standard` — create a standard ACL.

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

**Syntax** `resequence access-list {ipv4 | ipv6 | mac} {access-list-name StartingSeqNum Step-to-Increment}`

- Parameters**
- ipv4 | ipv6 | mac** Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.
  - access-list-name** Enter the name of a configured IP access list.
  - StartingSeqNum** Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
  - Step-to-Increment** Enter the step to increment the sequence number. The range is from 1 to 4294967290.

**Defaults** None

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series (IPv6).
8.1.1.0	Introduced on the E-Series (IPv4).
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

#### Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing access-list.

## seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

#### Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address}} [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]
```

To delete a filter, use the `no seq sequence-number` command.

#### Parameters

<b><i>sequence-number</i></b>	Enter a number from 0 to 4294967290.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<b><i>source</i></b>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<b><i>mask</i></b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host <i>ip-address</i></b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.

<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values. The range is from 0 to 63.
<b>ecn</b>	(OPTIONAL) Enter the keyword <code>ecn</code> to match to the ECN values. The range is from 0 to 3.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  <b>NOTE:</b> For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(0.0)</b>	Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
<b>9.11(0.0)</b>	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Add the DSCP value for ACL matching.
<b>8.2.1.0</b>	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added support for the non-contiguous mask and added the <code>monitor</code> option.
<b>6.5.10</b>	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

## Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

# Extended IP ACL Commands

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet's protocol type.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

## deny

Configure a filter that drops IP packets meeting the filter criteria.

### Syntax

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address}
{destination mask | any | host ip-address} [ttl operator] [count [byte] |
log] [dscp value] [order] [monitor] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>ip</b>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list denies all IP protocols.
<b>ip-protocol-number</b>	Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.
<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li></ul>

- `gt`(greater than) — matches packets that contain a `ttl` value that is greater than the specified `ttl` value.
- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets that the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes that the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to enter ACL matches in the log.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(0.0)</b>	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
<b>9.11(0.0)</b>	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Add the DSCP value for ACL matching.

Version	Description
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the noncontiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the *Dell EMC Networking OS Configuration Guide*.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

- `deny tcp` — assign a filter to deny TCP packets.
- `deny udp` — assign a filter to deny UDP packets.
- `ip access-list extended` — create an extended ACL.

## deny icmp

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```
deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [type] [ttl operator] [dscp] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>type</b>	Enter the ICMP packet type. The following types are available: For IPv4:

```
echo count
echo-reply count
host-unreachable count
host-unknown count
network-unknown count
```

```
net-unreachable count
packet-too-big count
parameter-problem count
port-unreachable count
source-quench count
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

<b>t</b>	Enter the keyword <code>t</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(2.0P0)	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

## deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

### Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [bit]
[operator port [port]] [count [bytes] [order] [fragments] [monitor] [no-
drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

**source** Enter the IP address of the network or host from which the packets are sent.

<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>bit</b>	Enter a flag or combination of bits: <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> <li>• <code>established</code>: datagram of established TCP session</li> </ul> <p>Use the <code>established</code> flag to match only ACK and RST flags of established TCP session.</p> <p>You cannot use <code>established</code> along with the other control flags</p> <p>While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.</p>
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li> </ul>
<b>port port</b>	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.
	The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(0.0)</b>	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
<b>9.11(2.0P0)</b>	Added the <code>established</code> parameter on the on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.11(0.0)</b>	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Added the keyword <code>dscp</code> .
<b>8.2.1.0</b>	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .

Version	Description
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```

Rule#  Data                Mask                From To #Covered
1  0000111110100000  1111111111100000  4000 4031 32
2  0000111111000000  1111111111100000  4032 4095 64
3  0001000000000000  1111100000000000  4096 6143 2048
4  0001100000000000  1111110000000000  6144 7167 1024
5  0001110000000000  1111111000000000  7168 7679 512
6  0001111000000000  1111111100000000  7680 7935 256
7  0001111100000000  1111111110000000  7936 7999 64
8  0001111101000000  1111111111111111  8000 8000 1

Total Ports: 4001

```

### Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

```

Rule#  Data                Mask                From To #Covered
1  0000000000000000  1111110000000000  0    1023 1024

Total Ports: 1024

```

### Related Commands

- `deny` — assign a filter to deny IP traffic.
- `deny udp` — assign a filter to deny UDP traffic.

## deny udp

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

### Syntax

```
deny udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host <i>ip-address</i></b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li> </ul>
<b>port <i>port</i></b>	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(0.0)</b>	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.

Version	Description
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>discp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt` or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	00001111110100000	11111111111100000	4000	4031	32
2	00001111111000000	11111111111000000	4032	4095	64
3	00010000000000000	11111000000000000	4096	6143	2048
4	00011000000000000	11111100000000000	6144	7167	1024
5	00011100000000000	11111110000000000	7168	7679	512
6	00011110000000000	11111111000000000	7680	7935	256
7	00011111000000000	11111111110000000	7936	7999	64

```
8 00011111101000000 1111111111111111 8000 8000 1
Total Ports: 4001
```

**Example**

An ACL rule with a TCP port It 1023 uses only one entry in the CAM.

```
Rule# Data Mask From To #Covered
1 0000000000000000 1111110000000000 0 1023 1024
Total Ports: 1024
```

**Related Commands**

- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.

## ip access-list extended

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

**Syntax**

`ip access-list extended access-list-name`

To delete an access list, use the `no ip access-list extended access-list-name` command.

**Parameters**

**access-list-name** Enter a string up to 140 characters long as the access list name.

**Defaults**

All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

## Example

```
DellEMC(conf)# ip access-list extended TESTListEXTEND
DellEMC(config-ext-nacl)#
```

## Related Commands

- [ip access-list standard](#) — configure a standard IP access list.
- [show config](#) — display the current configuration.

# permit

To pass IP packets meeting the filter criteria, configure a filter.

## Syntax

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [count [bytes]] [dscp value] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address in dotted decimal format of the network from which the packet was sent.
<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes processed by the filter.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DCSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the "Quality of Service" section of the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

- Related Commands**
- [ip access-list extended](#) — create an extended ACL.
  - [permit tcp](#) — assign a permit filter for TCP packets.
  - [permit udp](#) — assign a permit filter for UDP packets.

## permit icmp

Configure a filter to allow all or specific ICMP messages.

**Syntax** `permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [type] [dscp] [message-type] [count [byte] | log] [order] [monitor] [fragments] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
<b>any</b>	Enter the keyword <code>any</code> to match and drop specific Ethernet traffic on the interface.
<b>host ip-address</b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>type</b>	Enter the ICMP packet type. The following types are available:

For IPv4:

```
echo count
echo-reply count
host-unreachable count
host-unknown count
network-unknown count
net-unreachable count
packet-too-big count
parameter-problem count
port-unreachable count
source-quench count
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

<b>dscp</b>	Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is 0 to 63.
<b>message-type</b>	(OPTIONAL) Enter an ICMP message type, either with the type (and code, if necessary) numbers or with the name of the message type. The range is 0 to 255 for ICMP type and 0 to 255 for ICMP code.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to have the information kept in an ACL log file.

<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  <b>NOTE:</b> For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the <i>FTOS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History**

Version	Description
<b>9.11(2.0)</b>	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON..
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Added the keyword <code>dscp</code> .
<b>8.2.1.0</b>	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.4.1.0</b>	Added support for noncontiguous mask and added the <code>monitor</code> option.
<b>6.5.10</b>	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *FTOS Configuration Guide*.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

 **NOTE:** When ACL logging and byte counters are configured simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## permit tcp

To pass TCP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit tcp {source mask | any | host ip-address} [bit] [operator port
[port]] {destination mask | any | host ip-address} [bit] [ttl operator]
[dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor]
[no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>bit</b>	<p>Enter a flag or combination of bits:</p> <ul style="list-style-type: none"><li>• <code>ack</code>: acknowledgement field</li><li>• <code>fin</code>: finish (no more data from the user)</li><li>• <code>psh</code>: push function</li><li>• <code>rst</code>: reset the connection</li><li>• <code>syn</code>: synchronize sequence numbers</li><li>• <code>urg</code>: urgent field</li><li>• <code>established</code>: datagram of established TCP session</li></ul> <p>Use the <code>established</code> flag to match only ACK and RST flags of established TCP session.</p> <p>You cannot use <code>established</code> along with the other control flags</p> <p>While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.</p>
<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	<p>Enter one of the following logical operand:</p> <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>dscp</b>	Enter the keyword <code>dscp</code> to permit a packet based on the DSCP value. The range is from 0 to 63.
<b>operator</b>	<p>(OPTIONAL) Enter one of the following logical operand:</p> <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li></ul>
<b>port port</b>	<p>Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.</p> <p>The following list includes some common TCP port numbers:</p> <ul style="list-style-type: none"><li>• 23 = Telnet</li></ul>

- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP

<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.12(0.0)</b>	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
<b>9.11(2.0P0)</b>	Added the <code>established</code> parameter on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.11(0.0)</b>	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Added the keyword <code>ds cp</code> .
<b>8.2.1.0</b>	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```
DellEMC# Data                Mask                From To  #Covered
1 00001111110100000 11111111111000000 4000 4031 32
2 00001111111000000 11111111111000000 4032 4095 64
3 00010000000000000 11111000000000000 4096 6143 2048
4 00011000000000000 11111100000000000 6144 7167 1024
5 00011100000000000 11111110000000000 7168 7679 512
6 00011110000000000 11111111000000000 7680 7935 256
7 00011111000000000 11111111100000000 7936 7999 64
8 00011111010000000 11111111111111111 8000 8000 1

Total Ports: 4001
```

### Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

```
DellEMC# Data                Mask                From To  #Covered
1 00000000000000000 11111100000000000 0     1023 1024

Total Ports: 1024
```

### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## permit udp

To pass UDP packets meeting the filter criteria, configure a filter.

### Syntax

```
permit udp {source mask | any | host ip-address} [operator port [port]]
           {destination mask | any | host ip-address} [ttl operator] [dscp] [operator
           port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.
<b>ttl</b>	Enter the keyword <code>t t l</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>dscp</b>	Enter the keyword <code>d s c p</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter)</li> </ul>
<b>port port</b>	Enter the application layer port number. Enter two port numbers if you are using the <code>range</code> logical operand. The range is 0 to 65535.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the "Quality of Service" section of the *Dell EMC Networking OS Configuration Guide*.

**i** **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

DellEMC#	Data	Mask	From	To	#Covered
1	0000111110100000	1111111111100000	4000	4031	32
2	0000111111000000	1111111111100000	4032	4095	64

### Example

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

```

DellEMC# Data          Mask          From To    #Covered
1 0000000000000000 1111110000000000 0      1023 1024

Total Ports: 1024

```

### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit tcp](#) — assign a permit filter for TCP packets.

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

### Syntax

```
resequence access-list {ipv4 | mac} {access-list-name StartingSeqNum Step-to-Increment}
```

### Parameters

- ipv4 | mac** Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.
- access-list-name** Enter the name of a configured IP access list, up to 140 characters.
- StartingSeqNum** Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
- Step-to-Increment** Enter the step to increment the sequence number. The range is from 1 to 4294967290.

### Defaults

None

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series (IPv4).

Version	Description
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

### Usage Information

When all sequence numbers are exhausted, this feature permits re-assigning a new sequence number to entries of an existing access-list.

## seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator [portnumber | portname]] [ttl operator] [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]
```

### Parameters

<b>sequence-number</b>	Enter a number from 0 to 4294967290.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<b>ip-protocol-number</b>	Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.
<b>icmp</b>	Enter the keyword <code>icmp</code> to configure an ICMP access list filter.
<b>ip</b>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.
<b>tcp</b>	Enter the keyword <code>tcp</code> to configure a TCP access list filter.
<b>udp</b>	Enter the keyword <code>udp</code> to configure a UDP access list filter.
<b>source</b>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address or hostname.
<b>operator</b>	(OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter.)</li> </ul>
<b>portnumber</b>	(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP-DATA and FTP
- 25 = SMTP
- 169 = SNMP

**portname**

(OPTIONAL) Enter the logical name of the protocol.

The following logical names are supported in TCP:

bgp	Border Gateway Protocol (179)
chargen	Character generator (19)
cmd	Remote commands (rcmd, 514)
daytime	Daytime (13)
discard	Discard (9)
domain	Domain Name Service (53)
drip	Dynamic Routing Information Protocol
(3949)	
echo	Echo (7)
exec	Exec (512)
finger	Finger (79)
ftp	File Transfer Protocol (21)
ftp-data	FTP data connections (20)
gopher	Gopher (70)
hostname	NIC hostname server (101)
ident	Ident Protocol (113)
irc	Internet Relay Chat (194)
klogin	Kerberos login (543)
kshell	Kerberos shell (544)
login	Login (rlogin, 513)
lpd	Printer service (515)
nntp	Network News Transport Protocol (119)
pim-rp-disc	PIM-RP-DISC(496)
pop2	Post Office Protocol v2 (109)
pop3	Post Office Protocol v3 (110)
smtp	Simple Mail Transport Protocol (25)
sunrpc	Sun Remote Procedure Call (111)
tacacs	TAC Access Control System (49)
talk	Talk (517)
telnet	Telnet (23)
time	Time (37)
uucp	Unix-to-Unix Copy Program (540)
whois	Nickname (43)
www	World Wide Web (HTTP, 80)

The following logical names are supported in UDP:

biff	Biff (mail notification, comsat, 512)
bootpc	Bootstrap Protocol (BOOTP) client (68)
bootps	Bootstrap Protocol (BOOTP) server (67)
discard	Discard (9)
dnsix	DNSIX security protocol auditing (195)
domain	Domain Name Service (DNS, 53)
echo	Echo (7)
isakmp	Internet Security Association and Key
Management Protocol (500)	
mobile-ip	Mobile IP registration (434)
nameserver	IEN116 name service (obsolete, 42)
netbios-dgm	NetBios datagram service (138)
netbios-ns	NetBios name service (137)
netbios-ss	NetBios session service (139)
non500-isakmp	Internet Security Association and Key
Management Protocol (4500)	
ntp	Network Time Protocol (123)
pim-rp-disc	PIM-RP-DISC(496)
rip	Routing Information Protocol (router,
in.routed, 520)	
snmp	Simple Network Management Protocol (161)
snmptrap	SNMP Traps (162)

sunrpc	Sun Remote Procedure Call (111)
syslog	System Logger (514)
tacacs	TAC Access Control System (49)
talk	Talk (517)
tftp	Trivial File Transfer Protocol (69)
time	Time (37)
who	Who service (rwho, 513)
xdmcp	X Display Manager Control Protocol (177)

- destination** Enter the IP address of the network or host to which the packets are sent.
- ttl** Enter the keyword `ttl` to permit or deny a packet based on the time to live value. The range is from 1 to 255.
- operator** Enter one of the following logical operand:
- `eq`(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range`(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
- count** (OPTIONAL) Enter the keyword `count` to count the packets.
- bytes** (OPTIONAL) Enter the keyword `bytes` to count the bytes.
- log** (OPTIONAL) Enter the keyword `log` to enter ACL matches in the log.
- dscp** (OPTIONAL) Enter the keyword `dscp` to match to the IP DSCP values. The range is from 0 to 63.
- ecn** (OPTIONAL) Enter the keyword `ecn` to match to the ECN values. The range is from 0 to 3.
- order** (OPTIONAL) Enter the keyword `order` to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword `order`, the ACLs have the lowest order by default (255).
- monitor** (OPTIONAL) Enter the keyword `monitor` then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.
-  **NOTE:** For more information, see “Flow-based Monitoring” in the Port Monitoring section of the *Dell EMC Networking OS Configuration Guide*.
- fragments** Enter the keyword `fragments` to use ACLs to control packet fragments.
- no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.11(2.0P0)	Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

If you configure the `sequence-number`, the `sequence-number` is used as a tie breaker for rules with the same order.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

# Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

## clear counters mac access-group

Clear counters for all or a specific MAC ACL.

**Syntax** `clear counters mac access-group [mac-list-name]`

**Parameters** **mac-list-name** (OPTIONAL) Enter the name of a configured MAC access list.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

## mac access-group

Apply a MAC ACL to traffic entering or exiting an interface. You can apply a MAC ACL on a physical, port-channel, or VLAN interface.

**Syntax** `mac access-group access-list-name {in [vlan vlan-range] | optimized | out}`  
To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

## Parameters

- access-list-name*** Enter the name of a configured MAC access list, up to 140 characters.  
 **NOTE:** This option is available only with the keyword `in` option.
- vlan vlan-range*** (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).  
 **NOTE:** This option is available only with the keyword `in` option.
- optimized*** Enter the keyword `optimized` to enable ACL optimization.
- in*** Enter the keyword `in` to configure the ACL to filter incoming traffic.
- out*** Enter the keyword `out` to configure the ACL to filter outgoing traffic.

### **NOTE:**

1. If the MAC ACL is applied on VLAN, none of the VLAN members should have an access list applied for that VLAN.
2. If the MAC ACL is applied on a Physical or Port Channel interface, the VLAN in which this port is associated should not have an access list applied.
3. If the MAC ACL is applied on a VLAN, then that VLAN should not belong to VLAN ACL group.
4. If the MAC ACL is applied on a VLAN ACL group, then none of the VLANs in that group should have an access list applied on it.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.

Version	Description
8.4.1.0	Introduced.

## show mac accounting access-list

Display MAC access list configurations and counters (if configured).

<b>Syntax</b>	<code>show mac accounting access-list [access-list-name [cam_count   interface interface {in   out}]</code>
<b>Parameters</b>	<p><b>access-list-name</b> Enter the name of a configured MAC ACL, up to 140 characters.</p> <p><b>interface interface</b> Enter the keyword <code>interface</code> then the one of the following keywords and the interface information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> <p><b>in   out</b> Identify whether ACL is applied on ingress or egress side.</p>
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.

Version	Description
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series
6.1.1.0	Introduced on the E-Series.

### Usage Information

The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

### Example

```
DellEMC#show mac accounting access-list
Ingress Extended mac access-list acl1 on hundredGigE 1/1
Total cam count 1
  seq 5 permit host 00:00:00:00:00:aa host 00:00:00:00:00:bb
Egress Extended mac access-list acl1 on hundredGigE 1/32
Total cam count 1
  seq 5 permit host 00:00:00:00:00:aa host 00:00:00:00:00:bb
DellEMC#
```

## Standard MAC ACL Commands

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

### deny

To drop packets with a the MAC address specified, configure a filter.

**Syntax** `deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see the "Flow-based Monitoring" in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .

**Defaults** Not enabled.

**Command Modes** CONFIGURATION-MAC ACCESS LIST-STANDARD

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.

**Usage Information** When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- `permit` — configures a MAC address filter to pass packets.
- `seq` — configures a MAC address filter with a specified sequence number.

## mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

**Syntax** `mac access-list standard mac-list-name`

To delete a MAC access list, use the `no mac access-list standard mac-list-name` command.

**Parameters** ***mac-list-name*** Enter a text string as the name of the standard MAC access list (140 character maximum).

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Usage Information

Dell EMC Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, see your line card documentation.

 **NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

### Example

```
DellEMC(conf)# mac-access-list access-list standard TestMAC
DellEMC(config-std-macl)# permit 00:00:00:00:00:00 00:00:00:00:ff:ff
count
DellEMC(config-std-macl)# deny any count
DellEMC(config-std-macl)#
```

## permit

To forward packets from a specific source MAC address, configure a filter.

### Syntax

```
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]]
| [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to forward all packets received with a MAC address.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.
<b>threshold-in msgs <i>count</i></b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval <i>minutes</i></b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .

**Defaults** Not configured.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging `inst"ad`.

- Related Commands**
- `deny` — configure a MAC ACL filter to drop packets.
  - `seq` — configure a MAC ACL filter with a specified sequence number.

## seq

To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

**Syntax** `deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .

**Defaults** Not configured

**Command Modes** CONFIGURATION-MAC ACCESS LIST-STANDARD

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the no-drop parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

### Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

## Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

**NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

### deny

To drop packets that match the filter criteria, configure a filter.

#### Syntax

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype-operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

#### Parameters

<b>any</b>	Enter the keyword <code>any</code> to drop all packets.
<b>host mac-address</b>	Enter the keyword <code>host</code> and then enter a MAC address to drop packets with that host address.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>mac-destination-address</b>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.

<b><i>mac-destination-address-mask</i></b>	Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.
<b><i>ethertype operator</i></b>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> <li>• <i>ev2</i> - is the Ethernet II frame format</li> <li>• <i>11c</i> - is the IEEE 802.3 frame format</li> <li>• <i>snap</i> - is the IEEE 802.3 SNAP frame format</li> </ul>
<b><i>count</i></b>	(OPTIONAL) Enter the keyword <i>count</i> to count packets processed by the filter.
<b><i>byte</i></b>	(OPTIONAL) Enter the keyword <i>byte</i> to count bytes processed by the filter.
<b><i>log</i></b>	(OPTIONAL) Enter the keyword <i>log</i> to include ACL messages in the log.
<b><i>threshold-in-msgs count</i></b>	(OPTIONAL) Enter the <i>threshold-in-msgs</i> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <i>seq</i> , <i>permit</i> , or <i>deny</i> commands. The threshold range is from 1 to 100.
<b><i>interval minutes</i></b>	(OPTIONAL) Enter the keyword <i>interval</i> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b><i>monitor</i></b>	(OPTIONAL) Enter the keyword <i>monitor</i> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .

**Defaults** Not configured.

**Command Modes** CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added the <i>monitor</i> option.

Version	Description
6.1.1.0	Introduced on the E-Series.

**Usage Information**

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- `permit` — configure a MAC address filter to pass packets.
- `seq` — configure a MAC address filter with a specified sequence number.

## mac access-list extended

Name a new or existing extended MAC access control list (extended MAC ACL).

**Syntax**

`mac access-list extended access-list-name [cpu-qos]`

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.

**Parameters**

- access-list-name** Enter a text string as the MAC access list name, up to 140 characters.
- cpu-qos** Enter the keywords `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
6.1.1.0	Introduced on the E-Series.

### Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

### Example

```
DelleMC(conf)# mac-access-list access-list extended TestMATExt
DelleMC(config-ext-macl)# remark 5 IPv4
DelleMC(config-ext-macl)# seq 10 permit any any ev2 eq 800 count bytes
DelleMC(config-ext-macl)# remark 15 ARP
DelleMC(config-ext-macl)# seq 20 permit any any ev2 eq 806 count bytes
DelleMC(config-ext-macl)# remark 25 IPv6
DelleMC(config-ext-macl)# seq 30 permit any any ev2 eq 86dd count bytes
DelleMC(config-ext-macl)# seq 40 permit any any count bytes
DelleMC(config-ext-macl)# exit
DelleMC(conf)# do show mac accounting access-list snickers interface
tengig 1/17 in
Extended mac access-list snickers on TenGigabitEthernet 1/17
seq 10 permit any any ev2 eq 800 count bytes (559851886 packets
191402152148
bytes)
seq 20 permit any any ev2 eq 806 count bytes (74481486 packets 5031686754
bytes)
seq 30 permit any any ev2 eq 86dd count bytes (7751519 packets 797843521
bytes)
```

### Related Commands

- [mac access-list standard](#) — configure a standard MAC access list.
- [show mac accounting access-list](#) — display MAC access list configurations and counters (if configured).

## permit

To pass packets matching the criteria specified, configure a filter.

### Syntax

```
permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype operator] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | mac-destination-address mac-destination-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to forward all packets.
<b>host</b>	Enter the keyword <code>host</code> then a MAC address to forward packets with that host address.
<b><i>mac-source-address</i></b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b><i>mac-source-address-mask</i></b>	(OPTIONAL) Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b><i>mac-destination-address</i></b>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
<b><i>mac-destination-address-mask</i></b>	Specify which bits in the MAC address must be matched.

The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

<b><i>ether</i>type <i>operator</i></b>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> <li>• <code>ev2</code> - is the Ethernet II frame format</li> <li>• <code>11c</code> - is the IEEE 802.3 frame format</li> <li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format</li> </ul>
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  <b>NOTE:</b> For more information, see Flow-based Monitoring in the “Port Monitoring” section of the <i>Dell EMC Networking OS Configuration Guide</i> .

**Defaults** Not configured.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related  
Commands**

- [deny](#) — configure a MAC ACL filter to drop packets.
- [seq](#) — configure a MAC ACL filter with a specified sequence number.

## IP Prefix List Commands

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. To configure or enable IP prefix lists, use these commands.

### clear ip prefix-list

Reset the number of times traffic meets the conditions (“hit” counters) of the configured prefix lists.

**Syntax** `clear ip prefix-list [prefix-name]`

**Parameters** **prefix-name** (OPTIONAL) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.

**Defaults** Clears “hit” counters for all prefix lists unless a prefix list is specified.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Related  
Commands**

- [ip prefix-list](#) — configure a prefix list.

# deny

To drop packets meeting the criteria specified, configure a filter.

**Syntax** `deny ip-prefix [ge min-prefix-length] [le max-prefix-length]`

To delete a drop filter, use the `no deny ip-prefix` command.

<b>Parameters</b>	<b>ip-prefix</b>	Specify an IP prefix in the network/length format. For example, 35.0.0.0/ 8 means match the first 8 bits of address 35.0.0.0.
	<b>ge min-prefix-length</b>	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
	<b>le max-prefix-length</b>	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.

**Defaults** Not configured.

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Usage Information** Sequence numbers for this filter are automatically assigned starting at sequence number 5. If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

## ip prefix-list

Enter the PREFIX-LIST mode and configure a prefix list.

**Syntax** `ip prefix-list prefix-name`

To delete a prefix list, use the `no ip prefix-list prefix-name` command.

**Parameters**      *prefix-name*      Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

**Command Modes**    CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.2.1.1</b>	Introduced on the E-Series.

**Usage Information**      Prefix lists redistribute OSPF and RIP routes meeting specific criteria.

**Related Commands**

- [show ip route list](#) — display IP routes in an IP prefix list.
- [show ip prefix-list summary](#) — display a summary of the configured prefix lists.

## seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

**Syntax**      `seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`.

**Parameters**

<b><i>sequence-number</i></b>	Enter a number. The range is from 1 to 4294967294.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition..
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition.

<b>any</b>	(OPTIONAL) Enter the keyword <code>any</code> to match any packets.
<b>ip-prefix /nn</b>	(OPTIONAL) Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
<b>ge min-prefix-length</b>	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
<b>le max-prefix-length</b>	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.
<b>bitmask number</b>	Enter the keyword <code>bitmask</code> then enter a bit mask number in dotted decimal format.

**Defaults** Not configured.

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.3.1.0</b>	Added the <code>bit mask</code> option.

**Usage Information** If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

## show config

Display the current PREFIX-LIST configurations.

**Syntax** `show config`

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

#### Example

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list snickers
DellEMC(conf-nprefix1)#
```

## show ip prefix-list detail

Display details of the configured prefix lists.

**Syntax** `show ip prefix-list detail [prefix-name]`

**Parameters** *prefix-name* (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Example

```
DellEMC# show ip prefix-list detail
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
  seq 5 permit 1.1.1.0/24 (hit count: 0)
  seq 10 deny 2.1.0.0/16 ge 23 (hit count: 0)
  seq 25 permit 192.0.0.0 bitmask 192.0.0.0 (hit count: 800)
DellEMC#
```

## show ip prefix-list summary

Display a summary of the configured prefix lists.

<b>Syntax</b>	<code>show ip prefix-list summary [prefix-name]</code>
<b>Parameters</b>	<b>prefix-name</b> (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Example

```
DellEMC# show ip prefix-list summary
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
DellEMC#
```

## Route Map Commands

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit.

To configure route maps and their redistribution criteria, use the following commands.

### continue

To a route-map entry with a higher sequence number, configure a route-map.

<b>Syntax</b>	<code>continue [sequence-number]</code>
<b>Parameters</b>	<b><i>sequence-number</i></b> (OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	ROUTE-MAP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
7.4.1.0	Introduced on the E-Series.

### Usage Information

The `continue` feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the `continue` feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the `continue` feature executes only after a successful match occurs. If there are no successful matches, the `continue` feature is ignored.

#### Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The continue clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the continue clause.
- If the next route map entry contains a continue clause, the route map executes the continue clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

#### Set Clause with Continue Clause

If the route-map entry contains sets with the continue clause, set actions are performed first then the continue clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same `set` command.
- If `set community additive` and `set as-path prepend` are configure, the communities and AS numbers are prepended.

### Related Commands

- [set community](#) — specify a COMMUNITY attribute.
- [set as-path](#) — configure a filter to modify the AS path.

## description

Add a description to this route map.

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

**Parameters** **description** Enter a description to identify the route map (80 characters maximum).

**Defaults** None

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
pre-7.7.1.0	Introduced.

**Related Commands**

- [route-map](#) — enable a route map.

## match as-path

To match routes that have a certain AS number in their BGP path, configure a filter.

**Syntax** `match as-path as-path-name`  
 To delete a match AS path filter, use the `no match as-path as-path-name` command.

**Parameters** **as-path-name** Enter the name of an established AS-PATH ACL, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## Related Commands

- [set as-path](#) — add information to the BGP AS\_PATH attribute.

## match community

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

**Syntax** `match community community-list-name [exact]`

To delete a community match filter, use the `no match community` command.

### Parameters

***community-list-name*** Enter the name of a configured community list.

**exact** (OPTIONAL) Enter the keywords `exact` to process only those routes with this community list name.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## Related Commands

- [set community](#) — specify a COMMUNITY attribute.

## match interface

To match routes whose next hop is on the interface specified, configure a filter.

**Syntax** `match interface interface`

To remove a match, use the `no match interface interface` command.

**Parameters*****interface***

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## match ip address

To match routes based on IP addresses specified in an access list, configure a filter.

**Syntax** `match ip address prefix-list-name`  
To delete a match, use the `no match ip address prefix-list-name` command.

**Parameters** ***prefix-list-name*** Enter the name of configured prefix list, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## match ip next-hop

To match based on the next-hop IP addresses specified in an IP access list or IP prefix list, configure a filter.

**Syntax** `match ip next-hop {prefix-list prefix-list-name}`  
To delete a match, use the `no match ip next-hop {prefix-list prefix-list-name}` command.

**Parameters** **prefix-list *prefix-list-name*** Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## match ip route-source

To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

**Syntax** `match ip route-source {prefix-list prefix-list-name}`

To delete a match, use the `no match ip route-source {prefix-list prefix-list-name}` command.

**Parameters** **prefix-list *prefix-list-name*** Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

## Related Commands

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match metric](#) — redistribute routes that match a specific metric.
- [match route-type](#) — redistribute routes that match a route type.
- [match tag](#) — redistribute routes that match a specific tag.

## match metric

To match on a specified value, configure a filter.

### Syntax

```
match metric metric-value
```

To delete a value, use the `no match metric [metric-value]` command.

### Parameters

***metric-value*** Enter a value to match. The range is from zero (0) to 4294967295.

### Defaults

Not configured.

### Command Modes

ROUTE-MAP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
- [match route-type](#) — redistribute routes that match a route type.
- [match tag](#) — redistribute routes that match a specific tag.

## match origin

To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

**Syntax** `match origin {egp | igp | incomplete}`  
 To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

**Parameters**

<b>egp</b>	Enter the keyword <code>egp</code> to match routes originating outside the AS.
<b>igp</b>	Enter the keyword <code>igp</code> to match routes originating within the same AS.
<b>incomplete</b>	Enter the keyword <code>incomplete</code> to match routes with incomplete routing information.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

## match route-type

To match routes based on the how the route is defined, configure a filter.

**Syntax** `match route-type {external [type-1 | type-2] | internal | level-1 | level-2 | local}`

To delete a match, use the `no match route-type {local | internal | external [type-1 | type-2] | level-1 | level-2}` command.

**Parameters**

- external [type-1] type-2]** Enter the keyword `external` then either `type-1` or `type-2` to match only on OSPF Type 1 routes or OSPF Type 2 routes.
- internal** Enter the keyword `internal` to match only on routes generated within OSPF areas.
- level-1** Enter the keyword `level-1` to match IS-IS Level 1 routes.
- level-2** Enter the keyword `level-2` to match IS-IS Level 2 routes.
- local** Enter the keyword `local` to match only on routes generated within the switch.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

- [match metric](#) — redistribute routes that match a specific metric.
- [match tag](#) — redistribute routes that match a specific tag.

## match tag

To redistribute only routes that match a specified tag value, configure a filter.

**Syntax** `match tag tag-value`  
 To remove a match, use the `no match tag` command.

**Parameters** **tag-value** Enter a value as the tag on which to match. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.7.0	Introduced on the S4810.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
- [match metric](#) — redistribute routes that match a specific metric.
- [match route-type](#) — redistribute routes that match a route type.

## route-map

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

**Syntax**

`route-map map-name [permit | deny] [sequence-number]`

To delete a route map, use the `no route-map map-name [permit | deny] [sequence-number]` command.

**Parameters**

<b>map-name</b>	Enter a text string of up to 140 characters to name the route map for easy identification.
<b>permit</b>	(OPTIONAL) Enter the keyword <code>permit</code> to set the route map default as permit. If you do not specify a keyword, the default is <code>permit</code> .
<b>deny</b>	(OPTIONAL) Enter the keyword <code>deny</code> to set the route map default as deny.
<b>sequence-number</b>	(OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535.

**Defaults**

Not configured.

If you do not define a keyword (`permit` or `deny`) for the route map, the `permit` action is the default.

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information**

Use caution when you delete route maps because if you do not specify a sequence number, all route maps with the same *map-name* are deleted when you use the `no route-map map-name` command.

**Example**

```
DellEMC(conf)# route-map dempsey
DellEMC(config-route-map)#
```

**Related Commands**

- [show config](#) — display the current configuration.

## set as-path

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

**Syntax**

```
set as-path prepend as-number [... as-number]
```

To remove an AS-Path setting, use the `no set as-path {prepend as-number | tag}` command.

**Parameters**

**prepend as-number** Enter the keyword `prepend` and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information**

You can prepend up to eight AS numbers to a BGP route.

This command influences best path selection in BGP by inserting a tag or AS number into the AS\_PATH attribute.

**Related Commands**

- [match as-path](#) — redistribute routes that match an AS-PATH attribute.

## set automatic-tag

To automatically compute the tag value of the route, configure a filter.

**Syntax**

`set automatic-tag`

To return to the default, enter `no set automatic-tag`.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related  
Commands**

- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the metric type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set comm-list delete

To remove the specified community list from the BGP route's COMMUNITY attribute, configure a filter.

**Syntax**

```
set comm-list community-list-name delete
```

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

**Parameters**

***community-list-name*** Enter the name of an established Community list, up to 140 characters.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command  
History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage  
Information**

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

- Related Commands**
- [match community](#) — redistribute routes that match the COMMUNITY attribute.
  - [set community](#) — specify a COMMUNITY attribute.

## set community

Allows you to assign a BGP COMMUNITY attribute.

**Syntax** `set community {community-number | local-as | no-advertise | no-export | none} [additive]`

To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none}` command.

### Parameters

<b>community-number</b>	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.
<b>local-AS</b>	Enter the keywords <code>local-as</code> to drop all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.  All routes with the NO_EXPORT_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.
<b>no-advertise</b>	Enter the keywords <code>no-advertise</code> to drop all routes containing the well-known community attribute of NO_ADVERTISE.  All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.
<b>no-export</b>	Enter the keywords <code>no-export</code> to drop all routes containing the well-known community attribute of NO_EXPORT.  All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.
<b>none</b>	Enter the keyword <code>none</code> to remove the community attribute from routes meeting the route map criteria.
<b>additive</b>	(OPTIONAL) Enter the keyword <code>additive</code> to add the communities to already existing communities.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [match community](#) — redistribute routes that match the COMMUNITY attribute.
- [show ip bgp community](#) — display BGP community groups.

## set level

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

**Syntax**

```
set level {backbone | level-1 | level-1-2 | level-2 | stub-area}
```

To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area}` command.

**Parameters**

<b>backbone</b>	Enter the keyword <code>backbone</code> to redistribute matched routes to the OSPF backbone area (area 0.0.0.0).
<b>level-1</b>	Enter the keyword <code>level-1</code> to redistribute matched routes to IS-IS Level 1.
<b>level-1-2</b>	Enter the keyword <code>level-1-2</code> to redistribute matched routes to IS-IS Level 1 and Level 2.
<b>level-2</b>	Enter the keyword <code>level-2</code> to redistribute matched routes to IS-IS Level 2.
<b>stub-area</b>	Enter the keyword <code>stub</code> to redistributed matched routes to OSPF stub areas.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Dell EMC Networking OS Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [set automatic-tag](#) — compute the tag value of the route.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the metric type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set local-preference

To set the BGP LOCAL\_PREF attribute for routers within the local autonomous system, configure a filter.

**Syntax**

`set local-preference value`

To delete a BGP LOCAL\_PREF attribute, use the `no set local-preference` command.

**Parameters**

**value** Enter a number as the LOCAL\_PREF attribute value. The range is from 0 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information** The `set local-preference` command changes the LOCAL\_PREF attribute for routes meeting the route map criteria. To change the LOCAL\_PREF for all routes, use the `bgp default local-preference` command.

**Related Commands**

- [bgp default local-preference](#) — change the default LOCAL\_PREF attribute for all routes.

## set metric

To assign a new metric to redistributed routes, configure a filter.

**Syntax** `set metric [+ | -] metric-value`  
To delete a setting, enter `no set metric`.

**Parameters**

- +** (OPTIONAL) Enter + to add a metric-value to the redistributed routes.
- (OPTIONAL) Enter - to subtract a metric-value from the redistributed routes.
- metric-value** Enter a number as the new metric value. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Related Commands**

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric-type](#) — specify the route type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

**Syntax** `set metric-type {internal | external | type-1 | type-2}`

To delete a setting, use the `no set metric-type` command.

<b>Parameters</b>	<b>internal</b>	Enter the keyword <code>internal</code> to assign the Interior Gateway Protocol metric of the next hop as the route's BGP MULTI_EXIT_DES (MED) value.
	<b>external</b>	Enter the keyword <code>external</code> to assign the IS-IS external metric.
	<b>type-1</b>	Enter the keyword <code>type-1</code> to assign the OSPF Type 1 metric.
	<b>type-2</b>	Enter the keyword <code>type-2</code> to assign the OSPF Type 2 metric.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Related Commands**

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set next-hop

To specify an IP address as the next hop, configure a filter.

**Syntax** `set next-hop ip-address`

To delete the setting, use the `no set next-hop ip-address` command.

<b>Parameters</b>	<b><code>ip-address</code></b>	Specify an IP address in dotted decimal format.
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	ROUTE-MAP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

<b>Usage Information</b>	If you configure the <code>set next-hop</code> command, its configuration takes precedence over the <code>neighbor next-hop-self</code> command in the ROUTER BGP mode.  If you configure the <code>set next-hop</code> command with the interface's IP address (either Loopback or physical), the software declares the route unreachable.
--------------------------	---

<b>Related Commands</b>	<ul style="list-style-type: none"><li>• <a href="#">match ip next-hop</a> — redistribute routes that match the next-hop IP address.</li></ul>
-------------------------	---

## set origin

To manipulate the BGP ORIGIN attribute, configure a filter.

<b>Syntax</b>	<code>set origin {igp   egp   incomplete}</code> To delete an ORIGIN attribute setting, use the <code>no set origin</code> command.
---------------	--

<b>Parameters</b>	<b><code>egp</code></b>	Enter the keyword <code>egp</code> to set routes originating from outside the local AS.
	<b><code>igp</code></b>	Enter the keyword <code>igp</code> to set routes originating within the same AS.
	<b><code>incomplete</code></b>	Enter the keyword <code>incomplete</code> to set routes with incomplete routing information.
<b>Defaults</b>	Not configured.

7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## set tag

To specify a tag for redistributed routes, configure a filter.

**Syntax** `set tag tag-value`

To delete a setting, use the `no set tag` command.

**Parameters** **tag-value** Enter a number as the tag. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the route type assigned to redistributed routes.

## set weight

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

**Syntax** `set weight weight`

To delete a weight specification, use the `no set weight weight` command.

**Parameters**

**weight** Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is router-originated = **32768** and all other routes = **0**.  
When there are multiple routes to the same destination, the routes with a higher weight are preferred.

**Defaults** router-originated = **32768**; all other routes = **0**

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information**

If you do not use the `set weight` command, router-originated paths have a weight attribute of 32768 and all other paths have a weight attribute of zero.

## show config

Display the current route map configuration.

**Syntax** `show config`

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Example**

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list PL_OSPF_to_RIP
 seq 5 permit 1.1.1.0/24
 seq 10 deny 2.1.0.0/16 ge 23
```

```
seq 25 permit 192.0.0.0 bitmask 192.0.0.0
DellEMC(conf-nprefix1)#
```

## show route-map

Display the current route map configurations.

**Syntax** `show route-map [map-name]`

**Parameters** **map-name** (OPTIONAL) Enter the name of a configured route map, up to 140 characters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

### Example

```
DellEMC# show route-map
route-map firpo, permit, sequence 10
Match clauses:
Set clauses:
tag 34
DellEMC#
```

**Related Commands**

- [route-map](#) — configure a route map.

# deny (for Standard IP ACLs)

To drop packets with a certain IP address, configure a filter.

**Syntax** `deny {source | any | host {ip-address}}[count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

**Parameters**

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows

that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- [ip access-list standard](#) — configure a standard ACL.
- [permit](#) — configure a permit filter.

## deny (for Extended IP ACLs)

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax**

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address}
{destination mask | any | host ip-address} [ttl operator] [count
[byte]] [dscp value] [order] [monitor] [fragments] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [deny tcp](#) — assign a filter to deny TCP packets.
- [deny udp](#) — assign a filter to deny UDP packets.
- [ip access-list extended](#) — create an extended ACL.

# seq (for Standard IPv4 ACLs)

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

## Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address} [count [bytes]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs <i>count</i></b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.

- interval *minutes*** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- [deny](#) — configure a filter to drop packets.
- [permit](#) — configure a filter to forward packets.

# deny tcp (for Extended IP ACLs)

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

**Syntax** `deny tcp {source mask | any | host ip-address} [bit] [operator port [port]] {destination mask | any | host ip-address} [ttl operator] [dscp] [bit] [operator port [port]] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

<b>Parameters</b>	<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
	<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
	<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
	<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
	<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
	<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added the support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added the support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- `deny` — assign a filter to deny IP traffic.
- `deny udp` — assign a filter to deny UDP traffic.

## deny (for Standard MAC ACLs)

To drop packets with a the MAC address specified, configure a filter.

### Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]]
[log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started

and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `deny` — assign a IP ACL filter to deny IP packets.
- `ip access-list standard` — create a standard ACL.

## permit icmp (for Extended IP ACLs)

Configure a filter to allow all or specific ICMP messages.

**Syntax**

```
permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit udp (for Extended IP ACLs)

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte]] [order] [fragments] [log [interval minutes]
[threshold-in-msgs [count]]][monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

<b>Parameters</b>	<p><b>ttl</b> Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.</p> <p><b>operator</b> Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> <p><b>log</b> (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.</p> <p><b>threshold-in msgs count</b> (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code>, <code>permit</code>, or <code>deny</code> commands. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit tcp](#) — assign a permit filter for TCP packets.

## permit (for Extended IP ACLs)

To pass IP packets meeting the filter criteria, configure a filter.

#### Syntax

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [ttl operator] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added the support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added the support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- [ip access-list extended](#) — create an extended ACL.
- [permit tcp](#) — assign a permit filter for TCP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## permit (for Standard MAC ACLs)

To forward packets from a specific source MAC address, configure a filter.

**Syntax** `permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

## permit tcp (for Extended IP ACLs)

To pass TCP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit tcp {source mask | any | host ip-address} [bit] [operator port
[port]] {destination mask | any | host ip-address} [bit] [ttl operator]
[dscp] [operator port [port]] [count [byte]] [order] [fragments] [log
[interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## seq (for IP ACLs)

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [ttl operator] [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

### Parameters

<b>ttl</b>	Enter the keyword <code>ttl</code> to permit or deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand:

- `eq`(equal to) — matches packets that contain a `ttl` value that is equal to the specified `ttl` value.
- `neq`(not equal to) — matches packets that contain a `ttl` value that is not equal to the specified `ttl` value.
- `gt`(greater than) — matches packets that contain a `ttl` value that is greater than the specified `ttl` value.
- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

## seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

**Syntax**

```
seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [operator port [portnumber | portname]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

**Parameters**

<b><i>sequence-number</i></b>	Enter a number from 0 to 4294967290.
<b><i>deny</i></b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<b><i>permit</i></b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<b><i>ipv6-protocol-number</i></b>	Enter a number to filter based on the protocol identified in the IPv6 protocol header.
<b><i>icmp</i></b>	Enter the keyword <code>icmp</code> to configure an ICMP access list filter.
<b><i>ip</i></b>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.
<b><i>tcp</i></b>	Enter the keyword <code>tcp</code> to configure a TCP access list filter.
<b><i>udp</i></b>	Enter the keyword <code>udp</code> to configure a UDP access list filter.
<b><i>source</i></b>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<b><i>mask</i></b>	(OPTIONAL) Enter a network mask in /prefix format (/x) .
<b><i>any</i></b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b><i>host ipv6-address</i></b>	Enter the keyword <code>host</code> and then enter the IPv6 address to specify a host IP address or hostname.
<b><i>operator</i></b>	(OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter.)</li> </ul>
<b><i>portnumber</i></b>	(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP-DATA and FTP
- 25 = SMTP
- 169 = SNMP

**portname**

(OPTIONAL) Enter the logical name of the protocol.

The following logical names are supported in TCP:

bgp	Border Gateway Protocol (179)
chargen	Character generator (19)
cmd	Remote commands (rcmd, 514)
daytime	Daytime (13)
discard	Discard (9)
domain	Domain Name Service (53)
drip	Dynamic Routing Information Protocol
(3949)	
echo	Echo (7)
exec	Exec (512)
finger	Finger (79)
ftp	File Transfer Protocol (21)
ftp-data	FTP data connections (20)
gopher	Gopher (70)
hostname	NIC hostname server (101)
ident	Ident Protocol (113)
irc	Internet Relay Chat (194)
klogin	Kerberos login (543)
kshell	Kerberos shell (544)
login	Login (rlogin, 513)
lpd	Printer service (515)
nntp	Network News Transport Protocol (119)
pim-rp-disc	PIM-RP-DISC(496)
pop2	Post Office Protocol v2 (109)
pop3	Post Office Protocol v3 (110)
smtp	Simple Mail Transport Protocol (25)
sunrpc	Sun Remote Procedure Call (111)
tacacs	TAC Access Control System (49)
talk	Talk (517)
telnet	Telnet (23)
time	Time (37)
uucp	Unix-to-Unix Copy Program (540)
whois	Nickname (43)
www	World Wide Web (HTTP, 80)

The following logical names are supported in UDP:

biff	Biff (mail notification, comsat, 512)
bootpc	Bootstrap Protocol (BOOTP) client (68)
bootps	Bootstrap Protocol (BOOTP) server (67)
discard	Discard (9)
dnsix	DNSIX security protocol auditing (195)
domain	Domain Name Service (DNS, 53)
echo	Echo (7)
isakmp	Internet Security Association and Key
Management Protocol (500)	
mobile-ip	Mobile IP registration (434)
nameserver	IEN116 name service (obsolete, 42)
netbios-dgm	NetBios datagram service (138)
netbios-ns	NetBios name service (137)
netbios-ss	NetBios session service (139)
non500-isakmp	Internet Security Association and Key
Management Protocol (4500)	
ntp	Network Time Protocol (123)
pim-rp-disc	PIM-RP-DISC(496)
rip	Routing Information Protocol (router,
in.routed, 520)	
snmp	Simple Network Management Protocol (161)
snmptrap	SNMP Traps (162)

sunrpc	Sun Remote Procedure Call (111)
syslog	System Logger (514)
tacacs	TAC Access Control System (49)
talk	Talk (517)
tftp	Trivial File Transfer Protocol (69)
time	Time (37)
who	Who service (rwho, 513)
xdmcp	X Display Manager Control Protocol (177)

- destination** Enter the IP address of the network or host to which the packets are sent.
- count** (OPTIONAL) Enter the keyword `count` to count the packets.
- bytes** (OPTIONAL) Enter the keyword `bytes` to count the bytes.
- log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- threshold-in  
msgs count** (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminate with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- interval minutes** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.11(2.0P0)</b>	Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

- [permit](#) – configure a filter to forward packets.

## permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

#### Syntax

```
permit udp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

#### Parameters

<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit tcp (for IPv6 ACLs)

Configure a filter to pass TCP packets that match the filter criteria.

### Syntax

```
permit tcp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [bit] [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes]] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

### Parameters

<b>source address mask</b>	Enter a network mask in /prefix format (/x).
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.

<b>host ipv6-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination address</b>	Enter the IPv6 address of the network or host to which the packets are sent.
<b>bit</b>	<p>Enter a flag or combination of bits:</p> <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> <li>• <code>established</code>: datagram of established TCP session</li> </ul> <p>Use the <code>established</code> flag to match only ACK and RST flags of established TCP session.</p> <p>You cannot use <code>established</code> along with the other control flags</p> <p>While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.</p>
<b>operator</b>	<p>(OPTIONAL) Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li> </ul>
<b>port port</b>	<p>Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.</p> <p>The following list includes some common TCP port numbers:</p> <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>
<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	<p>Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding

which the generation of ACL logs is terminated. with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

**interval *minutes*** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- `permit` – assign a permit filter for IP packets.

# permit icmp (for IPv6 ACLs)

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax** `permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [type] [message-type] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

## Parameters

**source address mask** Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**any** Enter the keyword `any` to specify that all routes are subject to the filter.

**host ipv6-address** Enter the keyword `host` then the IPv6 address to specify a host IP address.

**destination** Enter the IP address of the network or host to which the packets are sent.

**type** Enter the ICMP packet type. The following types are available:

For IPv4:

```
echo count
echo-reply count
host-unreachable count
host-unknown count
network-unknown count
net-unreachable count
packet-too-big count
parameter-problem count
port-unreachable count
source-quench count
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

**ttl** Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

**operator** Enter one of the following logical operand:

- `eq`(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.

- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

### Command History

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit (for IPv6 ACLs)

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

**Syntax** `permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

<b>Parameters</b>	<p><b>log</b> (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.</p> <p><b>threshold-in-msgs count</b> (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code>, <code>permit</code>, or <code>deny</code> commands. The threshold range is from 1 to 100.</p> <p><b>interval minutes</b> (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.</p> <p><b>monitor</b> (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.</p> <p><b>no-drop</b> Enter the keywords <code>no-drop</code> to match only the forwarded packets.</p>
-------------------	---

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.

Version	Description
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

### Syntax

```
deny udp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [operator port
[port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-
in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

<b>ttl</b>	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which

the generation of ACL logs is terminated. with the seq, permit, or deny commands. The threshold range is from 1 to 100.

**interval *minutes*** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.12(0.0)</b>	Introduced the <code>t11</code> parameter.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.
<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

**Syntax** `deny tcp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [bit] [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes]] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

## Parameters

<b>source address mask</b>	Enter a network mask in /prefix format (/x).
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ipv6-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination address</b>	Enter the IPv6 address of the network or host to which the packets are sent.
<b>bit</b>	Enter a flag or combination of bits: <ul style="list-style-type: none"><li>• <code>ack</code>: acknowledgement field</li><li>• <code>fin</code>: finish (no more data from the user)</li><li>• <code>psh</code>: push function</li><li>• <code>rst</code>: reset the connection</li><li>• <code>syn</code>: synchronize sequence numbers</li><li>• <code>urg</code>: urgent field</li><li>• <code>established</code>: datagram of established TCP session</li></ul> Use the <code>established</code> flag to match only ACK and RST flags of established TCP session. You cannot use <code>established</code> along with the other control flags While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li></ul>
<b>port port</b>	Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"><li>• 23 = Telnet</li><li>• 20 and 21 = FTP</li><li>• 25 = SMTP</li><li>• 169 = SNMP</li></ul>
<b>ttl</b>	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand:

- `eq`(equal to) — matches packets that contain a `ttl` value that is equal to the specified `ttl` value.
- `neq`(not equal to) — matches packets that contain a `ttl` value that is not equal to the specified `ttl` value.
- `gt`(greater than) — matches packets that contain a `ttl` value that is greater than the specified `ttl` value.
- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.12(0.0)</b>	Introduced the <code>t11</code> parameter.
<b>9.11(2.0P0)</b>	Added the <code>established</code> parameter on the on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started

and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

### Syntax

```
deny icmp {source address mask | any | host ipv6-address} {destination  
address | any | host ipv6-address} [type] [message-type] [ttl operator]  
[count [byte]] | [log [interval minutes] [threshold-in-msgs [count]]  
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

<b>source address mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-v6address</b>	Enter the keyword <code>host</code> then the IPv6 address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>type</b>	Enter the ICMP packet type. The following types are available:

For IPv4:

```
echo count  
echo-reply count  
host-unreachable count  
host-unknown count  
network-unknown count  
net-unreachable count  
packet-too-big count  
parameter-problem count  
port-unreachable count  
source-quench count  
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

<b>t</b>	Enter the keyword <code>t</code> to deny a packet based on the time to live value. The range is from 1 to 255.
<b>operator</b>	Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul>
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.12(0.0)</b>	Introduced the <code>t</code> parameter.
<b>9.11(2.0P0)</b>	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.5(0.1)	Introduced on the Z9500.
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny (for IPv6 ACLs)

Configure a filter that drops IPv6 packets that match the filter criteria.

### Syntax

```
deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]]
[dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs
[count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>

If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection.

The Dell EMC Networking OS implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03, and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels

## Topics:

- [bfd all-neighbors](#)
- [bfd disable](#)
- [bfd enable \(Configuration\)](#)
- [bfd enable \(Interface\)](#)
- [bfd interval](#)
- [bfd protocol-liveness](#)
- [ip route bfd](#)
- [ip ospf bfd all-neighbors](#)
- [ipv6 ospf bfd all-neighbors](#)
- [ipv6 route bfd](#)
- [isis bfd all-neighbors](#)
- [neighbor bfd](#)
- [neighbor bfd disable](#)
- [show bfd neighbors](#)
- [vrrp bfd neighbor](#)

## bfd all-neighbors

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

**Syntax** `bfd all-neighbors [interval interval min_rx min_rx multiplier value role {active | passive}]`

Parameters		
<b>interval</b> <i>milliseconds</i>	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.	
<b>min_rx</b> <i>milliseconds</i>	Enter the keyword <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.	
<b>multiplier</b> <i>value</i>	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .	
<b>role</b> [active   passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"> <li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> The default is <b>active</b> .	

**Defaults** See *Parameters*.

**Command Modes** ROUTER OSPF  
ROUTER OSPFv3  
ROUTER BGP  
ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.13(0.0)</b>	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
<b>9.11(2.1P1)</b>	Introduced support for enabling BFD on non-default VRFs for OSPFv2 on all the remaining Dell EMC Networking OS platforms.  Introduced support for enabling BFD on non-default VRFs for OSPFv3 on all the Dell EMC Networking OS platforms.
<b>9.10(0.2)</b>	Introduced support for enabling BFD on non-default VRFs for OSPFv2 on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.2.(0.0)</b>	Introduced BFD for VRRP and OSPFv3 on Z9000, S4810, and S4820T.
<b>9.0.0.0</b>	Introduced BFD for BGP on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.8.0</b>	Introduced BFD for BGP on the S4810.
<b>8.4.1.3</b>	Introduced BFD for BGP on the E-Series.
<b>8.2.1.0</b>	Introduced BFD for OSPF and ISIS on the E-Series.
<b>7.6.1.0</b>	Introduced BFD for OSPF on the C-Series.
<b>7.5.1.0</b>	Introduced BFD for ISIS on the E-Series.
<b>7.4.1.0</b>	Introduced BFD for OSPF on the E-Series.

**Usage Information**

All neighbors inherit the timer values configured with the `bfd neighbor` command except in the following cases:

- Timer values configured with the `isis bfd all-neighbors` or `ip ospf bfd all-neighbors` commands in INTERFACE mode override timer values configured with the `bfd neighbor` command. Likewise, using the `no bfd neighbor` command does not disable BFD on an interface if you explicitly enable BFD using the `isis bfd all-neighbors` command.
- Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/

disable values configured with the `bfd neighbor` command or configured for the peer group to which a neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

You can enable BFD on both default and nondefault VRFs for OSPF and BGP protocols for both IPv4 and IPv6 neighbors.

 **NOTE:** The `bfd all-neighbors` command is applicable for both IPv4 and IPv6 BGP sessions.

## bfd disable

Disable BFD on an interface.

**Syntax** `bfd disable`

Re-enable BFD using the `no bfd disable` command.

**Defaults** BFD is disabled by default.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2(0.2)	Introduced on S4810.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

## bfd enable (Configuration)

Enable BFD on all interfaces.

**Syntax** `bfd enable`

Disable BFD using the `no bfd enable` command.

**Defaults** BFD is disabled by default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

## bfd enable (Interface)

Enable BFD on an interface.

**Syntax** `bfd enable`

**Defaults** BFD is enabled on all interfaces when you enable BFD from CONFIGURATION mode.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

# bfd interval

Specify non-default BFD session parameters beginning with the transmission interval.

**Syntax** `bfd interval interval min_rx min_rx multiplier value role {active | passive}`

<b>Parameters</b>	<b>interval</b> <i>milliseconds</i>	Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.
	<b>min_rx</b> <i>milliseconds</i>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.
	<b>multiplier</b> <i>value</i>	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .
	<b>role</b> [active   passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"><li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li><li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li></ul> The default is <b>Active</b> .

**Defaults** Refer to *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

## Example

```
DellEMC(conf-if-te-1/3/1)# bfd interval 250 min_rx 300 multiplier 4 role
passive
DellEMC(conf-if-te-1/3/1)#
```

# bfd protocol-liveness

Enable the BFD protocol liveness feature.

<b>Syntax</b>	<code>bfd protocol-liveness</code>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>7.4.1.0</b>	Introduced on the E-Series.

<b>Usage Information</b>	Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.
--------------------------	---

# ip route bfd

Enable BFD for all neighbors configured through static routes.

<b>Syntax</b>	<code>ip route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active   passive}]</code>
	To disable BFD for all neighbors configured through static routes, use the <code>no ip route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active   passive}]</code> command.

<b>Parameters</b>	<b>vrf vrf-name</b> Enter the keyword <code>vrf</code> and then the name of the VRF.
	<b>prefix-list prefix-list-name</b> (Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific neighbors.
	<b>interval milliseconds</b> (OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .
	<b>min_rx milliseconds</b> Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .
	<b>multiplier value</b> Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .

**role [active | passive]** Enter the role that the local system assumes:

- **Active** — active system initiates the BFD session. Both systems can be active for the same session.
- **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

**Defaults** See *Parameters*.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.13(0.0)</b>	Introduced the <code>vrf</code> keyword on S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.11(2.5)</b>	Introduced the <code>vrf</code> keyword on the Z9100-ON.
<b>9.11(0.0)</b>	Introduced the <code>prefix-list</code> keyword.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.3.(0.0)</b>	Introduced on S6000.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.2.(0.0)</b>	Introduced on Z9000, S4810, and S4820T.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

## ip ospf bfd all-neighbors

Establish BFD sessions with all OSPF neighbors on a single interface or use non-default BFD session parameters.

**Syntax** `ip ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To disable all BFD sessions on an OSPF interface implicitly, use the `no ip ospf bfd all-neighbors disable` command in interface mode..

**Parameters**

**disable** (OPTIONAL) Enter the keyword `disable` to disable BFD on this interface.

**interval milliseconds** (OPTIONAL) Enter the keyword `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is **200**.

<b>min_rx milliseconds</b>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .
<b>multiplier value</b>	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .
<b>role [active   passive]</b>	Enter the role that the local system assumes: <ul style="list-style-type: none"> <li>• <i>Active</i> — active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <i>Passive</i> — passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> The default is <b>Active</b> .

**Defaults** See *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.2)</b>	Introduced support for enabling BFD on non-default VRFs for OSPFv2.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2.0.0</b>	Introduced on the Z9000, S4820T, and S4810.

**Usage Information**

This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ip ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

## ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

**Syntax** `ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode..

**Parameters**

<b>disable</b>	(OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.
<b>interval milliseconds</b>	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .
<b>min_rx milliseconds</b>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .

- multiplier *value*** Enter the keyword `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is **3**.
- role [active | passive]** Enter the role that the local system assumes:
- **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.
- The default is **Active**.

**Defaults** See *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2.0.0</b>	Introduced on the Z9000, S4820T, and S4810.

**Usage Information** This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

## ipv6 route bfd

Enable BFD for all IPv6 neighbors configured through static routes.

**Syntax** `ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]`

To disable BFD for all IPv6 neighbors configured through static routes, use the `no ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

Parameters	
<b>vrf <i>vrf-name</i></b>	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to enable or disable BFD on the next-hop IPv6 neighbor corresponding to that VRF.
<b>prefix-list <i>prefix-list-name</i></b>	(Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific IPv6 neighbors.
<b>interval <i>milliseconds</i></b>	(OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .
<b>min_rx <i>milliseconds</i></b>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .

- multiplier *value*** Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is **3**.
- role [active | passive]** Enter the role that the local system assumes:
- **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.
- The default is **Active**.

**Defaults** See *Parameters*.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.13(0.0)</b>	Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6100-ON, C9010, and the Z9500.
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.11(2.5)</b>	Introduced the <code>ipv6 route bfd</code> command on the Z9100-ON.

### Example

```
DelleMC(conf)#ipv6 route bfd
DelleMC(conf)#ipv6 route bfd vrf vrf1 prefix-list p6_le
```

## isis bfd all-neighbors

Enable BFD on all IS-IS neighbors discovered on an interface.

**Syntax** `isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To remove all BFD sessions with IS-IS neighbors discovered on this interface, use the `no isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]` command.

### Parameters

- disable** (OPTIONAL) Enter the keyword `disable` to disable BFD on this interface.
- interval *milliseconds*** (OPTIONAL) Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is **200**.
- min\_rx *milliseconds*** Enter the keywords `min_rx` to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is **200**.
- multiplier *value*** Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is **3**.
- role [active | passive]** Enter the role that the local system assumes:
- **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.
- The default is **Active**.

**Defaults** See *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.0.0.0	Introduced on Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on S4810.
8.2.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the E-Series.

**Usage Information** This command provides the flexibility to fine-tune the timer values based on individual interface needs when ISIS BFD is configured in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if BFD is configured in CONFIGURATION mode.

To disable BFD on a specific interface while BFD is configured in CONFIGURATION mode, use the keyword `disable`.

## neighbor bfd

Explicitly enable or disable a BFD session with a BGP neighbor or a BGP peer group.

**Syntax** `neighbor {ip-address | ipv6-address | peer-group-name} bfd`

**Parameters**

- ip-address*** Enter the IP address of the BGP neighbor that you want to explicitly enable for BFD sessions in dotted decimal format (A.B.C.D).
- peer-group-name*** Enter the name of the peer group that you want to explicitly enable for BFD sessions.

**Defaults** None

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series.

### Usage Information

When you enable a BFD session with a specified BGP neighbor or peer group using the `bfd neighbor` command, the default BFD session parameters are used (interval: **200** milliseconds, min\_rx: **200** milliseconds, multiplier: **3** packets, and role: **active**) if you have not specified parameters with the `bfd neighbor` command.

When you explicitly enable a BGP neighbor for a BFD session with the `bfd neighbor` command:

- The neighbor does not inherit the global BFD enable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, min\_rx, and multiplier.

### Related Commands

- [neighbor bfd disable](#) — disable a BFD session explicitly with a BGP neighbor or a BGP peer group.

## neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

**Syntax** `neighbor {ip-address | ipv6-address | peer-group-name} bfd disable`

**Parameters**

- ip-address*** Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).
- peer-group-name*** Enter the name of the peer group that you want to explicitly disable for BFD sessions.

**Defaults** None

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series.

### Usage Information

When you explicitly disable a BGP neighbor for a BFD session with the `neighbor bfd disable` command:

- The neighbor does not inherit the global BFD disable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: `interval`, `min_rx`, and `multiplier`.

When you remove the Disabled state of a BFD for a BGP session with a specified neighbor by entering the `no neighbor bfd disable` command, the BGP link with the neighbor returns to normal operation and uses the BFD session parameters globally configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.

## show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

### Syntax

```
show bfd [vrf vrf name] neighbors [interface] [detail]
```

### Parameters

<b>vrf vrf name</b>	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to display the BFD sessions with all neighbors within the VRF.
<b>interface</b>	(OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port/subport information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>
<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to view detailed information about BFD neighbors.

### Defaults

None

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.1P1)	Introduced the <code>vrf</code> keyword on all the remaining Dell EMC Networking OS platforms.
9.10(0.2)	Introduced the <code>vrf</code> keyword on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Added support for BFD for BGP on the S4810.
8.4.1.3	Added support for BFD for BGP on the E-Series.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Added support for BFD for VLAN and port-channel interfaces on the E-Series.
7.4.1.0	Introduced BFD on physical ports on the E-Series.

## Example

The following example shows the `show bfd neighbors` command output for the default VRF.

```
show bfd neighbors

*          - Active session role
Ad Dn     - Admin Down
B         - BGP
C         - CLI
I         - ISIS
O         - OSPF
O3        - OSPFv3
R         - Static Route (RTM)
M         - MPLS
V         - VRRP
VT        - Vxlan Tunnel

LocalAddr  RemoteAddr  Interface  State  Rx-int  Tx-int  Mult  Clients
* 5.1.1.1  5.1.1.2    Po 30     Up     200    200    3      O
* 6.1.1.1  6.1.1.2    Vl 30     Up     200    200    3      O
* 7.1.1.1  7.1.1.2    Te 1/21/1 Up     200    200    3      O
* 11:::1   11:::2     Te 1/1    Up     200    200    3      R
* 21:::1   21:::2     Vl 100    Up     200    200    3      R
* 31:::1   31:::2     Vl 101    Up     200    200    3      R
```

The following example shows the `show bfd vrf neighbors` command output showing the nondefault VRF.

```
DellEMC(conf)#do sho bfd vrf vrf2 neighbors

*          - Active session role
Ad Dn     - Admin Down
B         - BGP
C         - CLI
I         - ISIS
```

```

O      - OSPF
O3     - OSPFv3
R      - Static Route (RTM)
M      - MPLS
V      - VRRP
VT     - Vxlan Tunnel

```

LocalAddr	RemoteAddr	Interface	State	Rx-int	Tx-int	Mult
VRF Clients						
* 13::1 R	13::2	Te 1/1/1	Up	200	200	3 2
* 23::1 R	23::2	Vl 300	Up	200	200	3 2
* 33::1 R	33::2	Vl 301	Up	200	200	3 2
* 13.1.1.1 R	13.1.1.2	Te 1/1/	Up	200	200	3 2
* 23.1.1.1 R	23.1.1.2	Vl 300	Up	200	200	3 2
* 33.1.1.1 R	33.1.1.2	Vl 301	Up	200	200	3 2

**Example (Detail)** The following example shows the `show bfd vrf neighbors detail` command output showing the nondefault VRF called "VRF\_blue".

```

show bfd vrf VRF_blue neighbors detail

Session Discriminator: 5

### Related Commands

- [bfd all-neighbors](#) — establish BFD sessions with all neighbors discovered by the IS-IS protocol or OSPF protocol out of all interfaces.

## vrrp bfd neighbor

Establish a BFD for VRRP session with a neighbor.

**Syntax** `vrrp bfd neighbor ip-address`

To remove the BFD session with the neighbor, use the `no vrrp bfd neighbor ip-address` command.

**Parameters** ***ip-address*** Enter the IP address of the neighbor in dotted decimal format (A.B.C.D).

**Defaults** None

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

<b>Version</b>	<b>Description</b>
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the C-Series.
<b>7.5.1.0</b>	Added support for VLAN and port-channel interfaces on the E-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

**Related  
Commands**

- [show bfd neighbors](#) — display the BFD neighbor information on all interfaces or a specified interface.

# Boot Command Line Interface

To access this BOOT\_USER mode, first boot your Dell EMC Networking platform. When you see the “Press ESC to stop auto-boot”, press the ESC key to log into BCLI

You enter BOOT\_USER mode immediately, as indicated by the BOOT\_USER# prompt.

**NOTE:** All commands in this chapter are in `boot_user` mode. These commands are supported on the Dell EMC Networking platform.

You cannot use the Tab key to complete commands in this mode.

## Topics:

- [boot change](#)
- [boot message](#)
- [boot show net config retries](#)
- [boot write net config retries](#)
- [boot zero](#)
- [default-gateway](#)
- [etheraddr <macaddr>](#)
- [ignore enable-password](#)
- [ignore startup-config](#)
- [interface management ethernet ip address](#)
- [NVRAM erase](#)
- [reload](#)
- [serial console](#)
- [show bootvar](#)
- [show default-gateway](#)
- [show interface management ethernet](#)
- [show serial console baud rate](#)
- [watchdog <string>](#)

## boot change

Change the primary, secondary, or default Dell EMC Networking OS boot configuration.

<b>Syntax</b>	<b>boot change</b> { <i>primary</i>   <i>secondary</i>   <i>default</i> }
<b>Parameters</b>	
	<b><i>primary</i></b> Enter the keyword <b>primary</b> to configure the boot parameters used in the first attempt to boot Dell EMC Networking OS.
	<b><i>secondary</i></b> Enter the keyword <b>secondary</b> to configure boot parameters used if the primary operating system boot selection is not available.
	<b><i>default</i></b> Enter the keyword <b>default</b> to configure boot parameters used if the secondary operating system boot parameter selection is not available. You can configure this option to any of the available type, for example flash/usb/ftp/tftp.
<b>Defaults</b>	None
<b>Command Modes</b>	BOOT_USER

## Command History

Version	Description
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100-ON.
9.0.2.0	Introduced on the S6000.

## Usage Information

After entering the `boot change` command and selecting the parameters, press **Enter**. The software prompts you to enter the following:

- The boot device (flash, ftp, tftp, or usbflash), image file name, IP address of the server containing the image, username, and password (only for ftp).

**Note** When you enter a new parameter that extends beyond 80 characters, you cannot use the **Backspace** key to correct any mistakes. If you make a mistake, you must re-enter the parameter.

**Note:** You must set the IP address of the designated download port before you execute this command. Otherwise, an second statement message alerts you that the configuration cannot proceed.

shows the first field after you enter **boot change primary**. At this point:

- Press **Enter** to accept the information already configured, or
- Change that information. To do so, press the `.` (period) key and enter new information. After you enter the information, press **Enter**.

## Example

```
BOOT_USER # boot change primary
boot device : ftp
```

shows the completed command:

```
BOOT_USER # boot change primary
'.' = clear field; '-' = go to previous field
boot device : ftp
file name : tt/latestlabel
Server IP address : 10.16.1.200
username : amsterdam
password : *****
BOOT_USER #
```

To view the current boot configuration, use the **show bootvar** command.

## Related Commands

[show\\_bootvar](#) — Display boot configuration information.  
[boot\\_zero](#) — Remove the primary, secondary, or default boot image configuration.

# boot message

Use this command to enable/disable boot logs during reload.

## Syntax

**boot message on / off**

## Parameters

**on** Enter the keyword **on** to turn on boot logs during reload.

**off** Enter the keyword **off** to suppress the boot logs during reload.

 **NOTE:** By default, watchdog is disabled.

## Defaults

None

## Command Modes

BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

#### Example

```
BOOT_USER #boot message
boot messages off
BOOT_USER #
```

## boot show net config retries

Show the number of retries for network boot configuration failure.

**Syntax** `boot show net config retries`

**Command Modes** BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

#### Example

```
BOOT_USER #boot show net config retries
Number of Network Boot Config Retries is : 0
BOOT_USER #
```

## boot write net config retries

Set the number of retries for network boot configuration failure.

**Syntax** `boot write net config retries <int>`

**Command Modes** BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

#### Example

```
BOOT_USER # boot write net config retries 2
Updated number of Network Boot Config retries to 2
BOOT_USER #
```

# boot zero

Erase the configured primary, secondary, or default boot image parameters. If you erase all three parameters, the S6000 switch boots from its internal Flash.

<b>Syntax</b>	<b>boot zero</b> { <i>primary</i>   <i>secondary</i>   <i>default</i> }
<b>Parameters</b>	<b><i>primary</i></b> Enter the keyword <b>primary</b> to remove the primary boot parameter.
	<b><i>secondary</i></b> Enter the keyword <b>secondary</b> to remove the secondary boot parameter.
	<b><i>default</i></b> Enter the keyword <b>default</b> to remove the default boot parameter.

**Defaults** None

**Command Modes** BOOT\_USER

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

**Usage Information** This command reverses changes made with the **boot change** command.

```
BOOT_USER # boot zero primary
BOOT_USER # boot zero secondary
BOOT_USER # boot zero default
BOOT_USER # show bootvar
PRIMARY OPERATING SYSTEM BOOT PARAMETERS:
=====
No Operating System boot parameters specified!
SECONDARY OPERATING SYSTEM BOOT PARAMETERS:
=====
No Operating System boot parameters specified!
DEFAULT OPERATING SYSTEM BOOT PARAMETERS:
=====
No Operating System boot parameters specified!
BOOT_USER #
```

**Related Commands** [boot\\_change](#)— Change the primary, secondary, or default boot image configuration.

# default-gateway

Assign an IP address as the default gateway for the system.

**Syntax** [no] **default-gateway** *ip-address*

<b>Parameters</b>	<i>ip-address</i>	Enter the <b>IP address</b> of the gateway router in dotted decimal format (A.B.C.D).
<b>Command Modes</b>	BOOT_USER	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.
<b>Usage Information</b>	Use the <b>show default-gateway</b> command to view the current default gateway.	
<b>Related Commands</b>	<a href="#">show _default-gateway</a> — Change the primary, secondary, or default boot image configuration.	

## etheraddr <macaddr>

Assign the management port MAC address.

<b>Syntax</b>	<b>etheraddr &lt;macaddr&gt;</b>	
<b>Parameters</b>	<i>mac-address</i>	Enter a <b>MAC address</b> in standard format.
<b>Command Modes</b>	BOOT_ADMIN	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.
<b>Usage Information</b>	Use this command to assign a MAC address if FTOS cannot find a default MAC address.	
<b>Example</b>	<pre>BOOT_ADMIN # etheraddr aa:aa:aa:aa:aa:aa &lt;Macaddr&gt; XX:xx:xx:xx:xx:xx No defaults for this</pre>	

## ignore enable-password

Reload the system software without the enable password configured.

<b>Syntax</b>	<b>ignore enable-password</b>	
<b>Command Modes</b>	BOOT_USER	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

### Usage Information

When you enter the **reload** command and the system reboots, you will not be prompted for a password to enter the EXEC Privilege mode (normally you are required to enter the enable command).

If your console or Telnet session expires after you used the **ignore enable-password** command, you are prompted for an **enable** password when you re-establish the session

### Related Commands

[reload](#) — Exit from this mode and reload FTOS.

## ignore startup-config

During a reload, do not load the startup-config file.

**Syntax** `ignore startup-config`

**Defaults** disabled

**Command Modes** BOOT\_USER

### Command History

Version	Description
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100–ON.
9.0.2.0	Introduced on the S6000.

### Usage Information

Use this command if you have authentication procedures in the startup-config other than the enable-password setting.

## interface management ethernet ip address

Assign an IP address to the Management Ethernet interface.

**Syntax** `[no] interface management ethernet ip address ip-address mask`

To delete the IP address, enter **no interface management ethernet ip address**.

**Defaults** Not configured.

**Command Modes** BOOT\_USER

### Command History

Version	Description
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100–ON.
9.0.2.0	Introduced on the S6000.

### Usage Information

In the runtime CLI, use the **ip address** command in INTERFACE mode to change the Management interface's IP address.

To view the current IP address configured on the Management interface, enter the show interfaces **management ethernet** command

### Related Commands

[show\\_default-gateway](#) — Display the IP address configured for the default gateway.

[show\\_interface\\_mangement\\_ethernet](#) — Display the IP address configured for the Management interface.

# NVRAM erase

Erase all NVRAM contents alone.

**Syntax** `nvramp erase`

**Parameters** `mac-address` Enter a **MAC address** in standard format.

**Command Modes** BOOT\_ADMIN

Command History	Version	Description
-----------------	---------	-------------

	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

**Usage Information** Use this command to assign a MAC address if FTOS cannot find a default MAC address.

**Example**

```
BOOT_USER # BOOT_ADMIN # nvramp erase
Are you sure (y/n)? : yes
Erasing NVRAM sectors....Erasing NvRam of size 1024 KB ... DONE
```

# reload

Exit from this mode and reload Dell EMC Networking OS.

**Syntax** `reload`

**Command Modes** BOOT\_USER

Command History	Version	Description
-----------------	---------	-------------

	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

# serial console

Use the serial console to set the serial console baud rate.

**Syntax** `serial console <int> <int>`

**Parameters** `serial console [unit] [baud]` Enter the keyword to set the serial port baud rate. The supported values for serial console:

- Unit - 0
- Baud rate -9600,115200

No defaults.

**Command Modes** BOOT\_USER

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

**Example Serial**  
BOOT\_USER # serial console 0 9600  
BOOT\_USER # BOOT\_USER #

## show bootvar

Display boot configuration information.

**Syntax** show bootvar

**Command Modes** BOOT\_USER

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

### Example

```
BOOT_USER # show bootvar
```

```
PRIMARY OPERATING SYSTEM BOOT PARAMETERS:
=====
No Operating System boot parameters specified!
SECONDARY OPERATING SYSTEM BOOT PARAMETERS:
=====
boot device : flash
file name : systema (FTOS system://A Partition)
DEFAULT OPERATING SYSTEM BOOT PARAMETERS:
=====
boot device : tftp
file name : PS-SI-9-0-0-566.bin
Management Ethernet IP address : 10.16.133.17
Mask : 255.255.0.0
Server IP address : 10.16.1.200
Default Gateway IP address : 10.16.1.254
BOOT_USER #
```

**Related Commands** [boot\\_change](#)— Change the primary, secondary, or default boot image configuration.

[boot\\_zero](#) — Erase the configured primary, secondary, or default boot image parameters.

# show default-gateway

Display the IP address configured for the default gateway.

**Syntax** `show default-gateway`

**Command Modes** BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

## Example

```
BOOT_USER # show default-gateway
```

Gateway IP address: 10.16.100.254

```
BOOT_USER #
```

## Related Commands

[default-gateway](#)— Configure the IP address for the default gateway.

[interface\\_management\\_ethernet\\_ip\\_address](#) — Assign an IP address to the Management Ethernet interface.

# show interface management ethernet

Display the IP address configured for the Management interface.

**Syntax** `show interface management ethernet`

**Command Modes** BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

## Example

```
BOOT_USER # show interfaces management ethernet
Management ethernet IP address: 10.16.133.17/24
BOOT_ADMIN #
```

On the S6000, the output of this command includes the MAC address and port number of the assigned management port.

## Example

```
BOOT_ADMIN # show int man eth
Management ethernet IP address: 10.16.132.4/16
BOOT_ADMIN #
```

## Related Commands

[interface\\_management\\_ethernet\\_ip\\_address](#) — Assign an IP address to the Management Ethernet interface.

[reload](#) — Configure speed, duplex, and negotiation settings for the management interface.

# show serial console baud rate

Use the show serial console to show the values of the serial console baud rate.

**Syntax** `show serial console baudrate`

**Command Modes** BOOT\_USER

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

**Example**

```
BOOT_USER # show serial console baudrate
Serial console baudrate = 9600
```

# watchdog <string>

Enable the watchdog timer, when the enabled watchdog timer is set to 60 seconds.

**Syntax** `<string> enable | disable | status | timeout | settimeout watchdog timer`

Parameters	enable	disable	status	timeout	settimeout
	Enter the keyword <b>enable</b> to enable the watchdog.	Enter the keyword <b>disable</b> to disable the watchdog.	Enter the keyword <b>status</b> to see the watchdog status.	Enter the keyword <b>timeout</b> to see the timeout configured for the watchdog.	Enter the keyword <b>set timeout</b> to set timeout.

 **NOTE:** By default, watchdog is disabled.

**Command Modes** BOOT\_ADMIN

Command History	Version	Description
	<b>9.10(0.0)</b>	Introduced on the S6100.
	<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
	<b>9.0.2.0</b>	Introduced on the S6000.

**Example**

```
Boot_user#BOOT_ADMIN # watchdog status
WATCHDOG DISABLED
BOOT_ADMIN # watchdog enable
WATCHDOG ENABLED
BOOT_ADMIN # watchdog status
WATCHDOG ENABLED
BOOT_ADMIN # watchdog timeout
```

WATCHDOG TIMEOUT: 60

# Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically sent messages to update those routing tables.

**i** **NOTE:** For more information about configuring the border gateway protocol (BGP), see the *BGP* section in the *Dell EMC Networking OS Configuration Guide*.

## Topics:

- [BGP IPv4 Commands](#)
- [MBGP Commands](#)

## BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

**i** **NOTE:** Dell EMC Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

**i** **NOTE:** Dell EMC Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the `show ip bgp` commands. To determine the comparable dot format for an ASN from a traditional format, use `ASN/65536`. `ASN%65536`. For more information about using the 2- or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

## address-family

Enable the IPv4 multicast or the IPv6 address family.

<b>Syntax</b>	<code>address-family {ipv4 multicast   ipv6 unicast} [vrf vrf-name]</code>	
<b>Parameters</b>	<b>ipv4 multicast</b>	Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to enable BGPv4 multicast mode.
	<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> and then the name of the VRF to enable VRF mode. <b>i</b> <b>NOTE:</b> It is not possible to enable VRF mode for IPv6 unicast without configuring the corresponding IPv4 unicast mode for the same VRF. While deletion, whenever the IPv4 VRF mode is deleted for the VRF, Dell EMC Networking OS automatically deletes the IPv6 VRF configurations as well.
	<b>ipv6 unicast</b>	Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to enable BGPv6 mode.
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	ROUTER BGP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for IPv6 VRF.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
6.5.1.0	Introduced

## aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

<b>Syntax</b>	<code>aggregate-address ip-address mask [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]</code>
<b>Parameters</b>	<p><b><i>ip-address mask</i></b> Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).</p> <p><b><i>advertise-map map-name</i></b> (OPTIONAL) Enter the keywords <code>advertise-map</code> then the name of a configured route map to set filters for advertising an aggregate route.</p> <p><b><i>as-set</i></b> (OPTIONAL) Enter the keyword <code>as-set</code> to generate path attribute information and include it in the aggregate. AS_SET includes AS_PATH and community information from the routes included in the aggregated route.</p> <p><b><i>attribute-map map-name</i></b> (OPTIONAL) Enter the keywords <code>attribute-map</code> then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.</p> <p><b><i>summary-only</i></b> (OPTIONAL) Enter the keyword <code>summary-only</code> to advertise only the aggregate address. Specific routes are not advertised.</p> <p><b><i>suppress-map map-name</i></b> (OPTIONAL) Enter the keywords <code>suppress-map</code> then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.</p>
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>ROUTER BGP ADDRESS FAMILY</li> <li>ROUTER BGP ADDRESS FAMILY IPv6</li> </ul>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

### Usage Information

At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the `as-set` parameter to the aggregate as the aggregate flaps to keep track of the changes in the AS\_PATH.

In route maps used in the `suppress-map` parameter, routes meeting the `deny` clause are not suppressed; in other words, they are allowed. The opposite is also true: routes meeting the `permit` clause are suppressed.

If the route is injected via the `network` command, that route still appears in the routing table if the `summary-only` parameter is configured in the `aggregate-address` command.

The `summary-only` parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the `neighbor distribute-list` command.

In the `show ip bgp` command, aggregates contain an 'a' in the first column and routes suppressed by the aggregate contain an 's' in the first column.

When an aggregate address is denied using a peer's outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; the value set in that attribute-map will not be shown in the output of the `show ip bgp aggregate route` command.

## bgp add-path

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

**Syntax** `bgp add-path [send | receive | both | enable] path-count`

Parameters	
<b>send</b>	Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.
<b>receive</b>	Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.
<b>both</b>	Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.
<b>enable</b>	Enter the keyword <code>enable</code> to enable add-path support support for the node.
<b>path-count</b>	Enter the number paths supported. The range is from 2 to 64.

**Defaults** Disabled

- Command Modes**
- ROUTER BGP
  - ROUTER BGP-address-family

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information** Using this command recycles all current sessions.

- Related Commands**
- [neighbor add-path](#) — specify that this neighbor/peer group can send/receive multiple path advertisements.

## bgp always-compare-med

Allows you to enable comparison of the MULTI\_EXIT\_DISC (MED) attributes in the paths from different external ASs.

**Syntax** `bgp always-compare-med`  
 To disable comparison of MED, enter `no bgp always-compare-med`.

**Defaults** Disabled (that is, the software only compares MEDs from neighbors within the same AS).

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
8.2.1.0	Introduced command.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

Any update without a MED attribute is the least preferred route.  
If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp asnotation

Allows you to implement a method for AS number representation in the command line interface (CLI).

**Syntax**

`bgp asnotation [asplain | asdot+ | asdot]`  
To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

**Defaults**

**asplain**

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the dynamic application of AS notation changes.
8.2.1.0	Introduced.

**Usage Information**

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octet-support` command after using dot or dot+ format, the AS numbers revert to asplain text.

When you apply an asnotation, it is reflected in the running-configuration. If you change the notation type, the running-config updates dynamically and the new notation shows.

**Example**

```
DellEMC(conf)# router bgp 1
DellEMC(conf-router_bgp)#bgp asnotation asdot
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot
```

```

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asdot+
DellEMC(conf-router_bgp)# ex

DellEMC(conf)#do show run | grep bgp
router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot+

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asplain
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run |grep bgp
router bgp 1
  bgp four-octet-as-support

DellEMC(conf)#

```

**Related  
Commands**

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

**Syntax**

`bgp bestpath as-path ignore`

To return to the default, enter the `no bgp bestpath as-path ignore` command.

**Defaults**

Disabled (that is, the software considers the AS\_PATH when choosing a route as best).

**Command Modes**

ROUTER BGP

**Command  
History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage  
Information**

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp bestpath as-path multipath-relax

Include prefixes received from different AS paths during multipath calculation.

<b>Syntax</b>	<code>bgp bestpath as-path multipath-relax</code> To return to the default BGP routing process, use the <code>no bgp bestpath as-path multipath-relax</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.4</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

<b>Usage Information</b>	The <code>bestpath router bgp configuration mode</code> command changes the default bestpath selection algorithm. The <code>multipath-relax</code> option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.
--------------------------	--

## bgp bestpath med confed

Enable MULTI\_EXIT\_DISC (MED) attribute comparison on paths learned from BGP confederations.

<b>Syntax</b>	<code>bgp bestpath med confed</code> To disable MED comparison on BGP confederation paths, enter the <code>no bgp bestpath med confed</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI\_EXIT\_DISC) over paths with an advertised MED attribute.

**Syntax**

`bgp bestpath med missing-as-best`

To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
6.3.1.0	Introduced

**Usage Information**

The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

## bgp bestpath router-id ignore

Do not compare router-id information for external paths during best path selection.

<b>Syntax</b>	<code>bgp bestpath router-id ignore</code> To return to the default selection, use the <code>no bgp bestpath router-id ignore</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced

<b>Usage Information</b>	Configuring this option retains the current best-path. When sessions are then reset, the oldest received path is chosen as the best-path.
--------------------------	---

## bgp client-to-client reflection

Allows you to enable route reflection between clients in a cluster.

<b>Syntax</b>	<code>bgp client-to-client reflection</code> To disable client-to-client reflection, use the <code>no bgp client-to-client reflection</code> command.
<b>Defaults</b>	Enabled when a route reflector is configured.
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

Route reflection to clients is not necessary if all client routers are fully meshed.

**Related Commands**

- [bgp cluster-id](#) — assign an ID to a BGP cluster with two or more route reflectors.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.

## bgp cluster-id

Assign a cluster ID to a BGP cluster with more than one route reflector.

**Syntax**

`bgp cluster-id {ip-address | number}`

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

**Parameters**

- ip-address** Enter an IP address as the route reflector cluster ID.
- number** Enter a route reflector cluster ID as a number from 1 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the `bgp cluster-id` command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

### Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and clients.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.
- [show ip bgp cluster-list](#) — view paths with a cluster ID.

## bgp confederation identifier

Configure an identifier for a BGP confederation.

### Syntax

`bgp confederation identifier as-number`

To delete a BGP confederation identifier, use the `no bgp confederation identifier as-number` command.

### Parameters

**as-number** Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

### Defaults

Not configured.

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added support for the 4-byte format

### Usage Information

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell EMC Networking OS accepts confederation EBGP peers without a LOCAL\_PREF attribute. The software sends AS\_CONFED\_SET and accepts AS\_CONFED\_SET and AS\_CONF\_SEQ.

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGP neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS\_SEQUENCE or AS\_CONFED\_SEQUENCE (in the case of confederations). If the first entry appears as an AS\_CONFED\_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

#### Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## bgp confederation peers

Specify the autonomous systems (ASs) that belong to the BGP confederation.

#### Syntax

```
bgp confederation peers as-number [...as-number]
```

To return to the default, use the `no bgp confederation peers` command.

#### Parameters

<b><i>as-number</i></b>	Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).
<b><i>...as-number</i></b>	(OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series. Added support for the 4-byte format.

## Usage Information

All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems.

After specifying autonomous systems numbers for the BGP confederation, recycle the peers to update their configuration.

## Related Commands

- [bgp confederation identifier](#) — configure a confederation ID.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

# bgp dampening

Enable BGP route dampening and configure the dampening parameters.

## Syntax

```
bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]
```

To disable route dampening, use the `no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]` command.

## Parameters

<b><i>half-life</i></b>	(OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is <b>15 minutes</b> .
<b><i>reuse</i></b>	(OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route's Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is <b>750</b> .
<b><i>suppress</i></b>	(OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route's Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is <b>2000</b> .
<b><i>max-suppress-time</i></b>	(OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is <b>60 minutes</b> .
<b><i>route-map map-name</i></b>	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.  Only <code>match</code> commands in the configured route map are supported.

## Defaults

Disabled.

## Command Modes

- ROUTER BGP
- ROUTER BGP-address-family

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

If you enter the `bgp dampening` command, the default values for *half-life*, *reuse*, *suppress*, and *max-suppress-time* are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

#### Related Commands

- [show ip bgp dampened-paths](#) — view the BGP paths.

## bgp default local-preference

Change the default local preference value for routes exchanged between internal BGP peers.

#### Syntax

```
bgp default local-preference value
```

To return to the default value, use the `no bgp default local-preference` command.

#### Parameters

**value**

Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is **100**.

#### Defaults

100

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

<b>Usage Information</b>	All routers apply the <code>bgp default local-preference</code> command setting within the AS. To set the local preference for a specific route, use the <code>set local-preference</code> command in ROUTE-MAP mode.
<b>Related Commands</b>	<ul style="list-style-type: none"> <li>• <a href="#">set local-preference</a> — assign a local preference value for a specific route.</li> </ul>

## bgp dmzlink-bw

Enables BGP Link Bandwidth.

<b>Syntax</b>	<code>bgp dmzlink-bw</code> To disable BGP Link Bandwidth, enter the <code>no bgp dmzlink-bw</code> command.
<b>Parameters</b>	<b>dmzlink-bw</b> Enter the keyword <code>dmzlink-bw</code> to enable BGP Link Bandwidth in BGP multipath.
<b>Defaults</b>	N/A
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S-Series.
<b>9.2(1.0)</b>	Introduced on the Z9500.

<b>Usage Information</b>	<p>Configuring or un-configuring the command brings down and brings up the BGP Route Manager, this results in tear down and re-establishment of all active sessions.</p> <p>Link Bandwidth has to be configured on the router to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.</p> <p>This is done under BGP configuration and is supported per address family – for IPv4 and IPv6 address families.</p> <p>The configuration for a particular address family applies across all VRFs configured.</p> <p>This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.</p>
--------------------------	---

## bgp enforce-first-as

Disable (or enable) `enforce-first-as` check for updates received from EBGp peers.

<b>Syntax</b>	<code>bgp enforce-first-as</code> To turn off the default, use the <code>no bgp enforce-first-as</code> command.
<b>Defaults</b>	Enabled
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

#### Usage Information

This command is enabled by default, that is for all updates received from EBGP peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is increments. Use the `show ip bgp neighbors` command to view the “failed enforce-first-as check” counter.

If you disable the `enforce-first-as` command, it can be viewed using the `show ip protocols` command.

In the event of an enforce-first-as check failure, the existing BGP session is flapped.

#### Related Commands

- [show ip bgp neighbors](#) — view the information the BGP neighbors exchange.
- [show ip protocols](#) — view information on routing protocols.

## bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

#### Syntax

`bgp fast-external-fallover`

To disable fast external fallover, use the `no bgp fast-external-fallover` command.

#### Defaults

Enabled

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

#### Usage Information

The `bgp fast-external-fallover` command appears in the `show config` command output. The fast external fallover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the `clear ip bgp` command in order for the configuration to take effect.

## bgp four-octet-as-support

Enable 4-byte support for the BGP process.

**Syntax** `bgp four-octet-as-support`

To disable fast external fallover, use the `no bgp four-octet-as-support` command.

**Defaults** Disabled (supports 2-byte format)

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

#### Usage Information

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp graceful-restart

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

**Syntax** `bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]`

To return to the default, use the `no bgp graceful-restart` command.

**Parameters**

<b>restart-time seconds</b>	Enter the keyword <code>restart-time</code> then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is <b>120 seconds</b> .
<b>stale-path-time seconds</b>	Enter the keyword <code>stale-path-time</code> then the maximum number of seconds to wait before restarting a peer's stale paths. The default is <b>360 seconds</b> .
<b>role receiver-only</b>	Enter the keyword <code>role receiver-only</code> to designate the local router to support graceful restart as a receiver only.

**Defaults** as above

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp non-deterministic-med

Compare MEDs of paths from different autonomous systems.

<b>Syntax</b>	<code>bgp non-deterministic-med</code> To return to the default, use the <code>no bgp non-deterministic-med</code> command.
<b>Defaults</b>	Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell EMC Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (`no bgp non-deterministic-med`), Dell EMC Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.

When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the `clear ip bgp` command to clear existing paths.

## bgp outbound-optimization

Enables outbound optimization for IBGP peer-group members.

<b>Syntax</b>	<code>bgp outbound-optimization</code> To disable outbound optimization, enter the <code>no bgp outbound-optimization</code> command.
<b>Defaults</b>	Enabled.
<b>Command Modes</b>	ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.4(0.0)	Introduced on the S4810.
9.2(1.0)	Introduced on the Z9500.

**Usage Information** The updates are sent to all the neighbors in the peer-group and all the neighbors have the same attributes including next-hop.

Enabling or disabling outbound optimization dynamically resets all neighbor sessions.

When you enable outbound optimization, all peers receive the same update packets. Also, the next-hop address, which is chosen as one of the addresses of the neighbor's reachable interface, is the same for all peers.

## bgp recursive-bgp-next-hop

Enable next-hop resolution through other routes learned by BGP.

**Syntax** `bgp recursive-bgp-next-hop`  
To disable next-hop resolution, use the `no bgp recursive-bgp-next-hop` command.

**Defaults** Enabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

**Usage Information** This command is a *knob* to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

**Related Commands**

- `clear ip bgp` — clear the ip bgp.

## bgp redistribute-internal

Redistribute internal Border Gateway Protocol (iBGP) routes into an IGP such as OSPF and IS-IS.

**Syntax** `bgp redistribute-internal`  
To disable iBGP redistribution, use the `no bgp redistribute-internal` command.

**Defaults** Not configured.

- Command Modes**
- ROUTER BGP
  - ROUTER BGP-address-family
  - ROUTER BGP-address-family-IPv6
  - IPv4 VRF mode
  - IPv6 Unicast VRF mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.1)	Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, and Z9100-ON.

**Usage Information** After configuring the `bgp redistribute-internal` command, use the `clear ip bgp *` command to clear all BGP sessions. If you don't clear all BGP sessions, route redistribution happens only for new routes.

**NOTE:** When you enable redistribution of iBGP routes into an IGP, ensure that you use route maps to control what prefixes are redistributed. Redistributing all iBGP routes can create a loop in the network.

**Example**

```
Router(config)# router ospf 10
Router(config-router_ospf)# redistribute bgp 10 route-map bgp_2_ospf
Router(config-router_ospf)# exit
DellEMC(conf)# router bgp 10
DellEMC(conf-router_bgp)# bgp redistribute-internal
Caution: Might cause routing loops; please use prefix-list to restrict
the prefixes
Router(config-router_bgp)# end
Router# clear ip bgp
```

## bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

**Syntax** `bgp regex-eval-optz-disable`  
To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

**Defaults** Enabled

**Command Modes** ROUTER BGP (conf-router\_bgp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced

### Usage Information

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expense of RP1 processor memory.

### Examples

```
DellEMC(conf-router_bgp)# no bgp regex-eval-optz-disable
DellEMC(conf-router_bgp)# do show ip protocols
Routing Protocol is "ospf 22222"
  Router ID is 2.2.2.2
  Area           Routing for Networks
  51             10.10.10.0/00

Routing Protocol is "bgp 1"
  Cluster Id is set to 10.10.10.0
  Router Id is set to 10.10.10.0
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE_REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200

DellEMC(conf-router_bgp)#
```

### Related Commands

- [show ip protocols](#) — view information on all routing protocols enabled and active on the E-Series.

## bgp router-id

Assign a user-given ID to a BGP router.

**Syntax** `bgp router-id ip-address`

To delete a user-assigned IP address, use the `no bgp router-id` command.

**Parameters** **ip-address** Enter an IP address in dotted decimal format to reset only that BGP neighbor.

**Defaults** The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** Peering sessions are reset when you change the router ID of a BGP router.

This command automatically restarts the BGP instance for the configuration to take effect.

## clear ip bgp

Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

**Syntax** `clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> | A.B.C.D {soft {in | out}} | X:X:X:X::X {soft {in | out}} | dampening | flap-statistics | ipv4 | ipv6 | peer-group]`

**Parameters** **\*** Enter an asterisk ( \* ) to reset all BGP sessions.

**<1-4294967295>** Enter <1-4294967295> to clear peers with the AS number.

**<0.1-65535.65535>** Enter <0.1-65535.65535> to clear peers with the AS number in dot format.

<b>A.B.C.D</b>	Enter the BGP neighbor address in the A.B.C.D format to clear.
<b>X:X:X:X::X</b>	Enter the BGP neighbor address in the X:X:X:X::X format to clear.
<b>soft</b>	(OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration. <i>i</i> <b>NOTE:</b> If you enter the <code>clear ip bgp ip-address soft</code> command, both inbound and outbound policies are reset.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to activate only inbound policies.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to activate only outbound policies. <i>i</i> <b>NOTE:</b> You must execute the <code>clear ip bgp soft out</code> command when ever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer's route refresh messages.
<b>dampening</b>	Enter the keyword <code>dampening</code> to clear the flap dampening information.
<b>flap-statistics</b>	Enter the keywords <code>flap-statistics</code> to clear the flap statistics information.
<b>ipv4</b>	Enter the ipv4 address family to clear.
<b>ipv6</b>	Enter the ipv6 address family to clear.
<b>peer-group</b>	Enter the peer-group to clear all members of the peer-group.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

<b>Syntax</b>	<code>clear ip bgp [vrf vrf-name] [ipv4 [multicast   unicast]   ipv6 unicast] [flap-statistics [ipv4-address mask   ipv6-address mask]   filter-list as-path-name   regexp regular-expression]</code>
---------------	---

## Parameters

<b><i>ipv4-address mask</i></b>	(OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.
<b><i>ipv6-address mask</i></b>	(OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.
<b><i>filter-list as-path-name</i></b>	(OPTIONAL) Enter the keywords <code>filter-list</code> then the name of a configured AS-PATH list.
<b><i>regexp regular-expression</i></b>	(OPTIONAL) Enter the keyword <code>regexp</code> then regular expressions. Use one or a combination of the following: <ul style="list-style-type: none"><li>• <code>.</code> = (period) any single character (including a white space).</li><li>• <code>*</code> = (asterisk) the sequences in a pattern (0 or more sequences).</li><li>• <code>+</code> = (plus) the sequences in a pattern (1 or more sequences).</li><li>• <code>?</code> = (question mark) sequences in a pattern (either 0 or 1 sequences).</li></ul> <p> <b>NOTE:</b> Enter an escape sequence (CTRL+v) prior to entering the <code>?</code> regular expression.</p> <ul style="list-style-type: none"><li>• <code>[ ]</code> = (brackets) a range of single-character patterns.</li><li>• <code>( )</code> = (parenthesis) groups a series of pattern elements to a single element.</li><li>• <code>{ }</code> = (braces) minimum and the maximum match count.</li><li>• <code>^</code> = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.</li><li>• <code>\$</code> = (dollar sign) the end of the output string.</li></ul>

## clear ip bgp peer-group

Reset a peer-group's BGP sessions.

<b>Syntax</b>	<code>clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast   unicast]   ipv6 unicast] [soft {in   out}]</code>
<b>Parameters</b>	
<b>peer-group-name</b>	Enter the peer group name to reset the BGP sessions within that peer group.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to reset ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to reset ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to reset ipv6 unicast routes.
<b>soft</b>	(OPTIONAL) Enter the keyword <code>soft</code> to reset soft configuration.
<b>in</b>	Enter the keyword <code>in</code> to re-configure soft inbound updates.
<b>out</b>	Enter the keyword <code>out</code> to re-configure soft outbound updates.

<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

## debug ip bgp

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

**Syntax** `debug ip bgp [ vrf vrf-name | A.B.C.D | X:X:X:X::X | peer-group peer-group-name] [in | out]`

To disable all BGP debugging, use the `no debug ip bgp` command.

## Parameters

<b>vrf <i>vrf-name</i></b>	Enter the keyword <code>vrf</code> and then the name of the VRF to debug BGP information corresponding to that VRF.  <b>NOTE:</b> Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF.
<b><i>A.B.C.D</i></b>	Enter the IPv4 address of the neighbor in dotted decimal format.
<b><i>X:X:X:X::X</i></b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group <i>peer-group-name</i></b>	Enter the keywords <code>peer-group</code> then the name of the peer group to debug.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only information on inbound BGP routes.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only information on outbound BGP routes.
<b><i>A.B.C.D</i></b>	Enter the IP address of peer in the A.B.C.D format.
<b><i>X:X:X:X::X</i></b>	Enter the IPv6 IP address of peer in the X:X:X:X::X format.
<b>dampening</b>	Enter the keyword <code>dampening</code> to view BGP dampening.
<b>events</b>	Enter the keyword <code>events</code> to view BGP protocol events.
<b>ipv4</b>	Enter the ipv4 IP address to view the IPV4 route information.
<b>ipv6</b>	Enter the ipv6 IP address to view the IPV6 route information.
<b>keepalives</b>	Enter the keyword <code>keepalives</code> to view BGP keepalives.
<b>notifications</b>	Enter the keyword <code>notifications</code> to view BGP notifications.
<b>soft-reconfiguration</b>	Enter the keywords <code>soft-reconfiguration</code> to view only information on inbound BGP soft reconfiguration.
<b>updates</b>	Enter the keyword <code>updates</code> to view BGP updates.

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

To view information on both incoming and outgoing routes, do not include the `in` and `out` parameters in the debugging command. The `in` and `out` parameters cancel each other; for example, if you enter the `debug ip bgp in` command and then enter the `debug ip bgp out` command, you do not see information on the incoming routes.

Entering a `no debug ip bgp` command removes all configured debug commands for BGP.

### Related Commands

- [debug ip bgp events](#) — view information about BGP events.
- [debug ip bgp keepalives](#) — view information about BGP keepalives.
- [debug ip bgp notifications](#) — view information about BGP notifications.
- [debug ip bgp updates](#) — view information about BGP updates.
- [show debugging](#) — view enabled debugging operations.

## debug ip bgp dampening

View information on routes being dampened.

### Syntax

```
debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast}] | ipv6 unicast
dampening
```

To disable debugging, use the `no debug ip bgp dampening` command.

### Parameters

<b>vrf <i>vrf-name</i></b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
<b>ipv4 <i>multicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes.
<b>ipv4 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv4 unicast routes.
<b>ipv6 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.

**Command Modes** EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP support for the E-Series.

## debug ip bgp events

Display information on local BGP state changes and other BGP events.

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]` command.

Parameters	
<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display BGP state changes corresponding to that VRF.
<b>A.B.C.D</b>	(OPTIONAL) Enter the IPv4 address of the neighbor.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only events on inbound BGP messages.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only events on outbound BGP messages.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp keepalives

Display information about BGP keepalive messages.

#### Syntax

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]
```

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]` command.

#### Parameters

<b>A.B.C.D</b>	(OPTIONAL) Enter the IPv4 address of the neighbor.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only inbound keepalive messages.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only outbound keepalive messages.

**Command Modes** EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>ipv4</code> multicast and <code>ipv6</code> unicast parameters.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

**Syntax** `debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]`

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

**Parameters**

- A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- X:X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- peer-group peer-group-name** (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- in** (OPTIONAL) Enter the keyword `in` to view BGP notifications received from neighbors.
- out** (OPTIONAL) Enter the keyword `out` to view BGP notifications sent to neighbors

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added ipv6 support.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

# debug ip bgp soft-reconfiguration

Enable soft-reconfiguration debug.

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration`

To disable, use the `debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration` command.

**Parameters**

- A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.
- X:X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- peer-group-name** (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group..

**Defaults** Disabled

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

**Usage Information** This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

# debug ip bgp updates

Allows you to view information about BGP updates.

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]` command.

<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view BGP updates information corresponding to that VRF.
	<b>A.B.C.D</b>	(OPTIONAL) Enter an IPv4 address of the neighbor.
	<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
	<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> followed by the name of the peer group.
	<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.
	<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.
	<b>prefix-list prefix-list-name</b>	(OPTIONAL) Enter the keyword <code>prefix-list</code> then the name of an established prefix list. If the prefix list is not configured, the default is <b>permit</b> (to allow all routes).
	<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
	<b>peer-group-name</b>	(OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## default-metric

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

**Syntax** `default-metric number`

To return to the default setting, use the `no default-metric` command.

**Parameters** *number* Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.

**Defaults** 0

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The `default-metric` command in BGP sets the value of the BGP MULTI\_EXIT\_DISC (MED) attribute for redistributed routes only.

**Related Commands**

- [bgp always-compare-med](#) — enable comparison of all BGP MED attributes.
- [redistribute](#) — redistribute routes from other routing protocols into BGP.

## deny bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

**Syntax** `deny bandwidth`

To disable this setting, enter the `no deny bandwidth` command.

<b>Parameters</b>	<b>bandwidth</b>	Enter the keyword <code>bandwidth</code> to specify extended-community attribute as the matching criteria for denying traffic. The range is from 0 to 102400.
<b>Defaults</b>	N/A	
<b>Command Modes</b>	EXTENDED COMMUNITY LIST	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>

	<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
	<b>9.7(0.0)</b>	Introduced on the S-Series and Z9500.
<b>Related Commands</b>	<ul style="list-style-type: none"><li>• <a href="#">permit bandwidth</a> – specify link band width extended-community attribute as the matching criteria to permitting incoming or outgoing traffic.</li></ul>	

## description

Enter a description of the BGP routing protocol.

<b>Syntax</b>	<code>description {description}</code> To remove the description, use the <code>no description {description}</code> command.	
<b>Parameters</b>	<b><i>description</i></b> Enter a description to identify the BGP protocol (80 characters maximum).	
<b>Defaults</b>	none	
<b>Command Modes</b>	ROUTER BGP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S3148.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(2.0)</b>	Introduced on the S3100 series.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
	<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.2(1.0)</b>	Introduced on the Z9500.
	<b>9.0.2.0</b>	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
pre-7.7.1.0	Introduced.

**Related Commands**

- [router bgp](#) — enter ROUTER mode on the switch.

## maximum-paths

Configure the maximum number of parallel routes (multipath support) BGP supports.

**Syntax** `maximum-paths {ebgp | ibgp} number`

To return to the default values, enter the `no maximum-paths` command.

**Parameters**

- ebgp** Enter the keyword `ebgp` to enable multipath support for External BGP routes.
- ibgp** Enter the keyword `ibgp` to enable multipath support for Internal BGP routes.
- number** Enter a number as the maximum number of parallel paths.

**Defaults** none

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Support from 2 to 64 paths on the S4810. Command syntax changed to <code>max-path</code> (was <code>maximum-paths</code> ).
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

**Usage Information**

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## neighbor activate

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

<b>Syntax</b>	<code>neighbor [ip-address   peer-group-name] activate</code> To disable, use the <code>no neighbor [ip-address   peer-group-name] activate</code> command.
<b>Parameters</b>	<p><b>ip-address</b> (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.</p> <p><b>peer-group-name</b> (OPTIONAL) Enter the name of the peer group.</p> <p><b>activate</b> Enter the keyword <code>activate</code> to enable the neighbor/peer group in the new AFI/SAFI.</p>
<b>Defaults</b>	IPv4 Unicast – Enabled. IPv6 Unicast – Disabled.
<b>Command Modes</b>	CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use `activate` in the new context, the neighbor/peer group enables for AFI/SAFI. It is possible to activate or de-activate a peer from the IPv4/IPv6 unicast address family.

**i** **NOTE:** The `no neighbor peer ip-address activate` command takes precedence over the `no neighbor peer-group-name activate` command.

The following tables list the neighbor activation and its expected results for IPv4 and IPv6 address families:

**Table 1. Neighbor activation and update status for peers activated for IPv4 address family**

S.No	Peer – IPv4 address family	Peer group	Update status for IPv4 prefixes
1.	Activate	Activate	Send Updates
2.	Activate	No-Activate	Send Updates
3.	No-Activate	Activate	Stop Updates
4.	No-Activate	No-Activate	Stop Updates

**Table 2. Neighbor activation and update status for peers activated for IPv6 unicast address family**

S.No	Peer– IPv6 unicast address family	Peer group	Update status for IPv6 prefixes
1.	Activate	Activate	Send Updates
2.	Activate	No-Activate	Send Updates
3.	No-Activate	Activate	Send Updates
4.	No-Activate	No-Activate	Stop Updates

## neighbor add-path

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

**Syntax** `neighbor [ip-address | peer-group-name] add-path [send | receive | both] path-count`

**Parameters**

- ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** (OPTIONAL) Enter the name of the peer group.
- send** Enter the keyword `send` to indicate that the system sends multiple paths to peers.
- receive** Enter the keyword `receive` to indicate that the system accepts multiple paths from peers.
- both** Enter the keyword `both` to indicate that the system sends and accepts multiple paths from peers.
- path-count** Enter the number paths supported. The range is from 2 to 64.

**Defaults** none

**Command Modes** CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Related Commands**

- [bgp add-path](#) — allow the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previous ones.

## neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

**Syntax** `neighbor {ip-address | peer-group-name} advertisement-interval seconds`

To return to the default value, use the `no neighbor {ip-address | peer-group-name} advertisement-interval` command.

**Parameters**

- **ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name** Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- **seconds** Enter a number as the time interval, in seconds, between BGP advertisements. The range is from 0 to 600 seconds. The default is **5 seconds** for internal BGP peers and **30 seconds** for external BGP peers.

**Defaults**

- seconds = **5 seconds** (internal peers)
- seconds = **30 seconds** (external peers)

**Command Modes** ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor advertisement-start

To send BGP routing updates, set the minimum interval before starting.

**Syntax** `neighbor {ip-address} advertisement-start seconds`

To return to the default value, use the `no neighbor {ip-address} advertisement-start` command.

**Parameters**

**ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.

**seconds** Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.

**Defaults** none

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor allowas-in

Set the number of times an AS number can occur in the AS path.

**Syntax** `neighbor {ip-address | peer-group-name} allowas-in number`  
To return to the default value, use the `no neighbor {ip-address | peer-group-name} allowas-in` command.

**Parameters**

<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
<b><i>number</i></b>	Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

**Related Commands**

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor default-originate

Inject the default route to a BGP peer or neighbor.

**Syntax** `neighbor {ip-address | peer-group-name} default-originate [route-map map-name]`  
To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-originate` command.

<b>Parameters</b>	<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
	<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the default route of all routers in that peer group.
	<b><i>route-map map-name</i></b>	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** If you apply a route map to a BGP peer or neighbor with the `neighbor default-originate` command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the `neighbor default-originate` command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.

When you apply a default route to a BGP peer or peer group using the `neighbor default-originate` command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the `clear ip bgp` command.

In case of eBGP, the `neighbor default-originate` command does not support *extended-community* as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the `neighbor default-originate` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor default-originate` command.

## neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

**Syntax** `neighbor {ip-address | peer-group-name} description text`  
To delete a description, use the `no neighbor {ip-address | peer-group-name} description` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group.
<b><i>text</i></b>	Enter a continuous text string up to 80 characters.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor distribute-list

Distribute BGP information via an established prefix list.

**Syntax** `neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}`  
To delete a neighbor distribution list, use the `no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.
<b><i>prefix-list-name</i></b>	Enter the name of an established prefix list.

If the prefix list is not configured, the default is **permit** (to allow all routes).

**in** Enter the keyword `in` to distribute only inbound traffic.  
**out** Enter the keyword `out` to distribute only outbound traffic.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** Other BGP filtering commands include: `neighbor filter-list`, `ip as-path access-list`, and `neighbor route-map`.

**Related Commands**

- [neighbor route-map](#) — assign a route map to a neighbor or peer group.

## neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

**Syntax** `neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]`  
To disallow and disconnect connections, use the `no neighbor {ip-address | peer-group-name} ebgp-multihop` command.

**Parameters**

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group.
- ttl** (OPTIONAL) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is **255**.

**Defaults** Disabled.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To prevent loops, the `neighbor ebgp-multihop` command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

## neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

**Syntax**

`neighbor {ipv4-address | peer-group-name} fall-over`

To disable, use the `no neighbor {ipv4-address | peer-group-name} fall-over` command.

**Parameters**

- ipv4-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group.

**Defaults**

Disabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

**Usage Information**

When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

**Related Commands**

- [show ip bgp neighbors](#) — display information on the BGP neighbors.

## neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

**Syntax**

```
neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} local-as` command.

**Parameters**

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- as-number** Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format).
- no prepend** Specifies that local AS values do not prepend to announcements from the neighbor.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.

### Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor maximum-prefix

Control the number of network prefixes received.

### Syntax

```
neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold]
[warning-only]
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} maximum-prefix maximum` command.

### Parameters

<b>ip-address</b>	Enter the IP address of the neighbor in dotted decimal format.
<b>peer-group-name</b>	Enter the name of the peer group.
<b>maximum</b>	Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.
<b>threshold</b>	(OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is <b>75</b> .
<b>warning-only</b>	(OPTIONAL) Enter the keyword <code>warning-only</code> to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.
	<b>NOTE:</b> When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives.

### Defaults

threshold = 75

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

If you configure the `neighbor maximum-prefix` command and the neighbor receives more prefixes than the `neighbor maximum-prefix` command configuration allows, the neighbor goes down and the `show ip bgp summary` command displays (prfxd) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the `clear ip bgp` command for the neighbor or the peer group to which the neighbor belongs or you enter the `neighbor shutdown` and `neighbor no shutdown` commands.

### Related Commands

- [show ip bgp summary](#) — display the current BGP configuration.

## neighbor password

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

### Syntax

```
neighbor {ip-address | peer-group-name} password [encryption-type] password
```

To delete a password, use the `no neighbor {ip-address | peer-group-name} password` command.

### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the router to be included in the peer group.
<b><i>peer-group-name</i></b>	Enter the name of a configured peer group.
<b><i>encryption-type</i></b>	(OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.
<b><i>password</i></b>	Enter a text string up to 80 characters long. The first character of the password must be a letter.  You cannot use spaces in the password.

### Defaults

Not configured.

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

This command automatically restarts the neighbor session for the configuration to take effect.

Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the `peer-group-name` parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]
:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from
[peer's IP address] : 11502 to [local router's IP address] :179
```

## neighbor peer-group (assigning peers)

Allows you to assign one peer to an existing peer group.

### Syntax

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.

To disable `dmzlink-dw` for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

### Parameters

**ip-address** Enter the IP address of the router to be included in the peer group.

**peer-group-name** Enter the name of a configured peer group.

**dmzlink-bw** Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

**NOTE:** If `dmzlink-bw` is configured for a peer, in order for the BGP peer to advertise the prefixes with `dmzlink-bw` attached to it, you must reset the peer or peer-group using the `clear ip bgp session` command.

### Defaults

Not configured.

**Command Modes** ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the dmzlink-bw parameter.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group's configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- [neighbor advertisement-interval](#)
- [neighbor distribute-list](#)
- [neighbor route-map](#)
- [neighbor route-reflector-client](#)

If a neighbor's configuration is more specific than its peer group's configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor's configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the remote-as for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

## Related Commands

- [clear ip bgp](#) — reset BGP sessions.
- [neighbor peer-group \(creating group\)](#) — create a peer group.
- [show ip bgp peer-group](#) — view BGP peers.
- [show ip bgp neighbors](#) — view BGP neighbors configurations.

## neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

### Syntax

```
neighbor peer-group-name peer-group
```

To delete a peer group, use the `no neighbor peer-group-name peer-group` command.

### Parameters

***peer-group-name*** Enter a text string up to 16 characters long as the name of the peer group.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** When you create a peer group, it is disabled (Shut mode).

**Related Commands**

- [neighbor peer-group \(assigning peers\)](#) — assign routers to a peer group.
- [neighbor remote-as](#) — assign an indirectly connected AS to a neighbor or peer group.
- [neighbor shutdown](#) — disable a peer or peer group.

## neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

**Syntax** `neighbor peer-group-name peer-group passive [ sessions]`

To delete a passive peer-group, use the `no neighbor peer-group-name peer-group passive` command.

**Parameters** **peer-group-name** Enter a text string up to 16 characters long as the name of the peer group.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced the <code>limit</code> keyword on the S4810.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

After you configure a peer group as passive, assign it a subnet using the `neighbor soft-reconfiguration inbound` command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

#### Related Commands

- [neighbor soft-reconfiguration inbound](#) — assign a subnet to a dynamically configured BGP neighbor.
- [neighbor remote-as](#) — assign an indirectly connected AS to a neighbor or peer group.

## neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

#### Syntax

```
neighbor {ip-address | peer-group-name} remote-as number
```

To delete a remote AS entry, use the `no neighbor {ip-address | peer-group-name} remote-as number` command.

#### Parameters

- ip-address*** Enter the IP address of the neighbor to enter the remote AS in its routing table.
- peer-group-name*** Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.
- number*** Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

### Usage Information

To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the `number` parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (Shutdown).

This command automatically restarts the neighbor session for the configuration to take effect.

### Related Commands

- [router bgp](#) — enter ROUTER BGP mode and configures routes in an AS.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

### Syntax

```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

### Parameters

- ip-address*** Enter the IP address of the neighbor to remove the private AS numbers.
- peer-group-name*** Enter the name of the peer group to remove the private AS numbers.

### Defaults

Disabled (that is, private AS number are not removed).

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

### Usage Information

Applies to EBGp neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGp neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

## neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

### Syntax

```
neighbor {ip-address | peer-group-name} route-map map-name {in | out}
```

To remove the route map, use the `no neighbor {ip-address | peer-group-name} route-map map-name {in | out}` command.

### Parameters

<b>ip-address</b>	Enter the IP address of the neighbor in dotted decimal format.
<b>peer-group-name</b>	Enter the name of the peer group.
<b>map-name</b>	Enter the name of an established route map. If the Route map is not configured, the default is <b>deny</b> (to drop all routes).
<b>in</b>	Enter the keyword <code>in</code> to filter inbound routes.
<b>out</b>	Enter the keyword <code>out</code> to filter outbound routes.

 **NOTE:** This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.

### Defaults

Not configured.

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.

If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

## neighbor route-reflector-client

Configure the router as a route reflector and the specified neighbors as members of the cluster.

#### Syntax

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

#### Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group.  
All routers in the peer group receive routes from a route reflector.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need to be fully meshed. By default, when you use `no route reflector`, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the `no neighbor route-reflector-client` command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the `no bgp client-to-client reflection` command.

This command automatically restarts the neighbor session for the configuration to take effect.

### Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and the clients.

## neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

### Syntax

```
neighbor {ip-address | peer-group-name} send-community [extended | standard]
```

To disable sending a COMMUNITY attribute, use the `no neighbor {ip-address | peer-group-name} send-community` command.

### Parameters

<b>ip-address</b>	Enter the IP address of the peer router in dotted decimal format.
<b>peer-group-name</b>	Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.
<b>extended</b>	(OPTIONAL) Enter the keyword <code>extended</code> to send extended community attribute.
<b>standard</b>	(OPTIONAL) Enter the keyword <code>standard</code> to send standard community attribute.

### Defaults

Not configured and COMMUNITY attributes are not sent to neighbors.

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
Version 9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

To configure a COMMUNITY attribute, use the `set community` command in ROUTE-MAP mode.

In order that settings corresponding to the `neighbor send-community` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor send-community` command.

If you do not set any of the optional parameters (standard or extended), then both standard as well as extended attributes are sent. If you set either the standard or extended parameter, only the attribute that is specified is sent.

## neighbor shutdown

Disable a BGP neighbor or peer group.

**Syntax** `neighbor {ip-address | peer-group-name} shutdown`

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name}no shutdown` command.

### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to disable or enable all routers within the peer group.

**Defaults** Enabled (that is, BGP neighbors and peer groups are disabled.)

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

Peers that are enabled within a peer group are disabled when their peer group is disabled.

The `neighbor shutdown` command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shut down, use the `show ip bgp summary` command to confirm its status.

#### Related Commands

- [show ip bgp summary](#) — display the current BGP configuration.
- [show ip bgp neighbors](#) — display the current BGP neighbors.

## neighbor soft-reconfiguration inbound

Enable soft-reconfiguration for BGP.

#### Syntax

```
neighbor {ip-address | peer-group-name} soft-reconfiguration inbound
```

To disable, use the `no neighbor {ip-address | peer-group-name} soft-reconfiguration inbound` command.

#### Parameters

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group to disable or enable all routers within the peer group.

#### Defaults

Disabled

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## Usage Information

This command enables soft-reconfiguration for the BGP neighbor specified. BGP stores all the updates the neighbor receives but does not reset the peer-session.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

 **CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.**

## Related Commands

- [show ip bgp neighbors](#) — display routes received by a neighbor.

## neighbor timers

Set keepalive and hold time timers for a BGP neighbor or a peer group.

### Syntax

```
neighbor {ip-address | peer-group-name} timers keepalive holdtime
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} timers` command.

### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the peer router in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the timers for all routers within the peer group.
<b><i>keepalive</i></b>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is <b>60 seconds</b> .
<b><i>holdtime</i></b>	Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is <b>180 seconds</b> .

### Defaults

- keepalive = **60 seconds**
- holdtime = **180 seconds**

**Command Modes** ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

#### Usage Information

Timer values configured with the `neighbor timers` command override the timer values configured with any other command.

When two neighbors, configured with different `keepalive` and `holdtime` values, negotiate for new values, the resulting values are as follows:

- the lower of the `holdtime` value is the new `holdtime` value, and
- whichever is the lower value; one-third of the new `holdtime` value, or the configured `keepalive` value, is the new `keepalive` value.

## neighbor timers extended

Set idle hold time for a BGP neighbor or a peer group.

**Syntax** `neighbor {ip-address | ipv6-address | peer-group-name} timers extended idle holdtime`

To return to the default values, use the `no neighbor {ip-address | ipv6-address | peer-group-name} timers extended idle holdtime` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the peer router in dotted decimal format.
<b><i>ipv6-address</i></b>	Enter the IPv6 address of the peer router in X:X:X::X format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the timers for all routers within the peer group.
<b><i>timers extended idle holdtime</i></b>	Enter a number for the time interval, in seconds, for the peer to be idle state. The range is from 1 to 32767. The default is <b>15 seconds</b> .

#### Defaults

The default idle holdtime is **15 seconds**.

**Command Modes** ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the C9010, MXL, FN IOM, S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, and S6000-ON.

#### Usage Information

The peer remains in idle state based on the configured `idle holdtime`. The less the `idle holdtime`, less the peer in idle state.

For the new `idle holdtime` to take effect, you need to shutdown the respective peer manually using `neighbor shutdown` command and enable the peer again.

## neighbor update-source

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

**Syntax** `neighbor {ip-address | peer-group-name} update-source interface`

To use the closest interface, use the `no neighbor {ip-address | peer-group-name} update-source interface` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the peer router in dotted decimal format.
--------------------------	---

**peer-group-name** Enter the name of the peer group to disable all routers within the peer group.

**interface** Enter the keyword `loopback` then a number of the Loopback interface. The range is from 0 to 16383.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The `neighbor update-source` command is not necessary for directly connected internal BGP sessions.

Neighbors are sorted according to the source and destination ip addresses. If an update-source ip address exists, then the source ip address determines the order in which the neighbors are displayed.

## neighbor weight

Assign a weight to the neighbor connection, which is used to determine the best path.

**Syntax** `neighbor {ip-address | peer-group-name} weight weight`

To remove a weight value, use the `no neighbor {ip-address | peer-group-name} weight` command.

**Parameters**

**ip-address** Enter the IP address of the peer router in dotted decimal format.

**peer-group-name** Enter the name of the peer group to disable all routers within the peer group.

**weight** Enter a number as the weight. The range is from 0 to 65535. The default is **0**.

**Defaults** **0**

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

In the Dell EMC Networking OS best path selection process, the path with the highest weight value is preferred.

 **NOTE:** In the Dell EMC Networking OS best-path selection process, the path with the highest weight value is preferred.

If you configure the `set weight` command in a route map applied to this neighbor, the weight set in that command overrides the weight set in the `neighbor weight` command.

#### Related Commands

- `set weight` — assign a weight to all paths meeting the route map criteria.

## network

Specify the networks for the BGP process and enter them in the BGP routing table.

#### Syntax

```
network ip-address mask [route-map map-name]
```

To remove a network, use the `no network ip-address mask [route-map map-name]` command.

#### Parameters

- |                                  |  |
|----------------------------------|--|
| <b><i>ip-address</i></b>         | Enter an IP address in dotted decimal format of the network.   |
| <b><i>mask</i></b>               | Enter the mask of the IP address in the slash prefix length format (for example, /24).<br><br>The mask appears in command outputs in dotted decimal format (A.B.C.D).  |
| <b><i>route-map map-name</i></b> | (OPTIONAL) Enter the keyword <code>route-map</code> then the name of an established route map.<br><br>Only the following ROUTE-MAP mode commands are supported: <ul style="list-style-type: none"> <li>• <code>match ip address</code></li> <li>• <code>set community</code></li> <li>• <code>set local-preference</code></li> </ul> |

- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** Dell EMC Networking OS software resolves the network address the `network` command configures with the routes in the main routing table to ensure that the networks are reachable using non-BGP routes and non-default routes.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

In BGP, the next-hop for the route is calculated from the information that is acquired through IGP or static routes.

**Related Commands**

- [redistribute](#) — redistribute routes into BGP.

## network backdoor

Specify this IGP route as the preferred route.

**Syntax** `network ip-address mask backdoor`

To remove a network, use the `no network ip-address mask backdoor` command.

**Parameters**

<b><i>ip-address</i></b>	Enter an IP address in dotted decimal format of the network.
<b><i>mask</i></b>	Enter the mask of the IP address in the slash prefix length format (for example, /24). The mask appears in command outputs in dotted decimal format (A.B.C.D).

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** Although Dell EMC Networking OS does not generate a route due to the backdoor config, there is an option for injecting/sourcing a local route in the presence of network backdoor config on a learned route.

## permit bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to permit incoming or outgoing traffic.

**Syntax** `permit bandwidth`

To disable this setting, enter the `no permit bandwidth` command.

**Parameters**

<b>bandwidth</b>	Enter the keyword bandwidth to specify extended-community attribute as the matching criteria for permitting traffic. The range is from 0 to 102400.
------------------	---

**Defaults** N/A

**Command Modes** EXTENDED COMMUNITY LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

**Related Commands**

- [deny bandwidth](#) – link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

## redistribute

Redistribute routes into BGP.

**Syntax** `redistribute {connected | static} [route-map map-name]`  
To disable redistribution, use the `no redistribution {connected | static}` command.

**Parameters**

**connected** Enter the keyword `connected` to redistribute routes from physically connected interfaces.

**static** Enter the keyword `static` to redistribute manually configured routes. These routes are treated as incomplete routes.

**route-map map-name** (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

Only the following ROUTE-MAP mode commands are supported:

- [match ip address](#)
- [set community](#)
- [set local-preference](#)
- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as <b>internal</b> .
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

### Usage Information

You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and applied outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

If you do not configure the `default-metric` command, in addition to the `redistribute` command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0.0.0.0/0), configure the `neighbor default-originate` command.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

### Related Commands

- [neighbor default-originate](#) — inject the default route.

## redistribute ospf

Redistribute OSPF routes into BGP.

### Syntax

```
redistribute ospf process-id [[match external {1 | 2}] [match internal]]
[route-map map-name]
```

To stop redistribution of OSPF routes, use the `no redistribute ospf process-id` command.

### Parameters

<b><i>process-id</i></b>	Enter the number of the OSPF process. The range is from 1 to 65535.
<b>match external {1   2}</b>	(OPTIONAL) Enter the keywords <code>match external</code> to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.
<b>match internal</b>	(OPTIONAL) Enter the keywords <code>match internal</code> to redistribute OSPF internal routes only.

**route-map *map-name*** (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as <b>internal</b> .
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with `metric-type internal` and apply outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

When you enter the `redistribute isis process-id` command without any other parameters, Dell EMC Networking OS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. RFC does not support this feature.

## router bgp

To configure and enable BGP, enter ROUTER BGP mode.

**Syntax** `router bgp as-number`

To disable BGP, use the `no router bgp as-number` command.

**Parameters** ***as-number*** Enter the AS number. The range is from 1 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

At least one interface must be in Layer 3 mode for the `router bgp` command to be accepted. If all interfaces are configured under VRF, at least one interface should be in the default VRF for the `router bgp` command to be accepted. If no interfaces are enabled for Layer 3, an error message appears:

```
% Error: No router id
configured
```

BGP does not allow 23456 (AS-TRANS) as a configured AS number.

#### Example

```
DellEMC(conf)# router bgp 3
DellEMC(conf-router_bgp)#
```

## shutdown all

Disables all the BGP neighbors.

#### Syntax

```
shutdown all
```

Use the `no shutdown all` command to enable all the configured BGP neighbors.

**Command Modes** ROUTER BGP

#### Command History

Version	Description
9.11.0.0	Introduced on the S-Series, Z-Series, MXL, and IOM.

#### Usage Information

You can use this command to disable all the configured BGP neighbors.

This command is global for all VRFs.

## shutdown address-family-ipv4-multicast

Disables all the BGP neighbors corresponding to the multicast IPv4 address families.

#### Syntax

```
shutdown address-family-ipv4-unicast
```

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

**Command Modes** ROUTER BGP  
CONFIGURATION

<b>Command History</b>	<b>Version</b>	Description
	<b>9.11.0.0</b>	Introduced on the S-Series, Z-Series, MXL, and IOM.

**Usage Information** You can use this command to disable all the configured BGP neighbors corresponding to the multicast IPv4 address families.  
This command is global for all VRFs.

## shutdown address-family-ipv4-unicast

Disables all the BGP neighbors corresponding to the unicast IPv4 address families.

**Syntax** `shutdown address-family-ipv4-unicast`

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the unicast IPv4 address families.

**Command Modes** ROUTER BGP  
CONFIGURATION

<b>Command History</b>	<b>Version</b>	Description
	<b>9.11.0.0</b>	Introduced on the S-Series, Z-Series, MXL, and IOM.

**Usage Information** You can use this command to disable all the configured BGP neighbors corresponding to the unicast IPv4 address families.  
This command is global for all VRFs.

## shutdown address-family-ipv6-unicast

Disables all the BGP neighbors corresponding to the unicast IPv6 address families.

**Syntax** `shutdown address-family-ipv6-unicast`

Use the `no shutdown address-family-ipv6-unicast` command to enable all the configured BGP neighbors corresponding to the unicast IPv6 address families.

**Command Modes** ROUTER BGP  
CONFIGURATION

<b>Command History</b>	<b>Version</b>	Description
	<b>9.11.0.0</b>	Introduced on the S-Series, Z-Series, MXL, and IOM.

**Usage Information** You can use this command to disable all the configured BGP neighbors corresponding to the unicast IPv6 address families.  
This command is global for all VRFs.

## set extcommunity bandwidth

Enables you to set extended community bandwidth.

<b>Syntax</b>	<code>set extcommunity bandwidth</code> To disable extended community bandwidth, enter the <code>no set extcommunity bandwidth</code> command.
<b>Parameters</b>	<b>bandwidth</b> Enter the keyword <code>bandwidth</code> to enable extended community bandwidth. The range is from 0 to 102400.
<b>Defaults</b>	N/A
<b>Command Modes</b>	ROUTER MAP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S-Series.

<b>Usage Information</b>	<p>A new policy command is introduced in order to attach the Link Bandwidth extended community only to the prefixes that are received from a neighbor that satisfy the desired conditions. This command is relevant for both inbound as well as outbound policy handling (for received prefixes). Also, there is no change to the set of supported conditions or filters.</p> <p>During configuration, the bandwidth is specified in Mbps, not in bytes/second. While creating the actual LB extended community, the system will attach the AS number and encode the bandwidth in floating point format.</p>
--------------------------	--

## show capture bgp-pdu neighbor

Display BGP packet capture information for an IPv4 address on the system.

<b>Syntax</b>	<code>show capture bgp-pdu neighbor ipv4-address</code>
<b>Parameters</b>	<b>ipv4-address</b> Enter the IPv4 address (in dotted decimal format) of the BGP address to display packet information for that address.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.

DellEMC#
```

## show config

View the current ROUTER BGP configuration.

**Syntax** show config

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Example

```
DellEMC(conf-router_bgp)# show config
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
DellEMC(conf-router_bgp)#
```

## show ip bgp

View the current BGP IPv4 routing table for the system.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6
{unicast}] [network [network-mask] [longer-prefixes]] [cluster-list
cluster-id] [community community-number] [community-list community-list-
name] [dampened-paths] [extcommunity-list list name] [filter-list as-path-
name] [flap-statistics [ip-address [mask]]] [neighbors [all {received-
routes}] [network[network-mask]]] [next-hop] [paths] [peer-group peer-
group-name] [regex regular-expression] [summary]
```

### Parameters

<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 multicast</code> to view information only related to ipv4 multicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv6 unicast</code> to view information only related to ipv6 unicast routes.
<b>network</b>	(OPTIONAL) Enter the network address (in dotted decimal format) of the BGP network to view information only on that network.
<b>network-mask</b>	(OPTIONAL) Enter the network mask (in slash prefix format) of the BGP network address.
<b>longer-prefixes</b>	(OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.

<b>cluster-list</b> <i>cluster-id</i>	(OPTIONAL) Enter the keyword <code>cluster-list</code> then the cluster-ID to display the routes matching the cluster.
<b>community</b> <i>community-number</i>	(OPTIONAL) Enter the keyword <code>community</code> then the community-number to display the routes matching the communities.
<b>community-list</b> <i>community-list-name</i>	(OPTIONAL) Enter the keyword <code>community-list</code> then the community-list-name to display the routes matching the community-list.
<b>dampened-paths</b>	(OPTIONAL) Enter the keyword <code>dampened-paths</code> to display the paths suppressed due to dampening.
<b>extcommunity-list</b> <i>list name</i>	(OPTIONAL) Enter the keyword <code>extcommunity-list</code> then the list name to display the routes matching the extended community-list.
<b>filter-list</b> <i>as-path-name</i>	(OPTIONAL) Enter the keyword <code>filter-list</code> then the as-path-name to display the routes conforming to the filter-list.
<b>flap-statistics</b>	(OPTIONAL) Enter the keyword <code>flap-statistics</code> to display flap statistics of the routes.
<b>neighbors</b>	(OPTIONAL) Enter the keyword <code>neighbors</code> to display the detailed information on TCP and BGP neighbor connections.
<b>neighbors</b> <b>[all {received-routes}]</b>	(OPTIONAL) Enter the keyword <code>neighbors [all {received-routes}]</code> to display all the received routes both accepted and rejected from all the IPv4 or IPv6 neighbors.
<b>next-hop</b>	(OPTIONAL) Enter the keyword <code>next-hop</code> to view all the next-hop information on the learnt routes.
<b>paths</b>	(OPTIONAL) Enter the keyword <code>paths</code> to view the BGP path attributes in the BGP database.
<b>peer-group</b> <i>peer-group-name</i>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the peer-group-name to view the information on the BGP peers in a peer group.
<b>regex</b> <i>regular-expression</i>	(OPTIONAL) Enter the keyword <code>regex</code> then the regular expressions to display BGP information based on a regular expression.
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to display the summary of BGP neighbor status.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.14(1.0)</b>	Introduced the <code>[all {received-routes}]</code> option for IPv4 and IPv6 neighbors on S4810 and S4820T.
<b>9.14(0.0)</b>	Introduced the <code>[all {received-routes}]</code> option for IPv4 and IPv6 neighbors.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.

Version	Description
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the add-path option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

When you enable the `bgp non-deterministic-med` command, the `show ip bgp` command output for a BGP route does not list the INACTIVE reason.

In BGP, this command displays the exact reason why the route is discarded.

The following describes the `show ip bgp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the AS the route passed through to reach the destination network.

The `show ip bgp` command displays the `dmzlink-dw` details only if `dmzlink-bw` is enabled using the `bgp dmzlink-dw` command.

### Example

```
DelleMC# show ip bgp
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop           Metric      LocPrf Weight Path
*>  55.0.0.0/24     172.16.0.2                0 200 i
*>  66.0.0.0/24     172.16.0.2                0 200 i
```

All the `show` and `debugs` commands display the link band width extended-community prefixed with DMZ-Link-bw along with other extended communities.

```
DelleMC# show ip bgp 3.3.3.0/24
BGP routing table entry for 3.3.3.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
  1.1.1.2 (3.3.3.1) Best
  AS_PATH :
  Next-Hop : 1.1.1.2, Cost : 0
```

```
Origin IGP, Metric 0, LocalPref 100, Weight 0, internal
Extended Communities :
  DMZ-Link Bw: 2000 kbytes*
```

Following is the example for displaying all the received routes from all IPv4 neighbors:

```
DelleMC# show ip bgp vrf test ipv4 unicast neighbors all received-routes
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 1.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Network	Next Hop	Metric	LocPrf	Weight	Path
ID 110.1.1.0/24	11.1.1.2	0	100	0	?
*>I 111.1.1.0/24	11.1.1.2	0	100	0	?
ID 112.1.1.0/24	11.1.1.2	0	100	0	?
*>I 113.1.1.0/24	11.1.1.2	0	100	0	?
ID 114.1.1.0/24	11.1.1.2	0	100	0	?
*>I 115.1.1.0/24	11.1.1.2	0	100	0	?
ID 116.1.1.0/24	11.1.1.2	0	100	0	?
ID 117.1.1.0/24	11.1.1.2	0	100	0	?
ID 118.1.1.0/24	11.1.1.2	0	100	0	?
ID 119.1.1.0/24	11.1.1.2	0	100	0	?
ID 120.1.1.0/24	11.1.1.2	0	100	0	?

Following is the example for displaying all the received routes from all IPv6 neighbors:

```
DelleMC# show ip bgp ipv6 unicast neighbors all received-routes
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 11.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Network	Next Hop	Metric	LocPrf	Weight	Path
*>I 200::/64	12::2		0	0	i
*>I 200:0:0:1::/64	12::2		0	0	i
*>I 200:0:0:2::/64	12::2		0	0	i

## Related Commands

- [show ip bgp community](#) — view the BGP communities.
- [neighbor maximum-prefix](#) — control the number of network prefixes received.
- [show ip bgp cluster-list](#) — view BGP neighbors in a specific cluster.
- [show ip bgp community](#) — view information on all routes with Community attributes or view specific BGP community groups.
- [show ip bgp community-list](#) — view routes that a specific community list affects.

- [show ip bgp dampened-paths](#) — view BGP routes that are dampened (non-active).
- [show ip bgp extcommunity-list](#) — view information on all routes with Extended Community attributes.
- [show ip bgp filter-list](#) — view the routes that match the filter lists.
- [show ip bgp flap-statistics](#) — view flap statistics on BGP routes.
- [show ip bgp neighbors](#) — allow you to view the information BGP neighbors exchange.
- [show ip bgp next-hop](#) — view all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.
- [show ip bgp paths](#) — view all the BGP path attributes in the BGP database.
- [show ip bgp peer-group](#) — allow you to view information on the BGP peers in a peer group.
- [show ip bgp regexp](#) — display the subset of the BGP routing tables matching the regular expressions specified.
- [show ip bgp summary](#) — allow you to view the status of all BGP connections.

## show ip bgp cluster-list

View BGP neighbors in a specific cluster.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] cluster-list [cluster-id]`

<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view cluster information of BGP neighbors corresponding to that VRF.
	<b>ipv4 multicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
	<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to the ipv6 unicast routes.
	<b>cluster-id</b>	(OPTIONAL) Enter the cluster id in dotted decimal format. The range is 1 — 4294967295.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp cluster-list` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
DellEMC# show ip bgp cluster-list
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.6
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

DellEMC#
```

## show ip bgp community

View information on all routes with Community attributes or view specific BGP community groups.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
community [community-number] [local-as] [no-export] [no-advertise]
```

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.

<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>community-number</b>	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.  You can specify up to eight community numbers to view information on those community groups.
<b>local-AS</b>	Enter the keywords <code>local-AS</code> to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.  All routes with the NO_EXPORT_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.
<b>no-advertise</b>	Enter the keywords <code>no-advertise</code> to view all routes containing the well-known community attribute of NO_ADVERTISE.  All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.
<b>no-export</b>	Enter the keywords <code>no-export</code> to view all routes containing the well-known community attribute of NO_EXPORT.  All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added the ipv4 multicast and ipv6 unicast parameters.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
DelleMC# show ip bgp community ?
local-AS          Do not export outside local AS (well-known community)
no-advertise      Do not advertise to any peer (well-known community)
no-export         Do not export to next AS (well-known community)
aa:nn            Community number in aa:nn format
|               Pipe through a command

DelleMC# show ip bgp community
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

*>  55.0.0.0/24        172.16.0.2                0 200 i
*>  66.0.0.0/24        172.16.0.2                0 200 i

DelleMC# show ip bgp community no-advertise
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path
*>  66.0.0.0/24        172.16.0.2                0 200 i
DelleMC#
```

## show ip bgp community-list

View routes that a specific community list affects.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast]
community-list community-list-name [exact-match]
```

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes affected by a specific community list corresponding to that VRF.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>community-list-name</b>	Enter the name of a configured IP community list (maximum 140 characters).
<b>exact-match</b>	Enter the keyword for an exact match of the communities.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

The `show ip bgp community-list` command without any parameters lists BGP routes matching the Community List and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community-list pass` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

**Example**

```
DelleMC# conf t
DelleMC(conf)# ip community-list c11

## show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

### Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is dampened.
<b>From</b>	Displays the IP address of the neighbor advertising the dampened route.
<b>Reuse</b>	Displays the hour:minutes:seconds until the dampened route is available.
<b>Path</b>	Lists all the ASs the dampened route passed through to reach the destination network.

### Example

```
DellEMC# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From           Reuse      Path
d 55.0.0.0/24        172.16.0.2          00:36:23    200
DellEMC#
```

## show ip bgp detail

Display BGP internal information for the IPv4 Unicast address family.

**Syntax** `show ip bgp [ipv4 unicast] detail`

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

### Example

## show ip bgp extcommunity-list

View information on all routes with Extended Community attributes.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] extcommunity-list [list name]`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information on all routes with extended community attributes corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>list name</b>	Enter the extended community list name you wish to view. The range is 140 characters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>ipv4 multicast</code> and <code>ipv6 unicast</code> parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

## Example

```
DelleEMC# show run extcommunity-list
!
ip extcommunity-list ecl1
 permit rt 100:4
 permit soo 40:4
DelleEMC#show ip bgp extcommunity-list ecl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path
*>  55.0.0.0/24        172.16.0.2
*>  77.0.0.0/24        172.16.0.2          0 200 i
DelleEMC#show ip bgp extcommunity-list ec
% Error: Extended community list does not exist.
DelleEMC#
```

## show ip bgp filter-list

View the routes that match the filter lists.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
filter-list as-path-name
```

### Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.
- as-path-name** Enter an AS-PATH access list name. The range is 140 characters.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp filter-list hello` command shown in the following example.

Field	Description
<b>Path source codes</b>	Lists the path sources shown to the right of the last AS number in the Path column: <ul style="list-style-type: none"> <li>• i = internal route entry</li> <li>• a = aggregate route entry</li> <li>• c = external confederation route entry</li> <li>• n = network route entry</li> <li>• r = redistributed route entry</li> </ul>
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell EMC# show run as-path a1
!
ip as-path access-list a1
 permit 500
Dell EMC#

Dell EMC# show ip bgp filter-list a1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop           Metric      LocPrf Weight Path
*>  55.0.0.0/24       172.16.0.2
*>  66.0.0.0/24       172.16.0.2
Dell EMC#
```

## show ip bgp flap-statistics

View flap statistics on BGP routes.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
flap-statistics [ip-address [mask]] [filter-list as-path-name] [regex
regular-expression]
```

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.

<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>ip-address</b>	(OPTIONAL) Enter the IP address (in dotted decimal format) of the BGP network to view information only on that network.
<b>mask</b>	(OPTIONAL) Enter the network mask (in slash prefix (/x) format) of the BGP network address.
<b>filter-list as-path-name</b>	(OPTIONAL) Enter the keyword <code>filter-list</code> then the name of a configured AS-PATH ACL. The range is 140 characters.
<b>regex regular-expression</b>	<p>Enter a regular expression then use one or a combination of the following characters to match. The range is 256 characters.</p> <ul style="list-style-type: none"> <li>• <code>.</code> = (period) any single character (including a white space).</li> <li>• <code>*</code> = (asterisk) the sequences in a pattern (zero or more sequences).</li> <li>• <code>+</code> = (plus) the sequences in a pattern (one or more sequences).</li> <li>• <code>?</code> = (question mark) sequences in a pattern (either zero or one sequences).</li> </ul> <p> <b>NOTE:</b> Enter an escape sequence (CTRL+v) prior to entering the <code>?</code> regular expression.</p> <ul style="list-style-type: none"> <li>• <code>[ ]</code> = (brackets) a range of single-character patterns.</li> <li>• <code>( )</code> = (parenthesis) groups a series of pattern elements to a single element.</li> <li>• <code>{ }</code> = (braces) minimum and the maximum match count.</li> <li>• <code>^</code> = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.</li> <li>• <code>\$</code> = (dollar sign) the end of the output string.</li> </ul>

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

## Usage Information

The following describes the `show ip bgp flap` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is flapping.
<b>From</b>	Displays the IP address of the neighbor advertising the flapping route.
<b>Flaps</b>	Displays the number of times the route flapped.
<b>Duration</b>	Displays the hours:minutes:seconds since the route first flapped.
<b>Reuse</b>	Displays the hours:minutes:seconds until the flapped route is available.
<b>Path</b>	Lists all the ASs the flapping route passed through to reach the destination network.

## Example

```
DellEMC# show ip bgp flap-statistics
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best

```

## show ip bgp inconsistent-as

View routes with inconsistent originating autonomous system (AS) numbers; that is, prefixes that are announced from the same neighbor AS but with a different AS-Path.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 unicast] inconsistent-as`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view routes corresponding to the VRF that contain inconsistent originating AS numbers.
- ipv4 unicast** (OPTIONAL) Enter the keywords `ipv4 unicast` to view information only related to ipv4 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp inconsistent-as` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

### Example

```
DellEMC# show ip bgp inconsistent-as
BGP table version is 280852, local router ID is 10.1.2.100
Status codes: s suppressed, d damped, h history, * valid, > best
Path source: I - internal, c - confed-external, r - redistributed, n - network
Origin codes: i - IGP, e - EGP, ? - incomplete

## show ip bgp neighbors

Allows you to view the information BGP neighbors exchange.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] neighbors [ip-address [advertised-routes | dampened-routes | detail | flap-statistics | routes | all {received-routes [network [network-mask]]} | {denied-routes [network [network-mask]]}]`

<b>Parameters</b>	<p><b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view information exchanged by BGP neighbors corresponding to that VRF.</p> <p> <b>NOTE:</b> You can use this attribute to view information exchanged by BGP neighbors that correspond to either a default or a non-default VRF.</p> <p><b>ipv4 multicast</b> (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.</p> <p><b>ipv4 unicast</b> (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.</p> <p><b>ipv6 unicast</b> (OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.</p> <p><b>ip-address</b> (OPTIONAL) Enter the IP address of the neighbor to view only BGP information exchanged with that neighbor.</p> <p><b>advertised-routes</b> (OPTIONAL) Enter the keywords <code>advertised-routes</code> to view only the routes the neighbor sent.</p> <p><b>dampened-routes</b> (OPTIONAL) Enter the keywords <code>dampened-routes</code> to view information on dampened routes from the BGP neighbor.</p> <p><b>detail</b> (OPTIONAL) Enter the keyword <code>detail</code> to view neighbor-specific internal information for the IPv4 Unicast address family.</p> <p><b>flap-statistics</b> (OPTIONAL) Enter the keywords <code>flap-statistics</code> to view flap statistics on the neighbor's routes.</p> <p><b>routes</b> (OPTIONAL) Enter the keyword <code>routes</code> to view only the neighbor's feasible routes.</p> <p><b>all {received-routes [network [network-mask]]}</b> (OPTIONAL) Enter the keywords <code>all {received-routes}</code> then either the network address alone (in dotted decimal format) or the network address along with the network mask (in slash prefix format) to view all the information received from neighbors.</p> <p> <b>NOTE:</b> Configure the <code>neighbor soft-reconfiguration inbound</code> command prior to viewing all the information received from the neighbors.</p> <p><b>denied-routes [network [network-mask]]</b> (OPTIONAL) Enter the keywords <code>denied-routes</code> then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information on routes denied via neighbor inbound filters.</p>
-------------------	--

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced the [all] option for IPv4 and IPv6 neighbors.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the add-path option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Added the detail option. Output now displays the default MED value.
7.2.1.0	Added the received and denied route options.
6.3.10	The output is changed to display the total number of advertised prefixes.

## Usage Information

After a peer reset, the contents of the notification log messages is displayed in hex values for debugging.

The neighbor information that this command displays does not include counts corresponding to ignored prefixes and updates. However, the martian case is an exception where neighbor information corresponding to ignored updates is displayed.

BGP shows the exact information that is exchanged between the BGP peers. It also indicates whether or not this information is received by the BGP peer.

The following describes the `show ip bgp neighbors` command shown in the following examples.

The Lines Beginning with:	Description
<b>BGP neighbor</b>	Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.
<b>BGP version</b>	Displays the BGP version (always version 4) and the remote router ID.
<b>BGP state</b>	Displays the neighbor's BGP state and the amount of time in hours:minutes:seconds it has been in that state.
<b>Last read</b>	This line displays the following information: <ul style="list-style-type: none"> <li>last read is the time (hours:minutes:seconds) the router read a message from its neighbor</li> <li>hold time is the number of seconds configured between messages from its neighbor</li> </ul>

<b>The Lines Beginning with:</b>	<b>Description</b>
	<ul style="list-style-type: none"> <li>keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.</li> </ul>
<b>Received messages</b>	This line displays the number of BGP messages received, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
<b>Sent messages</b>	The line displays the number of BGP messages sent, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
<b>Received updates</b>	This line displays the number of BGP updates received and sent.
<b>Soft reconfiguration</b>	This line indicates that soft reconfiguration inbound is configured.
<b>Minimum time</b>	Displays the minimum time, in seconds, between advertisements.
<b>(list of inbound and outbound policies)</b>	Displays the policy commands configured and the names of the Route map, AS-PATH ACL, or Prefix list configured for the policy.
<b>For address family:</b>	Displays the IPv4 Unicast as the address family.
<b>BGP table version</b>	Displays which version of the primary BGP routing table the router and the neighbor are using.
<b>accepted prefixes</b>	Displays the number of network prefixes the router accepts and the amount of memory used to process those prefixes.
<b>Prefix advertised</b>	Displays the number of network prefixes advertised, the number rejected, and the number withdrawn from the BGP routing table.
<b>Connections established</b>	Displays the number of TCP connections established and dropped between the two peers to exchange BGP information.
<b>Last reset</b>	Displays the amount of time since the peering session was last reset. Also states if the peer resets the peering session. If the peering session was never reset, the word never is displayed.
<b>Local host:</b>	Displays the peering address of the local router and the TCP port number.
<b>Foreign host:</b>	Displays the peering address of the neighbor and the TCP port number.

### Example

```
DelleMC# show ip bgp neighbors 172.16.0.2
BGP neighbor is 172.16.0.2, remote AS 200, external link
  Member of peer-group port0 for session parameters
  BGP remote router ID 172.16.0.2
  BGP state ESTABLISHED, in this state for 00:13:55
  Last read 00:00:03, Last write 00:00:55
  Hold time is 180, keepalive interval is 60 seconds
  Received 50 messages, 0 in queue
    1 opens, 0 notifications, 34 updates
    15 keepalives, 0 route refresh requests
  Sent 18 messages, 0 in queue
    1 opens, 0 notifications, 0 updates
    16 keepalives, 0 route refresh requests

Route refresh request: received 0, sent messages 1
Minimum time between advertisement runs is 30 seconds
Minimum time before advertisements start is 0 seconds

Capabilities received from neighbor for IPv4 Unicast :
  MULTIPROTO_EXT(1)
  ROUTE_REFRESH(2)
```

```
Capabilities advertised to neighbor for IPv4 Unicast :
MULTIPROTO_EXT(1)
ROUTE_REFRESH(2)
ADD_PATH(69)
CISCO_ROUTE_REFRESH(128)

For address family: IPv4 Unicast
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
InQ : Added 0, Replaced 0, Withdrawn 0
OutQ : Added 0, Withdrawn 0
Allow local AS number 0 times in AS-PATH attribute
Prefixes accepted 2, withdrawn 15 by peer, martian prefixes ignored 0
Prefixes advertised 0, denied 0, withdrawn 0 from peer

Connections established 1; dropped 0
Last reset never
Local host: 172.16.0.1, Local port: 58145
Foreign host: 172.16.0.2, Foreign port: 179

DellEMC#
```

**Related Commands**

- [show ip bgp](#) — view the current BGP routing table.

## show ip bgp next-hop

View all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.

**Syntax** `show ip bgp [vrf vrf-name] next-hop`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp next-hop` command shown in the following example.

Field	Description
<b>Next-hop</b>	Displays the next-hop IP address.
<b>Via</b>	Displays the IP address and interface used to reach the next hop.
<b>RefCount</b>	Displays the number of BGP routes using this next hop.
<b>Cost</b>	Displays the cost associated with using this next hop.
<b>Flaps</b>	Displays the number of times the next hop has flapped.
<b>Flaps</b>	Displays the number of times the next hop has flapped.

### Example

```
DellEMC# show ip bgp next-hop
      Next-hop          Resolved
      172.16.0.2        YES
DellEMC#
```

## show ip bgp paths

View all the BGP path attributes in the BGP database.

**Syntax** `show ip bgp[vrf vrf-name] paths [regex regular-expression]`

### Parameters

- regex regular-expression** Enter a regular expression then use one or a combination of the following characters to match:
- `.` = (period) any single character (including a white space).
  - `*` = (asterisk) the sequences in a pattern (zero or more sequences).
  - `+` = (plus) the sequences in a pattern (one or more sequences).
  - `?` = (question mark) sequences in a pattern (either zero or one sequences).
-  **NOTE:** Enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.
- `[ ]` = (brackets) a range of single-character patterns.
  - `( )` = (parenthesis) groups a series of pattern elements to a single element.
  - `{ }` = (braces) minimum and the maximum match count.
  - `^` = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
  - `$` = (dollar sign) the end of the output string.

- Command Modes**
- EXEC
  - EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF for the S4810, S4820T, and S6000.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp path` command shown in the following example.

Field	Description
<b>Total</b>	Displays the total number of BGP path attributes.
<b>Address</b>	Displays the internal address where the path attribute is stored.
<b>Hash</b>	Displays the hash bucket where the path attribute is stored.
<b>Refcount</b>	Displays the number of BGP routes using this path attribute.
<b>Metric</b>	Displays the MED attribute for this path attribute.
<b>Path</b>	Displays the AS path for the route, with the origin code for the route listed last. Numbers listed between braces {} are AS_SET information.

### Example

```
DelleMC# show ip bgp paths ?
community          Display community information
extcommunity       Display extended community information
regex              Display path information based on a regular
expression
|                  Pipe through a command

DelleMC#show ip bgp paths
Total 2 Paths
Refcount Metric Path
1          0          200 i
1          0          200 i
DelleMC#
```

## show ip bgp paths community

View all unique COMMUNITY numbers in the BGP database.

**Syntax** `show ip bgp [vrf vrf-name] paths community`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The following describes the `show ip bgp paths community` command shown in the following example.

Field	Description
<b>Address</b>	Displays the internal address where the path attribute is stored.
<b>Hash</b>	Displays the hash bucket where the path attribute is stored.
<b>Refcount</b>	Displays the number of BGP routes using these communities.
<b>Community</b>	Displays the community attributes in this BGP path.

### Example

```
DellEMC# show ip bgp paths community
Total 2 communities
Refcount   Community
1          NO-ADVERTISE
1          200:1          1000:1          3000:1
DellEMC#
```

## show ip bgp peer-group

Allows you to view information on the BGP peers in a peer group.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]  
peer-group [peer-group-name [detail | summary]]`

<b>Parameters</b>	<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
	<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
	<b>peer-group-name</b>	(OPTIONAL) Enter the name of a peer group to view information about that peer group only.
	<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to view detailed status information of the peers in that peer group.
	<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view status information of the peers in that peer group. The output is the same as that found in the <code>show ip bgp summary</code> command.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>ipv4 multicast</code> and <code>ipv6 unicast</code> parameters. Introduced on S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the <code>ADDPATH</code> parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The following describes the `show ip bgp peer-group` command shown in the following example.

## Line beginning with: Description

<b>Peer-group</b>	Displays the peer group's name.
<b>Administratively shut</b>	Displays the peer group's status if the peer group is not enabled. If you enable the peer group, this line is not displayed.
<b>BGP version</b>	Displays the BGP version supported.
<b>Minimum time</b>	Displays the time interval between BGP advertisements.
<b>For address family</b>	Displays IPv4 Unicast as the address family.
<b>BGP neighbor</b>	Displays the name of the BGP neighbor.
<b>Number of peers</b>	Displays the number of peers currently configured for this peer group.
<b>Peer-group members:</b>	Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an * is displayed next to the IP address.

### Example

```
DelleMC# show ip bgp peer-group
Peer-group port0, remote AS 200
BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
BGP neighbor is port0, peer-group external
Update packing has 4_OCTET_AS support enabled

Number of peers in this group 1
Maximum limit on the accepted connections 256

Peer-group members (* - outbound optimized):
172.16.0.2
DelleMC#
```

### Related Commands

- [neighbor peer-group \(assigning peers\)](#) — assign a peer to a peer-group.
- [neighbor peer-group \(creating group\)](#) — create a peer group.

## show ip bgp regexp

Display the subset of the BGP routing tables matching the regular expressions specified.

### Syntax

```
show ip bgp [vrf vrf-name] regexp regular-expression [character]
```

### Parameters

<b>vrf vrf-name</b>	Enter the keyword <i>vrf</i> and then the name of the VRF to view the subset of BGP routing tables that match the regular expression specified on that VRF. <b>i</b> <b>NOTE:</b> You can use this attribute to view the subset of BGP routing tables that match the regular expression that is specified on either a default or a non-default VRF.
<b>regular-expression</b> <b>[character]</b>	Enter a regular expression then use one or a combination of the following characters to match: <ul style="list-style-type: none"><li>• . = (period) any single character (including a white space).</li><li>• * = (asterisk) the sequences in a pattern (zero or more sequences).</li><li>• + = (plus) the sequences in a pattern (one or more sequences).</li><li>• ? = (question mark) sequences in a pattern (either zero or one sequences).</li></ul> <b>i</b> <b>NOTE:</b> Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.

- [ ] = (brackets) a range of single-character patterns.
- ( ) = (parenthesis) groups a series of pattern elements to a single element.
- { } = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- \$ = (dollar sign) the end of the output string.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

The following describes the `show ip bgp regexp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then non-BGP routes exist in the router's routing table.
<b>Metric</b>	Displays the BGP router's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight
<b>Path</b>	Lists all the AS paths the route passed through to reach the destination network.

**Example**

```
DelleMC# show ip bgp regexp ^200
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop          Metric    LocPrf Weight Path
```

```
*> 55.0.0.0/24      172.16.0.2      0 200 i
*> 66.0.0.0/24      172.16.0.2      0 200 i
DellEMC#
```

## show ip bgp summary

Allows you to view the status of all BGP connections.

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] summary`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view the status of all BGP connections corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added the ipv4 multicast and ipv6 unicast parameters.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** In BGP, route attributes are maintained at different locations. When attributes that correspond to multiple routes change, then attribute counts that the `show ip bgp summary` command displays are calculated as summations of attributes corresponding to all the associated routes. For example, if `cluster_id` is an attribute associated with thousand routes that contain exactly the same set of attributes, then the `cluster_id` count is 1. If these thousand routes are set with different attribute values with the

same cluster\_id, then the cluster\_id count is 1000, since the same value is stored for thousand different attribute records.

The attribute next-hop is a part of the BGP attribute data structure.

If two peers send the same route that contains similar path attributes, then two entries are maintained in the back-end, as both these entries have different next-hops. If this same route is sent to a different peer, an entry for each peer is created, as the next-hop is different. As a result, the BGP attributes count in the summary output will differ accordingly.

The following describes the `show ip bgp summary` command shown in the following example.

Field	Description								
<b>BGP router identifier</b>	Displays the local router ID and the AS number.								
<b>BGP table version</b>	Displays the BGP table version and the main routing table version.								
<b>network entries</b>	Displays the number of network entries, route paths, and the amount of memory used to process those entries.								
<b>paths</b>	Displays the number of paths and the amount of memory used.								
<b>denied paths</b>	Displays the number of denied paths and the amount of memory used.								
<b>BGP path attribute entries</b>	Displays the number of BGP path attributes and the amount of memory used to process them.								
<b>BGP AS-PATH entries</b>	Displays the number of BGP AS_PATH attributes processed and the amount of memory used to process them.								
<b>BGP community entries</b>	Displays the number of BGP COMMUNITY attributes processed and the amount of memory used to process them. The <code>show ip bgp community</code> command provides more details on the COMMUNITY attributes.								
<b>Dampening enabled</b>	Displayed only when you enable dampening. Displays the number of paths designated as history, dampened, or penalized.								
<b>Neighbor</b>	Displays the BGP neighbor address.								
<b>AS</b>	Displays the AS number of the neighbor.								
<b>MsgRcvd</b>	Displays the number of BGP messages that neighbor received.								
<b>MsgSent</b>	Displays the number of BGP messages that neighbor sent.								
<b>TblVer</b>	Displays the version of the BGP table that was sent to that neighbor.								
<b>InQ</b>	Displays the number of messages from that neighbor waiting to be processed.								
<b>OutQ</b>	Displays the number of messages waiting to be sent to that neighbor. If a number appears in parentheses, the number represents the number of messages waiting to be sent to the peer group.								
<b>Up/Down</b>	Displays the amount of time that the neighbor is in the Established stage. If the neighbor has never moved into the Established stage, the word never is displayed. The output format is:								
	<table border="1"> <thead> <tr> <th>Time Established</th> <th>Display Example</th> </tr> </thead> <tbody> <tr> <td>&lt; 1 day</td> <td>00:12:23 (hours:minutes:seconds)</td> </tr> <tr> <td>&lt; 1 week</td> <td>1d21h (DaysHours)</td> </tr> <tr> <td>&gt; 1 week</td> <td>11w2d (WeeksDays)</td> </tr> </tbody> </table>	Time Established	Display Example	< 1 day	00:12:23 (hours:minutes:seconds)	< 1 week	1d21h (DaysHours)	> 1 week	11w2d (WeeksDays)
Time Established	Display Example								
< 1 day	00:12:23 (hours:minutes:seconds)								
< 1 week	1d21h (DaysHours)								
> 1 week	11w2d (WeeksDays)								
<b>State/Pfxrcd</b>	If the neighbor is in Established stage, the number of network prefixes received. If a maximum limit was configured with the <code>neighbor maximum-prefix</code> command, (prfxd) appears in this column.								

Field	Description
	If the neighbor is not in Established stage, the current stage is displayed (Idle, Connect, Active, OpenSent, OpenConfirm). When the peer is transitioning between states and clearing the routes received, the phrase (Purging) may appear in this column.
	If the neighbor is disabled, the phrase (Admin shut) appears in this column.

### Example

```
DellEMC# show ip bgp summary
BGP router identifier 192.168.11.5, local AS number 100
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
2 network entrie(s) using 152 bytes of memory
2 paths using 208 bytes of memory
BGP-RIB over all using 210 bytes of memory
2 BGP path attribute entrie(s) using 144 bytes of memory
1 BGP AS-PATH entrie(s) using 10 bytes of memory
2 neighbor(s) using 16384 bytes of memory

Neighbor      AS           MsgRcvd  MsgSent    TblVer  InQ   OutQ  Up/Down  State/Pfx
172.16.0.2    200          10        8           0     0     0 00:05:34 2
192.168.10.2  100           0        22          0     0     0 00:00:00 (shut)
DellEMC#
```

## show running-config bgp

To display the current BGP configuration, use this feature.

<b>Syntax</b>	show running-config bgp
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.
<b>7.6.1.0</b>	Introduced on the E-Series.

## Example

```
DellEMC# show running-config bgp
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
DellEMC#
```

## timers bgp

Adjust the BGP Keep Alive and Hold Time timers.

### Syntax

```
timers bgp keepalive holdtime
```

To return to the default, use the `no timers bgp` command.

### Parameters

<b><i>keepalive</i></b>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is <b>60 seconds</b> .
<b><i>holdtime</i></b>	Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is <b>180 seconds</b> .

### Defaults

None

### Command Modes

EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.
<b>7.6.1.0</b>	Introduced on the E-Series.

## timers bgp extended

Adjust the BGP idle holdtime for all the BGP neighbors.

<b>Syntax</b>	<code>timers bgp extended <i>idle-holdtime</i></code> To return to the default, use the <code>no timers bgp extended</code> command.				
<b>Parameters</b>	<b>extended <i>idle-holdtime</i></b> Enter a number for the time interval, in seconds, for the peer to be idle state. The range is from 1 to 32767. The default is <b>15 seconds</b> .				
<b>Defaults</b>	The default <i>idle-holdtime</i> is <b>15 seconds</b> .				
<b>Command Modes</b>	EXEC Privilege				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .				
	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td><b>9.14(0.0)</b></td><td>Introduced on the C9010, MXL, FN IOM, S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, and S6000-ON.</td></tr></tbody></table>	Version	Description	<b>9.14(0.0)</b>	Introduced on the C9010, MXL, FN IOM, S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, and S6000-ON.
Version	Description				
<b>9.14(0.0)</b>	Introduced on the C9010, MXL, FN IOM, S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, and S6000-ON.				
<b>Usage Information</b>	The peer remains in idle state based on the configured <i>idle-holdtime</i> . The less the <i>idle-holdtime</i> , lesser the peer in idle state.  For the new <i>idle-holdtime</i> to take effect, you need to shutdown all the peers manually using <code>neighbor shutdown</code> command and enable the peers again.				

## MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (ASs).

Dell EMC Networking OS MBGP is implemented as per IETF RFC 1858.

BGPv4 is supported in the following:

Dell EMC Networking OS Version	Platform Support
<b>7.8.1.0, MBGP for IPv4 Multicast Only</b>	S-Series

## debug ip bgp dampening

View information on routes being dampened.

<b>Syntax</b>	<code>debug ip bgp [<i>vrf vrf-name</i>] [<i>ipv4</i> {unicast   multicast}   <i>ipv6</i> unicast] dampening</code> To disable debugging, use the <code>no debug ip bgp dampening</code> command.
---------------	--

<b>Parameters</b>	<b>vrf <i>vrf-name</i></b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
	<b>ipv4 <i>multicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes.
	<b>ipv4 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 unicast routes.
	<b>ipv6 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.
<b>7.6.1.0</b>	Introduced IPv6 MGBP support for the E-Series.

## distance bgp

Define an administrative distance for routes.

**Syntax** `distance bgp external-distance internal-distance local-distance`

To return to default values, use the `no distance bgp` command.

<b>Parameters</b>	<b><i>external-distance</i></b>	Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is <b>20</b> .
	<b><i>internal-distance</i></b>	Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is <b>200</b> .
	<b><i>local-distance</i></b>	Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is <b>200</b> .

- Defaults**
- external-distance = **20**
  - internal-distance = **200**
  - local-distance = **200**

**Command Modes** ROUTER BGP (conf-router\_bgp\_af)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP on the E-Series.

**Usage Information**

 **CAUTION:** Dell EMC Networking recommends that you do not change the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.

The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

## neighbor auto-local-address

Enable BGP to pick the next hop IPv6 address automatically for IPv6 prefix advertised over an IPv4 neighbor.

**Syntax** `neighbor {neighbor-ipv6-address | peer-group name} auto-local-address`  
To disable this feature, use the `no neighbor {neighbor-ipv6-address | peer-group name} auto-local-address` command.

**Parameters**

- neighbor-ipv6-address** Enter the neighbor IPv6 address.
- peer-group name** Enter the name of the peer group.

**Defaults** Disabled.

**Command Modes** ROUTER-BGP mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.2)	Introduced on the S6000, S6000-ON, S6100-ON, and Z9100-ON..

**Usage Information** If you use this command, the system dynamically picks up the local interface IPv6 address as the next hop for all the outgoing updates over an IPv4 neighbor configured under an IPv6 address family.

## show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is dampened.
<b>From</b>	Displays the IP address of the neighbor advertising the dampened route.
<b>Reuse</b>	Displays the hour:minutes:seconds until the dampened route is available.
<b>Path</b>	Lists all the ASs the dampened route passed through to reach the destination network.

### Example

```

DelleMC# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From          Reuse      Path
d 55.0.0.0/24        172.16.0.2          00:36:23    200
DelleMC#

```

# Content Addressable Memory (CAM)

You can use content addressable memory (CAM) commands to configure the amount of memory allocated to CAM memory partitions.

**NOTE:** Not all CAM commands are supported on all platforms. Be sure to note the platform when looking for a command.

**NOTE:** If you are using these features for the first time, contact Dell EMC Networking Technical Assistance Center (TAC) for guidance.

## Topics:

- [CAM Profile Commands](#)
- [Unified Forwarding Table Modes](#)

## CAM Profile Commands

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).
- Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
- Hash based on bidirectional flow for LAGs.
- Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

## Important Points to Remember

- Dell EMC Networking OS supports CAM allocations on the S-Series.
- The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with `port range` options might require more than one CAM entry.
- You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

## cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

**Syntax**

```
cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos
number l2qos number l2pt number ipmacacl number [vman-qos | vman-
dual-qos number] [etsacl number] [fcoe number][fedgovacl number]
[nlbclusteracl number] [ipv4pbr number] [openflow number] [vrfv4acl number]
[ipv4udfenable] [ipv4udfmirracl number]
```

### Parameters

#### default

Use the default CAM profile settings and set the CAM as follows:

- L2Acl : 2
- Ipv4Acl : 2

- Ipv6Acl : 0
- Ipv4Qos : 2
- L2Qos : 2
- L2PT : 0
- IpMacAcl : 1
- VmanQos : 0
- EtsAcl : 0
- FcoeAcl : 0
- ipv4pbr : 0
- vrfv4Acl : 0
- Openflow : 0
- fedgovacl : 0
- nlbclusteracl : 0
- ipv4udfmirracl : 0
- ipv4mirracl : 0

<b>I2acl number</b>	Enter the keyword <code>i2acl</code> and then the number of I2acl blocks. The range is from 0 to 8 in multiples of 2.
<b>ipv4acl number</b>	Enter the keyword <code>ipv4acl</code> and then the number of FP blocks for IPv4 ACL. The range is from 0 to 9 in multiples of 3, when <code>ipv4udfenable</code> is selected. If not enabled, it is in multiples of 2. If the feature <code>acloptimized</code> command is enabled, the allocation is in multiples of 1.
<b>ipv6acl number</b>	Enter the keyword <code>ipv6acl</code> and then the number of FP blocks for IPv6 ACL. The range is from 0 to 9 in multiples of 3. If you used the feature <code>ipv6acloptimized</code> command, the range is from 0 to 8 in multiples of 2.
<b>ipv4qos number</b>	Enter the keyword <code>ipv4qos</code> and then the number of FP blocks for IPv4 QoS. The range is from 0 to 8 in multiples of 2.
<b>I2qos number</b>	Enter the keyword <code>i2qos</code> and then the number of FP blocks for L2 QoS. The range is from 0 to 8 in multiples of 2.
<b>I2pt number</b>	Enter the keyword <code>i2pt</code> and then the number of FP blocks for I2 protocol tunnelling. The range is from 0 to 8 in multiples of 2.
<b>lpmacacl number</b>	Enter the keyword <code>lpmacacl</code> and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 9.
<b>etsacl number</b>	Enter the keyword <code>etsacl</code> and then the number of FP blocks for ETS ACL. The range is from 0 to 9.
<b>nlbclusteracl number</b>	Enter the keyword <code>nlbclusteracl</code> and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 9. By default, the value is 0 and it supports 8 NLB arp entries reserved for internal functionality. <div style="border-left: 1px solid blue; padding-left: 10px; margin-left: 20px;"> <p><b>NOTE:</b> When you reconfigure CAM allocation, use the <code>nlbclusteracl number</code> command to change the number of NLB ARP entries. The range is from 0 to 9. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell EMC Networking recommends that you use a maximum of 64 NLB ARP entries.</p> </div>
<b>vman-qos</b>	Enter the keyword <code>vman-qos</code> and then the number of FP blocks for VMAN QoS. The range is from 0 to 9.
<b>ipv4pbr number</b>	Enter the keyword <code>ipv4pbr</code> and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8. Each PBR entry is carved out in double wide mode. While carving, specify only even groups for PBR.
<b>Openflow number</b>	Enter the keyword <code>openflow</code> and then the number of FP blocks for open flow. The range is from 0 to 9 in multiples of 3.

<b>fcoeacl number</b>	Enter the keyword <code>fcoeacl</code> and then the number of FP blocks for FCOE ACL. The range is from 0 to 8 in multiples of 2.
<b>ipv4udfmirracl</b>	Enter the keyword <code>ipv4udfmirracl</code> and then the number of FP blocks for IPv4 UDF and IPv6 mirror ACL. The range is from 0 to 8.
<b>ipv4mirracl</b>	Enter the <code>ipv4mirracl</code> keyword and then the number of FP blocks for IPv4 mirror ACL. The range is from 0 to 8. You cannot use the <code>ipv4mirracl</code> and <code>ipv4udfmirracl</code> commands at the same time.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.14(1.5)</b>	Added the keyword <code>radius-v4acl</code> on the S3048-ON.
<b>9.14(1.3P2)</b>	Added the keyword <code>radius-v4acl</code> on the S3100 series.
<b>9.14(0.0)</b>	Added the keyword <code>ipv6mirracl</code> on the S6000 and S6000-ON. Introduced the feature <code>ipv6acloptimized</code> command to make the IPv6 ACL CAM region double-wide on the S5048F-ON, S6100-ON, and Z9100-ON.
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.12(0.0)</b>	Added the keyword <code>ipv4mirracl</code> .
<b>9.11(0.0)</b>	Added the keyword <code>ipv4udfmirracl</code> .
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added the <code>n1bcluster</code> ACL keyword. Introduced on the S6000-ON.
<b>9.4.(0.0)</b>	Added support for PBR and VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.2(0.2)</b>	Added support for fcoe.
<b>9.1.(0.0)</b>	Added support for OpenFlow.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.10.2</b>	Clarified block information for the S4810.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
<b>8.2.1.0</b>	Introduced on the S-Series.
<b>7.8.1.0</b>	Introduced on the C-Series.

**Usage Information** Save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system for the new settings to take effect.

The total amount of space allowed is 12 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only 9 number of blocks can be configured by the user .

If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

## cam-acl-egress

Allocate CAM for egress ACLs.

**Syntax** `cam-acl-egress default | l2acl number ipv4acl number ipv6acl number`

**Parameters**

<b>default</b>	Reset the egress CAM ACL entries to default settings.
<b>l2acl number</b>	Set the number of blocks for L2 egress ACL entries.
<b>ipv4acl number</b>	Set the number of blocks for IPv4 egress ACL entries.
<b>ipv6acl number</b>	Set the number of blocks for IPv6 egress ACL entries. It must be a multiple of 2.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

## cam-optimization

Optimize CAM utilization for QoS Entries by minimizing require policy-map CAM space.

**Syntax** `cam-optimization [qos]`

**Parameters** **qos** Optimize CAM usage for QoS.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0.	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

**Usage Information**

When you enable this command, if a Policy Map containing classification rules (ACL and/or dscp/ ip-precedence rules) is applied to more than one physical interface on the same port pipe, only a single copy of the policy is written (only one FP entry is used).

**i** **NOTE:** An ACL itself may still require more than a single FP entry, regardless of the number of interfaces. For more information, refer to the “IP Access Control Lists”, “Prefix Lists”, and “Route-map” sections in the *Dell EMC Networking OS Configuration Guide*.

## cam-sharing

Enable IPV4 QOS CAM sharing with the IPV6 ACL CAM region.

**Syntax** `cam-sharing ipv4qos value ipv6acl value`

**Parameters**

- ipv4qos value** Enter the `ipv4qos` keyword and a value in percentage.
- ipv6acl value** Enter the `ipv6acl` keyword and a value in percentage.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the S6100-ON and Z9100-ON.

**Usage Information**

Use the `cam-sharing` command to share the IPV6 ACL CAM region with the IPV4 QOS CAM region. You can partition the CAM as per the sharing requirements and both IPV6 ACLs and IPV4 QOS ACLs are installed on the same CAM region.

You can enable this command only after using the `feature ipv6acloptimized` command on the system.

When you use this feature, set either the IPV4 QoS or the IPV6 ACL CAM region to zero using the `cam-acl` command

Save the configuration and reload the system for the change to take effect.

The IPv4 QoS region reserves 32 ACLs. Sharing is calculated on the remaining ACLs. For example, if you configure the IPv6 ACL value as 2, the system reserves 32 entries for IPv4 QoS and the remaining 224 entries (256-32) are shared between IPv4 QoS and IPv6 ACL entries according to the configured CAM sharing percentages.

The sum of the percentage values between the two regions must be 100.

### Example

The following example shows that IPv4 QoS is disabled and IPv6 ACL is set to 4. With this configuration, you can share a total of 480 entries between the IPv4 QoS and IPv6 ACL regions after allocating 32 entries for IPv4 QoS.

```
DellEMC(conf)# cam-sharing ipv4qos 50 ipv6acl 50
DellEMC(conf)#cam-acl l2acl 0 ipv4acl 0 ipv6acl 4 ipv4qos 0 l2qos 0 l2pt
0 ipmacacl 1 vman-qos 0
```

## cam-threshold

Configure CAM threshold value for sending the syslog message on CAM usage. Configure silence period for stop receiving syslog message on CAM usage.

<b>Syntax</b>	<code>cam-threshold threshold {default   <i>threshold-percent</i>} silence-period {default   <i>silence-period-value</i>}</code>	
<b>Defaults</b>	Enabled	
<b>Parameters</b>	<b>threshold default</b>	Enter the keyword <code>default</code> for CAM usage threshold for notification of the CAM usage through syslog message. The default threshold value is <b>90</b> percent.
	<b>threshold <i>threshold-percent</i></b>	Enter the threshold percent for notification of the CAM usage through syslog message. The range is from 1 to 100 percent.
	<b>silence-period default</b>	Enter the keyword <code>default</code> to set the silence period for receiving syslog message regarding CAM usage for CAM region, slot/portpipe. The default silence period is <b>0</b> seconds.
	<b>silence-period <i>silence-period-value</i></b>	Enter the silence period for stop receiving syslog message for the respective CAM region, slot/portpipe. The range is from 0 to 65535 seconds.
<b>Command Modes</b>	CONFIGURATION	
<b>Supported Modes</b>		
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.14.1.0</b>	Introduced on the S4810 and S4820T.
	<b>9.13.0.0</b>	Introduced on the MXL, FN IOM, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON.
<b>Usage Information</b>	<p>The <code>no cam-threshold</code> command will set the CAM threshold to 90 percent and silence period to 0.</p> <p>The CAM threshold and silence period configuration is applicable only for Ingress L2, IPv4, IPv6 and Egress L2, IPv4, and IPv6 ACL CAM groups. For other ACL CAM regions, the CAM threshold and silence period is not configurable and the values are fixed to 90 percent and 0 respectively.</p>	
<b>Example</b>	<pre>DellEMC(conf)#cam-threshold threshold 2 silence-period 2 DellEMC(conf)#do show running-config   g cam-threshold cam-threshold threshold 2 silence-period 2</pre>	

## feature ipv6acloptimized

Convert the IPv6 ACL CAM to double-wide.

**Syntax** `feature ipv6acloptimized`

To disable this feature, use the `no feature ipv6acloptimized` command.

**Command Modes** CONFIGURATION

**Defaults** Not configured

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the S5048F-ON, S6100-ON, and Z9100-ON..

**Usage Information**

- When you convert the IPv6 ACL CAM region to double-wide, you can configure only up to 64 bit masks for the source IPv6 address and the destination IPv6 address in IPv6 ACL rules. The system rejects the `host` keyword when you write your ACL rules.
- When you convert the IPv6 ACL CAM region to double-wide, carve the IPv6 CAM region in multiples of two. You can use a maximum value of eight.
- This feature is supported for IPv6 user ACLs only in the ingress direction.
- After using the `feature ipv6acloptimized` command on the system, reload the system for the configuration to take effect.

**Example**

```
DellEMC(conf)# feature ipv6acloptimized
Configuration change will be in effect after save and reload. IPV6
Acls would be based on <= /64 Mask addresses only, Rules with mask
greater than 64 bits or host keyword will be rejected while applying on
interface.
DellEMC(conf)# cam-acl l2acl 0 ipv4acl 0 ipv6acl 8 ipv4qos 0 l2qos 0
l2pt 0 ipmacacl 1 vman-qos 0
DellEMC(conf)# reload
```

## show cam-acl

Display the details of the CAM profiles on the chassis and all stack units.

**Syntax** `show cam-acl`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Updated to display IPv6 flow-based mirroring information on S5048F-ON, S6100-ON, Z9100-ON, S6000, and S6000-ON. Updated to display the IPv6 ACL region in multiples of 2 when the <code>feature ipv6acloptimized</code> command is enabled on the S5048F-ON, S6100-ON, and Z9100-ON.
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series.

### Usage Information

The display reflects the settings implemented with the `cam-acl` command.

### Example

#### Example (IPv6 flow-based mirroring information)

```
DellEMC#show cam-acl
-- Chassis Cam ACL --
      Current Settings(in block sizes)
      1 block = 256 entries
      Single Wide Regions: Ipv4Acl
      Double Wide Regions: L2Acl, L2Qos, L2PT
                          : FcoeAcl, ipv4pbr, vrfv4Acl
      Triple Wide Regions: Ipv6Acl, VmanQos, Openflow, ipv4udfmirracl(ipv6mirracl)
L2Acl      : 0
Ipv4Acl    : 2
Ipv6Acl    : 3
Ipv4Qos    : 0
L2Qos      : 0
L2PT       : 0
IpMacAcl   : 1
VmanQos    : 0
EcfmAcl    : 0
EtsAcl     : 0
FcoeAcl    : 0
iscsiOptAcl : 0
ipv4pbr    : 0
vrfv4Acl   : 0
Openflow   : 0
fedgovacl  : 0
nlbclusteracl : 0
ipv4udfmirracl* : 3
ipv4mirracl : 0
* - shared regions
```

#### Example (When the IPv4 QoS and IPv6 ACL optimization is enabled)

```
DellEMC#show cam-acl
-- Chassis Cam ACL --
      Current Settings(in block sizes)
      1 block = 256 entries
      Double Wide Regions: L2Acl, Ipv4Acl, Ipv4Qos, L2Qos, L2PT
                          : FcoeAcl, ipv4pbr, vrfv4Acl, IPV6Acl,
      IPV6 (IPV4QOS)
      Triple Wide Regions: VmanQos, Openflow, ipv4udfmirracl
L2Acl      : 2
Ipv4Acl    : 4
Ipv6Acl*   : 2
Ipv4Qos*   : 0
L2Qos      : 2
L2PT       : 0
IpMacAcl   : 1
VmanQos    : 0
EcfmAcl    : 0
EtsAcl     : 0
FcoeAcl    : 0
iscsiOptAcl : 0
ipv4pbr    : 0
vrfv4Acl   : 0
```

```

Openflow      :      0
fedgovacl    :      0
nlbclusteracl :      0
ipv4udfmirracl :      0
ipv4mirracl  :      0
* - shared regions

```

## show cam-sharing

Display the configured CAM space sharing information between IPv6 ACL and IPv6 QoS in percentage.

**Syntax** `show cam-sharing`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the S6100-ON, and Z9100-ON.

### Example

```

DellEMC#show cam-sharing
Configured:  ipv4qos  50%  ipv6acl  50%
Operational: ipv4qos  50%  ipv6acl  50%

DellEMC#

```

## show cam-usage

Display the amount of memory space used and available in each CAM partition (including Layer 2 ACL, Layer 3 ACL, and IPv4Flow)

**Syntax** `show cam-usage [acl | router | switch]`

**Parameters**

- acl** (OPTIONAL) Enter the keyword `acl` to display Layer 2 and Layer 3 ACL CAM usage.
- router** (OPTIONAL) Enter the keyword `router` to display Layer 3 CAM usage.
- switch** (OPTIONAL) Enter the keyword `switch` to display Layer 2 CAM usage.

**Defaults** none

**Command Modes** EXEC Privilege

Version	Description
9.14(0.0)	Updated to display IPv6 flow-based mirroring information on the S5048F-ON, S6100-ON, Z9100-ON, S6000, and S6000-ON. Updated to display the shared region between IPv4 QoS and IPv6 ACL entries on the S5048F-ON, S6100-ON, and Z9100-ON.
9.12(1.0)	Introduced on the S5048F-ON.
9.11(2.0P1)	Optimized the ACL filters to support more than 200 egress ACL rules on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11.0.0	The <code>show cam-usage</code> command is updated to display ECMP count information.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z9000.

### Usage Information

The following table describes the output fields of the `show cam-usage` command.

**Table 3. Output fields of the show cam-usage command**

Field	Description
Stackunit	Number of the stack unit that contains information on ACL VLAN groups
Portpipe	The hardware path that packets follow through a system for ACL optimization
CAM-Region	Type of area in the CAM block that is used for ACL VLAN groups
Total CAM space	Total amount of space in the CAM block
Used CAM	Amount of CAM space that is currently in use
Available CAM	Amount of CAM space that is free and remaining to be allocated for ACLs

### Example

```
DelleMC#show cam-usage
Stackunit|Portpipe|Pipeline|CAM Partition|Total CAM|Used CAM|Available CAM
-----|-----|-----|-----|-----|-----|-----
1|0|0|IN-L2 ACL|0|0|0
| | |IN-L3 ACL|512|1|511
| | |IN-L3 ECMP GRP|2048|0|2048
| | |IN-V6 ACL|256|0|256
| | |IN-NLB ACL|0|0|0
| | |IPMAC ACL|256|0|256
| | |IN-L3-UDFMIRACL|256|3|253
| | |(IN-V6-MIRR ACL)
| | |IN-L3-MIRR ACL|0|0|0
| | |OUT-L2 ACL|206|12|194
| | |OUT-L3 ACL|202|8|194
| | |OUT-V6 ACL|202|3|199
| | |IN-L3 QOS|0|0|0
| | |IN-L3 FIB|90112|5|90107
Codes: * - cam usage is above 90%.
```

### Example (show cam-usage router)

```
DelleMC#show cam-usage router
Stackunit|Portpipe|Pipeline|CAM Partition|Total CAM|Used CAM|Available CAM
-----|-----|-----|-----|-----|-----|-----
1|0|0|IN-L3 ACL|512|1|511
| | |IN-L3 ECMP GRP|2048|0|2048
| | |IN-V6 ACL|256|0|256
| | |IN-L3-UDFMIRACL|256|0|256
| | |(IN-V6-MIRR ACL)
| | |IN-L3-MIRR ACL|0|0|0
| | |OUT-L3 ACL|202|8|194
| | |OUT-V6 ACL|202|3|199
| | |IN-L3 QOS|0|0|0
| | |IN-L3 FIB|90112|5|90107
```

### Example (Displaying the available IPv4 QoS and IPv6 ACL entries)

```
DelleMC# show cam-usage
Stackunit|Portpipe|Pipeline|CAM Partition|Total CAM|Used CAM|Available CAM
-----|-----|-----|-----|-----|-----|-----
1|0|0|IN-L2 ACL|256|0|256
| | |IN-L3 ACL|512|1|511
| | |IN-L3 ECMP GRP|2048|0|2048
| | |IN-V6 ACL|112|0|112
| | |IN-NLB ACL|0|0|0
| | |IPMAC ACL|768|0|768
| | |IN-L3-UDFMIRACL|0|0|0
| | |IN-L3-MIRR ACL|0|0|0
| | |OUT-L2 ACL|206|12|194
| | |OUT-L3 ACL|202|8|194
| | |OUT-V6 ACL|202|3|199
| | |IN-L3 QOS|144|0|144
| | |IN-L3 FIB|90112|3|90109
| | |IN-IPV6 (IPV4QOS)|256|0|256
```

## test cam-usage

Verify that enough CAM space is available for the IPv6 ACLs you have created.

<b>Syntax</b>	<code>test cam-usage service-policy input <i>input</i> policy name <i>stack-unit</i> {<i>number</i>   <i>all</i>}</code>
<b>Parameters</b>	<p><b><i>policy-map name</i></b> Enter the name of the policy-map to verify. Maximum is 32 characters.</p> <p><b><i>number</i></b> Enter <code>all</code> to get information for all the stack-units or enter the stack-unit number to get information for a specific stack-unit.</p>
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced.

<b>Usage Information</b>	<p>This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.</p> <p>QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.</p>
--------------------------	--

The following describes the `test cam-usage` command shown in the following example.

<b>Term</b>	<b>Explanation</b>
<b>Stack-Unit</b>	Lists the stack unit or units that are checked. Entering <code>all</code> shows the status for all stacks.
<b>Portpipe</b>	Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering <code>all</code> shows the status for stack-units and port-pipes in the chassis. .
<b>CAM Partition</b>	Shows the CAM profile of the CAM.
<b>Available CAM</b>	Identifies the amount of CAM space remaining for that profile.

Term	Explanation
<b>Estimated CAM per Port</b>	Estimates the amount of CAM space the listed policy will require.
<b>Status</b>	Indicates whether or not the policy will be allowed in the CAM.

#### Example

```
DellEMC# test cam-usage service-policy input In stack-unit all
Stack-unit|Portpipe| Tile |CAM Partition|Available CAM|Estimated CAM per Port|Status
-----|-----|-----|-----|-----|-----|-----
1 | 0 | 0 | L2ACL | 0 | 100 | Exception
1 | 0 | 1 | L2ACL | 156 | 100 | Allowed
1 | 0 | 2 | L2ACL | 256 | 100 | Allowed
1 | 0 | 3 | L2ACL | 256 | 100 | Allowed
```

#### Example

```
DellEMC# test cam-usage service-policy input In stack-unit all
Stack-unit|Portpipe| Tile |CAM Partition|Available CAM|Estimated CAM per Port|Status
-----|-----|-----|-----|-----|-----|-----
1 | 0 | 0 | L2ACL | 0 | 100 | Exception
1 | 0 | 1 | L2ACL | 156 | 100 | Allowed
1 | 0 | 2 | L2ACL | 256 | 100 | Allowed
1 | 0 | 3 | L2ACL | 256 | 100 | Allowed
```

## Unified Forwarding Table Modes

Unified Forwarding Table (UFT) consolidates the resources of several search tables (Layer 2, Layer 3 Hosts, and Layer 3 Route [Longest Prefix Match — LPM]) into a single flexible resource. The system supports several UFT modes to extract the forwarding tables, as required. By default, Dell EMC Networking OS initializes the table sizes to UFT mode 2 profile, as it provides a reasonable shared memory for all the tables. The other supported UFT modes are scaled-I3-hosts (UFT mode 3) and scaled-I3-routes (UFT mode 4).

#### Important Points to Remember

- All line cards/Stack Members within a single system must have the same UFT mode profiles. This profile must match the system UFT mode profile (the profile on the primary route processor module [RPM]/ Master Unit of the Stack).
- Apply the UFT mode configuration to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- Save the changes and reboot the system for UFT mode profiling to take effect.

## hardware forwarding-table mode

Select a mode to initialize the maximum scalability size for L2 MAC table or L3 Host table or L3 Route table.

**Syntax** hardware forwarding-table-mode {scaled-12-switch | scaled-13-hosts | scaled-13-routes}

Parameters	Parameter	Description
	<b>scaled-12-switch</b>	Enter the keywords <code>scaled-12-switch</code> to select the forwarding table mode for scaling I3 switch entries.
	<b>scaled-13-hosts</b>	Enter the keywords <code>scaled-13-hosts</code> to select the forwarding table mode for scaling I3 host entries.
	<b>scaled-13-routes</b>	Enter the keywords <code>scaled-13-routes</code> to select the forwarding table mode for scaling I3 route entries.

**Defaults** UFT mode 2

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.7(0.0)	Introduced on the S6000, S6000-ON, and Z9500 switch..

**Usage Information** This command takes effect only after reboot.

**Related Commands** [show hardware forwarding-table mode](#) — displays the hardware forwarding table mode in the current boot and in the next boot.

## show hardware forwarding-table mode

Display the hardware forwarding table mode in the current boot and in the next boot.

**Syntax** `show hardware forwarding-table mode`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.7(0.0)	Introduced on the S6000, S6000-ON, and Z9500 switch.

### Example

```
DellEMC#show hardware forwarding-table mode

Mode                : Current Settings      Next Boot Settings
L2 MAC Entries     : 72K                    scaled-l3-hosts
L3 Host Entries    : 72K                    8K
L3 Route Entries   : 16K                    136K
DellEMC#           : 16K                    16K
```

**Related Commands** [hardware forwarding-table mode](#) — selects the mode to initialize the maximum scalability size for L2 MAC table or L3 Host table or L3 Route table.

# Control Plane Policing (CoPP)

Control plane policing (CoPP) uses access control list (ACL) rules and quality of service (QoS) policies to create filters for a system's control plane. The CoPP filters prevent traffic that is not identified as legitimate from reaching the control plane, and rate-limit traffic to an acceptable level.

## Topics:

- [control-plane-cpuqos](#)
- [cpu-protocol-group](#)
- [copp-profile](#)
- [cpu-queue](#)
- [copp-policy](#)
- [protocol-list](#)
- [queue-length](#)
- [service-policy rate-limit-cpu-queues](#)
- [service-policy rate-limit-protocols](#)
- [show cpu-queue rate cp](#)
- [show ip protocol-queue-mapping](#)
- [show ipv6 protocol-queue-mapping](#)
- [show mac protocol-queue-mapping](#)
- [show running-config copp-profile](#)
- [show running-config cpu-protocol-group](#)

## control-plane-cpuqos

To manage control-plane traffic, enter control-plane mode and configure the switch.

**Syntax** `control-plane-cpuqos`

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

## cpu-protocol-group

Creates or removes a protocol group.

**Syntax** `cpu-protocol-group group-name`  
 Use the `no cpu-protocol-group group-name` command to remove the protocol-group.

**Command Modes** CONFIGURATION

**Parameters** *group-name* Enter the unique protocol-group name that you want to create.  
 **NOTE:** The length of the group-name that you specify cannot exceed 32 characters.

**Command History**

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, S6100-ON.

**Example**

```
DellEMC#configure terminal
DellEMC(conf)#cpu-protocol-group PGO
DellEMC(conf-cpu-protocol-group)#
```

## copp-profile

Creates a control plane policing (CoPP) profile.

**Syntax** `copp-profile profile-name`  
 Use the `no copp-profile profile-name` command to remove the CoPP profile.

**Command Modes** CONFIGURATION

**Parameters** *profile-name* Enter the unique profile name for the CoPP profile that you want to create.  
 **NOTE:** The length of the CoPP profile name cannot exceed 32 characters.

**Command History**

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Example**

```
DellEMC(conf)#copp-profile COPP
DellEMC(conf-copp-profile)#show config
!
copp-profile COPP
DellEMC(conf-copp-profile)#
```

# cpu-queue

Configures queue parameters.

**Syntax** `cpu-queue queue-number {protocol-group group-name [qos-policy policy-name] | qos-policy policy-name}`

Use the `no cpu-queue queue-number` command to remove the queue parameter configuration.

**Command Modes** COPP-PROFILE

**Parameters**

- queue-number** Enter the queue number that you want to configure. The range is from 0 to 11. A queue can be mapped to a protocol-group or a qos-policy or both. Protocol groups cannot be configured for queue numbers 0 and 4. Only qos-policy can be mapped to these two queues.
- protocol-group group-name** Enter the keyword `protocol-group` followed by the name of the protocol group.
- qos-policy policy-name** Enter the keyword `qos-policy` followed by the name of the QoS policy. The Rateshape parameters and queue-length are defined in the QoS policy.

**Command History**

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Usage Information** The protocols which are not mapped to the cpu queues will be mapped to Queue 0. The internal protocols like IPC, VLT etc will be mapped to Queue 4.

**Example**

```
DellEMC(conf)#copp-profile COPP
DellEMC(conf-copp-profile)#cpu-queue 1 protocol-group PG1 qos-policy QP1
DellEMC(conf-copp-profile)#cpu-queue 2 protocol-group PG2
DellEMC(conf-copp-profile)#cpu-queue 3 qos-policy QP3
DellEMC(conf-copp-profile)#show config
!
copp-profile COPP
cpu-queue 1 protocol-group PG1 qos-policy QP1
cpu-queue 2 protocol-group PG2
cpu-queue 3 qos-policy QP3
DellEMC(conf-copp-profile)#
```

# copp-policy

Creates a control plane policing (CoPP) policy.

**Syntax** `copp-policy profile-name`

Use the `no copp-policy profile-name` command to remove the CoPP policy.

**Command Modes** CONTROL-PLANE-CPUQOS

**Parameters**

- profile-name** Enter the unique profile name for the CoPP policy that you want to create.  
 **NOTE:** The length of the profile name that you specify cannot exceed 32 characters.

**Command History**

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Usage Information** Following are the prerequisite for applying a CoPP policy:

- Ensure that the protocols are not running. If protocols are running, issues such as, packets arriving out of order, may occur.

- Ensure that the `service-class cpu-queue-buffer` command is not configured. The `copp-policy` command will not be available if the `service-class cpu-queue-buffer` command is configured.
- Ensure that the `service-policy rate-limit-cpu-queues` command is not configured. The `copp-policy` command will not be available if the `service-policy rate-limit-cpu-queues` is configured.
- You cannot associate a protocol group with more than one queue.
- Ensure that each queue contains a unique protocol list. A protocol cannot be configured in more than one queue.

 **NOTE:** The protocols that are not mapped to the CPU queues are mapped to Queue 0.

### Example

```
DellEMC(conf)#control-plane-cpuqos
DellEMC(conf-control-cpuqos)#copp-policy COPP
DellEMC(conf-control-cpuqos)#show config
!
control-plane-cpuqos
  copp-policy COPP
DellEMC(conf-control-cpuqos)#
```

## protocol-list

Creates a protocol list to be configured under a protocol group.

**Syntax** `protocol-list protocol-name1, protocol-name2,.....`

Use the `no protocol-list` command to remove the protocols from the protocol-group.

**Command Modes** CPU-PROTOCOL-GROUP

**Parameters** ***protocol-name1, protocol-name2, ...*** Enter the list of protocols to be associated with the protocol group.  
 **NOTE:** When you specify multiple protocols to be associated with a protocol-group profile, you must de-limit each protocol name with only a coma.

Command History	Version	Description
	<b>9.11.0.0</b>	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Usage Information** When a new set of protocols is configured in the protocol-group over an existing set of protocols, the new set replaces the existing list of protocols in the protocol-group.

### Example

```
DellEMC#configure terminal
DellEMC(conf)#cpu-protocol-group PG0
DellEMC(conf-cpu-protocol-group)#protocol-list 802dot1x , arp-req , arp-rsp
DellEMC(conf-cpu-protocol-group)#show config
!
cpu-protocol-group PG0
protocol-list 802dot1x , arp-req , arp-rsp
DellEMC(conf-cpu-protocol-group)#
```

## queue-length

Configures queue length.

**Syntax** `queue-length queue-length-value`

Use the `no queue-length` command to remove the queue length configuration.

**Command Modes** QOS-POLICY-INPUT

**Parameters** ***queue-length-value*** Enter the queue length value you want to configure. The range is from 0 to 235.

**Default** The default value is 235.

**Command History**

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Usage Information** The queue-length takes effect only if the qos-policy is associated with a copp-policy.

**Example**

```
DellEMC(conf)#qos-policy-input QP1 cpu-qos
DellEMC(conf-in-qos-policy-cpuqos)#queue-length 235
%Info: queue-length will take effect only when qos-policy is associated
with a CoPP profile.
DellEMC(conf-in-qos-policy-cpuqos)#show conf
!
qos-policy-input QP1 cpu-qos
  queue-length 235
DellEMC(conf-in-qos-policy-cpuqos)#
```

## service-policy rate-limit-cpu-queues

Apply a policy map for the system to rate limit control traffic on a per-queue basis.

**Syntax** `service-policy rate-limit-cpu-queues policy-name`

**Parameters** ***policy-name*** Enter the service-policy name, using a string up to 32 characters.

**Defaults** Not configured.

**Command Modes** CONTROL-PLANE-CPUQOS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information**

Create a policy-map by associating a queue number with the qos-policy.  
Create QoS policies prior to enabling this command.  
For CoPP, use the keyword `cpu-qos` when creating qos-policy-input.

**Related Commands**

- [qos-policy-input](#) — create a QoS input policy map.
- [policy-map-input](#) — create an input policy map.

## service-policy rate-limit-protocols

Apply a policy for the system to rate limit control protocols on a per-protocol basis.

**Syntax**

```
service-policy rate-limit-protocols policy-name
```

**Parameters**

***policy-name*** Enter the service-policy name, using a string up to 32 characters.

**Defaults**

Not configured.

**Command Modes**

CONTROL-PLANE-CPUQOS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.8.0</b>	Introduced on the S4810.

**Usage Information**

This command applies the service-policy based on the type of protocol defined in the ACL rules.  
Create ACL and QoS policies prior to enabling this command.  
For CoPP, use the keyword `cpu-qos` when creating qos-policy-input.

**Related Commands**

- [ip access-list extended](#) — creates an extended IP ACL.
- [mac access-list extended](#) — creates an extended MAC ACL.
- [qos-policy-input](#) — creates a QoS input policy map.
- [class-map](#) — creates a QoS class map.
- [policy-map-input](#) — creates an input policy map.

# show cpu-queue rate cp

Display the rates for each CPU queue.

**Syntax** `show cpu-queue rate cp`

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

# show ip protocol-queue-mapping

Display the queue mapping for each configured protocol.

**Syntax** `show ip protocol-queue-mapping`

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(3.0)	Modified the output to display MCAST data packet information.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

#### Example

```
DellEMC# show ip protocol-queue-mapping
Protocol  Src-Port  Dst-Port  TcpFlag  Queue  EgPort  Rate (kbps)
-----
TCP (BGP)  any/179   179/any   -         Q9     -        -
UDP (DHCP) 67/68     68/67     -         Q10    -        -
UDP (DHCP-R) 67        67        -         Q10    -        -

09:00:2b:00:00:04/05 any Q9 CP -
DellEMC#
```

## show running-config copp-profile

Displays the configured CoPP profiles.

**Syntax** show running-config copp-profile

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

#### Example

```
DellEMC# show running-config copp-profile
!
copp-profile COPP
  cpu-queue 1 protocol-group PG1 qos-policy qin1
  cpu-queue 11 protocol-group PG3
DellEMC#
```

## show running-config cpu-protocol-group

Displays the configured CPU protocol groups.

**Syntax** show running-config cpu-protocol-group

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11.0.0	Introduced on the S6000, S6000-ON, Z9100-ON, and S6100-ON.

**Example**

```
DellEMC#show running-config cpu-protocol-group
!
cpu-protocol-group PG0
protocol-list 802dot1x , arp-req , arp-rsp
!
cpu-protocol-group PG1
protocol-list arp-req , arp-rsp , ip-local-term
!
cpu-protocol-group PG3
protocol-list ttl0 , ttl1
DellEMC#
```

# Data Center Bridging (DCB)

Data center bridging (DCB) refers to a set of IEEE Ethernet enhancements that provide data centers with a single, robust, converged network to support multiple traffic types, including local area network (LAN), server, and storage traffic.

The Dell EMC Networking OS commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

This section includes the following:

- [DCB Command](#)
- [PFC Commands](#)
- [ETS Commands](#)
- [DCBX Commands](#)

## Topics:

- [DCB Command](#)
- [PFC Commands](#)
- [ETS Commands](#)
- [DCBX Commands](#)
- [dcb-map](#)
- [priority-pgid](#)
- [priority-group bandwidth pfc](#)
- [dcb pfc-shared-buffer-size](#)
- [dcb-buffer-threshold](#)
- [priority](#)
- [dcb-policy buffer-threshold \(Interface Configuration\)](#)
- [dcb pfc-total-buffer-size](#)
- [show running-config dcb-buffer-threshold](#)
- [dcb {ets | pfc} enable](#)

## DCB Command

The following DCB command is supported on the Dell EMC Networking OS.

### dcb-enable

Enable data center bridging.

<b>Syntax</b>	<code>dcb enable [pfc-queues 1-4]</code> To disable DCB, use the <code>no dcb enable</code> command.
<b>Parameters</b>	<b><i>pfc-queues</i></b> Enter the pfc-queue range. To disable DCB, use the <code>no dcb enable</code> command. The range is from 1 to 4.
<b>Defaults</b>	None
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

For ETS functioning, first assign the etsacl space using the `cam-acl` command.

```
DellEMC(conf)#cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 l2pt 0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2
```

### Related Commands

- [dcb <ets | pfc> enable](#) — enable priority flow control or enhanced transmission selection on interface.

## PFC Commands

The following PFC commands are supported on the Dell EMC Networking OS.

### clear hardware pfc-nodrop-priority

Clear the drop statistics.

**Syntax** `clear hardware pfc-nodrop-priority l2-dlf drops stack-unit stack-unit-number port-set port-pipe`

**Parameters**

- stack-unit stack-unit-number*** Enter the keywords `stack-unit` and the stack unit number.
- port-set port-pipe*** Enter the keywords `port-set` and port-pipe number. The port-pipe number is 0.

**Command Modes** EXEC  
EXEC Privilege

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the C9010, S6000, S6000-ON, Z9100-ON and S6100-ON.

**Related Commands**

- [pfc-nodrop-priority l2-dlf drop](#) — configures to drop the unknown unicast packets flooding on lossless priorities.
- [show hardware pfc-nodrop-priority](#) — displays the packets drop count corresponding to the priority.

## clear pfc counters

Clear the PFC TLV counters and PFC statistics on an interface or stack unit.

<b>Syntax</b>	<code>clear pfc counters [interface-type   stack-unit {unit number   all } all stack-ports all]]</code>								
<b>Parameters</b>	<table><tr><td><b>interface</b> <b>interface-type</b></td><td>Enter the keywords <code>port-type</code> then the interface information. Enter the subport number if a port is fanned-out into 10G ports.</td></tr><tr><td><b>stack-unit</b> <b>unit number</b></td><td>Enter the keywords <code>stack-unit</code> then the stack-unit number to be cleared.</td></tr><tr><td><b>statistics</b></td><td>Enter the keyword <code>statistics</code> to clear the hardware PFC counters.</td></tr><tr><td><b>stack-ports</b> <b>all</b></td><td>Enter the keywords <code>stack-ports all</code> to clear the counters on all stack ports.</td></tr></table>	<b>interface</b> <b>interface-type</b>	Enter the keywords <code>port-type</code> then the interface information. Enter the subport number if a port is fanned-out into 10G ports.	<b>stack-unit</b> <b>unit number</b>	Enter the keywords <code>stack-unit</code> then the stack-unit number to be cleared.	<b>statistics</b>	Enter the keyword <code>statistics</code> to clear the hardware PFC counters.	<b>stack-ports</b> <b>all</b>	Enter the keywords <code>stack-ports all</code> to clear the counters on all stack ports.
<b>interface</b> <b>interface-type</b>	Enter the keywords <code>port-type</code> then the interface information. Enter the subport number if a port is fanned-out into 10G ports.								
<b>stack-unit</b> <b>unit number</b>	Enter the keywords <code>stack-unit</code> then the stack-unit number to be cleared.								
<b>statistics</b>	Enter the keyword <code>statistics</code> to clear the hardware PFC counters.								
<b>stack-ports</b> <b>all</b>	Enter the keywords <code>stack-ports all</code> to clear the counters on all stack ports.								
<b>Defaults</b>	none								
<b>Command Modes</b>	EXEC Privilege								
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .								

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

<b>Usage Information</b>	If you do not use the <code>statistics</code> parameter, both hardware and DCBx counters clear.
--------------------------	---

## dcb pfc-headroom-buffer-size

Configure a shared head room pool limit, which is the threshold value for the shared head room pool size.

<b>Syntax</b>	<code>dcb pfc-headroom-buffer-size buffer-size</code>  To undo the shared head room pool limit configuration, use the <code>no dcb pfc-headroom-buffer-size buffer-size</code> command.		
<b>Parameters</b>	<table><tr><td><b>buffer-size</b></td><td>Enter the maximum buffer value that you want to allocate for the shared head room pool. Each lossless Priority or Priority Group can use up to the peak head room configured for that particular priority from the shared head room configured. The range is from 0 to 3399.</td></tr></table>	<b>buffer-size</b>	Enter the maximum buffer value that you want to allocate for the shared head room pool. Each lossless Priority or Priority Group can use up to the peak head room configured for that particular priority from the shared head room configured. The range is from 0 to 3399.
<b>buffer-size</b>	Enter the maximum buffer value that you want to allocate for the shared head room pool. Each lossless Priority or Priority Group can use up to the peak head room configured for that particular priority from the shared head room configured. The range is from 0 to 3399.		
<b>Defaults</b>	1040 KB.		
<b>Command Modes</b>	CONFIGURATION		
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .		

Version	Description
9.11(2.0)	Introduced on the Z9100-ON and S6100-ON.

#### Example

## pfc-asymmetric

Enables honoring of PFC frames on all queues (lossy and lossless).

<b>Syntax</b>	<code>pfc-asymmetric</code>
<b>Defaults</b>	Enabled
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.14(0.0)	Introduced on the S5048F-ON, S6000, S6100-ON, and Z9100-ON.

<b>Usage Information</b>	Used to enable honoring of PFC frames on all queues (lossy and lossless) and to initiate PFC storm control on all queues, when PFC storm control is configured with PFC asymmetric on an interface.  <ol style="list-style-type: none"> <li>1. Enable pfc asymmetric on interface.</li> <li>2. Configure pfc storm control to disable the queue if the pfc storm is detected.</li> <li>3. Clear the queue disable state when the queue is disabled during the pfc storm detection.</li> </ol>
--------------------------	---

## pfc-nodrop-priority l2-dlf drop

Configure to drop the unknown unicast packets flooding on lossless priorities.

<b>Syntax</b>	<code>pfc-nodrop-priority l2-dlf drop</code> To disable the feature, use the <code>no pfc-nodrop-priority l2-dlf drop</code> command.				
<b>Parameters</b>	<table> <tr> <td><b>l2-dlf</b></td> <td>Enter the keywords <code>l2-dlf</code> to drop flooding traffic on lossless priorities.</td> </tr> <tr> <td><b>drop</b></td> <td>Enter the keyword <code>drop</code> to enable the drop action.</td> </tr> </table>	<b>l2-dlf</b>	Enter the keywords <code>l2-dlf</code> to drop flooding traffic on lossless priorities.	<b>drop</b>	Enter the keyword <code>drop</code> to enable the drop action.
<b>l2-dlf</b>	Enter the keywords <code>l2-dlf</code> to drop flooding traffic on lossless priorities.				
<b>drop</b>	Enter the keyword <code>drop</code> to enable the drop action.				
<b>Command Modes</b>	CONFIGURATION				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .				
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.10(0.0)</td> <td>Introduced on the C9010, S6000, S6000-ON, Z9100-ON and S6100-ON.</td> </tr> </tbody> </table>	Version	Description	9.10(0.0)	Introduced on the C9010, S6000, S6000-ON, Z9100-ON and S6100-ON.
Version	Description				
9.10(0.0)	Introduced on the C9010, S6000, S6000-ON, Z9100-ON and S6100-ON.				
<b>Related Commands</b>	<code>show hardware pfc-nodrop-priority</code> — displays the packets drop count corresponding to the priority.				

## pfc no-drop queues

Configure the port queues that still function as no-drop queues for lossless traffic.

<b>Syntax</b>	<code>pfc no-drop queues queue-range</code> To remove the no-drop port queues, use the <code>no pfc no-drop queues</code> command.
---------------	---

**Parameters** *queue-range* Enter the queue range. Separate the queue values with a comma; specify a priority range with a dash; for example, `pfc no-drop queues 1,3` or `pfc no-drop queues 7` or `pfc no-drop queues 0,7`. The range is from 0 to 3.

**Defaults** No lossless queues are configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

- Usage Information**
- When you configure lossless queues on an interface, PFC priority configuration is not allowed on the dcb-map profile applied on the interface.
  - The maximum number of lossless queues globally supported on the switch is two.

The following lists the dot1p priority-queue assignments.

**dot1p Value in the Incoming Frame**      **Description heading**

0	1
1	0
2	2
3	3
4	4
5	5
6	6
7	7

- Before configuring the port queues to function as no-drop queues, you must first apply the dcb-map map with pfc mode off. To apply the dcb-map with pfc mode off, use the following commands: `dcb-map pfc off` and `no pfc mode on`.

## pfc priority

Configure the CoS traffic to be stopped for the specified delay.

**Syntax** `pfc priority priority-range`

To delete the pfc priority configuration, use the `no pfc priority` command.

**Parameters** *priority-range* Enter the 802.1p values of the frames to be paused. Separate the priority values with a comma; specify a priority range with a dash; for example, pfc priority 1,3,5-7. The range is from 0 to 7.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** The default number of 802.1p priorities that you can enable for PFC is 2. The maximum number of 802.1p priorities that you can enable for PFC is -4. Queues to which PFC priority traffic is mapped are lossless by default. Traffic may be interrupted due to an interface flap (going down and coming up) when you reconfigure the lossless queues for no-drop priorities.

The default number of lossless queues supported on the switch is two. The maximum number of lossless queues supported on the system is 4.

A PFC peer must support the configured priority traffic (as DCBX detects) to apply PFC.

## show dcb

Displays the data center bridging status, the number of PFC-enabled ports, and the number of PFC-enabled queues.

**Syntax** show dcb

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** Specify a stack-unit number on the Master switch in a stack.

## Example

```
DellEMC#show dcb
DCB Status: Enabled, PFC Queue Count: 2
Total Buffer:      Total available buffer excluding the buffer pre-allocated
                  for guaranteed services like global headroom, queue's min
                  guaranteed buffer and CPU queues.
PFC Total Buffer:  Maximum buffer available for lossless queues.
PFC Shared Buffer: Buffer used by ingress priority groups for shared usage.
PFC Headroom Buffer: Buffer used by ingress priority group for shared headroom usage.
PFC Available Buffer: Current buffer available for new lossless queues to be
                  Provisioned.

## show hardware pfc-nodrop-priority

View the packets drop count corresponding to the priority.

**Syntax** `show hardware pfc-nodrop-priority l2-dlf drops stack-unit stack-unit-number port-set port-pipe`

**Parameters**

- stack-unit *stack-unit-number*** Enter the keywords `stack-unit` and the stack unit number.
- port-set *port-pipe*** Enter the keywords `port-set` and port-pipe number. The port-pipe number is 0.

**Command Modes** EXEC  
EXEC Privilege

**Command History**

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the C9010, S6000, S6000-ON, Z9100-ON and S6100-ON.

## Example

```
DellEMC#show hardware pfc-nodrop-priority l2-dlf drops stack-unit 1 port-set 0
-----
Priority                                DropCount
-----
0                                        0
1                                        0
2                                        0
3                                        0
4                                        0
5                                        0
6                                        0
7                                        0
```

**Related Commands** [pfc-nodrop-priority l2-dlf drop](#) — configures to drop the unknown unicast packets flooding on lossless priorities.

## show interface pfc

Displays the PFC configuration applied to ingress traffic on an interface, including priorities and link delay.

**Syntax** `show interface port-type slot/port[/subport] pfc {summary | statistics | detail | buffer-threshold}`

## Parameters

**port-type slot/  
port[/subport]  
pfc** Enter the port-type slot and port PFC information. Enter the subport number if a port is fanned-out into 10G ports.

**{summary |  
statistics |  
detail | buffer-  
threshold}** Enter the keyword `summary` for a summary list of results or enter the keyword `detail` for a full list of results. Enter the keyword `statistics` to view pfc statistics. Use the keyword `buffer-threshold` to display the buffer threshold details.

**i** **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes** EXEC Privilege  
CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the Z9500.
9.2.(0.0)	Down status messages added.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

To clear the PFC TLV counters, use the `clear pfc counters interface` command.

The following describes the `show interface pfc summary` command shown in the following example.

Field	Description
<b>Interface</b>	Interface type with stack-unit and port number.
<b>Admin mode is on Admin is enabled</b>	PFC admin mode is on or off with a list of the configured PFC priorities. When the PFC admin mode is on, PFC advertisements are enabled to be sent and received from peers; received PFC configuration take effect. The admin operational status for a DCBX exchange of PFC configuration is enabled or disabled.
<b>Remote is enabled, Priority list Remote</b>	Operational status (enabled or disabled) of peer device for DCBX exchange of PFC configuration with a list of the configured PFC priorities. Willing status of peer device for DCBX exchange (Willing bit received in PFC TLV): enabled or disabled.

Field	Description
<b>Willing Status is enabled</b>	
<b>Local is enabled</b>	DCBX operational status (enabled or disabled) with a list of the configured PFC priorities.
<b>Operational status (local port)</b>	Port state for current operational PFC configuration: <ul style="list-style-type: none"> <li>• <code>Init</code>: Local PFC configuration parameters were exchanged with the peer.</li> <li>• <code>Recommend</code>: Remote PFC configuration parameters were received from the peer.</li> <li>• <code>Internally propagated</code>: PFC configuration parameters were received from the configuration source.</li> </ul>
<b>PFC DCBX Oper status</b>	Operational status for the exchange of the PFC configuration on the local port: match (up) or mismatch (down).
<b>State Machine Type</b>	Type of state machine used for DCBX exchanges of the PFC parameters: Feature — for legacy DCBX versions; Symmetric — for an IEEE version.
<b>TLV Tx Status</b>	Status of the PFC TLV advertisements: enabled or disabled.
<b>PFC Link Delay</b>	Link delay (in quanta) used to pause specified priority traffic.
<b>Application Priority TLV: FCOE TLV Tx Status</b>	Status of FCoE advertisements in application priority TLVs from the local DCBX port: enabled or disabled.
<b>Application Priority TLV: Local FCOE Priority Map</b>	Priority bitmap the local DCBX port uses in FCoE advertisements in application priority TLVs.
<b>Application Priority TLV: Remote FCOE Priority Map</b>	Status of FCoE advertisements in application priority TLVs from the remote peer port: enabled or disabled.
<b>PFC TLV Statistics: Input TLV pkts</b>	Number of PFC TLVs received.
<b>PFC TLV Statistics: Output TLV pkts</b>	Number of PFC TLVs transmitted.
<b>PFC TLV Statistics: Error pkts</b>	Number of PFC error packets received.
<b>PFC TLV Statistics: Pause Tx pkts</b>	Number of PFC pause frames transmitted.
<b>PFC TLV Statistics: Pause Rx pkts</b>	Number of PFC pause frames received.

# show interface pfc statistics

Displays counters for the PFC frames received and transmitted (by dot1p priority class) on an interface.

**Syntax** `show interface port-type pfc statistics`

**Parameters** *port-type* Enter the port type and the interface information.

**NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Enabled to display the command output even without enabling DCB.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

You can use this command even without enabling DCB.

## Example (Summary)

```
DellEMC#show interfaces tengigabitethernet 1/13/2 pfc statistics
Interface TenGigabitEthernet 1/13/2
-----
Interface  Priority  Rx XOFF  Frames  Rx Total  Frames  Tx Total  Frames
-----
Te 1/13/2  P0           0         0         0         0
Te 1/13/2  P1           0         0         0         0
Te 1/13/2  P2           0         0         0         0
Te 1/13/2  P3           0         0         0         0
Te 1/13/2  P4           0         0         0         0
Te 1/13/2  P5           0         0         0         0
Te 1/13/2  P6           0         0         0         0
Te 1/13/2  P7           0         0         0         0
DellEMC (conf) #
```

# ETS Commands

The following ETS commands are supported on the Dell EMC Networking OS.

**i** **NOTE:** Before configuring ETS, assign the etsacl space. using the `cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 l2pt 0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2` command.

## dcb-enable

Enable data center bridging.

<b>Syntax</b>	<code>dcb enable [pfc-queues 1-4]</code> To disable DCB, use the <code>no dcb enable</code> command.
<b>Parameters</b>	<b>pfc-queues</b> Enter the pfc-queue range. To disable DCB, use the <code>no dcb enable</code> command. The range is from 1 to 4.
<b>Defaults</b>	None
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** For ETS functioning, first assign the etsacl space using the `cam-acl` command.

```
DellEMC(conf)#cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 l2pt 0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2
```

**Related Commands**

- `dcb <ets | pfc> enable` — enable priority flow control or enhanced transmission selection on interface.

## clear ets counters

Clear all ETS TLV counters on an interface.

<b>Syntax</b>	<code>clear ets counters port-type slot/port[/subport]</code>
<b>Parameters</b>	<b>port-type</b> Enter the keywords <code>port-type</code> then the slot/port information. Enter the subport number if a port is fanned-out into 10G ports.
<b>Defaults</b>	None
<b>Command Modes</b>	EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## show interface ets

Displays the ETS configuration applied to egress traffic on an interface, including priority groups with priorities and bandwidth allocation.

### Syntax

```
show interface port-type slot/port[/subport] ets {summary | detail}
```

### Parameters

***port-type slot/port[/subport]*** **ets** Enter the port-type slot and port ETS information. Enter the subport number if a port is fanned-out into 10G ports.

**{summary | detail}** Enter the keyword *summary* for a summary list of results or enter the keyword *detail* for a full list of results.

**i** **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as *slot/port-range*. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as *slot/port/[subport] - slot/port/[subport]*. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes** EXEC Privilege

## DCBX Commands

The following DCBX commands are supported on the Dell EMC Networking OS.

### advertise dcbx-tlv

On a DCBX port with a manual role, configure the PFC and ETS TLVs advertised to DCBX peers.

**Syntax** `advertise dcbx-tlv {ets-conf | ets-reco | pfc} [ets-conf | ets-reco | pfc] [ets-conf | ets-reco | pfc]`

To remove the advertised ETS TLVs, use the `no advertise dcbx-tlv` command.

**Parameters**

**{ets-conf | ets-reco | pfc}** Enter the PFC and ETS TLVs advertised, where:

- `ets-conf`: enables the advertisement of ETS configuration TLVs.
- `ets-reco`: enables the advertisement of ETS recommend TLVs.
- `pfc`: enables the advertisement of PFC TLVs.

**Defaults** All PFC and ETS TLVs are advertised.

**Command Modes** PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

You can configure the transmission of more than one TLV type at a time; for example: `advertise dcbx-tlv ets-conf ets-reco`.

You can enable ETS recommend TLVs (`ets-reco`) only if you enable ETS configuration TLVs (`ets-conf`). To disable TLV transmission, use the `no` form of the command; for example, `no advertise dcbx-tlv pfc ets-reco`.

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

## dcbx port-role

Configure the DCBX port role the interface uses to exchange DCB information.

### Syntax

```
dcbx port-role {config-source | auto-downstream | auto-upstream | manual}
```

To remove DCBX port role, use the `no dcbx port-role {config-source | auto-downstream | auto-upstream | manual}` command.

### Parameters

config-source   auto-downstream   auto-upstream   manual	Description
	Enter the DCBX port role, where:
	<ul style="list-style-type: none"> <li>• <code>config-source</code>: configures the port to serve as the configuration source on the switch.</li> <li>• <code>auto-upstream</code>: configures the port to receive a peer configuration. The configuration source is elected from auto-upstream ports.</li> <li>• <code>auto-downstream</code>: configures the port to accept the internally propagated DCB configuration from a configuration source.</li> <li>• <code>manual</code>: configures the port to operate only on administer-configured DCB parameters. The port does not accept a DCB configuration received form a peer or a local configuration source.</li> </ul>

### Defaults

Manual

### Command Modes

INTERFACE PROTOCOL LLDP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

If you use the `auto-upstream` option and the port does not come up on a switch from a different vendor, manually configure the version a CEE on the peer device.

## dcbx version

Configure the DCBX version used on the interface.

**Syntax** `dcbx version {auto | cee | ieee-v2.5}`

To remove the DCBX version, use the `dcbx version {auto | cee | ieee-v2.5}` command.

**Parameters** **auto | cee | ieee-v2.5** Enter the DCBX version type used on the interface, where:

- `auto`: configures the port to operate using the DCBX version received from a peer.
- `cee`: configures the port to use CDD (Intel 1.01).
- `ieee-v2`: configures the port to use IEEE 802.1az (Draft 2.5).

**Defaults** **Auto**

**Command Modes** INTERFACE PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

**Usage Information** DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

## debug dcbx

Enable DCBX debugging.

**Syntax** `debug dcbx {all | auto-detect-timer | config-exchng | fail | mgmt | resource | sem | tlv}`

To disable DCBX debugging, use the `no debug dcbx` command.

**Parameters** **{all | auto-detect-timer | config-exchng | fail | mgmt |** Enter the type of debugging, where:

- `all`: enables all DCBX debugging operations.
- `auto-detect-timer`: enables traces for DCBX auto-detect timers.
- `config-exchng`: enables traces for DCBX configuration exchanges.

- resource | sem | tlv}**
- `fail`: enables traces for DCBX failures.
  - `mgmt`: enables traces for DCBX management frames.
  - `resource`: enables traces for DCBX system resource frames.
  - `sem`: enables traces for the DCBX state machine.
  - `tlv`: enables traces for DCBX TLVs.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.

<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on the MXL 10/40GbE Switch IO Module.

## fcoe priority-bits

Configure the FCoE priority advertised for the FCoE protocol in application priority TLVs.

**Syntax** `fcoe priority-bits priority-bitmap`  
 To remove the configured FCoE priority, use the `no fcoe priority-bits` command.

**Parameters** ***priority-bitmap*** Enter the priority-bitmap range. The range is from 1 to FF.

**Defaults** 0x8

**Command Modes** PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

This command is available at the global level only.

# show interface dcbx detail

Displays the DCBX configuration on an interface.

**Syntax** `show interface port-type dcbx detail`

**Parameters** *port-type* Enter the port type along with the port number.

**NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Down status messages added.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

To clear DCBX frame counters, use the `clear dcbx counters interface stack-unit/port` command.

The following describes the `show interface dcbx detail` command shown in the following example.

Field	Description
<b>Interface</b>	Interface type with chassis slot and port number.
<b>Port-Role</b>	Configured the DCBX port role: auto-upstream, auto-downstream, config-source, or manual.

<b>Field</b>	<b>Description</b>
<b>DCBX Operational Status</b>	Operational status (enabled or disabled) used to elect a configuration source and internally propagate a DCB configuration. The DCBX operational status is the combination of PFC and ETS operational status.
<b>Configuration Source</b>	Specifies whether the port serves as the DCBX configuration source on the switch: true (yes) or false (no).
<b>Local DCBX Compatibility mode</b>	DCBX version accepted in a DCB configuration as compatible. In auto-upstream mode, a port can only receive a DCBX version supported on the remote peer.
<b>Local DCBX Configured mode</b>	DCBX version configured on the port: CEE,, IEEE v2.5, or Auto (port auto-configures to use the DCBX version received from a peer).
<b>Peer Operating version</b>	DCBX version that the peer uses to exchange DCB parameters.
<b>Local DCBX TLVs Transmitted</b>	Transmission status (enabled or disabled) of advertised DCB TLVs (see TLV code at the top of the show command output).
<b>Local DCBX Status: DCBX Operational Version</b>	DCBX version advertised in Control TLVs.
<b>Local DCBX Status: DCBX Max Version Supported</b>	Highest DCBX version supported in Control TLVs.
<b>Local DCBX Status: Sequence Number</b>	Sequence number transmitted in Control TLVs.
<b>Local DCBX Status: Acknowledgment Number</b>	Acknowledgement number transmitted in Control TLVs.
<b>Local DCBX Status: Protocol State</b>	Current operational state of the DCBX protocol: ACK or IN-SYNC.
<b>Peer DCBX Status: DCBX Operational Version</b>	DCBX version advertised in Control TLVs received from the peer device.
<b>Peer DCBX Status: DCBX Max Version Supported</b>	Highest DCBX version supported in Control TLVs received from the peer device.
<b>Peer DCBX Status: Sequence Number</b>	Sequence number transmitted in Control TLVs received from the peer device.
<b>Peer DCBX Status: Acknowledgment Number</b>	Acknowledgement number transmitted in Control TLVs received from the peer device.
<b>Total DCBX Frames transmitted</b>	Number of DCBX frames sent from the local port.
<b>Total DCBX Frames received</b>	Number of DCBX frames received from the remote peer port.

Field	Description
<b>Total DCBX Frame errors</b>	Number of DCBX frames with errors received.
<b>Total DCBX Frames unrecognized</b>	Number of unrecognizable DCBX frames received.

### Example

```
DelleMC# show interface tengigabitethernet 1/9/1 dcbx detail

E-ETS Configuration TLV enabled
  e-ETS Configuration TLV disabled
R-ETS Recommendation TLV enabled
  r-ETS Recommendation TLV disabled
P-PFC Configuration TLV enabled
  p-PFC Configuration TLV disabled
F-Application priority for FCOE enabled
  f-Application Priority for FCOE disabled

-----

Interface TenGigabitEthernet 1/9/1
  Remote Mac Address 00:00:00:00:00:11
  Port Role is Auto-Upstream
  DCBX Operational Status is Enabled
  Is Configuration Source? TRUE

Local DCBX Compatibility mode is CEE
  Local DCBX Configured mode is CEE
  Peer Operating version is CEE
  Local DCBX TLVs Transmitted: ErPfi

Local DCBX Status
-----
  DCBX Operational Version is 0
  DCBX Max Version Supported is 0
  Sequence Number: 2

```

## dcb-map

Create a DCB map to configure priority flow control (PFC) and enhanced transmission selection (ETS) on Ethernet ports that support converged Ethernet traffic. Apply the DCB map to an Ethernet interface.

<b>Syntax</b>	<code>dcb-map map-name</code> To remove a DCB map from an ethernet interface, use the <code>no dcb-map</code> command.
<b>Parameters</b>	<b>map-name</b> Enter a DCB map name. The maximum number of alphanumeric characters is 32.
<b>Defaults</b>	None.
<b>Command Modes</b>	CONFIGURATION

## INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.3(0.0)	Introduced on the S4810 and S6000 platforms.

### Usage Information

A DCB map is a template used to configure DCB parameters and apply them on converged Ethernet interfaces. DCB parameters include priority-based flow control (PFC) and enhanced traffic selection (ETS).

To display the PFC and ETS settings in DCB maps, enter the `show qos dcb-map name` command.

Use the `dcb-map` command to create a DCB map to specify PFC and ETS settings and apply it on Ethernet ports. After you apply a DCB map to an interface, the PFC and ETS settings in the map are applied when the Ethernet port is enabled. DCBx is enabled on Ethernet ports by default.

The `dcb-map` command is supported only on physical Ethernet interfaces.

To remove a DCB map from an interface, enter the `no dcb-map map-name` command in Interface configuration mode.

You can enable or disable pfc mode on the DCB mode using the `pfc mode on` or `pfc mode off` command.

## priority-pgid

Assign 802.1p priority traffic to a priority group in a DCB map.

### Syntax

```
priority-pgid dot1p0_group-num dot1p1_group-num dot1p2_group-num  
dot1p3_group-num dot1p4_group-num dot1p5_group-num dot1p6_group-num  
dot1p7_group-num
```

### Parameters

**dot1p0-7\_group-num** Enter the priority group number for each 802.1p class of traffic in a DCB map.

### Defaults

None

### Command Modes

DCB MAP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.3(0.0)	Introduced on the S4810, S6000 platforms.

## Usage Information

PFC and ETS settings are not pre-configured on Ethernet ports. You must use the `dcb-map` command to configure different groups of 802.1p priorities with PFC and ETS settings.

Using the `priority-pgid` command, you assign each 802.1p priority to one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group. For example, the `priority-pgid 0 0 0 1 2 4 4 4` command creates the following groups of 802.1p priority traffic:

- Priority group 0 contains traffic with dot1p priorities 0, 1, and 2.
- Priority group 1 contains traffic with dot1p priority 3.
- Priority group 2 contains traffic with dot1p priority 4.
- Priority group 4 contains traffic with dot1p priority 5, 6, and 7.

To remove a priority-pgid configuration from a DCB map, enter the `no priority-pgid` command. For PFC enabled priorities, it is recommended to map single priority per Priority group.

## priority-group bandwidth pfc

Configure the ETS bandwidth allocation and PFC mode used to manage port traffic in an 802.1p priority group.

### Syntax

```
priority-group group-num {bandwidth percentage| strict-priority}
[[committed | peak ] | [peak | committed] {<0-10000>} [<0-10000>]] pfc {on
| off}
```

### Parameters

<b>priority-group group-num</b>	Enter the keyword <code>priority-group</code> followed by the number of an 802.1p priority group. Use the <code>priority-pgid</code> command to create the priority groups in a DCB map.
<b>bandwidth percentage</b>	Enter the keyword <code>bandwidth</code> followed by a bandwidth percentage allocated to the priority group. The range of valid values is 1 to 100. The sum of all allocated bandwidth percentages in priority groups in a DCB map must be 100%.
<b>strict-priority</b>	Configure the priority-group traffic to be handled with strict priority scheduling. Strict-priority traffic is serviced first, before bandwidth allocated to other priority groups is made available.
<b>pfc {on   off}</b>	Configure whether priority-based flow control is enabled (on) or disabled (off) for port traffic in the priority group.

### Defaults

None

### Command Modes

DCB MAP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.6(0.0)</b>	Added support to configure peak and committed rate on the S6000 platform.
<b>9.3(0.0)</b>	Introduced on the S4810, S6000 platforms.

## Usage Information

Use the `dcb-map` command to configure priority groups with PFC and/or ETS settings and apply them to Ethernet interfaces.

Use the `priority-pgid` command to map 802.1p priorities to a priority group. You can assign each 802.1p priority to only one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group.

Repeat the `priority-group bandwidth pfc` command to configure PFC and ETS traffic handling for each priority group in a DCB map.

You can enable PFC on a maximum of two priority queues.

If you configure more than one priority group as strict priority, the higher numbered priority queue is given preference when scheduling data traffic.

If a priority group does not use its allocated bandwidth, the unused bandwidth is made available to other priority groups.

To remove a priority-group configuration in a DCB map, enter the `no priority-group bandwidth pfc` command.

By default, equal bandwidth is assigned to each dot1p priority in a priority group. Use the `bandwidth` parameter to configure the bandwidth percentage assigned to a priority group. The sum of the bandwidth allocated to all priority groups in a DCB map must be 100% of the bandwidth on the link. You must allocate at least 1% of the total port bandwidth to each priority group.

## dcb pfc-shared-buffer-size

Configure the maximum amount of shared buffer size for PFC packets in kilobytes.

<b>Syntax</b>	<code>dcb pfc-shared-buffer-size <i>buffer-size</i></code>
<b>Parameters</b>	<b><i>buffer-size</i></b> Enter a number in the range of 0 to 3399.
<b>Default</b>	The default is 1040KB.
<b>Command Modes</b>	CONFIGURATION mode
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.11(2.0P0)</b>	The default value is changed to 1040 KB for the Z9100-ON and S6100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.6(0.0)</b>	Introduced on the S5000.
<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, and S6000 platforms.

### Usage Information

Configure the maximum shared buffer available for PFC traffic. You can choose to increase or decrease the shared buffer that is allocated in the system by default. Configure the shared buffer size less than the total PFC buffer size. If the shared buffer size is more than the total PFC buffer size value, the configuration is not saved and a system logging message is generated.

```
DellEMC(conf)#dcb pfc-shared-buffer-size 3000
% Error: Shared buffer size cannot be greater than the the available
buffer in the system
DellEMC(conf)#
```

Enter a smaller value for the shared buffer size or increase the total buffer size appropriately by using the `dcb pfc-total- buffer-size` command.

**Example** `DellEMC(conf)#dcb pfc-shared-buffer-size 800`

## dcb-buffer-threshold

Configure the profile name for the DCB buffer threshold.

**Syntax** `dcb buffer-threshold profile-name`

**Parameters** **profile-name** Enter the name of the profile, which can be a string of up to 32 characters in length.

**Default** None

**Command Modes** CONFIGURATION mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S4048-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.6(0.0)	Introduced on the S5000.
9.3(0.0)	Introduced on the S4810, S4820T, and S6000.

**Usage Information** When you enter the profile name, you enter the DCB buffer threshold configuration mode. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets.

**Example** `DellEMC(conf)#dcb-buffer-threshold test`

**Example of commands in dcb buffer-threshold mode**  
`priority value buffer-size size pause-threshold threshold-value peak-headroom headroom-value resume-offset threshold-value shared-threshold-weight size`

```
DellEMC(conf-dcb-buffer)#priority value buffer-size size pause-threshold
threshold-value peak-headroom headroom-value resume-offset threshold-
value shared-threshold-weight size
```

## priority

Configure the priority for the PFC threshold to be allocated to the buffer space parameters.

**Syntax** `priority value buffer-size size pause-threshold threshold-value peak-headroom headroom-value resume-offset threshold-value shared-threshold-weight size`

**Parameters**

- priority** Specify the priority of the queue for which the buffer space settings apply.
- value** Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism.
- buffer-size** Ingress buffer size.

<b>size</b>	Size of the ingress buffer in KB. Enter a number in the range of 0 to 9. The default is as follows: <ul style="list-style-type: none"> <li>● 10G – 9</li> <li>● 25G – 9</li> <li>● 40G – 9</li> <li>● 50G – 9</li> <li>● 100G – 9</li> </ul>
<b>pause-threshold</b>	Buffer limit for pause frames to be sent. <p><b>NOTE:</b> In addition to the specified pause-threshold value, pause frames are sent only when the buffer usage exceeds some percentage of the shared buffer.</p>
<b>threshold-value</b>	Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range of 0 to 9. The default is as follows: <ul style="list-style-type: none"> <li>● 10G – 9</li> <li>● 25G – 9</li> <li>● 40G – 9</li> <li>● 50G – 9</li> <li>● 100G – 9</li> </ul>
<b>peak-headroom</b>	Maximum buffer that a priority can use from the shared headroom pool buffer.
<b>headroom-value</b>	Enter a number in the range 0 to 9. The defaults are as follows: <ul style="list-style-type: none"> <li>● 10G - 36 KB</li> <li>● 25G - 76 KB</li> <li>● 40G - 76 KB</li> <li>● 50G - 143 KB</li> <li>● 100G - 143 KB</li> </ul>
<b>resume-offset</b>	Buffer offset limit for stopping the transmission of pause frames.
<b>threshold-value</b>	Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range of 0 to 512. The default is 9 KB.
<b>shared-threshold-weight</b>	Buffer shared threshold weight
<b>size</b>	Weightage of the priorities on the shared buffer size in the system. Enter a number in the range of 0 to 11. The default shared threshold weight is 11.

**Command Modes** DCB-BUFFER-THRESHOLD mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.11(2.0P0)</b>	Default values of buffer threshold profile parameters are changed for the Z9100-ON and S6100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, and S6000 platforms.

**Usage Information** For each priority, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use the `priority` command to set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all eight priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities configured within the DCB input policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

**Example** `DellEMC(conf-dcb-buffer-thr)# priority 0 buffer-size 68 pause-threshold 30 resume-offset 10 shared-threshold-weight 10`

## dcb-policy buffer-threshold (Interface Configuration)

Assign the DCB policy to the DCB buffer threshold profile on interfaces. This setting takes precedence over the global `buffer-threshold` setting.

**Syntax** `dcb-policy buffer-threshold profile-name`

**Parameters**

<b>buffer-threshold</b>	Configure the profile name for the DCB buffer threshold
<b>profile-name</b>	Enter the name of the profile, which can be a string of up to 32 characters in length.

**Default** None

**Command Modes** INTERFACE mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, and S6000 platforms.

**Usage Information** You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.

**Example** `DellEMC(conf-if-te-1/1/1)# dcb-policy buffer-threshold testDellEMC(conf-if-tf-1/1)# dcb-policy buffer-threshold test`

## dcb pfc-total-buffer-size

Configure the total buffer size for PFC in kilobytes.

**Syntax** `dcb pfc-total-buffer-size buffer-size`

**Parameters**

<b>buffer-size</b>	Enter a number in the range of 0 to 3399.
--------------------	---

**Default** The default is 2656KB.

**Command Modes** CONFIGURATION mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.11(2.0P0)</b>	Default value is changed from 3088 KB to 2656 KB in the Z9100-ON and S6100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.6(0.0)</b>	Introduced on the S5000.
<b>9.3(0.0)</b>	Introduced on the S6000, S4810, and S4820T.

**Usage Information**

Configure the maximum buffer available for PFC traffic. You can choose to increase or decrease the buffer size that is allocated in the system by default. However, if you modify the PFC buffer size lower than the previously configured size, the system determines whether this reduction in size is valid without disrupting the existing configuration. In such a scenario, disable and re-enable DCB.

The lossless queue limit per port is validated based on the `dcb pfc-queues` command. PFC queue configuration identifies the maximum number of queues a port can support. Although the queue limit per port is a baseline when dynamic buffering is enabled, the limit per port for queues depends on the availability of the buffer.

**Example**

```
DelleMC(conf)#dcb pfc-total-buffer-size 2800
DelleMC(conf)#

DelleMC#show dcb

DCB Status: Enabled, PFC Queue Count: 2

Total Buffer:          Total available buffer excluding the buffer pre-allocated
                      for guaranteed services like global headroom, queue's min
                      guaranteed buffer and CPU queues.

PFC Total Buffer:      Maximum buffer available for lossless queues.

PFC Shared Buffer:     Buffer used by ingress priority groups for shared usage.

PFC Headroom Buffer:   Buffer used by ingress priority group for shared headroom usage.
PFC Available Buffer:  Current buffer available for new lossless queues to be
                      Provisioned.

stack-unit Total Buffer PFC Total Buffer PFC Shared Buffer PFC Headroom Buffer PFC Available Buffer
          PP          (KB)          (KB)          (KB)          (KB)          (KB)

```

```
DelleMC(conf)#dcb pfc-total-buffer-size 2000
% Error: Total buffer size should not be less than the buffer consumed already
in the system
DelleMC(conf)#
```

## show running-config dcb-buffer-threshold

Displays the DCB buffer threshold details in the running configuration.

**Syntax** `show running-config dcb-buffer-threshold`

**Command Modes** EXEC

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the S6000-ON and Z9500.
9.3(0.0)	Introduced on the S6000 platform.

## Usage Information

The following table describes the output fields displayed for the `show running-config dcb-buffer-threshold` command:

Field	Description
Field	Description
Profile name	Name of the DCB buffer threshold profile
Priority	The priority of the queue for which the buffer space settings apply
buffer-size	Ingress buffer size
pause-threshold-value	Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value	Buffer offset limit at which the port resumes the peer in KB.

## Example

```
DellEMC#show interfaces tengigabitethernet 1/1/1 pfc buffer-threshold
Interface TenGigabitEthernet 1/1/1
-----
Interface  Queue#  Lossless  Buffer-size  Pause-threshold  Peak-headroom  Resume-offset  Shared Threshold
              (KB)          (KB)          (KB)          (KB)          Weight
-----
Te 1/1/1   Q0         NO         -           -               -               -               -
Te 1/1/1   Q1         NO         -           -               -               -               -
Te 1/1/1   Q2         NO         -           -               -               -               -
Te 1/1/1   Q3         YES        9           9               36              9               11
Te 1/1/1   Q4         NO         -           -               -               -               -
Te 1/1/1   Q5         NO         -           -               -               -               -
Te 1/1/1   Q6         NO         -           -               -               -               -
Te 1/1/1   Q7         NO         -           -               -               -               -

On interfaces in which PFC is not enabled.

DellEMC#show interfaces te 1/1/2 pfc buffer-threshold

Te 1/3/2   Q6         NO         -           -               -               -
```

```
Te 1/3/2   Q7   NO   -   -   -   -  
DellEMC(conf)#
```

```
On interface in which PFC is not enabled:  
DellEMC#show interface tengigabitethernet 1/20/1 pfc buffer-threshold
```

The following table describes the output fields displayed for the `show interface pfc buffer-threshold` command:

Field	Description
<b>queue</b>	Number of the queue
<b>lossless</b>	Whether the queue is a lossy or lossless queue for which buffer threshold is configured
<b>buffer-size</b>	Ingress buffer size
<b>pause-threshold-value</b>	Buffer limit at which the port sends the pause to peer in KB.
<b>resume-threshold-value</b>	Buffer offset limit at which the port resumes the peer in KB.
<b>shared threshold weight</b>	Weightage of the priorities on the shared buffer size in the system.

## dcb {ets | pfc} enable

Enable priority flow control or enhanced transmission selection on interface.

- Syntax** `dcb {ets | pfc} enable`
- To disable ETS on interface, use “**no dcb ets enable**” command.
  - To disable PFC on interface, use “**no dcb pfc enable**” command.

**Defaults** Enable

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON and Z9500.
<b>9.3 (0.1)</b>	Introduced on S6000, S4810, and S4820T.

**Usage Information** PFC and ETS are enabled by default on the interfaces when DCB is globally enabled (refer to `dcb enable`). In some network topology, you may want to disable PFC on an interface and apply link level flow control; Similarly you may want to disable ETS on an interface and apply QoS bandwidth configurations.

- Limitations**
- “`dcb-map`” CLI on interface is mutually exclusive to “`no dcb ets enable`” and “`no dcb pfc enable`”.
  - “`pfc priority`” CLI is mutually exclusive to “`no dcb pfc enable`” command.

# Debugging and Diagnostics

The basic debugging and diagnostic commands are supported by the Dell EMC Networking OS.

## Topics:

- [Diagnostics and Monitoring Commands](#)
- [Offline Diagnostic Commands](#)
- [Hardware Commands](#)

## Diagnostics and Monitoring Commands

The following section describes the diagnostics and monitoring commands.

For similar commands, refer to the [Control and Monitoring](#) chapter.

### logging coredump stack-unit

Enable coredump on a stack.

**Syntax** `logging coredump stack-unit {stack-unit-number | all}`

**Parameters**

<b><i>stack-unit stack-unit-number</i></b>	Enter the stack-unit id to enable coredump in a particular stack-unit.
<b>all</b>	Enable coredump on all stack-unit.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON and the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

**Usage Information** The Kernel core dump can be large and may take up to 5 to 30 minutes to upload. Dell EMC Networking OS does not overwrite application core dumps so you should delete them as necessary to conserve space

on the flash; if the flash is out of memory, the coredump is aborted. Dell EMC Networking OS completes the coredump process and wait until the upload is complete before rebooting the system.

## Offline Diagnostic Commands

The offline diagnostics test suite is useful for isolating faults and debugging hardware. While tests are running, Dell EMC Networking OS results are saved as a text file (TestReport-SU-X.txt) in the flash directory. This `show file` command is available only on master and standby.

### Important Points to Remember

- Offline diagnostics can only be run when the unit is offline.
- You can only run offline diagnostics on a unit to which you are connected via the console. In other words, you cannot run diagnostics on a unit to which you are connected to via a stacking link.
- Diagnostics only test connectivity, not the entire data path.

### diag stack-unit

Run offline diagnostics on a stack unit.

**Syntax** `diag stack-unit number [alllevels | level0 | level1 | level2 | interactive test-id] verbose [no-reboot]`

<b>Parameters</b>	<b><i>number</i></b>	Enter the stack-unit id.
	<b>alllevels</b>	Enter the keyword <code>alllevels</code> to run the complete set of offline diagnostic tests.
	<b>level0</b>	Enter the keyword <code>level0</code> to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.
	<b>level1</b>	Enter the keyword <code>level1</code> to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD) wherever possible.
	<b>level2</b>	Enter the keyword <code>level2</code> to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations.
	<b>verbose</b>	Enter the keyword <code>verbose</code> to run the diagnostic in Verbose mode. Verbose mode gives more information in the output than Standard mode.
	<b>no-reboot</b>	Enter the keyword <code>no-reboot</code> to prevent the system from rebooting after the test. To bring the stack unit to online state, use the <code>online stack-unit <i>stack-unit-number</i></code> command.
	<b>interactive</b>	Enter the keyword <code>interactive</code> with the test ID to test interactive test cases. The test cases can be found using the <code>show diag testcase stack-unit <i>stack-unit-id</i> interactive</code> command.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced the <code>verbose</code> option.
<b>7.7.1.0</b>	Introduced on the S-Series.

## offline stack-unit

Place a stack unit in the offline state.

**Syntax** `offline stack-unit number`

**Parameters** *number* Enter the stack-unit id.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
8.2.1.0	Added a warning message to the off-line diagnostic.
7.7.1.0	Introduced on the S-Series.

**Usage Information**

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

```
DellEMC#offline stack-unit 1
Warning - offline of unit will bring down all the protocols and
the unit will be operationally down, except for running Diagnostics.
Please make sure that stacking is not configured for Diagnostics
execution.
Also reboot/online command is necessary for normal operation after the
offline command is issued.
Proceed with Offline [confirm yes/no]:yes
```

## online stack-unit

Place a stack unit in the online state.

**Syntax** `online stack-unit number`

**Parameters** *number* Enter the stack-unit number.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

**Usage Information**

You cannot enter this command on a unit which is already online.

The system which is currently offline reboots when the `online` command is given.

# show diag

Display the diagnostic information.

**Syntax** `show diag {information | stack-unit number [detail [interval] | summary] | testcase stack-unit number [interactive | level0 | level1 | level2]}`

**Parameters**

- information** Enter the keyword `information` to display diagnostic information.
- stack-unit number** Enter the keywords `stack-unit` then the stack-unit number to display diagnostic details of the specific stack unit.
- detail** Enter the keyword `detail` to display diagnostic information in detail.
- summary** Enter the keyword `summary` to display a summary of diagnostic information.
- testcase** Enter the keyword `testcase` to display the list of diagnostic test cases. To display the diagnostic test cases of the particular level, use the keywords `interactive`, `level0`, `level1`, `level2` after the keyword `testcase`.

**Defaults** None

**Command Modes** EXEC Privilege

### Example

```
DelleMC#show diag information
Diag information:
Diag software image version:
9.8(1.0)
-----
stack-unit Member 1:      No Unit diags executed yet (stack-unit not
Offline).
-----

DelleMC#show diag testcase stack-unit 1

***** Z9100 Diagnostics Test
*****

Test ID      Test Description                Test Level
-----
1            SMARTFUSIONFPGAACCESSTEST      Level0
2            CPLDACCESSTEST                 Level0
3            CPUTYPEDETECTTEST              Level0

15           FANSTATUSMONITORTTEST          Level0
16           FANAIRFLOWTYPETEST             Level0
17           RTCPRESENCETEST                Level0
18           SSDPRESENCETEST                Level0

[output truncated]
```

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the <code>verbose</code> option.
7.7.1.0	Introduced on the S-Series.

## Hardware Commands

These commands display information from a hardware sub-component or ASIC.

### clear hardware stack-unit

Clear statistics from selected hardware components.

**Syntax** `clear hardware stack-unit id {counters | cpu {data-plane statistics | i2c statistics | sata-interface statistics} | unit number counters | stack-port stack-port-number}`

Parameters	Parameter	Description
	<b>stack-unit <i>id</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data. The range is from 1 to 6.
	<b>counters</b>	Enter the keyword <code>counters</code> to clear the counters on the selected stack member.
	<b>cpu data-plane statistics</b>	Enter the keywords <code>cpu data-plane statistics</code> to clear the data plane statistics.
	<b>cpu i2c statistics</b>	Enter the keywords <code>cpu i2c statistics</code> to clear the i2c devices statistics.
	<b>cpu party-bus statistics</b>	Enter the keywords <code>cpu party-bus statistics</code> to clear the management statistics.
	<b>cpu sata-interface statistics</b>	Enter the keywords <code>cpu sata-interface statistics</code> to clear the sata interface statistics.
	<b>stack-port</b>	Enter the keywords <code>stack-port</code> then the port number of the stacking port to clear the statistics of the particular stacking port.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the stacking range to 12 units in S3100 series.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Related Commands**

- [show hardware stack-unit](#) — display the data plane or management plane input and output statistics of the designated component of the designated stack member.

## clear hardware system-flow

Clear system-flow statistics from selected hardware components.

**Syntax** `clear hardware system-flow stack-unit number port-set 0-0 counters`

**Parameters**

<b>stack-unit <i>number</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data.
<b>port-set <i>0-0</i> counters</b>	Enter the keywords <code>port-set</code> along with a port-pipe number, then the keyword <code>counters</code> to clear the system-flow counters on the selected port-pipe. The range is from 0 to 0.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

## clear hardware vlan-counters

Clear VLAN statistics.

**Syntax** `clear hardware vlan-counters vlan-id`

**Parameters** *vlan-id* Enter the interface VLAN number. The range is from 1 to 4094.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced this command.

## hardware watchdog

To trigger a reboot and restart the system, set the watchdog timer.

**Syntax** `hardware watchdog stack-unit {stack-unit-number | all}`

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.

**Usage Information**

This command enables a hardware watchdog mechanism that automatically reboots an Dell EMC Networking OS switch/ router with a single unresponsive unit. This behavior is a last-resort mechanism intended to prevent a manual power cycle.

## show hardware mac

Display MAC ACL entries for the specified stack-unit, port-pipe and pipeline ID.

**Syntax** `show hardware mac {eg-acl | in-acl} stack-unit id port-set 0-0 pipeline pipeline-number`

**Parameters**

<b>eg-acl   in-acl</b>	Enter either the keyword <code>eg-acl</code> or the keyword <code>in-acl</code> to select between ingress or egress ACL data.
<b>stack-unit id</b>	Enter the keyword <code>stack-unit</code> to select the stack unit ID.
<b>port-set 0-0</b>	Enter the keywords <code>port-set</code> with a port-pipe number to display the MAC ACL entries for the specified port-pipe number. . The range is from 0 to 0.
<b>pipeline pipeline-number</b>	Enter the keyword <code>pipeline</code> with a pipeline number to display the MAC ACL entries specific to the pipeline number. The range is from 0 to 3.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Usage Information**

The unit numbers given are internal port numbers.

## show hardware ip

Display ACL or QoS data for the selected stack member and stack member port-pipe.

<b>Syntax</b>	<code>show hardware layer3 {acl   qos} stack-unit <i>number</i> port-set <i>0-0</i> pipeline <i>pipeline-number</i></code>	
<b>Parameters</b>	<b>acl   qos</b>	Enter either the keyword <code>acl</code> or the keyword <code>qos</code> to select between ACL or QoS data.
	<b>stack-unit <i>number</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a stack ID.
	<b>port-set <i>0-0</i></b>	Enter the keyword <code>port-set</code> with a port-pipe number. The range is from 0 to 0.
	<b>pipeline <i>pipeline-number</i></b>	Enter the keyword <code>pipeline</code> with a pipeline number to display the MAC ACL entries specific to the pipeline number. The range is from 0 to 3.
<b>Defaults</b>	None	
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

## show hardware ipv6

Display Layer 3 IPv6 ACL data for the selected stack member and stack member port-pipe.

<b>Syntax</b>	<code>show hardware layer3 ipv6 acl stack-unit <i>number</i> port-set <i>0-0</i> pipeline <i>pipeline-number</i></code>	
<b>Parameters</b>	<b>ipv6 acl</b>	Enter the keyword <code>ipv6 acl</code> to select IPv6 ACL data.
	<b>stack-unit <i>number</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a stack ID. The range is from 1 to 6.
	<b>port-set <i>0-0</i></b>	Enter the keyword <code>port-set</code> with a port-pipe number. The range is from 0 to 0.
	<b>pipeline <i>pipeline-number</i></b>	Enter the keyword <code>pipeline</code> with a pipeline number to display the MAC ACL entries specific to the pipeline number. The range is from 0 to 3.

<b>Defaults</b>	None
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.0</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.

## show hardware stack-unit

Display the data plane or management plane input and output statistics of the designated component of the designated stack member.

**Syntax**

```
show hardware stack-unit stack-unit-number {cpu {data-plane statistics | i2c statistics | management statistics | party-bus statistics | sata-interface statistics} | drops [unit unit-number] | fpga registers | stack-port stack-port-number | unit unit-number {counters | details | ipmc-replication | port-stats [detail] | register | table-dump table-name}}
```

<b>Parameters</b>	
<b>stack-unit <i>stack-unit-number</i> {command-option}</b>	Enter the keywords <code>stack-unit</code> to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered. The range is from 1 to 6.
<b>cpu data-plane statistics</b>	Enter the keywords <code>cpu data-plane statistics</code> to display the data plane statistics.
<b>cpu i2c statistics</b>	Enter the keywords <code>cpu i2c statistics</code> to display the counters of i2c devices.
<b>cpu management statistics</b>	Enter the keywords <code>cpu management statistics</code> to display the counters of the management port.
<b>cpu party-bus statistics</b>	Enter the keywords <code>cpu party-bus statistics</code> , to display the Management plane input/output counter statistics of the pseudo party bus interface.
<b>cpu sata-interface statistics</b>	Enter the keywords <code>cpu sata-interface statistics</code> to display the sata interface error counter statistics.
<b>drops [<i>unit unit-number</i>]</b>	Enter the keyword <code>drops</code> to display internal drops on the selected stack member. Enter the optional keyword <code>unit unit-number</code> to display the internal drop counters of the specified port pipe.
<b>fpga register</b>	Enter the keyword to display the register value of the fpga register.

**unit *unit-number*** Enter the keyword `unit` then a number and then enter one of the keywords to troubleshoot errors on the selected port-pipe and to give status on why a port is not coming up to register level.

**{counters | ipmc-replication | details | port-stats [*detail*] | register | table-dump *table-name*}**

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the stacking range to 12 units in S3100 series.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Replaced the keyword <code>port</code> with <code>interface</code> .
9.7(0.0)	Introduced on the S6000-ON.
9.2(0.2)	Modified the <code>drops</code> keyword range, <code>unit</code> keyword range and added the <code>buffer</code> and <code>cpu management statistics</code> options.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.5	Added <code>i2c</code> statistics and <code>sata-interfaces</code> statistics.
8.3.11.4	Added user port information.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

**Example (Data-Plane)**

```
DellEMC# show hardware stack-unit 1 cpu data-plane statistics

### Related Commands

- [clear hardware system-flow](#) — clear the statistics from selected hardware components.
- [show interfaces stack-unit](#) — display information on all interfaces on a specific S-Series stack member.
- [show processes cpu \(S-Series\)](#) — display the CPU usage information based on the processes running in an S-Series.
- [show system](#) — display the current status of all the stack members or a specific member.

## show hardware buffer

Display the counters for the specified port, minimum guaranteed buffer of a priority-group, and the shared buffer.

### Syntax

```

show hardware buffer {headroom-pool {buffer-info | detail buffer-info}}
interface interface-type interface-number {buffer-info | detail buffer-info
| priority-group priority-group-id {buffer-info | detail buffer-info} |
queue queue-no {buffer-info | detail buffer-info }}

```

### Parameters

- |  |   |
|--|---|
| <b>headroom-pool<br/>buffer-info</b>                     | Enter the keyword <code>headroom-pool</code> followed by the keyword <code>buffer-info</code> for information on the headroom pool buffer usage.  |
| <b>headroom-pool<br/>detail buffer-info</b>              | Enter the keyword <code>headroom-pool</code> followed by the keywords <code>detail</code> and <code>buffer-info</code> for detailed headroom buffer usage statistics.                   |
| <b>interface<br/>interface type<br/>interface-number</b> | Enter the keyword <code>interface</code> followed by the keyword <code>interface type</code> and <code>interface number</code> to display the buffer details of a particular interface. |

Enter any of the following keywords and slot/port[/subport] or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**queue** Enter the keyword `queue` followed by *id* for specific queue or keyword `all`.

**priority-group** Identifier of the priority group in the range of 0 to 7.  
Enter the keyword `priority-group` followed by *id* for specific priority group or keyword `all`.

**buffer-info** To display total buffer information for the port interface, enter the keywords `buffer-info`. To display a queue range, enter 0 to 19 for a specific queue or `all`.

**Command Modes** EXEC  
EXEC Privilege

**Command History**

Version	Description
<b>9.11(2.0)</b>	Introduced the keyword <code>headroom-pool</code> on the Z9100-ON and S6100-ON.
<b>9.10(0.0)</b>	Introduced on the S6100.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Removed the keyword <code>port</code> and added the keywords <code>interface</code> , and the variable <code>interface</code> .
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>Version 9.3(0.0)</b>	Introduced on the S6000 platform.

**Usage Information** The following table describes the fields in the output of the `show` command:

**Table 4. Show Output Fields**

Field	Description
Buffer Stats for Interface interface-number Queue queue-number	Displays the counters that are calculated by the buffer statistics tracking method for each port per queue on a particular stack member.
Max Shared Limit	Maximum shared buffer space allotted to the specific port for the corresponding stack unit
Default Packet Buffer allocate for the queue	The default packet buffer size in KB that is associated with the particular queue
Used Packet Buffer	Shared buffer space that is in use by the packets

**Example displaying buffer information for specified queue**

```
DellEMC# show hardware buffer interface hundredGigE 1/10 queue 0 buffer-info
----- Buffer Stats for Interface Hu 1/10 Queue 0 -----
Maximum Shared Limit: 11158
```

```
Default Packet Buffer allocated for the Queue: 0
Used Packet Buffer: 0
```

### Example displaying buffer information for specified priority-group

```
Dell EMC# show hardware buffer interface hundredGigE 1/10 priority-group
0 buffer-info
----- Buffer stats for unit: 0 port: 34 (interface Hu 1/10) -----
-----
PG# PRIORITIES                ALLOTTED (CELLS)          COUNTER (CELLS)
      MIN      SHARED      MODE      HDRM      MIN      SHARED      HDRM
-----
0    0                0      17384      DYNAMIC 174      0        0        0
```

### Example displaying buffer information for headroom pool

```
Dell EMC# show hardware buffer headroom-pool buffer-info
-----Buffer Details for Stack-Unit 1 portpipe 0 -----
-----
Headroom-Pool   Configured Buffer(KB)   Used Buffer(KB)
-----
HP1              0                       0
Dell EMC#
```

## show hardware buffer headroom-pool

Display the headroom pool buffer usage.

**Syntax** `show hardware buffer {headroom-pool {buffer-info | detail buffer-info}}`

**Parameters**

- headroom-pool** Enter the keyword `headroom-pool` followed by the keyword `buffer-info` for information on the headroom pool buffer usage.
- headroom-pool detail buffer-info** Enter the keyword `headroom-pool` followed by the keywords `detail` and `buffer-info` for detailed headroom buffer usage statistics.

**Command Modes** EXEC  
EXEC Privilege

Command History	Version	Description
	9.11(2.0)	Introduced the keyword <code>headroom-pool</code> on the Z9100-ON and S6100-ON.

### Example displaying buffer information for headroom pool

```
Dell EMC# show hardware buffer headroom-pool buffer-info
-----Buffer Details for Stack-Unit 1 portpipe 0 -----
-----
Headroom-Pool   Configured Buffer(KB)   Used Buffer(KB)
-----
HP1              0                       0
Dell EMC#
```

## show hardware buffer service-pool

Displays the buffer details for the service pool. You can verify the total buffer allocated to the lossy and lossless traffic in the service pool.

**Syntax** `show hardware buffer service-pool {buffer-info | detail buffer-info}`

**Parameters**

- buffer-info** Enter the keyword `buffer-info` to view the buffer details for the service pool.
- detail buffer-info** Enter the keyword `detail buffer-info` to view the buffer details allocated for the MMU units.

**Command Modes** EXEC  
EXEC Privilege

**Command History**

Version	Description
9.11(0.0)	Introduced on the S6000, S6000-ON, S6100-ON and Z9100-ON.

**Usage Information**

Use this command to view the buffer details of lossy and lossless traffic in the service pool. Use the keyword `detail buffer-info` to view the buffer details allocated for each MMU unit.

**Example**

```
DellEMC#show hardware buffer service-pool buffer-info
-----Buffer Details for Stack-Unit 1 portpipe 0 -----
-----
Service-Pool          Configured Buffer (KB)      Used Buffer (KB)
-----
SP0 (Lossy)           9758                       7760
SP1 (Lossless)        3842                       697
DellEMC#
```

```
DellEMC#show hardware buffer service-pool detail buffer-info
-----Buffer Details for Stack-Unit 1 portpipe 0 -----
-----Buffer Details for MMU 0-----
-----
Service-Pool          Configured Buffer (KB)      Used Buffer (KB)
-----
SP0 (Lossy)           2440                       1942
SP1 (Lossless)        961                        225

-----Buffer Details for MMU 1-----
-----
Service-Pool          Configured Buffer (KB)      Used Buffer (KB)
-----

## show hardware buffer-stats-snapshot

Displays buffer statistics tracking resource information for a specific interface.

**Syntax** `show hardware buffer-stats-snapshot resource {headroom-pool [detail] | service-pool [detail] interface interface {{priority-group {id | all} | queue ucast {id | all} mcast {id | all} | all} [detail]}`

**Parameters**

<b>headroom-pool detail</b>	Enter the keyword <code>headroom-pool</code> followed by the keyword <code>detail</code> to view detailed information about the headroom pool usage.
<b>service-pool detail</b>	Enter the keyword <code>service-pool</code> followed by the keyword <code>detail</code> to view detailed information about the service pool usage.

**interface  
interface**

Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**queue**

Enter the keyword `queue` followed by `all` for displaying details of all queues, `ucast queue-id` or `all` for displaying Unicast queue details, and `mcast queue-id` or `all` for displaying Multicast queue details.

**priority-group**

Enter the keyword `priority-group` followed by `id` for specific priority-group or keyword `all`.

**Command Modes** EXEC

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version**

**Description**

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

**9.10(0.0)**

Introduced on the S6100-ON.

**9.8(2.0)**

Introduced on the S3100 series.

**9.8(1.0)**

Introduced on the Z9100-ON.

**9.8(0.0P5)**

Introduced on the S4048-ON.

**9.8(0.0P2)**

Introduced on the S3048-ON.

**9.8(0.0)**

Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, Z9500.

**Usage Information**

`<Interface><slot/port>-Queue ucast/mcast` — Displays the total unicast/multicast buffer usage on per-port per-queue basis.

**Example displaying egress queue-level snapshot for both unicast and multicast packets for the specific interface**

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 queue all
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST        0         0
UCAST        1         0
UCAST        2         0
UCAST        3         0
UCAST        4         0
UCAST        5         0
UCAST        6         0
UCAST        7         0
UCAST        8         0
UCAST        9         0
MCAST        0         0
MCAST        1         0
MCAST        2         0
MCAST        3         0
```

```
MCAST 4 0
MCAST 5 0
MCAST 6 0
MCAST 7 0
MCAST 8 0
MCAST 9 0
```

**Example displaying egress queue-level snapshot for unicast packets for the specific interface**

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 queue ucast 0
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      0      0
```

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 queue ucast all
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      0      0
UCAST      1      0
UCAST      2      0
UCAST      3      0
UCAST      4      0
UCAST      5      0
UCAST      6      0
UCAST      7      0
UCAST      8      0
UCAST      9      0
```

**Example displaying egress queue-level snapshot for multicast packets for the specific interface**

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 queue mcast 0
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      0      0
```

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 queue mcast all
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      0      0
MCAST      1      0
MCAST      2      0
MCAST      3      0
MCAST      4      0
MCAST      5      0
MCAST      6      0
MCAST      7      0
MCAST      8      0
MCAST      9      0
```

**Example displaying ingress priority-group level snapshot for the specific interface**

```
DelleMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 prio-group 0
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
-----
PG#      SHARED CELLS      HEADROOM CELLS
-----
0        0                0
```

```
DellEMC# show hardware buffer-stats-snapshot resource interface
hundredGigE 1/10 prio-group all
Stack-unit 1 unit: 0 port: 34 (interface Hu 1/10)
```

PG#	SHARED CELLS	HEADROOM CELLS
0	0	0
1	0	0
2	0	0
3	0	0
4	0	0
5	0	0
6	0	0
7	0	0

**Example showing buffer snap shot details for head room pool**

```
DellEMC#show hardware buffer-stats-snapshot resource headroom-pool
```

HP#	PEAK USE	COUNT (CELLS)
0	0	
1	0	
2	0	
3	0	

0	0
1	0
2	0
3	0

```
DellEMC#
```

```
DellEMC#show hardware buffer-stats-snapshot resource headroom-pool detail
```

HP#	MMU#	PEAK USE	COUNT (CELLS)
0	0	0	
0	1	0	
0	2	0	
0	3	0

```
DellEMC#
```

## show hardware drops

Displays internal drops on the specified interface or for a range of interface.

**Syntax** `show hardware drops interface interface`

**Parameters**

**drops** Enter the keyword `drops` to display internal drops.

**interface** Enter any of the following keywords and the interface or interface range information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.

- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**Command Modes** EXEC  
EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.14(0.0)</b>	Included the FEC BER details in the output for 25 and 50GG interfaces of the S5048-ON.
<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
<b>9.11(0.0)</b>	Included the FEC BER details in the output for 100G interfaces of S6100-ON and Z9100-ON .  Included FCS Error Ratio in the output for all interfaces of S6000, S6000-ON, S6100-ON, and Z9100-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.8(0.0)</b>	Removed the keywords <code>stack-unit</code> . Introduced on the Z9500.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(0.2)</b>	Modified the <code>drops</code> keyword range, unit keyword range and added the <code>buffer</code> and <code>cpu management statistics</code> options.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.5</b>	Added i2c statistics and sata-interfaces statistics.
<b>8.3.11.4</b>	Added user port information.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.7.1.0</b>	Introduced on the S-Series.

**Example displaying internal drops**

```
DellEMC#show hardware drops

RX - Debug Counter 0                           0
RX - Debug Counter 1                           0
RX - Debug Counter 2                           0
<output truncated for brevity>
```

# show hardware system-flow

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

**Syntax** `show hardware system-flow stack-unit id port-set number [counters | pipeline pipeline-number]`

**Parameters**

- stack-unit *id*** Enter the keywords `stack-unit` to select a stack member ID.
- port-set *number*** Enter the keywords `port-set` with a port-pipe number.
- [counters | pipeline *pipeline-number*]** (OPTIONAL) Enter the keyword `counters` for the specified port-pipe.
- number*** Enter the keyword `pipeline` to display entries specific to a pipeline.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.

## show hardware vlan-counters

Display the hardware VLAN statistics.

**Syntax** `show hardware vlan-counters vlan-id`

**Parameters** *vlan-id* Enter the interface VLAN number. The range is from 1 to 4094.

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced this command.

### Example

```

DellEMC# show hardware vlan-counters 1
Counters for vlanid: 1
-----
Total number of inpackets: 0
Total number of inbytes: 0
Total number of outpackets: 0
Total number of outbytes: 0
DellEMC#

```

**Related Commands**

- [clear hardware system-flow](#) — clear the statistics from selected hardware components.

# Dynamic Host Configuration Protocol (DHCP)

Dynamic host configuration protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations (hosts) based on the configuration policies the network administrators determine.

## Topics:

- [Commands to Configure the System to be a DHCP Server](#)
- [Commands to Configure Secure DHCP](#)
- [Commands to Configure DNS](#)

## Commands to Configure the System to be a DHCP Server

To configure the system to be a DHCP server, use the following commands.

### clear ip dhcp

Reset the DHCP counters.

**Syntax** `clear ip dhcp [binding {address} | conflict | server statistics]`

<b>Parameters</b>	<b>binding</b>	Enter the keyword <code>binding</code> to delete all entries in the binding table.
	<b>address</b>	Enter the IP address to clear the binding entry for a single IP address.
	<b>conflicts</b>	Enter the keyword <code>conflicts</code> to delete all of the log entries created for IP address conflicts.
	<b>server statistics</b>	Enter the keywords <code>server statistics</code> to clear all the server counter information.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

Version	Description
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

#### Usage Information

Press Enter after the `clear ip dhcp binding` command clears all the IPs from the binding table.

## debug ip dhcp server

Display Dell OS debugging messages for DHCP.

**Syntax** `debug ip dhcp server [events | packets]`

**Parameters**

- events** Enter the keyword `events` to display the DHCP state changes.
- packet** Enter the keyword `packet` to display packet transmission/reception.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## debug ipv6 dhcp

To enable debug logs for DHCPv6 relay agent transactions.

<b>Syntax</b>	<code>debug ipv6 dhcp</code> To disable the debug logs for dhcpv6 relay agent transactions, use the <code>debug ipv6 dhcp</code> command.
<b>Defaults</b>	None
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S6000 and Z-Series.

## default-router

Assign a default gateway to clients based on the address pool.

<b>Syntax</b>	<code>default-router address [address2...address8]</code>
<b>Parameters</b>	<b>address</b> Enter a list of routers that may be the default gateway for clients on the subnet. You may specify up to eight routers. List them in order of preference.
<b>Defaults</b>	None
<b>Command Modes</b>	DHCP <POOL>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.

<b>Version</b>	<b>Description</b>
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## disable

Disable the DHCP server.

<b>Syntax</b>	<pre>disable</pre> <p>DHCP Server is disabled by default. To enable the system to be a DHCP server, use the <code>no disable</code> command.</p>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION DHCP <POOL>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## dns-server

Assign a DNS server to clients based on address pool.

<b>Syntax</b>	<code>dns-server address [address2...address8]</code>
---------------	---

**Parameters**      *address*      Enter a list of DNS servers that may service clients on the subnet. You may list up to eight servers, in order of preference.

**Defaults**      None

**Command Modes**      DHCP <POOL>

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## domain-name

Assign a domain to clients based on the address pool.

**Syntax**      domain-name *name*

**Parameters**      *name*      Give a name to the group of addresses in a pool.

**Defaults**      None

**Command Modes**      DHCP <POOL>

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## excluded-address

Prevent the server from leasing an address or range of addresses in the pool.

**Syntax** `excluded-address [address | low-address high-address]`

**Parameters**

- address*** Enter a single address to be excluded from the pool.
- low-address*** Enter the lowest address in a range of addresses to be excluded from the pool.
- high-address*** Enter the highest address in a range of addresses to be excluded from the pool.

**Defaults** None

**Command Modes** DHCP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## hardware-address

For manual configurations, specify the client hardware address.

**Syntax** `hardware-address address`

**Parameters** **address** Enter the hardware address of the client.

**Defaults** None

**Command Modes** DHCP <POOL>

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## host-address

For manual (rather than automatic) configurations, assign a host to a single-address pool.

**Syntax** `host-address address`

**Parameters** **address** Enter the host IP address.

**Defaults** None

**Command Modes** DHCP-POOL

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14.1.3	This command replaces <code>host</code> command. Introduced on S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, S6000, S4810, S4820T, S5048F-ON, MXL, FN-IOM, and C9010.

## Usage Information

When you upgrade the Dell EMC Networking OS from an earlier version to 9.14.1.3 or later, the system converts the DHCP CONFIGURATION `host` command in the running configuration to the `host-address` command. If you downgrade the Dell EMC Networking OS from version 9.14.1.3 or later to an earlier version, any existing `host-address` command is deleted from the running configuration. If you want to create manual DHCP bindings, use the `host` command.

## ip dhcp server

Enable DHCP server globally.

**Syntax** `[no] ip dhcp server`

To disable the DHCP server, use the `no ip dhcp server` command.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the S4810 and S4820T.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

## lease

Specify a lease time for the addresses in a pool.

**Syntax** `lease {days [hours] [minutes] | infinite}`

Parameters	
<b>days</b>	Enter the number of days of the lease. The range is from 0 to 31.
<b>hours</b>	Enter the number of hours of the lease. The range is from 0 to 23.
<b>minutes</b>	Enter the number of minutes of the lease. The range is from 0 to 59.
<b>infinite</b>	Specify that the lease never expires.

**Defaults** 24 hours

**Command Modes** DHCP <POOL>

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## netbios-name-server

Specify the NetBIOS Windows Internet Naming Service (WINS) name servers, in order of preference, that are available to Microsoft Dynamic Host Configuration Protocol (DHCP) clients.

**Syntax** netbios-name-server address [address2...address8]

**Parameters** **address** Enter the address of the NETBIOS name server. You may enter up to eight, in order of preference.

**Defaults** None

**Command Modes** DHCP <POOL>

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## netbios-node-type

Specify the NetBIOS node type for a Microsoft DHCP client. Dell EMC Networking recommends specifying clients as `hybrid`.

**Syntax** `netbios-node-type type`

**Parameters** `type`

Enter the NETBIOS node type:

- Broadcast: Enter the keyword `b-node`.
- Hybrid: Enter the keyword `h-node`.
- Mixed: Enter the keyword `m-node`.
- Peer-to-peer: Enter the keyword `p-node`.

**Defaults** `Hybrid`

**Command Modes** `DHCP <POOL>`

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## network

Specify the range of addresses in an address pool.

<b>Syntax</b>	<code>network network /prefix-length</code>
<b>Parameters</b>	<b><i>network/ prefix-length</i></b> Specify a range of addresses. Prefix-length range is from 17 to 31.
<b>Defaults</b>	None
<b>Command Modes</b>	DHCP <POOL>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## pool

Create an address pool.

<b>Syntax</b>	<code>pool name</code>
<b>Parameters</b>	<b><i>name</i></b> Enter the address pool's identifying name.
<b>Defaults</b>	None
<b>Command Modes</b>	DHCP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.

<b>Version</b>	<b>Description</b>
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## show ip dhcp binding

Display the DHCP binding table.

**Syntax** `show ip dhcp binding`

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

# show ip dhcp configuration

Display the DHCP configuration.

**Syntax** `show ip dhcp configuration [global | pool name]`

**Parameters**

<b>pool name</b>	Display the configuration for a DHCP pool.
<b>global</b>	Display the DHCP configuration for the entire system.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## Example

```
DellEMC# show ip dhcp configuration global

Protocol status      : Enabled
Number of ping packets : 1
DellEMC#

DellEMC# show ip dhcp configuration pool p1

Pool Name           : p1
Pool Type           : Dynamic
Domain Name         : dell.com
Lease Time          : 2Days 0Hrs 0Mins
DNS Servers         : 10.11.0.1
Default Routers     : 1.1.1.1
Network             : 1.1.1.0 255.255.255.0
```

## show ip dhcp conflict

Display the address conflict log.

**Syntax** `show ip dhcp conflict address`

**Parameters** **address** Display a particular conflict log entry.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## show ip dhcp server

Display the DHCP server statistics.

**Syntax** `show ip dhcp server statistics`

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

<b>Version</b>	<b>Description</b>
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

## Commands to Configure Secure DHCP

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

### arp inspection

Enable dynamic arp inspection (DAI) on a VLAN.

**Syntax**            `arp inspection`

**Defaults**            Disabled

**Command Modes**    INTERFACE VLAN

**Command History**    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced on the E-Series.
<b>8.2.1.0</b>	Introduced on the C-Series and S-Series.

**Related  
Commands**

- [arp inspection-trust](#) — specify a port as trusted so that ARP frames are not validated against the binding table.

## arp inspection-limit

Configure dynamic ARP inspection rate-limit to verify the rate of ARP packet received in a port on a specific interval.

**Syntax** `arp inspection-limit {rate pps [interval seconds]}`

**Defaults** None

**Command Modes** INTERFACE CONFIGURATION

**Parameters**

<b>rate <i>pps</i></b>	Enter the keyword <code>rate</code> then the packet per second (pps) value. The range is from 1 to 2048. The default is 15.
<b>interval <i>seconds</i></b>	(Optional) Enter the keyword <code>interval</code> then the burst interval in seconds. The range is from 1 to 15. The default is 1.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(1.0)	Introduced on the S3048-ON, S4048-ON, S4048T-ON, S3100 Series, Z9100-ON, S6100-ON, S6000, S6000-ON, S6010-ON, S5048F-ON, S4810, S4820T, FN IOM and MXL.

## arp inspection-trust

Specify a port as trusted so that ARP frames are not validated against the binding table.

**Syntax** `arp inspection-trust`

**Defaults** Disabled

**Command Modes**

- INTERFACE
- INTERFACE PORT-CHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

**Related Commands**

- [arp inspection](#) — enable dynamic ARP inspection on a VLAN.

## clear ip dhcp snooping

Clear the DHCP binding table.

**Syntax** `clear ip dhcp snooping {binding | source-address-validation discard-counters [interface interface]}`

Parameters	binding	source-address-validation discard-counters	interface <i>interface</i>
	Clears the binding table.	Clears discard counters from all the interfaces configured with IP Source Guard.	(OPTIONAL) Specifies an interface to clear the discard counters. Enter any of the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul>

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.6(0.0)	Added the keywords <code>discard-counters</code> , <code>interface</code> , and the variable <code>interface</code> on the S4810, S4820T, S5000, S6000, Z9000, Z9500.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

### Example

The following example shows how to clear the discard counters globally:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
```

The following example shows how to clear the discard counters on an interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface TenGigE 1/10/1
```

The following example shows how to clear the discard counters on a port channel interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface portchannel 1
```

### Related Commands

- [show ip dhcp snooping](#) — display the contents of the DHCP binding table.

## clear ipv6 dhcp snooping binding

Clear all the DHCPv6 snooping binding database entries.

**Syntax** `clear ipv6 dhcp snooping binding`

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## Example

```
DellEMC# clear ipv6 dhcp snooping?  
binding    Clear the snooping binding database
```

## ip dhcp relay

Enable Option 82.

### Syntax

```
ip dhcp relay information-option [remote-id {port | hostname:port | mac} |  
circuit-d {port | hostname:port | mac} | trust-downstream]
```

### Parameters

<b>remote-id</b>	Enter the keyword <code>remote-id</code> to configure the system to enable the remote-id string in option-82.
<b>remote-id port</b>	Enter the keywords <code>remote-id port</code> to configure the port as the remote id in option-82.
<b>remote-id hostname:port</b>	Enter the keywords <code>remote-id hostname:port</code> to configure the format of the hostname and port attributes.
<b>remote-id mac</b>	Enter the keywords <code>remote-id mac</code> to configure the chassis MAC address as the remote-id in option-82.
<b>circuit-id</b>	Enter the keyword <code>circuit-id</code> to configure the system to enable the circuit-id string in option-82.
<b>circuit-id port</b>	Enter the keywords <code>circuit-id port</code> to configure the port as the circuit-id in option-82.
<b>circuit-id hostname:port</b>	Enter the keywords <code>circuit-id hostname:port</code> to configure the circuit-id format that is sent to the server.
<b>circuit-id mac</b>	Enter the keywords <code>circuit-id mac</code> to configure the chassis MAC address as the circuit-id in option-82.
<b>trust-downstream</b>	Configure the system to trust Option 82 when it is received from the previous-hop router.

### Defaults

Disabled

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(0.2)</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced on the E-Series.

Version	Description
7.8.1.0	Introduced on the C-Series and S-Series.

## ip dhcp snooping

Enable DHCP snooping globally.

<b>Syntax</b>	<code>[no] ip dhcp snooping</code>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the S4810 and S4820T.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series on Layer 2 interfaces.
7.8.1.0	Introduced on the C-Series and S-Series on Layer 3 interfaces.

<b>Usage Information</b>	<p>When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP snooping, the binding table deletes and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.</p> <p>Introduced in Dell EMC Networking OS version 7.8.1.0, DHCP snooping was available for Layer 3 only and dependent on DHCP Relay Agent (<code>ip helper-address</code>). Dell EMC Networking OS version 8.2.1.0 extends DHCP Snooping to Layer 2. You do not have to enable relay agent to snoop on Layer 2 interfaces.</p>
--------------------------	--

## ipv6 dhcp snooping

Enable DHCPv6 snooping globally for ipv6.

<b>Syntax</b>	<code>[no] ipv6 dhcp snooping</code>
	To disable the snooping globally, use the <code>no ipv6 dhcp snooping</code> command.
<b>Defaults</b>	Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ipv6 dhcp snooping vlan

Enable ipv6 DHCP Snooping on VLAN or range of VLANs.

**Syntax** [no] ip dhcp snooping vlan *vlan-id*

To disable the ipv6 dhcp snooping on VLAN basis or range of VLAN, use the `no ip dhcp snooping vlan <vlan-id>` command.

**Parameters** *vlan-id* Enter the name of a VLAN id or list of the VLANs to enable DHCP Snooping.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ip dhcp snooping binding

Create a static entry in the DHCP binding table.

**Syntax** [no] ip dhcp snooping binding mac *address* *vlan-id* *vlan-id* ip *ip-address*  
interface *interface-type* lease *number*

**Parameters** *mac address* Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IP address.

<b>vlan-id <i>vlan-id</i></b>	Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.
<b>ip <i>ip-address</i></b>	Enter the keyword <code>ip</code> then the IP address that the server is leasing.
<b>interface <i>type</i></b>	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> </ul>
<b>lease <i>time</i></b>	Enter the keyword <code>lease</code> then the amount of time the IP address are leased. The range is from 1 to 4294967295.

**Defaults** None

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.14(1.0)</b>	Enhanced the command to map multiple IP addresses to one MAC address on the S4810 and S4820T.
<b>9.13(0.0)</b>	Enhanced the command to map multiple IP addresses to one MAC address on the S5048F-ON.
<b>9.13(0.0)</b>	Enhanced the command to map multiple IP addresses to one MAC address. Enhanced to support DHCP snooping in a VLT setup.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series.

**Usage Instructions** You can map multiple IP addresses to the same MAC address.

## Related Commands

- [show ip dhcp snooping](#) — display the contents of the DHCP binding table.

# IPv6 DHCP Snooping Binding

Create a static DHCP snooping binding entry in the snooping database.

## Syntax

```
[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value
```

To delete the DHCP snooping binding entry from DHCP snooping database, use the `[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value` command.

## Parameters

<b>mac address</b>	Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IPv6 address.
<b>vlan-id</b>	Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.
<b>ipv6 ipv6-address</b>	Enter the keyword <code>ipv6</code> then the IPv6 address that is leased to the client.
<b>interface type</b>	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li></ul>
<b>interface number</b>	Enter the number of the interface.
<b>lease value</b>	Enter the keyword <code>lease</code> then the amount of time the IPv6 address are leased. The range is from 1 to 4294967295.

## Defaults

None

## Command Modes

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description

<b>8.3.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping database write-delay

To set time interval for storing the snooping binding entries in a file.

<b>Syntax</b>	<code>[no] ipv6 dhcp snooping database write-delay <i>value</i></code> To disable the storing of snooping binding entries in a file, use the <code>no ipv6 dhcp snooping write-delay</code> command.
<b>Parameters</b>	<b><i>value</i></b> The range is from 5 to 21600. The value of the minutes range is from 5 min. to 15 days.
<b>Defaults</b>	None
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ip dhcp snooping database renew

Renew the binding table.

**Syntax** `ip dhcp snooping database renew`

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping database renew

To load the binding entries from the file to DHCPv6 snooping binding database.

**Syntax** `ipv6 dhcp snooping database renew`

<b>Defaults</b>	None
<b>Command Modes</b>	• EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ip dhcp snooping trust

Configure an interface as trusted.

<b>Syntax</b>	[no] ip dhcp snooping trust
<b>Defaults</b>	<b>Untrusted</b>
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping trust

Configure an interface as trusted for DHCP snooping.

**Syntax** `[no] ipv6 dhcp snooping trust`

To disable dhcp snooping trusted capability on this interface, use the `no ipv6 dhcp snooping trust` command.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ip dhcp source-address-validation

Enable the IP Source Guard.

**Syntax** `[no] ip dhcp source-address-validation [ipmac] [vlan vlan-id]`

**Parameters**

<b>ipmac</b>	Enable IP+MAC Source Address Validation.
<b>vlan <i>vlan-id</i></b>	(OPTIONAL) SAV validates the source IP address along with the source VLAN ID against the DHCP snooping binding table.

**Defaults** Disabled

**Command Modes** INTERFACE

INTERFACE PORTCHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.6(0.0)	Added the <code>vlan</code> keyword and the <code>vlan-id</code> variable . Introduced support for SAV on port channels interfaces.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Added the keyword <code>ipmac</code> .
7.8.1.0	Introduced on the C-Series and S-Series.

### Usage Information

Allocate at least one FP block to `ipmacacl` before you can enable IP+MAC Source Address Validation and SAV with VLAN option.

1. Use the `cam-acl 12acl` command from CONFIGURATION mode.
2. Save the running-config to the startup-config.
3. Reload the system.

## ip dhcp relay information-option

Enable Option 82.

### Syntax

```
ip dhcp relay information-option [remote-id {hostname | mac | WORD}]
[circuit-d {hostname:port}] [trust-downstream] [vpn]
```

### Parameters

<b>remote-id</b>	Enter the keyword <code>remote-id</code> to configure the system to enable the remote-id string in option-82.
<b>remote-id hostname</b>	Enter the keywords <code>remote-id hostname</code> to configure the port as the remote id in option-82.
<b>remote-id mac</b>	Enter the keywords <code>remote-id mac</code> to configure the chassis MAC address as the remote-id in option-82.
<b>remote-id WORD</b>	Enter the <code>remote-id WORD</code> option to configure the system to enable the remote-id string in option 82.
<b>circuit-id</b>	Enter the keyword <code>circuit-id</code> to configure the system to enable the circuit-id string in option-82.
<b>circuit-id hostname:port</b>	Enter the keywords <code>circuit-id hostname:port</code> to configure the circuit-id format that is sent to the server.
<b>trust-downstream</b>	Configure the system to trust Option 82 when it is received from the previous-hop router.
<b>vpn</b>	Enter the keyword <code>vpn</code> to add VPN/VRF related sub-option to relay agent information Option 82.
	<b>NOTE:</b> Adds the VPN/VRF related sub-options into the relay agent information option(82). When DHCP broadcasts are forwarded by the relay agent from clients to DHCP server.

**Default** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.0P0)	Introduced the <code>circuit-id</code> attribute in the command.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on C-Series and S-Series.

#### Example

```
DellEMC(conf)# ip dhcp relay information-option vpn
```

## ip dhcp relay source-interface

Configure IPv4 DHCP relay source interface.

#### Syntax

```
ip dhcp relay source-interface interface
```

To disable the IPv4 DHCP relay source interface, use the `no ip dhcp relay source-interface interface` command.

#### Parameters

<b>source-interface <i>interface</i></b>	<p>Enter the keyword <code>source-interface</code> then the type of interface and the interface information:</p> <ul style="list-style-type: none"> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/plot information.</li> <li>For a 10-Gigabit Ethernet information, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet information, enter the keyword <code>FortyGigabitEthernet</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a Tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID. The range is from 1 to 16383.</li> <li>For a port channel interface, enter the keyword <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>

9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## ip helper-address

Configures the destination broadcast address or the host address for DHCP server requests.

<b>Syntax</b>	<code>ip helper-address [vrf vrf-name] ip-address</code> To disable the destination broadcast address or the host address for DHCP server requests, use the <code>ip helper-address [vrf vrf-name] ip-address</code> command.
<b>Parameters</b>	<p><b>vrf vrf-name</b> (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF through which the host address can be reached.</p> <p><b>ip-address</b> Enter an IP address through which the host address can be reached.</p>
<b>Default</b>	Disabled.
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
<b>Version 9.4.(0.0)</b>	Introduced on the S-Series and Z-Series.

<b>Usage Information</b>	Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.
--------------------------	--

### Example

```
DellEMC(conf-if-fo-1/1/1)# ip helper-address vrf jay 10.0.0.2
```

## ipv6 helper-address

Configures the IPv6 DHCP helper addresses.

<b>Syntax</b>	<code>[no] ipv6 helper-address [vrf vrf-name] ipv6-address</code> To delete the IPv6 helper address, use the <code>[no] ipv6 helper-address [vrf vrf-name] ipv6-address</code> command.
<b>Parameters</b>	<p><b>vrf vrf-name</b> (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF through which the host address can be reached.</p>

**ipv6-address** Enter the keyword `ipv6-address` through which the server address can be reached.

**Default** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(1.0)	Enhanced to support non-default VRF configuration for DHCPv6 helper address.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, Z9000, and Z9500.

**Usage Information** Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.

**Example**

```
DellEMC(conf-if-te-1/1/1)# ipv6 helper-address
X:X:X:X::X      IPv6 helper address
VRF            VRF name.
```

## show ip dhcp snooping

Display the contents of the DHCP binding table or display the interfaces configured with IP Source Guard.

**Syntax** `show ip dhcp snooping [binding | source-address-validation [discard-counters [interface interface]]]`

**Parameters**

Parameters	Description
<b>binding</b>	Display the binding table.
<b>source-address-validation</b>	Display the interfaces configured with IP Source Guard.
<b>discard-counters</b>	(OPTIONAL) Display the number of dropped packets.
<b>interface interface</b>	(OPTIONAL) Specifies an interface to show the discard counters. Enter any of the following keywords and the interface information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li></ul>

## Parameters Description

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** None

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Version Description

<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.6(0.0)</b>	Added the <code>discard-counters</code> , <code>interface</code> keywords, and the <code>interface</code> variable.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series.

**Example** The following example displays the interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation
ip sav access-list on TenGigabitEthernet 1/1/1
Total cam count 3
permit host 0.0.0.0 count (0 packets)
permit host 10.1.1.252 count (0 packets)
permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on TenGigabitEthernet 1/1/2
Total cam count 4
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 10.1.1.1 host 00:00:00:aa:00:01 count (0 packets)
permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0 packets)
permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0 packets)
permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0 packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation interface
portchannel 10
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
```

```

permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 3
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)

```

**NOTE:** The output for port-channel interfaces does not display the physical interface.

The following example displays the SAV discard counters on all interfaces:

```

DelleMC> show ip dhcp snooping source-address-validation discard-
counters
deny access-list on TenGigabitEthernet 1/1/1
Total cam count 1
deny count (0 packets)
deny access-list on TenGigabitEthernet 1/1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

```

The following example displays the SAV discard counters on a particular interface:

```

DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface TenGigabitEthernet 1/1/1
deny access-list on TenGigabitEthernet 1/1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

```

The following example displays the SAV discard counters on a port channel interface:

```

DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 3
Total cam count 1
deny vlan 10 count (0 packets)

```

**NOTE:** The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

## show ipv6 dhcp snooping

Display the DHCPv6 snooping binding database.

**Syntax** show ipv6 dhcp snooping

**Defaults** None

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

## Example

```
DellEMC# show ipv6 dhcp snooping
IPv6 DHCP Snooping                : Enabled.
IPv6 DHCP Snooping Mac Verification : Disabled.

Database write-delay (In minutes)  : 5

DHCP packets information
Snooping packets                   : 0
Snooping packets processed on L2 vlans : 0

DHCP Binding File Details
Invalid File                         : 0
Invalid Binding Entry                 : 0
Binding Entry lease expired           : 0

DellEMC#
```

# Commands to Configure DNS

To configure the Domain Names Systems (DNS) on the system, use the following commands:

## ip name-server

Configures one or more name server (DNS) IP addresses. You can configure up to six IP addresses.

### Syntax

```
ip name-server [vrf vrf-name] ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]
```

To undo the name server ip address configuration for VRF, use the `no ip name-server [vrf vrf-name] ip-address` command.

### Parameters

**vrf vrf-name** (Optional) Enter the key word `vrf` and then the name of the VRF to configure the name server IP addresses for that VRF.

**ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]** Enter the IP address of the name server in dotted decimal format.

**i** **NOTE:** Use the additional `ip-address` parameters (`ip-address2` to `ip-address6`) in a sequential order to specify up to a maximum of six IP addresses per VRF.

### Defaults

None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information** Use this command to associate the system with one or more DNS servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

**Example**

```
• DellEMC(conf)#ip name-server vrf jay 2.2.2.2
• DellEMC(conf)#ip name-server vrf jay 2.2.2.2 3.3.3.3 4.4.4.4
  5.5.5.5 6.6.6.6 7.7.7.7
```

## ip domain-name

Configures the default domain corresponding to a specific VRF. This domain is appended to the in complete DNS requests corresponding to the specified VRF.

**Syntax** `ip domain-name [vrf vrf-name] name`

To undo the domain name configuration corresponding to a specific VRF, use the `no ip domain-name [vrf vrf-name] name` command.

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the domain corresponding to that VRF.
<b>name</b>	Enter the name of the domain to be appended to the in complete DNS requests corresponding to the specified VRF.

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information**

Use this command to configure a domain name corresponding to a VRF. This domain is appended to the in complete DNS requests corresponding to the specified VRF.

**Example**

```
DellEMC(conf)# ip domain-name vrf jay dell.com
```

## ip domain-list

Adds a domain name to the DNS list. This domain name is appended to incomplete host names in DNS requests corresponding to a specific VRF.

**Syntax**

```
ip domain-list [vrf vrf-name] name
```

To remove a domain name from DNS list, use the `no ip domain-list [vrf vrf-name] name` command.

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to add a domain name to the DNS list corresponding to that VRF.
<b>name</b>	Enter the name of the domain to be appended to the DNS list corresponding to the VRF.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information**

Use this command to add domain names to the DNS lists corresponding to a specific VRF. You can add up to a maximum of six domain names to the DNS list corresponding to a VRF. This domain is used to complete the unqualified host names.

**Example**

```
DellEMC(conf)# ip domain-list vrf jay dell.com
DellEMC(conf)# ip domain-list vrf jay force10.com
```

## ip host

Configures a mapping between the host name server and the IP address for a specific VRF. This mapping information is used by the name-to-IP address table to resolve host names.

**Syntax** `ip host [vrf vrf-name] name ip-address`

To undo the host name server to IP address mapping for VRFs, use the `no ip host [vrf vrf-name] name ip-address` command.

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the name server to IP address mapping for that VRF.
<b>name</b>	Enter the name of the host to be associated with an IP address.
<b>ip-address</b>	Enter the IP address of the name server in dotted decimal format.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information** Use this command to create a mapping between a host name server and its IP addresses for a specific VRF.

**Example**

```
DellEMC(conf)# ip host vrf jay dell 1.1.1.1
```

## clear host

Removes one or all dynamically learned host table entries for a specific VRF.

**Syntax** `clear host [vrf vrf-name] { * | host-name }`

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to delete dynamically learned host table entries corresponding to that VRF.
<b>host-name</b>	Enter the name of the host corresponding to which you want to delete the dynamically learnt host table entries.
*	Enter * to delete all host table entries.

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4.(0.0)</b>	Introduced on the S-Series and Z-Series.

**Usage Information** Use this command to delete one or all dynamically learned host table entries corresponding to a specific VRF.

**Example**

```
DellEMC# clear host vrf jay dell
DellEMC# clear host vrf jay *
```

# Equal Cost Multi-Path (ECMP)

Equal cost multi-path (ECMP) supports multiple "best paths" in next-hop packet forwarding to a destination device.

## Topics:

- [ecmp-group](#)
- [hash-algorithm](#)
- [ip ecmp-group](#)
- [ip ecmp weighted](#)
- [link-bundle-distribution trigger-threshold](#)
- [link-bundle-monitor enable](#)

## ecmp-group

Provides a mechanism to monitor traffic distribution on an ECMP link bundle. A system log is generated when the standard deviation of traffic distribution on a member link exceeds a defined threshold.

### Syntax

```
ecmp-group {ecmp-group-id interface interface | link-bundle-monitor}
```

To remove the selected interface, use the `ecmp-group no interface` command.

To disable link bundle monitoring, use the `ecmp-group no link-bundle-monitor` command.

### Parameters

- |                             |  |
|-----------------------------|--|
| <b><i>ecmp-group ID</i></b> | Enter the identifier number for the ECMP group. The range is from 2 to 64.   |
| <b><i>interface</i></b>     | Enter the following keywords and the interface information to add the interface to the ECMP group: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a LAG interface, enter the keywords <code>port-channel</code> then the slot/port information.</li> </ul> |

### Defaults

Off

### Command Modes

- CONFIGURATION
- CONFIGURATION ECMP-GROUP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.

### Usage Information

Using CONFIGURATION mode, create an ECMP group ID. You can then assign interfaces to the ECMP group using CONFIGURATION ECMP-GROUP mode. You can also enable on the port-channel configuration using the CONFIGURATION ECMP-GROUP command mode.

## hash-algorithm

Changes the hash algorithm used to distribute traffic flows across a Port Channel and ECMP. The ECMP and LAG options are supported on the S-Series and Z-Series.

### Syntax

```
hash-algorithm {algorithm-number | {ecmp {crc16 | crc16cc | crc32MSB |
crc32LSB | crc-upper | dest-ip | lsb | xor1 | xor2 | xor4 | xor8 | xor16}
[number] hg {crc16 | crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4
| xor8 | xor16} stack-unit stack-unit-number | port-set port-pipe | hg-
seed seed-value stack-unit | lag {checksum | crc | xor} [number] nh-ecmp
{checksum | crc | xor}[number] stack-unit number ip-sa-mask value ip-da-
mask value | seed seed-value }
```

To return to the default hash algorithm, use the `no hash-algorithm` command.

To return to the default ECMP hash algorithm, use the `no hash-algorithm ecmp algorithm-value` command.

### Parameters

**ecmp** **crc16**  
**|** **crc16cc** **|**  
**crc32MSB** **|**  
**crc32LSB** **|** **crc-**  
**upper** **|** **dest-ip** **|**  
**lsb** **|** **xor1** **|** **xor2**  
**|** **xor4** **|** **xor8** **|**  
**xor16**

Enter the keyword `ecmp` then one of the following options:

- `crc16`: Use CRC16\_BISYNC — 16 bit CRC16-bisync polynomial (default)
- `crc16cc`: Use CRC16\_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- `crc32MSB`: Use CRC32\_UPPER — MSB 16 bits of computed CRC32
- `crc32LSB`: Use CRC32\_LOWER — LSB 16 bits of computed CRC32
- `crc-upper`: Uses the upper 32 bits of the key for the hash computation
- `dest-ip`: Uses the destination IP for ECMP hashing
- `lsb`: Returns the LSB of the key as the hash
- `xor1`: Use CRC16\_BISYNC\_AND\_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- `xor2`: Use CRC16\_BISYNC\_AND\_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- `xor4`: Use CRC16\_BISYNC\_AND\_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- `xor8`: Use CRC16\_BISYNC\_AND\_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8

**hg {*crc16* | *crc16cc* | *crc32MSB* | *crc32LSB* | *xor1* | *xor2* | *xor4* | *xor8* | *xor16*} *stack-unit* *stack-unit-number* | *port-set* *port-pipe***

- *xor16*: Use CR16 — 16 bit XOR

Enter the keyword *hg* then one of the following options:

- *crc16*: Use CRC16\_BISYNC — 16 bit CRC16-bisync polynomial (default)
- *crc16cc*: Use CRC16\_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- *crc32MSB*: Use CRC32\_UPPER — MSB 16 bits of computed CRC32
- *crc32LSB*: Use CRC32\_LOWER — LSB 16 bits of computed CRC32
- *xor1*: Use CRC16\_BISYNC\_AND\_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of *xor1*
- *xor2*: Use CRC16\_BISYNC\_AND\_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of *xor2*
- *xor4*: Use CRC16\_BISYNC\_AND\_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of *xor4*
- *xor8*: Use CRC16\_BISYNC\_AND\_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of *xor8*
- *xor16*: Use CR16 — 16 bit XOR

Enter the keywords *stack-unit*, then a stack-unit number, to specify a stack-unit.

Enter the keywords *port-set* *port-pipe* then the port pipe number. The range is from 0 to 5.

**hg-seed *seed-value* *stack-unit***

Enter the keywords *hg-seed* then the hash algorithm seed value. The range is from 0 to 2147483646.

Enter the keywords *stack-unit* then the stack unit number.

Enter the keywords *port-set* then the stack-unit port-pipe number.

**lag *hash* *algorithm***

Enter the keywords *hg-seed* . The range is from 0 to 47.

**nh-ecmp *hashalgorithm* *value***

(OPTIONAL) Enter the keyword **nh-ecmp** then the ECMP hash algorithm value.

**stack-unit *number***

(OPTIONAL) : Enter the keyword **stack—unit** then the stack—unit slot number.

**ip-sa-mask *value***

(OPTIONAL) Enter the keyword **ip-sa-mask** then the ECMP/LAG hash mask value. The range is from 0 to FF.

**ip-da-mask *value***

(OPTIONAL) Enter the keyword **ip-da-mask** then the ECMP/LAG hash mask value. The range is from 0 to FF.

#### Defaults

IPSA and IPDA mask value is **FF** for the stack-unit.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added <i>flow-based-hashing</i> support for hashing on ECMP for S4820T, S6000, S4048 and Z9500.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Added the <code>nh-ecmp</code> option.
7.7.1.1	Added the <code>nh-ecmp</code> option.

### Usage Information

To ensure that CRC is not used for LAG, set the default hash-algorithm method on E-Series systems. For example, `hash-algorithm ecmp xor lag checksum nh-ecmp checksum`.

The hash value calculated with the hash-algorithm command is unique to the entire unit. The hash algorithm command with the stack-unit option changes the hash for a particular stack-unit by applying the mask specified in the IPSA and IPDA fields.

The stack-unit option is applicable with the lag-hash-align microcode only. Any other microcode returns an error message as follows:

- `DellEMC(conf)#hash-algorithm linecard 5 ip-sa-mask ff ip-da-mask ff`
- `% Error: This command is not supported in the current microcode configuration`

In addition, the `linecard number ip-sa-mask value ip-da-mask value` option has the following behavior to maintain bi-directionality:

- When hashing is done on both IPSA and IPDA, the `ip-sa-mask` and `ip-da-mask` values must be equal. (Single Linecard).
- When hashing is done only on IPSA or IPDA, Dell EMC Networking OS maintains bi-directionality with masks set to `XX 00` for stack-unit 1 and `00 XX` for stack-unit 2 (`ip-sa-mask` and `ip-da-mask`). The mask value must be the same for both stack-units when using multiple stack-units as ingress (where `XX` is any value from `00` to `FF` for both stack-units). For example, assume that traffic is flowing between linecard 1 and linecard 2:
  - `hash-algorithm linecard 1 ip-sa-mask aa ip-da-mask 00`
  - `hash-algorithm linecard 2 ip-sa-mask 00 ip-da-mask aa`

The different hash algorithms are based on the number of Port Channel members and packet values. The default hash algorithm (number 0) yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use the hash-algorithm command to designate another algorithm.

When a Port Channel member leaves or is added to the Port Channel, the hash algorithm is recalculated to balance traffic across the members.

## ip ecmp-group

Enable and specify the maximum number of ecmp that the L3 CAM hold for a route. By default, when maximum paths are not configured, the CAM can hold a maximum of 16 ecmp per route.

### Syntax

```
ip ecmp-group {maximum-paths | {number} {path-fallback}}
```

To negate a command, use the `no ip ecmp-group maximum-paths {number}` command.

### Parameters

**maximum-paths** Specify the maximum number of ECMP for a route. The range is 2 to 64.

**path-fallback** Use the keywords `path-fallback` to enable this feature. If you enable the feature, re-enter this keyword to disable the feature.

**Defaults** 16

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

**Usage Information** You must save the new ECMP settings to the startup-config (`write mem`) then reload the system for the new settings to take effect.

## ip ecmp weighted

Enables weighted ECMP calculations.

**Syntax** `ip ecmp weighted`  
To disable weighted ECMP calculations, enter the `no ip ecmp weighted` command.

**Defaults** N/A

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

## Usage Information

Enabling this CLI would inform the FIB to re-program the destination prefix paths with weights in the HW/CAM on the fly.

If disabled, the CLI would inform the FIB to re-program the destination prefix paths with no weights or regular ECMP.

## Example

```
DelleMC(conf)# ip ecmp ?
weighted          Enables Weighted ECMP
DelleMC(conf)# ip ecmp weighted
DelleMC(conf)#do show running-config | grep ecmp
ip ecmp weighted
DelleMC(conf)#
DelleMC(conf)# no ip ecmp ?
weighted          Disables Weighted ECMP
DelleMC(conf)# no ip ecmp weighted
DelleMC(conf)# do show running-config | grep ecmp
```

# link-bundle-distribution trigger-threshold

Provides a mechanism to set the threshold to trigger when traffic distribution begins being monitored on an ECMP link bundle.

## Syntax

```
link-bundle-distribution trigger-threshold [percent]
```

To exit from ecmp group mode, use the `exit` command.

## Parameters

**percent** Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is **60%**.

**Command Modes** EXEC Privilege

## Command History

# Flex Hash and Optimized Boot-Up

This chapter describes the Flex Hash and fast-boot enhancements.

## Topics:

- [load-balance ingress-port enable](#)
- [load-balance flexhash](#)
- [lACP fast-switchover](#)
- [show issu clients](#)
- [show issu detail](#)
- [show issu status](#)
- [encapsulation dot1q](#)

## load-balance ingress-port enable

Enable the Flex hash functionality. This utility is supported on the platform.

**Syntax** `load-balance ingress-port enable`  
To disable the Flex hash capability, use the **no** version of this command.

**Default** None

**Command Modes** CONFIGURATION mode

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.3(0.0)</b>	Introduced on the S6000 platform.
	<b>9.2(1.0)</b>	Introduced on the Z9500.

**Usage Information** Flex hash uses the RTAG7 bins 2 and 3 (overlay bins). These bins must be enabled for Flex hash to be configured. These bins contain the source module and source port information. These bins are disabled by default in releases of Dell EMC Networking OS earlier than Release 9.3.0.0. The default behavior of disabling of these bins occurs because of incorrect egress port information that would otherwise be displayed in the output of the diagnostic show command of `show ip flow`.

As a result, when load balancing of RRoCE packets using Flex hash is enabled, the `show ip flow` command is not functional. Similarly, when `show ip flow` command operates (ingress port based load balancing is disabled) the hashing of RRoCE packets is not operational.

Flex hash APIs do not mask out unwanted byte values after extraction of the data from the Layer 4 headers for the offset value.

**Example** `DellEMC#load-balance ingress-port enable`

# load-balance flexhash

Specify the parameters for the Flex Hash mechanism, such as whether IPv4 or IPv6 packets must be subject to Flex Hash functionality, a unique protocol number, the offset of hash fields from the start of the L4 header to be used for hash calculation, and a meaningful description to associate the protocol number with the name.

**Syntax** `load-balance flexhash ipv4/ipv6 ip-proto <protocol number> <description string> offset1 <offset1 value> [offset2 <offset2 value>]`

To disable the Flex hash settings, use the `no load-balance flexhash ipv4/ipv6 ip-proto protocol number` command.

**Parameters**

- ipv4** Denotes whether Flex Hash needs to be enabled for IPv4 packets.
- ipv6** Denotes whether Flex Hash needs to be enabled for IPv6 packets.
- protocol number** Represents the Outer IPv4 protocol field in case of IPv4 packets, and the Outer IPv6 next header field in case of IPv6 packets.  
The `ipv4/ipv6` keyword and the IP protocol value are used as keys to identify if a duplicate flex hash configuration is already present. Duplicate flex hash configuration is not possible. To change an existing flex hash configuration, you must delete the existing flex hash attribute and configure the flex attribute afresh.
- description string** A description string is followed by the protocol number to enable you to associate the protocol number with the protocol name in an easily-identifiable way. For example, for a protocol number of 254, you can specify the description as RRoCE.
- offset1 value** Specify the byte offset from the start of the L4 header from which the 2-byte data is extracted and be used in hash computation. You must enter the offset as an even number. The offset range is 0 – 30 bytes from start of L4 header.
- offset2 value** (Optional) Specify the additional 2 bytes that must be extracted from the start of the L4 header to be used for hash computation. You must enter the offset as an even number. The offset range is 0 – 30 bytes from start of L4 header.

**Default** None

**Command Modes** CONFIGURATION mode

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.3(0.0)</b>	Introduced on the S6000 platform.
	<b>9.2(1.0)</b>	Introduced on the Z9500.

**Usage Information**

With the introduction of various overlay technologies such as network virtualization using generic routing encapsulation (NVGRE) segments and Routable Remote Direct Memory Access (RRDMA) over Converged Ethernet (RRoCE), information related to a traffic flow is contained in the L4 header. The fields in the L2 and L3 headers are not sufficient to distinguish the flows. Therefore, the fields in the L4 header are processed when hashing is performed for packets over LAG and ECMP links. The Flex Hash functionality enables you to configure a packet search key and matches packets based on the search key. When a packet matches the search key, two 16-bit hash fields are extracted from the start of the L4 header and provided as inputs (bins 2 and 3) for RTAG7 hash computation. You must specify the offset of hash fields from the start of the L4 header, which contains a flow identification field.

You can cause the system to include the fields present at the offsets that you define (from the start of the L4 header) as a part of LAG and ECMP computation. Also, you can specify whether the IPv4 or IPv6 packets must be operated with the Flex Hash mechanism.

**Example** `DellEMC(conf)# load-balance flexhash ipv4 ip-proto 1 desc offset1 1 offset2 2`

# lacp fast-switchover

Cause the physical ports to be aggregated faster by configuring this capability in a port-channel on both the nodes that are members of a port-channel.

**Syntax** `lacp fast-switchover`  
To disable the capability of faster aggregation of the member ports of a LAG or a port-channel bundle, use the `no` version of this command.

**Defaults** Not configured

**Command Modes** INTERFACE (conf-if-po-number)

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.3(0.0)</b>	Introduced on the S6000.
	<b>9.2(1.0)</b>	Introduced on the Z9500.

**Usage Information** You can configure the optimal switchover functionality for LACP even if you do not enable the fast boot mode on the system. You must configure the long timeout mechanism for the LACP session to enable the fast boot capability to operate properly. This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect

If you configure the optimized booting-time capability and perform a reload of the system, the LACP application sends PDUs across all the active LACP links immediately.

**Related Commands** [show lacp](#) — displays the LACP configuration.

# show issu clients

Shows the current state of the ISSU clients and if they are currently registered.

**Syntax** `show issu clients`

**Parameters** N/A

**Defaults** N/A

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.12(0.0)</b>	Introduced on the S6000, S6100-ON, and Z9100-ON

## Example

```
DellEMC#show issu clients

Current state of ISSU Clients :

ID          Client Name      Registered      Current state
=====
2           ISSU IFM Client  YES            Configuration audit completed
3           ISSU ACL Client  YES            Configuration audit completed
4           ISSU QoS Client  YES            Configuration audit completed
5           ISSU FIB Client  YES            Configuration audit completed

13         ISSU XSTP Client           YES Configuration audit completed
14         ISSU BGP Client            NO      ----
15         ISSU Mirror Client         YES Configuration audit completed
16         ISSU SupportAssist Client  YES Configuration audit completed
17         ISSU Tunnel Manger Client  YES Configuration audit completed
DellEMC#

```

## show issu detail

Shows the current state of warmboot and the names of the warmboot clients.

**Syntax** show issu detail

**Parameters** N/A

**Defaults** N/A

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the S6000, S6100-ON, and Z9100-ON

### Example

```

DellEMC#show issu detail

Current State: Configuration audit completed

Warmboot Failure Method : Normal Boot

Number of clients registered : 13

List of clients registered

ISSU NP Client
ISSU IFM Client
ISSU ACL Client
ISSU QoS Client
ISSU FIB Client
ISSU ARP Client
ISSU LC Client
ISSU Mac Manager Client
ISSU LACP Client
ISSU NDPM Client
ISSU BGP Client
ISSU Mirror Client

```

```
ISSU SupportAssist Client
DellEMC#
```

## show issu status

Shows the current state of warmboot and a summary of the number of clients registered.

**Syntax** `show issu status`

**Parameters** N/A

**Defaults** N/A

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the S6000, S6100-ON, and Z9100-ON

### Example

```
DellEMC#show issu status
Current State:          Configuration audit completed
Warmboot Failure Method :      Normal Boot
Number of clients registered : 13
DellEMC#
```

## encapsulation dot1q

Configures lite-subinterfaces.

**Syntax** `encapsulation dot1q vlan-id`

To remove a previously configured lite-subinterface, use the `no encapsulation dot1q vlan-id` command.

**Parameters** **dot1q vlan-id** Enter the keyword `dot1q` followed by the VLAN ID to which the host belongs. The range is from 1 to 4094. A lite subinterface is considered as a Layer 3 port property and is synchronous with the existing rules of applying Layer 2 or Layer 3 properties to an interface.

**Command Modes** INTERFACE

Command History	Version	Description
	9.12.1.0	Introduced on the S5048F-ON.
	9.10(0.1)	Introduced on the S6010-ON and S4048-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.3.0.0	Introduced on the S6000.
	9.2(1.0)	Introduced on the Z9500.

**Usage  
Information**

To enable routing of RRoCE packets, the VLAN ID is mapped to the default VLAN ID of 4095 and this mapping is performed using VLAN translation. After VLAN translation, the RRoCE packets are considered in the same manner as normal IP packets that received on L3 interface and routed in the egress direction. At the egress interface, the VLAN ID is appended to the packet and transmitted out of the interface as a tagged packet with the dot1Q value preserved. The dot1Q value is preserved only for egress interfaces that are associated with a VLAN or a lite-subinterface . If a Layer 3 interface is configured without the encapsulation 802.1Q VLAN ID or is an untagged interface in a VLAN , the dot1Q value is not preserved .

# FIP Snooping

In a converged Ethernet network, a switch can operate as an intermediate Ethernet bridge to snoop on FIP packets during the login process on Fibre Channel over Ethernet (FCoE) forwarders (FCFs). Acting as a transit FIP snooping bridge, the switch uses dynamically created access control lists (ACLs) to permit only authorized FCoE traffic to transmit between an FCoE end-device and an FCF.

## Topics:

- [show fip-snooping vlan](#)

## clear fip-snooping database interface vlan

Clear FIP snooping information on a VLAN for a specified FCoE MAC address, ENode MAC address, or FCF MAC address, and remove the corresponding ACLs FIP snooping generates.

**Syntax** `clear fip-snooping database interface vlan {vlan-id} enode {enode-mac-address} | fcf {fcf-mac-address} | session {session-mac-address}`

**Parameters**

- enode-mac-address*** Enter the ENode MAC address of the session which has to be cleared.
- fcf-mac-address*** Enter the FCF MAC address of the session which has to be cleared.
- session-mac-address*** Enter the MAC address of the session which has to be cleared.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## clear fip-snooping statistics

Clears the statistics on the FIP packets snooped on all VLANs, a specified VLAN, or a specified port interface.

**Syntax** `clear fip-snooping statistics [interface vlan vlan-id | interface port-type slot/port[/subport] | interface port-channel port-channel-number]`

**Parameters**

- vlan-id*** Enter the VLAN ID of the FIP packet statistics to be cleared.
- port-type slot/port*** Enter the slot number and port-type of the FIP packet statistics to be cleared.
- port-channel-number*** Enter the port channel number of the FIP packet statistics to be cleared.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## debug fip snooping

Enable debugging on FIP snooping.

**Syntax** `debug fip-snooping [all | acl | error | ifm | info | ipc | ns | rscn | rx | tx]`

**Parameters**

- all** Enter the keyword `all` to enable debugging on all the options.
- acl** Enter the keyword `acl` for ACL-specific debugging.
- error** Enter the keyword `error` for error-specific debugging.
- ifm** Enter the keyword `ifm` for IFM-specific debugging.
- info** Enter the keyword `info` for information-specific debugging.

<b>ipc</b>	Enter the keyword <code>ipc</code> for IPC-specific debugging.
<b>ns</b>	Enter the keyword <code>ns</code> for name-server-specific debugging.
<b>rscn</b>	Enter the keyword <code>rscn</code> for RSCN-specific debugging.
<b>rx</b>	Enter the keyword <code>rx</code> for packet receive-specific debugging.
<b>tx</b>	Enter the keyword <code>tx</code> for packet transmit-specific debugging.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the Z9500 and S6000-ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.

## debug fip snooping rx

Enable debugging for FIP snooping receive-specific packets.

**Syntax** `debug fip-snooping rx packet-type [all | discovery | ns | virtual-link-instantiation | virtual-link-maintenance | vlan-discovery] [interface]`

<b>Parameters</b>	<p><b>packet-type</b> Enter the keyword <code>packet-type</code> and then the option type on which to enable debugging. The options are:</p> <ul style="list-style-type: none"> <li>• <code>all</code> — Enter the keyword <code>all</code> to enable debugging on all the options.</li> <li>• <code>discovery</code> — Enter the keyword <code>discovery</code> to enable debugging on FCF advertisements and ENode solicitation.</li> <li>• <code>ns</code> — Enter the keyword <code>ns</code> to enable debugging of the name-server packets.</li> <li>• <code>virtual-link-instantiation</code> — Enter the keywords <code>virtual-link-instantiation</code> to enable debugging on FLOGI, FDISC, and FLOGO packets.</li> <li>• <code>virtual-link-maintenance</code> — Enter the keywords <code>virtual-link-maintenance</code> to enable debugging on FIP clear virtual link frames and keepalives.</li> <li>• <code>vlan-discovery</code> — Enter the keywords <code>vlan-discovery</code> to enable debugging on VLAN requests and notifications.</li> </ul> <p><b>interface</b> Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> </ul>
-------------------	--

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the Z9500 and S6000-ON.
<b>9.2(0.2)</b>	Introduced on the S4810 and S4820T. Added the receive parameters <code>packet-type</code> and <code>interfaces</code> and their options.

## feature fip-snooping

Enable FCoE transit and FIP snooping on a switch.

**Syntax** `feature fip-snooping`

To disable the FCoE transit feature, use the `no feature fip-snooping` command.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.7(0.0)</b>	Introduced on the Z9500.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.

### Usage Information

Before enabling FIP snooping, assign the `fcoeacl` space using the `cam-acl` command. If not assigned, the following error message is displayed:

```
DellEMC(conf)#feature fip-snooping
% Error: Cannot enable fip snooping. CAM Region not allocated for Fcoe.

DellEMC(conf)#cam-acl 12acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 l2pt
0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2
DellEMC(conf)#feature fip-snooping
```

# fip-snooping enable

Enable FIP snooping on all VLANs or on a specified VLAN.

**Syntax** `fip-snooping enable`  
To disable the FIP snooping feature on all or a specified VLAN, use the `no fip-snooping enable` command.

**Defaults** FIP snooping is disabled on all VLANs.

- Command Modes**
- CONFIGURATION
  - VLAN INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage Information** The maximum number of FCFs supported per FIP snooping-enabled VLAN is 12. The default number of FIP snooping sessions supported per ENode server is 32. The maximum number of FIP snooping sessions supported per ENode server is 64.

# fip-snooping fc-map

Configure the FC-MAP value FIP snooping uses on all VLANs.

**Syntax** `fip-snooping fc-map fc-map-value`  
To return the configured FM-MAP value to the default value, use the `no fip-snooping fc-map` command.

**Parameters** `fc-map-value` Enter the FC-MAP value FIP snooping uses. The range is from 0EFC00 to 0EFCFF.

**Defaults** `0x0EFC00`

- Command Modes**
- CONFIGURATION
  - VLAN INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## fip-snooping max-sessions-per-enodemac

Configure the maximum session limit per ENode MAC address.

<b>Syntax</b>	<code>fip-snooping max-sessions-per-enode-mac max-sessions-value</code> To return the configured maximum sessions to the default value, use the <code>no fip-snooping max-sessions-per-enode-mac</code> command.
<b>Parameters</b>	<b><i>max-sessions-value</i></b> Enter the maximum number of sessions allowed per ENode MAC address. The range is from 1 to 64.
<b>Defaults</b>	32
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
9.2(0.2)	Introduced on the S4810 and S4820T.

## fip-snooping port-mode fcf

Configure the port for bridge-to-FCF links.

<b>Syntax</b>	<code>fip-snooping port-mode fcf</code> To disable the bridge-to-FCF link on a port, use the <code>no fip-snooping port-mode fcf</code> command.
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage Information**

The maximum number of FCFs supported per FIP snooping-enabled VLAN is four.

## show fip-snooping config

Display the FIP snooping status and configured FC-MAP values.

**Syntax** `show fip-snooping config`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Example**

```
DelleMC# show fip-snooping config
FIP Snooping Feature enabled Status: Enabled
FIP Snooping Global enabled Status: Enabled
Global FC-MAP Value: 0X0EFC00

FIP Snooping enabled VLANs
VLAN    Enabled    FC-MAP
----    -
100     TRUE       0X0EFC00
```

## show fip-snooping enode

Display information on the ENodes in FIP-snooped sessions, including the ENode interface and MAC address, FCF MAC address, VLAN ID and FC-ID.

**Syntax** `show fip-snooping enode [enode-mac-address]`

**Parameters** *enode-mac-address* Enter the MAC address of the ENodes to display.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage Information** The following describes the `show fip-snooping enode` command shown in the following example.

Field	Description
<b>ENode MAC</b>	MAC address of the ENode.
<b>ENode Interface</b>	Slot/ port number of the interface connected to the ENode.
<b>FCF MAC</b>	MAC address of the FCF.
<b>VLAN</b>	VLAN ID number the session uses.
<b>FC-ID</b>	Fibre Channel session ID the FCF assigns.

**Example**

```
DellEMC# show fip-snooping enode
Enode MAC           Enode Interface FCF MAC           VLAN FC-ID
-----
d4:ae:52:1b:e3:cd Te 1/11/1         54:7f:ee:37:34:40 100 62:00:11
```

## show fip-snooping fcf

Display information on the FCFs in FIP-snooped sessions, including the FCF interface and MAC address, FCF interface, VLAN ID, FC-MAP value, FKA advertisement period, and number of ENodes connected.

**Syntax** `show fip-snooping fcf [fcf-mac-address]`

**Parameters** ***fcf-mac-address*** Enter the MAC address of the FCF to display.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

### Usage Information

The following describes the `show fip-snooping fcf` command shown in the following example.

Field	Description
<b>FCF MAC</b>	MAC address of the FCF.
<b>FCF Interface</b>	Slot/port number of the interface to which the FCF is connected.
<b>VLAN</b>	VLAN ID number the session uses.
<b>FC-MAP</b>	FC-Map value the FCF advertises.
<b>ENode Interface</b>	Slot/ number of the interface connected to the ENode.
<b>FKA_ADV_PERIOD</b>	Time (in milliseconds) during which FIP keep-alive advertisements transmit.
<b>No of ENodes</b>	Number of ENodes connected to the FCF.
<b>FC-ID</b>	Fibre Channel session ID the FCF assigns.

### Example

```
DelleMC# show fip-snooping fcf
FCF MAC          FCF Interface  VLAN  FC-MAP  FKA_ADV_PERIOD  No. of Enodes
-----
54:7f:ee:37:34:40 Po 22          100  0e:fc:00  4000                      2
```

## show fip-snooping statistics

Display statistics on the FIP packets snooped on all interfaces, including VLANs, physical ports, and port channels.

**Syntax** `show fip-snooping statistics [interface vlan vlan-id | interface interface-type | interface port-channel port-channel-number]`

**Parameters**

- vlan-id*** Enter the VLAN ID of the FIP packet statistics displays.
- port-channel-number*** Enter the port channel number of the FIP packet statistics displays.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.

<b>Version</b>	<b>Description</b>
<b>8.3.12.0</b>	Introduced on the S4810.

**Usage Information**

The following describes the `show fip-snooping statistics` command shown in the following example.

<b>Field</b>	<b>Description</b>
<b>Number of VLAN Requests</b>	Number of FIP-snoop VLAN request frames received on the interface.
<b>Number of VLAN Notifications</b>	Number of FIP-snoop VLAN notification frames received on the interface.
<b>Number of Multicast Discovery Solicits</b>	Number of FIP-snoop multicast discovery solicit frames received on the interface.
<b>Number of Unicast Discovery Solicits</b>	Number of FIP-snoop unicast discovery solicit frames received on the interface.
<b>Number of FLOGI</b>	Number of FIP-snoop FLOGI request frames received on the interface.
<b>Number of FDISC</b>	Number of FIP-snoop FDISC request frames received on the interface.
<b>Number of FLOGO</b>	Number of FIP-snoop FLOGO frames received on the interface.
<b>Number of ENode Keep Alives</b>	Number of FIP-snoop ENode keep-alive frames received on the interface.
<b>Number of VN Port Keep Alives</b>	Number of FIP-snoop VN port (Virtual N-port) keep-alive frames received on the interface.
<b>Number of Multicast Discovery Advertisements</b>	Number of FIP-snoop multicast discovery advertisements received on the interface.
<b>Number of Unicast Discovery Advertisements</b>	Number of FIP-snoop unicast discovery advertisements received on the interface.
<b>Number of FLOGI Accepts</b>	Number of FIP FLOGI accept frames received on the interface.
<b>Number of FLOGI Rejects</b>	Number of FIP FLOGI reject frames received on the interface.
<b>Number of FDISC Accepts</b>	Number of FIP FDISC accept frames received on the interface.
<b>Number of FDISC Rejects</b>	Number of FIP FDISC reject frames received on the interface.
<b>Number of FLOGO Accepts</b>	Number of FIP FLOGO accept frames received on the interface.
<b>Number of FLOGO Rejects</b>	Number of FIP FLOGO reject frames received on the interface.
<b>Number of CVLs</b>	Number of FIP clear virtual link frames received on the interface.
<b>Number of FCF Discovery Timeouts</b>	Number of FCF discovery timeouts that occurred on the interface.

Field	Description
<b>Number of VN Port Session Timeouts</b>	Number of VN port session timeouts that occurred on the interface.
<b>Number of Session failures due to Hardware Config</b>	Number of session failures due to hardware configuration that occurred on the interface.

### Example

```
DelleMC# show fip-snooping statistics interface vlan 100
Number of Vlan Requests           :0
Number of Vlan Notifications      :0
Number of Multicast Discovery Solicits :2
Number of Unicast Discovery Solicits :0
Number of FLOGI                   :2
Number of FDISC                    :16
Number of FLOGO                    :0
Number of Enode Keep Alive         :9021
Number of VN Port Keep Alive       :3349
Number of Multicast Discovery Advertisement :4437
Number of Unicast Discovery Advertisement :2
Number of FLOGI Accepts            :2
Number of FLOGI Rejects           :0
Number of FDISC Accepts            :16
Number of FDISC Rejects           :0
Number of FLOGO Accepts           :0
Number of FLOGO Rejects           :0
Number of CVL                      :0
Number of FCF Discovery Timeouts    :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0
DelleMC(conf)#
```

```
DelleMC# show fip-snooping statistics int tengigabitethernet 1/11/1
Number of Vlan Requests           :1
Number of Vlan Notifications      :0
Number of Multicast Discovery Solicits :1
Number of Unicast Discovery Solicits :0
Number of FLOGI                   :1
Number of FDISC                    :16
Number of FLOGO                    :0
Number of Enode Keep Alive         :4416
Number of VN Port Keep Alive       :3136
Number of Multicast Discovery Advertisement :0
Number of Unicast Discovery Advertisement :0
Number of FLOGI Accepts            :0
Number of FLOGI Rejects           :0
Number of FDISC Accepts            :0
Number of FDISC Rejects           :0
Number of FLOGO Accepts           :0
Number of FLOGO Rejects           :0
Number of CVL                      :0
Number of FCF Discovery Timeouts    :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0
```

### Example (Port Channel)

```
DelleMC# show fip-snooping statistics interface port-channel 22
Number of Vlan Requests           :0
Number of Vlan Notifications      :2
Number of Multicast Discovery Solicits :0
Number of Unicast Discovery Solicits :0
Number of FLOGI                   :0
Number of FDISC                    :0
Number of FLOGO                    :0
Number of Enode Keep Alive         :0
Number of VN Port Keep Alive       :0
```

```

Number of Multicast Discovery Advertisement :4451
Number of Unicast Discovery Advertisement :2
Number of FLOGI Accepts :2
Number of FLOGI Rejects :0
Number of FDISC Accepts :16
Number of FDISC Rejects :0
Number of FLOGO Accepts :0
Number of FLOGO Rejects :0
Number of CVL :0
Number of FCF Discovery Timeouts :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0

```

## show fip-snooping system

Display information on the status of FIP snooping on the switch (enabled or disabled), including the number of FCoE VLANs, FCFs, ENodes, and currently active sessions.

**Syntax** `show fip-snooping system`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

### Example

```

DellEMC# show fip-snooping system
Global Mode : Enabled
FCOE VLAN List (Operational) : 1, 100
FCFs : 1
Enodes : 2
Sessions : 17

```

## show fip-snooping vlan

Display information on the FCoE VLANs on which FIP snooping is enabled.

**Syntax** `show fip-snooping vlan`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

### Example

```
DelleMC# show fip-snooping vlan
* = Default VLAN
VLAN FC-MAP      FCFs Enodes Sessions
---- -
*1    -          -     -      -
100   0X0EFC00 1     2     17
```

# Force10 Resilient Ring Protocol (FRRP)

FRRP is a proprietary protocol for that offers fast convergence in a Layer 2 network without having to run the spanning tree protocol (STP). The resilient ring protocol is an efficient protocol that transmits a high-speed token across a ring to verify the link status. All the intelligence is contained in the master node with practically no intelligence required of the transit mode.

## Important Points to Remember

- FRRP is media- and speed-independent.
- FRRP is a Dell EMC Networking proprietary protocol that does not interoperate with any other vendor.
- Spanning Tree must be disabled on both primary and secondary interfaces before Resilient Ring protocol is enabled.
- A VLAN configured as the control VLAN for a ring cannot be configured as a control or member VLAN for any other ring.
- Member VLANs across multiple rings are not supported in Master nodes.
- If multiple rings share one or more member VLANs, they cannot share any links between them.
- Each ring can have only one Master node; all others are Transit nodes.

### Topics:

- [clear frrp](#)
- [debug frrp](#)
- [description](#)
- [disable](#)
- [interface](#)
- [member-vlan](#)
- [mode](#)
- [protocol frrp](#)
- [show frrp](#)
- [timer](#)

## clear frrp

Clear the FRRP statistics counters.

<b>Syntax</b>	<code>clear frrp [ring-id]</code>
<b>Parameters</b>	<b>ring-id</b> (Optional) Enter the ring identification number. The range is from 1 to 255.
<b>Defaults</b>	None
<b>Command Modes</b>	EXEC
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

### Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

### Example

```
DellEMC# clear frrp

Clear frrp statistics counter on all ring [confirm] yes

DellEMC#clear frrp 4

Clear frrp statistics counter for ring 4 [confirm] yes

DellEMC#
```

### Related Commands

- [show frrp](#) — display the Resilient Ring Protocol configuration.

## debug frrp

Clear the FRRP statistics counters.

### Syntax

```
debug frrp {event | packet | detail} [ring-id] [count number]
```

To disable debugging, use the `no debug frrp {event | packet | detail} {ring-id} [countnumber]` command.

### Parameters

<b>event</b>	Enter the keyword <code>event</code> to display debug information related to ring protocol transitions.
<b>packet</b>	Enter the keyword <code>packet</code> to display brief debug information related to control packets.
<b>detail</b>	Enter the keyword <code>detail</code> to display detailed debug information related to the entire ring protocol packets.
<b>ring-id</b>	(Optional) Enter the ring identification number. The range is from 1 to 255.

**count *number*** Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534.

**Defaults** Disabled.

**Command Modes** CONFIGURATION (conf-frpp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information** Because the resilient ring protocol can potentially transmit 20 packets per interface, restrict debug information.

## description

Enter an identifying description of the ring.

**Syntax** `description Word`  
To remove the ring description, use the `no description [Word]` command.

**Parameters** **Word** Enter a description of the ring. Maximum: 255 characters.

**Defaults** None

**Command Modes** CONFIGURATION (conf-frpp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## disable

Disable the resilient ring protocol.

**Syntax**            `disable`  
 To enable the Resilient Ring Protocol, use the `no disable` command.

**Defaults**            **Disabled**

**Command Modes**    CONFIGURATION (conf-frpp)

**Command History**    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

# interface

Configure the primary, secondary, and control-vlan interfaces.

**Syntax** `interface {primary interface secondary interface control-vlan vlan-id}`  
To return to the default, use the `no interface {primary interface secondary interface control-vlan vlan-id}` command.

**Parameters**

**primary interface** Enter the keyword `primary` to configure the primary interface then one of the following interfaces and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**secondary interface** Enter the keyword `secondary` to configure the secondary interface then one of the following interfaces and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**control-vlan vlan-id** Enter the keyword `control-vlan` then the VLAN ID. The range is from 1 to 4094.

**Defaults** None

**Command Modes** CONFIGURATION (conf-frp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information**

This command causes the Ring Manager to take ownership of the two ports after IFM validates the configuration. Ownership is relinquished for a port only when the interface does not play a part in any control VLAN, that is, the interface does not belong to any ring.

**Related Commands**

- [show frrp](#) — display the Resilient Ring Protocol configuration information.

## member-vlan

Specify the member VLAN identification numbers.

**Syntax**

`member-vlan {vlan-range}`

To return to the default, use the `no member-vlan [vlan-range]` command.

**Parameters**

**vlan-range** Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10. Combination: 3, 4, 5-10, 8.

**Defaults**

None

**Command Modes**

CONFIGURATION (conf-frpp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## mode

Set the Master or Transit mode of the ring.

**Syntax** `mode {master | transit}`

To reset the mode, use the `no mode {master | transit}` command.

**Parameters**

<b>master</b>	Enter the keyword <code>master</code> to set the Ring node to Master mode.
<b>transit</b>	Enter the keyword <code>transit</code> to set the Ring node to Transit mode.

**Defaults** **Mode None**

**Command Modes** CONFIGURATION (conf-frp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## protocol frp

Enter the Resilient Ring Protocol and designate a ring identification.

**Syntax** `protocol frp {ring-id}`

To exit the ring protocol, use the `no protocol frrp {ring-id}` command.

<b>Parameters</b>	<b>ring-id</b>	Enter the ring identification number. The range is from 1 to 255.
<b>Defaults</b>	None	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced

<b>Usage Information</b>	This command places you into the resilient ring protocol. After executing this command, the command line prompt changes to <code>conf-frrp</code> .
--------------------------	---

## show frrp

Display the resilient ring protocol configuration.

<b>Syntax</b>	<code>show frrp [ring-id [summary]]   [summary]</code>	
<b>Parameters</b>	<b>ring-id</b>	Enter the ring identification number. The range is from 1 to 255
	<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view just a summarized version of the Ring configuration.
<b>Defaults</b>	None	
<b>Command Modes</b>	EXEC	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

#### Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

#### Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

#### Example (Summary)

DellEMC# `show frrp summary`

```

Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2 UP Master 2 11-20, 25,27-30
31 UP Transit 31 40-41
50 Down Transit 50 32
DellEMC#

```

#### Command History

9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information**

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

**Usage Information**

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

**Example (Summary)**

DelleMC# show frfp summary

```
Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2       UP   Master  2      11-20, 25,27-30
31      UP   Transit 31     40-41
50      Down Transit 50     32
DelleMC#
```

**Example (1)**

```
DelleMC# show frfp 1
Ring protocol 1 is in Master mode
Ring Protocol Interface:
Primary : TenGigabitEthernet 1/16/1 State: Forwarding
Secondary: Port-channel 100 State: Blocking
Control Vlan: 1
Ring protocol Timers: Hello-Interval 50 msec Dead-Interval 150 msec
Ring Master's MAC Address is 00:01:e8:13:a3:19
Topology Change Statistics: Tx:110 Rx:45
Hello Statistics: Tx:13028 Rx:12348
Number of state Changes: 34
Member Vlans: 1000-1009
DelleMC#
```

**Example (1)**

```
DelleMC# show frfp 1
Ring protocol 1 is in Master mode
Ring Protocol Interface:
Primary : TenGigabitEthernet 1/16/1 State: Forwarding
Secondary: Port-channel 100 State: Blocking
Control Vlan: 1
Ring protocol Timers: Hello-Interval 50 msec Dead-Interval 150 msec
Ring Master's MAC Address is 00:01:e8:13:a3:19
Topology Change Statistics: Tx:110 Rx:45
Hello Statistics: Tx:13028 Rx:12348
Number of state Changes: 34

DelleMC#
```

## Example (2 Summary)

```
DellEMC# show frrp 2 summary
```

```
DellEMC#show frrp 2 summary
Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2 Up Master 2 11-20, 25, 27-30
DellEMC#
```

## Related Commands

- [protocol frrp](#) — enter the resilient ring protocol and designate a ring identification.

# timer

Set the hello interval or dead interval for the Ring control packets.

## Syntax

```
timer {hello-interval milliseconds}| {dead-interval milliseconds}
```

To remove the timer, use the `no timer {hello-interval [milliseconds] | {dead-interval milliseconds}` command.

## Parameters

### hello-interval *milliseconds*

Enter the keyword `hello-interval` then the time, in milliseconds, to set the hello interval of the control packets. The milliseconds must be entered in increments of 50 millisecond; for example, 50, 100, 150, and so on. If an invalid value is entered, an error message is generated. The range is from 50 to 2000 ms. Default: **500 ms**.

### dead-interval *milliseconds*

Enter the keyword `dead-interval` then the time, in milliseconds, to set the dead interval of the control packets. The range is from 50 to 6000 ms. Default: **1500 ms**.

**NOTE:** The configured dead interval must be at least three times the hello interval.

## Defaults

- **500 ms** for `hello-interval milliseconds`
- **1500 ms** for `dead-intervalmilliseconds`

**Command Modes** CONFIGURATION (conf-frrp)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

<b>Version</b>	<b>Description</b>
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced.

**Usage  
Information**

The `hello interval` command is the interval at which ring frames are generated from the primary interface of the master node. The `dead interval` command is the time that elapses before a time-out occurs.

# GARP VLAN Registration (GVRP)

The Dell EMC Networking operating system supports the basic GVRP commands on the Dell EMC Networking OS.

The generic attribute registration protocol (GARP) mechanism allows the configuration of a GARP participant to propagate through a network quickly. A GARP participant registers or de-registers its attributes with other participants by making or withdrawing declarations of attributes. At the same time, based on received declarations or withdrawals, GARP handles attributes of other participants.

GVRP enables a device to propagate local VLAN registration information to other participant devices and dynamically update the VLAN registration information from other devices. The registration information updates local databases regarding active VLAN members and through which port the VLANs can be reached.

GVRP ensures that all participants on a bridged LAN maintain the same VLAN registration information. The VLAN registration information propagated by GVRP includes both manually configured local static entries and dynamic entries from other devices.

GVRP participants have the following components:

- The GVRP application
- GARP information propagation (GIP)
- GARP information declaration (GID)

## Important Points to Remember

- GVRP is supported on Layer 2 ports only.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported on untagged ports belonging to a default VLAN and tagged ports.
- GVRP cannot be enabled on untagged ports belonging to a non-default VLAN *unless* native VLAN is turned on.
- GVRP requires end stations with dynamic access NICs.
- Based on updates from GVRP-enabled devices, GVRP allows the system to dynamically create a port-based VLAN (unspecified) with a specific VLAN ID and a specific port.
- On a port-by-port basis, GVRP allows the system to learn about GVRP updates to an existing port-based VLAN with that VLAN ID and IEEE 802.1Q tagging.
- GVRP allows the system to send dynamic GVRP updates about your existing port-based VLAN.
- GVRP updates are not sent to any blocked spanning tree protocol (STP) ports. GVRP operates only on ports that are in the forwarding state.
- GVRP operates only on ports that are in the STP forwarding state. If you enable GVRP, a port that changes to the STP Forwarding state automatically begin to participate in GVRP. A port that changes to an STP state other than forwarding no longer participates in GVRP.
- VLANs created dynamically with GVRP exist only as long as a GVRP-enabled device is sending updates. If the devices no longer send updates, or GVRP is disabled, or the system is rebooted, all dynamic VLANs are removed.
- GVRP manages the active topology, not non-topological data such as VLAN protocols. If a local bridge must classify and analyze packets by VLAN protocols, manually configure protocol-based VLANs, and simply rely on GVRP for VLAN updates. But if the local bridge must know only how to reach a given VLAN, then GVRP provides all necessary information.
- The VLAN topologies that GVRP learns are treated differently from VLANs that are statically configured. The GVRP dynamic updates are not saved in NVRAM, while static updates are saved in NVRAM. When GVRP is disabled, the system deletes all VLAN interfaces that were learned through GVRP and leaves unchanged all VLANs that were manually configured.

# debug gvrp

Enable debugging on GVRP.

**Syntax** `debug gvrp {config | events | pdu}`  
To disable debugging, use the `no debug gvrp {config | events | pdu}` command.

**Parameters**

<b>config</b>	Enter the keyword <code>config</code> to enable debugging on the GVRP configuration.
<b>event</b>	Enter the keyword <code>event</code> to enable debugging on the JOIN/LEAVE events.
<b>pdu</b>	Enter the keyword <code>pdu</code> then one of the following Interface keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul>

**Defaults** Disabled.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on C-Series, E-Series, and S-Series

<b>Related Commands</b>	<ul style="list-style-type: none"><li>• <a href="#">gvrp enable</a> — enable GVRP on physical interfaces and LAGs.</li><li>• <a href="#">protocol gvrp</a> — access GVRP protocol.</li></ul>
-------------------------	--

# garp timers

Set the intervals (in milliseconds) for sending GARP messages.

<b>Syntax</b>	<code>garp timers {join   leave   leave-all}</code> To return to the previous setting, use the <code>no garp timers {join   leave   leave-all}</code> command.
---------------	---

<b>Parameters</b>	<b>join</b> Enter the keyword <code>join</code> then the number of milliseconds to configure the join time. The range is from 100 to 147483647 milliseconds. The default is <b>200 milliseconds</b> .
-------------------	---

 **NOTE:** Designate the milliseconds in multiples of 100.

**leave** Enter the keyword `leave` then the number of milliseconds to configure the leave time. The range is from 100 to 2147483647 milliseconds. The default is **600 milliseconds**.

 **NOTE:** Designate the milliseconds in multiples of 100.

**leave-all** Enter the keywords `leave-all` then the number of milliseconds to configure the leave-all time. The range is from 100 to 2147483647 milliseconds. The default is 1000 milliseconds.

 **NOTE:** Designate the milliseconds in multiples of 100.

**Defaults** As above.

**Command Modes** CONFIGURATION-GVRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on C-Series, E-Series, and S-Series

**Usage Information**

- **Join Timer** — `Join` messages announce the willingness to register some attributes with other participants. For reliability, each GARP application entity sends a `Join` message twice and uses a join timer to set the sending interval.
- **Leave Timer** — `Leave` announces the willingness to de-register with other participants. Together with `Join`, `Leave` messages help GARP participants complete attribute reregistration and de-registration. The leave timer starts after receipt of a leave message sent for de-registering some attribute information. If a `Join` message is *not* received before the `Leave` time expires, the GARP application entity removes the attribute information as requested.
- **Leave All Timer** — The `Leave All` timer starts when a GARP application entity starts. When this timer expires, the entity sends a `Leave-all` message so that other entities can reregister their attribute information. Then the `Leave-all` time begins again.

**Related Commands**

- [show garp timers](#) — display the current GARP times.

# gvrp enable

Enable GVRP on physical interfaces and LAGs.

<b>Syntax</b>	<code>gvrp enable</code> To disable GVRP on the interface, use the <code>no gvrp enable</code> command.
<b>Defaults</b>	Disabled.
<b>Command Modes</b>	CONFIGURATION-INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Usage Information**

Fixed registration prevents an interface, configured using the command line, to belong to a VLAN (static configuration) from being unconfigured when it receives a `Leave` message. Therefore, Registration mode on that interface is fixed.

Normal registration is the default registration. The port's membership in the VLAN depends on GVRP. The interface becomes a member of a VLAN after learning about the VLAN through GVRP. If the VLAN is removed from the port that sends GVRP advertisements to this device, the port stops being a member of the VLAN.

To advertise or learn about VLANs through GVRP, use the `forbidden` command when you do not want the interface.

**Related Commands**

- `show gvrp` — display the GVRP configuration including the registration.

## protocol gvrp

Access GVRP protocol — (config-gvrp)#.

**Syntax** `protocol gvrp`

**Defaults** Disabled.

**Command Modes** CONFIGURATION

<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on C-Series, E-Series, and S-Series

### Example

```
DellEMC# show garp timers
GARP Timers          Value (milliseconds)
-----
Join Timer           200
Leave Timer           600
LeaveAll Timer        10000
DellEMC#
```

### Related Commands

- [garp timers](#) — set the intervals (in milliseconds) for sending GARP messages.

## show gvrp

Display the GVRP configuration.

**Syntax** `show gvrp [brief | interface]`

## Parameters

**brief** (OPTIONAL) Enter the keyword `brief` to display a brief summary of the GVRP configuration.

**interface** (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Usage Information** If no ports are GVRP participants, the message output changes from `GVRP Participants running on <port_list>` to `GVRP Participants running on no ports`.

## Example

```
DellEMC# show gvrp brief
GVRP Feature is currently enabled.
Port                GVRP Status      Edge-Port
-----
Te 3/1/1            Disabled          No
Te 3/1/2            Enabled           No
Te 3/1/3            Disabled          No
Te 3/1/4            Disabled          No
Te 3/2/1            Disabled          No
Te 3/2/2            Disabled          No
Te 3/2/3            Disabled          No
```

```
Te 3/2/4          Disabled          No
DellEMC# show gvrp brief
```

## Related Commands

- [show gvrp statistics](#) — display the GVRP statistics.

# show gvrp statistics

Display the GVRP configuration statistics.

## Syntax

```
show gvrp statistics {interface interface | summary}
```

## Parameters

### **interface** **interface**

(OPTIONAL) Enter the keyword `interface` then one of the interface keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

### **summary**

Enter the keyword `summary` to display just a summary of the GVRP statistics.

## Defaults

None

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### **Version**

### **Description**

<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.6.1.0</b>	Introduced on C-Series, E-Series, and S-Series

## Usage Information

Invalid messages/attributes skipped can occur in the following cases:

- The incoming GVRP PDU has an incorrect length.
- "End of PDU" was reached before the complete attribute could be parsed.

- The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01).
- The attribute that was being parsed had an invalid attribute length.
- The attribute that was being parsed had an invalid GARP event.
- The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 to 4095.

A failed registration can occur for the following reasons:

- Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state).
- An entry for a new GVRP VLAN could not be created in the GVRP database.

### Example

```
DellEMC# show gvrp statistics int tengigabitethernet 1/1/1

Join Empty Received: 0
Join In Received: 0
Empty Received: 0
LeaveIn Received: 0
Leave Empty Received: 0
Leave All Received: 40
Join Empty Transmitted: 156
Join In Transmitted: 0
Empty Transmitted: 0
Leave In Transmitted: 0
Leave Empty Transmitted: 0
Leave All Transmitted: 41
Invalid Messages/Attributes skipped: 0
Failed Registrations: 0
DellEMC#
```

### Related Commands

- [show gvrp](#) — display the GVRP configuration.

## ICMP Message Types

This section lists and describes the possible ICMP message type resulting from a ping. The first three columns list the possible symbol or type/code. For example, you would receive a ! or 03 as an echo reply from your ping.

**Table 5. ICMP messages and their definitions**

Symbol	Type	Code	Description	Query	Error
.			Timeout (no reply)		
!	0	3	echo reply	.	
U	3		destination unreachable:		
		0	network unreachable		.
		1	host unreachable		.
		2	protocol unreachable		.
		3	port unreachable		.
		4	fragmentation needed but don't fragment bit set		.
		5	source route failed		.
		6	destination network unknown		.
		7	destination host unknown		.
		8	source host isolated (obsolete)		.
		9	destination network administratively prohibited		.
		10	destination host administratively prohibited		.
		11	network unreachable for TOS		.
		12	host unreachable for TOS		.
		13	communication administratively prohibited by filtering		.
		14	host precedence violation		.
		15	precedence cutoff in effect		.
C	4	0	source quench		.
	5		redirect		.
		0	redirect for network		.
		1	redirect for host		.
		2	redirect for type-of-service and network		.
		3	redirect for type-of-service and host		.

# Internet Group Management Protocol (IGMP)

The IGMP commands are supported on the Dell EMC Networking OS.

## Topics:

- [IGMP Commands](#)
- [IGMP Snooping Commands](#)

## IGMP Commands

Dell EMC Networking OS supports IGMPv1/v2/v3 and is compliant with RFC-3376.

### Important Points to Remember

- Dell EMC Networking OS supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The maximum number of interfaces supported 95.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (`ip igmp version`) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

### clear ip igmp groups

Clear entries from the group cache table.

<b>Syntax</b>	<code>clear ip igmp [vrf vrf-name] groups [group-address   interface]</code>	
<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.  <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to default VRF.
	<b>group-address</b>	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.
	<b>interface interface</b>	Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> </ul>

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

## debug ip igmp

Enable debugging of IGMP packets.

**Syntax** `debug ip igmp [vrf vrf-name] [group address | interface]`

- To disable IGMP debugging, use the `no debug ip igmp [vrf vrf-name] [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging of IGMP packets corresponding to that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

**interface interface** Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.

- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

**Usage Information** IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

## ip igmp access-group

To specify access control for packets, use this feature.

**Syntax** `ip igmp access-group access-list`

To remove the feature, use the `no ip igmp access-group access-list` command.

**Parameters** ***access-list*** Enter the name of the extended ACL (16 characters maximum).

**Defaults** Not configured

**Command Modes** INTERFACE (*conf-if-interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.6.1.0	Introduced on E-Series.

**Usage Information** The access list accepted is an extended ACL. To block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list, use this feature.

## ip igmp immediate-leave

Enable IGMP immediate leave.

**Syntax** `ip igmp immediate-leave [group-list prefix-list-name]`

To disable `ip igmp immediate-leave`, use the `no ip igmp immediate-leave` command.

**Parameters** **group-list *prefix-list-name*** Enter the keywords `group-list` then a string up to 16 characters long of the `prefix-list-name`.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### E-Series legacy command

#### Usage Information

Querier normally sends some group-specific queries when a `leave` message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable `immediate-leave processing` for specified groups.

## ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

#### Syntax

```
ip igmp last-member-query-interval milliseconds
```

To return to the default value, use the `no ip igmp last-member-query-interval` command.

#### Parameters

***milliseconds*** Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is **1000 milliseconds**.

#### Defaults

**1000 milliseconds**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	For IGMP version 2, the Interval range is from 100 to 25599. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

Version	Description
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

## ip igmp query-interval

Change the transmission frequency of IGMP general queries the Querier sends.

<b>Syntax</b>	<code>ip igmp query-interval seconds</code>
	To return to the default values, use the <code>no ip igmp query-interval</code> command.
<b>Parameters</b>	<b>seconds</b> Enter the number of seconds between queries sent out. The range is from 1 to 18000. The default is <b>60 seconds</b> .
<b>Defaults</b>	<b>60 seconds</b>
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Maximum range of the Hello interval value is changed to 18000. Introduced on the S6000-ON.
<b>9.5(0.0)</b>	Introduced on the Z9500.
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
<b>E-Series legacy command.</b>	

**Usage Information**

If you have configured the hello interval value to be greater than 18000, you must first reset that value to be less than or equal to 18000 before upload. Otherwise, the command execution fails during bootup and the hello interval value is set to the default value.

## ip igmp query-max-resp-time

Set the maximum query response time advertised in general queries.

 **NOTE:** The IGMP query-max-resp-time value must be less than the IGMP query-interval value.

**Syntax**

`ip igmp query-max-resp-time seconds`

To return to the default values, use the `no ip igmp query-max-resp-time` command.

**Parameters**

**seconds**

Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is **10 seconds**.

**Defaults**

**10 seconds**

**Command Modes**

INTERFACE

7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.

**E-Series legacy command.**

## ip igmp ssm-map

To translate (\*,G) memberships to (S,G) memberships, use a statically configured list.

### Syntax

```
ip igmp [vrf vrf-name] ssm-map std-access-list source-address
```

Undo this configuration, that is, remove SSM map (S,G) states and replace them with (\*,G) state, use the `ip igmp [vrf vrf-name] ssm-map std-access-list source-address` command.

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.  <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.
<b>std-access-list</b>	Specify the standard IP access list that contains the mapping rules for multicast groups.
<b>source-address</b>	Specify the multicast source address to which the groups are mapped.

**Command Modes** CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF and Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

**Usage Information**

Mapping applies to both v1 and v2 IGMP joins; any updates to the ACL are reflected in the IGMP groups. You may not use extended access lists with this command. When you configure a static SSM map and the router cannot find any matching access lists, the router continues to accept (\*,G) groups.

**Related Commands**

- [ip access-list standard](#) — create a standard access list to filter based on IP address.

## ip igmp version

Manually set the version of the router to IGMPv2 or IGMPv3.

**Syntax** `ip igmp version {2 | 3}`

**Parameters**

<b>2</b>	Enter the number 2 to set the IGMP version number to IGMPv2.
<b>3</b>	Enter the number 3 to set the IGMP version number to IGMPv3.

**Defaults** 2 (IGMPv2)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Changed the default IGMP from version 2 to version 3. Introduced on the S6000-ON
<b>9.5(0.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.
<b>7.5.1.0</b>	Introduced on the E-Series.

# show ip igmp groups

View the IGMP groups.

<b>Syntax</b>	<code>show ip igmp [vrf vrf-name] groups [group-address [detail]   detail   interface [group-address [detail]]]</code>	
<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.
	<b>group-address</b>	(OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
	<b>interface</b>	(OPTIONAL) Enter the interface type and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>
	<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to display the IGMPv3 source information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
7.6.1.0	Introduced on the S-Series and C-Series.
7.5.1.0	Expanded to support the <code>detail</code> option.

**E-Series legacy command.**

**Usage Information**

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
<b>Group Address</b>	Lists the multicast address for the IGMP group.
<b>Interface</b>	Lists the interface type, slot and port number.
<b>Mode</b>	Displays the IGMP version used.
<b>Uptime</b>	Displays the amount of time the group has been operational.
<b>Expires</b>	Displays the amount of time until the entry expires.
<b>Last Reporter</b>	Displays the IP address of the last host to be a member of the IGMP group.

**Example**

```
DelleMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Uptime Expires
225.0.0.0      Vlan 100    00:00:05 00:02:04
225.0.0.1      Vlan 100    00:00:05 00:02:04
225.0.0.2      Vlan 100    00:00:05 00:02:04
225.0.0.3      Vlan 100    00:00:05 00:02:04
225.0.0.4      Vlan 100    00:00:05 00:02:04
```

**Example (VLT)**

**NOTE:** The asterisk (\*) after the port channel number (Po 2) highlighted in the following example indicates the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.

```
DelleMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
225.0.0.0      Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.1      Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.2      Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.3      Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.4      Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
```

**Example (Details)**

```
DelleMC# show ip igmp group details
Interface          Vlan 20
Group              232.1.1.5
Uptime             00:11:22
Expires            Never
Router mode        INCLUDE
```

```

Last reporter          35.0.0.2
Group source list
Source address        Expires
65.0.0.1              00:01:22
65.0.0.2              00:01:22
65.0.0.3              00:01:22
65.0.0.4              00:01:22
65.0.0.5              00:01:22

```

## show ip igmp interface

View information on the interfaces participating in IGMP.

**Syntax** `show ip igmp [vrf vrf-name] interface [interface]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IGMP interfaces associated with that VRF.
- interface** (OPTIONAL) Enter the interface type and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command.**

**Usage Information**

IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

**Example**

```
DelleMC# show ip igmp interface
TenGigabitEthernet 1/1/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/5/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/6/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/7/1 is up, line protocol is down
  Internet protocol processing disabled
Vlan 20
  Inbound IGMP access group is not set
  Internet address is 35.0.0.1/24
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 125 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is enabled for all groups
  IGMP activity: 0 joins
  IGMP querying router is 35.0.0.1 (this system)
  IGMP version is 2
```

**Example (VRF)**

```
DelleMC# show ip igmp vrf BLUE interface
TenGigabitEthernet 1/20
  Inbound IGMP access group is not set
  Internet address is 50.10.4.1/24
  IGMP is up on the interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 0 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is disabled
  IGMP activity: 0 joins
  IGMP querying router is 50.10.4.1 (this system)
  IGMP version is 3
Vlan 4007
  Inbound IGMP access group is not set
  Internet address is 50.30.124.4/24
  IGMP is up on the interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 83 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is disabled
  IGMP activity: 0 joins
  IGMP querying router is 50.30.124.1
  IGMP version is 3
DelleMC#
```

# show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

**Syntax** `show ip igmp [vrf vrf-name] ssm-map [group]`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- group** (OPTIONAL) Enter the multicast group address in the form A.B.C.D to display the list of sources to which this group is mapped.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

## Example

```
DellEMC# show ip igmp ssm-map
Interface          Vlan 20
Group              232.1.1.5
Uptime            00:11:22
Expires           Never
Router mode       INCLUDE
Last reporter     35.0.0.2
Group source list
Source address    Expires
65.0.0.1         00:01:22
65.0.0.2         00:01:22
65.0.0.3         00:01:22
65.0.0.4         00:01:22
65.0.0.5         00:01:22
```

- Related Commands**
- [ip igmp ssm-map](#) — use a statically configured list to translate (\*,G) memberships to (S,G) memberships.

# IGMP Snooping Commands

Dell EMC Networking OS supports IGMP Snooping version 2 and 3 on all Dell EMC Networking systems.

## Important Points to Remember for IGMP Snooping

- Dell EMC Networking OS supports version 1, version 2, and version 3 hosts.
- Dell EMC Networking OS IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).
- Dell EMC Networking OS IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
- Dell EMC Networking OS supports IGMP snooping on JUMBO-enabled cards.
- IGMP snooping is not enabled by default on the switch.
- A maximum of 1800 groups and 600 VLAN are supported.
- IGMP snooping is not supported on a default VLAN interface.
- IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).
- IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).
- IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.

## Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame.

If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.

If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

## clear ip igmp snooping groups

Clear snooping entries from the group cache table.

**Syntax** `clear ip igmp snooping groups [group-address interface | interface]`

**Parameters**

<b><i>group-address</i></b>	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.
<b><i>interface</i></b> <b><i>interface</i></b>	Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li></ul>

- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on S-Series and Z-Series.

**Usage Information** IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

## debug ip igmp snooping

Enable debugging of IGMP snooping packets on interfaces and groups.

**Syntax** `debug ip igmp snooping [group address | interface]`

- To disable debugging of IGMP snooping, use the `no debug ip igmp snooping [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

### Parameters

<b>snooping</b>	Enter the keyword <code>snooping</code> to enable debugging of IGMP snooping.
<b>group-address</b>	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.
<b>interface</b> <b>interface</b>	Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul>

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.

**Usage Information** IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

## ip igmp snooping enable

Enable IGMP snooping on all or a single VLAN. This command is the master on/off switch to enable IGMP snooping.

**Syntax** `ip igmp snooping enable`  
To disable IGMP snooping, use the `no ip igmp snooping enable` command.

**Defaults** Disabled.

**Command Modes**

- CONFIGURATION
- INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.

**Usage Information**

To enable IGMP snooping, enter this command. When you enable this command from CONFIGURATION mode, IGMP snooping enables on all VLAN interfaces (except the default VLAN).

 **NOTE:** Execute the `no shutdown` command on the VLAN interface for IGMP Snooping to function.

## ip igmp snooping fast-leave

Enable IGMP snooping fast-leave for this VLAN.

**Syntax**

`ip igmp snooping fast-leave`

To disable IGMP snooping fast leave, use the `no igmp snooping fast-leave` command.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN — (conf-if-vl-n)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command.**

**Usage Information**

Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.

## ip igmp snooping last-member-query-interval

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

**Syntax** `ip igmp snooping last-member-query-interval milliseconds`  
To return to the default value, use the `no ip igmp snooping last-member-query-interval` command.

**Parameters** ***milliseconds*** Enter the interval in milliseconds. The range is from 100 to 65535. The default is **1000 milliseconds**.

**Defaults** **1000 milliseconds**

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

**Usage Information** This last-member-query-interval is also the interval between successive Group-Specific Query messages. To change the last-member-query interval, use this command.

## ip igmp snooping mrouter

Statically configure a VLAN member port as a multicast router interface.

**Syntax** `ip igmp snooping mrouter interface interface`

To delete a specific multicast router interface, use the `no igmp snooping mrouter interface interface` command.

## Parameters

- interface**  
**interface**
- Enter the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

## Defaults

Not configured.

## Command Modes

INTERFACE VLAN — (conf-if-vl-n)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command.</b>	

## Usage Information

The Dell EMC Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the `ip igmp snooping mrouter interface` command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.

## ip igmp snooping querier

Enable IGMP querier processing for the VLAN interface.

<b>Syntax</b>	<code>ip igmp snooping querier</code> To disable IGMP querier processing for the VLAN interface, use the <code>no ip igmp snooping querier</code> command.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	INTERFACE VLAN — (conf-if-vl-n)
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.2(0.0)</b>	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

<b>Usage Information</b>	This command enables the IGMP switch to send General Queries periodically. This behavior is useful when there is no multicast router present in the VLAN because the multicast traffic is not routed. Assign an IP address to the VLAN interface for the switch to act as a querier for this VLAN.
--------------------------	--

## show ip igmp snooping groups

Display snooping related information for all the IGMP groups, interface or one group of one interface.

<b>Syntax</b>	<code>show ip igmp snooping groups [group-address [detail]   detail   interface [group-address [detail]]]</code>
<b>Parameters</b>	<b>snooping</b> Enter the keyword <code>snooping</code> to display snooping related information.

**group-address** (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.

**interface** (OPTIONAL) Enter the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500.

**Usage Information** This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
<b>Group Address</b>	Lists the multicast address for the IGMP group.
<b>Interface</b>	Lists the interface type, slot and port number.
<b>Mode</b>	Displays the IGMP version used.
<b>Uptime</b>	Displays the amount of time the group has been operational.
<b>Expires</b>	Displays the amount of time until the entry expires.
<b>Last Reporter</b>	Displays the IP address of the last host to be a member of the IGMP group.
<b>Member Ports</b>	Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up.

## Example

```
DellEMC# show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address      Interface      Mode          Uptime      Expires      Last
Reporter
225.1.1.1          Vlan 10       IGMPv2-Compat 00:00:07    00:02:09    1.1.1.2
  Member Ports: Te 1/17/1
DellEMC#
```

## show ip igmp snooping mrouter

Display multicast router interfaces.

**Syntax** `show ip igmp snooping mrouter [vlan number]`

**Parameters** **vlan number** Enter the keyword `vlan` then the vlan number. The range is from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.

**E-Series legacy command.**

**Usage Information** If the port channel is a VLT port channel, an asterisk (\*) after the port channel number (Po 100\*) indicates the port channel is locally down and that a remote VLT port is up.

## Example

```
DellEMC# show ip igmp snooping mrouter
Interface Router Ports
Vlan 2 Te 1/3/1, Po 1
DellEMC#
```

**Related  
Commands**

- [ip igmp snooping mrouter](#) — configure a static connection to the multicast router.
- [show ip igmp groups](#) — view groups.

# Interfaces

To configure egress, port channel, time domain, and UDP, use these interface commands.

## Topics:

- [Basic Interface Commands](#)
- [Port Channel Commands](#)
- [Enhanced Validation of Interface Ranges](#)
- [ip http source-interface](#)

## Basic Interface Commands

The following commands are for Physical, Loopback, and Null interfaces.

### clear counters

Clear the counters displayed in the show interfaces commands for all virtual router redundancy protocol (VRRP) groups, virtual local area networks (VLANs), and physical interfaces, or selected ones.

**Syntax** `clear counters [interface | vrrp {vr-id | ipv6 vr-id} | learning-limit | vlan vlan-id]`

**Parameters** *interface* (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For IPv4 access-group counters, enter the keyword `ip`.
- For IPv6 access-group counters, enter the keyword `ipv6`.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For MAC access-group counters, enter the keyword `mac`.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For the management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a tunnel interface, enter the keyword `tunnel`. The range is from 1 to 16383.

**NOTE:** This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**vrrp [ipv6 {vr-id} | vr-id]** (OPTIONAL) Enter the keyword `vrrp` to clear the counters of all VRRP groups. To clear the counters of VRRP groups on all IPv6 interfaces, enter `ipv6`. To clear the counters of a specified group, enter a VRID number from 1 to 255.

**learning-limit** (OPTIONAL) Enter the keywords `learning-limit` to clear unknown source address (SA) drop counters when MAC learning limit is configured on the interface.

**vlan vlan-id** Enter the keyword `vlan` followed by the interface VLAN number. The range is from 1 to 4094.

**Defaults** Without an interface specified, the command clears all interface counters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to clear the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Added the VLAN parameter.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.4.1.0	Added support (E-Series only) for VRRP groups in a VRF instance.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4093 VLANs on the E-Series. Prior to the release, 2094 was supported.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Updated the definition of the <code>learning-limit</code> option for clarity.

## Example

```
DellEMC# clear counters
Clear counters on all interfaces [confirm]
DellEMC#
```

## Related Commands

- [mac learning-limit](#) — allow aging of MACs even though a learning-limit is configured or disallow station move on learned MACs.

# clear dampening

Clear the dampening counters on all the interfaces or just the specified interface.

**Syntax** `clear dampening [interface]`

**Parameters** ***interface*** (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**Defaults** Without an interface specified, the command clears all interface dampening counters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

### Example

```
DellEMC# clear dampening tegigabitethernet 1/10/1
Clear dampening counters on TeGi 1/10/1 [confirm] y
DellEMC#
```

### Related Commands

- [show interfaces dampening](#) — display interface dampening information.
- [dampening](#) — configure dampening on an interface.

## dampening

Configure dampening on an interface.

**Syntax** dampening [[[*half-life*] [*reuse-threshold*]] [*suppress-threshold*]] [*max-suppress-time*]

### Parameters

<b><i>half-life</i></b>	Enter the number of seconds after which the penalty is decreased. The penalty decreases half after the half-life period expires. The range is from 1 to 30 seconds. The default is <b>5 seconds</b> .
<b><i>reuse-threshold</i></b>	Enter a number as the reuse threshold, the penalty value below which the interface state is changed to “up”. The range is from 1 to 20000. The default is <b>750</b> .
<b><i>suppress-threshold</i></b>	Enter a number as the suppress threshold, the penalty value above which the interface state is changed to “error disabled”. The range is from 1 to 20000. The default is <b>2500</b> .
<b><i>max-suppress-time</i></b>	Enter the maximum number for which a route can be suppressed. The default is four times the half-life value. The range is from 1 to 86400. The default is <b>20 seconds</b> .

**Defaults** Disabled.

**Command Modes** INTERFACE (conf-if-)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

### Usage Information

With each flap, Dell EMC Networking OS penalizes the interface by assigning a penalty (1024) that decays exponentially depending on the configured half-life. After the accumulated penalty exceeds the suppress threshold value, the interface moves to the Error-Disabled state. This interface state is deemed as "down" by all static/dynamic Layer 2 and Layer 3 protocols. The penalty is exponentially decayed based on the half-life timer. After the penalty decays below the reuse threshold, the interface enables. The configured parameters are as follows:

- `suppress-threshold` should be greater than `reuse-threshold`
- `max-suppress-time` should be at least 4 times `half-life`

 **NOTE:** You cannot apply dampening on an interface that is monitoring traffic for other interfaces.

### Example

```
DelleMC(conf-if-te-1/10/1)# dampening 20 800 4500 120
DelleMC(conf-if-te-1/10/1)#
```

### Related Commands

- [clear dampening](#) — clear the dampening counters on all the interfaces or just the specified interface.
- [show interfaces dampening](#) — display interface dampening information.

## description

Assign a descriptive text string to the interface.

**Syntax** `description desc_text`  
To delete a description, use the `no description` command.

**Parameters** `desc_text` Enter a text string up to 240 characters long.

**Defaults** None

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Modified for E-Series: Revised from 78 to 240 characters.

### Usage Information

#### Important Points to Remember:

- To use special characters as a part of the description string, you must enclose the whole string in double quotes.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks ("*desc\_text*").
- Entering a text string after the `description` command overwrites any previous text string that you previously configured as the description.
- The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port-channel.
- Use the `show interfaces description` command to display descriptions configured for each interface.

## default interface

Reset a physical interface to its factory default settings.

### Syntax

```
default interface interface-type slot/port - range
```

### Parameters

<b><i>interface-type</i></b>	Enter the interface type and slot/port [/subport] information:
<b><i>slot/port[/subport]</i></b>	<ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port/subport information.</li> </ul>
<b><i>range</i></b>	<ul style="list-style-type: none"> <li>• For non-ON platforms, you can specify multiple ports as <code>slot/port-range</code>. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as <code>show interfaces interface-type 1/1 - 4</code>.</li> <li>• For ON platforms, you can specify multiple ports as <code>slot/port/[subport] - slot/port/[subport]</code>. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as <code>show interfaces interface-type 1/1/1 - 1/1/4</code>.</li> </ul>

### Defaults

None

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series.
9.9(0.0)	Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, and Z9500.

### Usage Information

Use the `default interface` command to set a Gigabit Ethernet, 10-Gigabit Ethernet, or 40-Gigabit Ethernet interface to its factory-default state. By default, a physical interface is disabled (shutdown) with no assigned IP address or switchport (no ip address). This command removes all software settings and all L3, VLAN, VXLAN, and port-channel configurations on a physical interface.

### Example

```
DellEMC(conf-if-te-1/5/1)# show config
!
interface TenGigabitEthernet 1/5/1
  description testconfig
  no ip address
  portmode hybrid
  switchport
  rate-interval 8
  mac learning-limit 10 no-station-move
  no shutdown
DellEMC(conf-if-te-1/5/1)#

DellEMC(conf)# default interface tengigabitethernet 1/5/1

DellEMC(conf-if-te-1/5/1)# show config
!
interface TenGigabitEthernet 1/5/1
  no ip address
  shutdown
```

### Related Commands

- [show running-config](#) – display the current configuration.

## duplex (10/100 Interfaces)

Configure duplex mode on the Management Interface interfaces where the speed is set to 10/100.

### Syntax

```
duplex {half | full}
```

To return to the default setting, use the `no duplex` command.

### Parameters

<b>half</b>	Enter the keyword <code>half</code> to set the physical interface to transmit only in one direction.
<b>full</b>	Enter the keyword <code>full</code> to set the physical interface to transmit in both directions.

### Defaults

Not configured.

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.4.1.0</b>	Introduced

#### Usage Information

This command applies to any physical interface with speed set to 10/100.

**NOTE:** Starting with Dell EMC Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the `speed` command. When you set the speed to 10 Mbps or 100 Mbps, you can also execute the `duplex` command.

#### Related Commands

- [negotiation auto](#) — enable or disables auto-negotiation on an interface.

## encapsulation dot1q

Configures lite-subinterfaces.

#### Syntax

```
encapsulation dot1q vlan-id
```

To remove a previously configured lite-subinterface, use the `no encapsulation dot1q vlan-id` command.

#### Parameters

**dot1q *vlan-id*** Enter the keyword `dot1q` followed by the VLAN ID to which the host belongs. The range is from 1 to 4094. A lite subinterface is considered as a Layer 3 port property and is synchronous with the existing rules of applying Layer 2 or Layer 3 properties to an interface.

**Command Modes** INTERFACE

#### Command History

Version	Description
<b>9.12.1.0</b>	Introduced on the S5048F-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.3.0.0</b>	Introduced on the S6000.
<b>9.2(1.0)</b>	Introduced on the Z9500.

#### Usage Information

To enable routing of RRoCE packets, the VLAN ID is mapped to the default VLAN ID of 4095 and this mapping is performed using VLAN translation. After VLAN translation, the RRoCE packets are considered in the same manner as normal IP packets that received on L3 interface and routed in the egress direction.

At the egress interface, the VLAN ID is appended to the packet and transmitted out of the interface as a tagged packet with the dot1Q value preserved. The dot1Q value is preserved only for egress interfaces that are associated with a VLAN or a lite-subinterface . If a Layer 3 interface is configured without the encapsulation 802.1Q VLAN ID or is an untagged interface in a VLAN , the dot1Q value is not preserved .

## errdisable recovery cause

Enable automatic recovery of an interface from the Err-disabled state.

<b>Syntax</b>	<code>errdisable recovery cause {bpduguard   fefd   maclearnlimit   arp-inspection}</code>  To disable the automatic recovery, use the <code>no errdisable recovery cause {bpduguard   fefd   maclearnlimit   arp-inspection}</code> command.								
<b>Parameters</b>	<table><tr><td><b>bpduguard</b></td><td>Enter the keyword <code>bpduguard</code> to enable the timer to recover the interface from BPDU Guard error.</td></tr><tr><td><b>fefd</b></td><td>Enter the keyword <code>fefd</code> to enable the timer to recover the interface from FEFD error.</td></tr><tr><td><b>maclearnlimit</b></td><td>Enter the keyword <code>maclearnlimit</code> to enable the timer to recover the interface from MAC learning limit error.</td></tr><tr><td><b>arp-inspection</b></td><td>Enter the keyword <code>arp-inspection</code> to enable the timer to recover the interface from an arp-inspection error.</td></tr></table>	<b>bpduguard</b>	Enter the keyword <code>bpduguard</code> to enable the timer to recover the interface from BPDU Guard error.	<b>fefd</b>	Enter the keyword <code>fefd</code> to enable the timer to recover the interface from FEFD error.	<b>maclearnlimit</b>	Enter the keyword <code>maclearnlimit</code> to enable the timer to recover the interface from MAC learning limit error.	<b>arp-inspection</b>	Enter the keyword <code>arp-inspection</code> to enable the timer to recover the interface from an arp-inspection error.
<b>bpduguard</b>	Enter the keyword <code>bpduguard</code> to enable the timer to recover the interface from BPDU Guard error.								
<b>fefd</b>	Enter the keyword <code>fefd</code> to enable the timer to recover the interface from FEFD error.								
<b>maclearnlimit</b>	Enter the keyword <code>maclearnlimit</code> to enable the timer to recover the interface from MAC learning limit error.								
<b>arp-inspection</b>	Enter the keyword <code>arp-inspection</code> to enable the timer to recover the interface from an arp-inspection error.								
<b>Defaults</b>	Disabled								
<b>Command Modes</b>	CONFIGURATION								
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description								
<b>9.14(1.0)</b>	Introduced <code>arp-inspection</code> option.								
<b>9.14(0.0)</b>	Introduced on the platforms S4048-ON, S6100-ON, Z9100-ON, S4048T-ON, S3048-ON, S6000, S6010-ON, S5048F-ON, FN-IOM and MXL.								
<b>9.13(0.2P2)</b>	Introduced on the S3100.								
<b>Usage Information</b>	This command has to be configured before the interface moves to Err-disabled state. If not, the recovery action is not performed.								
<b>Related Commands</b>	<a href="#">errdisable recovery interval</a> — Configure recovery timer interval for an interface.								

## errdisable recovery interval

Configure recovery time interval to move an interface from the Err-disabled state.

<b>Syntax</b>	<code>errdisable recovery interval seconds</code>  To remove the configured recovery time interval, use the <code>no errdisable recovery interval seconds</code> command.		
<b>Parameters</b>	<table><tr><td><b>interval seconds</b></td><td>Enter the keyword <code>interval</code> and the number of seconds to recover the interface from Err-disabled state. The range is from 30 to 86,400 seconds. The default is 300 seconds.</td></tr></table>	<b>interval seconds</b>	Enter the keyword <code>interval</code> and the number of seconds to recover the interface from Err-disabled state. The range is from 30 to 86,400 seconds. The default is 300 seconds.
<b>interval seconds</b>	Enter the keyword <code>interval</code> and the number of seconds to recover the interface from Err-disabled state. The range is from 30 to 86,400 seconds. The default is 300 seconds.		
<b>Defaults</b>	300 seconds.		

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Introduced on the platforms S4048-ON, S6100-ON, Z9100-ON, S4048T-ON, S3048-ON, S6000, S6010-ON, S5048F-ON, FN-IOM, and MXL.
9.13(0.2P2)	Introduced on the S3100.

**Usage Information** Whenever the Err-disable recovery timer is reconfigured, it will get effective only after the current timer expires. Following message is displayed after each Err-disable recovery timer configuration:

```
DellEMC(conf)# errdisable recovery interval 30
New timer interval will be effective from the next timer instance only.
```

**Related Commands** [errdisable recovery cause](#) — Enable automatic recovery of an interface from the error disabled state.

## fec default

Set the FEC to default value.

**Syntax** `fec default`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

**Related Commands** [fec enable](#) — enables FEC on the interface.

## fec enable

Enable FEC on the interface.

**Syntax** `fec enable`

To disable FEC, use the `no fec enable` command.

**Defaults** Enabled on 25G and 50G interfaces

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Enabled on 25G and 50G interfaces on the Z9100-ON by default. Introduced support to enable or disable FEC independent of autonegotiation for 100G interfaces on the S6100-ON and Z9100-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

## Usage Information

This command is not applicable for 10-Gigabit and 40-Gigabit Ethernet interfaces.

The `fec enable` command enables Clause 91 error correction on 100G interfaces. On 25G and 50G interfaces, it enables Clause 74 error correction.

You can enable or disable FEC and auto negotiation irrespective of each other on 100G interfaces.

For 100G interfaces, CR4 auto-negotiation is enabled based on the media type. Autonegotiation is enabled on DAC cables by default.

## Related Commands

`fec default` — sets the FEC to default value.  
`show config` — displays the interface configuration.

## flowcontrol

Control how the system responds to and generates 802.3x pause flow control frames.

**Syntax** `flowcontrol {rx {off | on} tx {off | on} [negotiate | pause-threshold value | resume-offset value] | [monitor session-ID]}`

To return to the default, use the `no` form of this command.

## Parameters

<b>rx on</b>	Enter the keywords <code>rx on</code> to process the received flow control frames on this port.  <b>NOTE:</b> Flow-control packets are mirrored only when flow-control <code>rx</code> is enabled on an interface.
<b>rx off</b>	Enter the keywords <code>rx off</code> to ignore the received flow control frames on this port.
<b>tx on</b>	Enter the keywords <code>tx on</code> to send control frames from this port to the connected device when a higher rate of traffic is received.
<b>tx off</b>	Enter the keywords <code>tx off</code> so that flow control frames are not sent from this port to the connected device when a higher rate of traffic is received.
<b>pause-threshold</b>	Enter the buffer threshold limit for generating PAUSE frames.
<b>resume-offset</b>	Enter the offset value for generating PAUSE frames to resume traffic.

- negotiate** (Optional) Enter the keyword `negotiate` to enable the pause-negotiation with the egress port of the peer device. If the `negotiate` command is not used, pause-negotiation is disabled. 40-gigabit Ethernet interfaces do not support pause-negotiation
- monitor** Enter the keyword `monitor` then the session-ID to enable mirror flow control frames on the interface. The range is from 0 to 65535.

**Defaults**

**rx off tx off**

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.11(0.0)</b>	Added support for monitor session.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.6.0.0</b>	Added support for the negotiate feature on the S4810 and S4820T.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>6.5.1.9 and 7.4.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series with the <code>thresholds</code> option.

**Usage Information**

The globally assigned 48-bit multicast address 01-80-C2-00-00-01 is used to send and receive pause frames. To allow full-duplex flow control, stations implementing the pause operation instruct the MAC to enable the reception of frames with a destination address equal to this multicast address.

When a port receives traffic at a higher rate than it can process, the frames are stored in the port buffer. As a result, buffer usage increases. When the buffer usage reaches the value specified in the “pause-threshold” argument, the port sends PAUSE frame to the connected link partner to stop sending the traffic. Eventually this reduces the buffer usage. When the buffer usage drops by the value specified in the “resume-threshold”, the port again sends a PAUSE frame with 0 as wait-time. This results in resume of the paused traffic flow.

**Important Points to Remember**

- Do not enable `tx pause` when buffer carving is enabled. For information and assistance, consult Dell EMC Networking TAC.
- The only configuration applicable to half duplex ports is `rx off tx off`. The following error is returned:  

```
Can't configure flowcontrol when half duplex is configure, config ignored
```

- Half duplex cannot be configured when the flow control configuration is on (default is rx on tx on). The following error is returned:

Can't configure half duplex when flowcontrol is on, config ignored

**NOTE:** The flow control must be off (rx off tx off) before configuring the half duplex.

- Speeds less than one Gig cannot be configured when the asymmetric flow control configuration is on. The following error is returned:

Can't configure speed <1G when Asymmetric flowcontrol is on, config ignored

- Dell EMC Networking OS only supports rx on tx on and rx off tx off for speeds less than one Gig (Symmetric).

**NOTE:** If you use the disable rx flow control command, Dell EMC Networking recommends rebooting the system.

**NOTE:** Dell EMC Networking OS does not support mirroring of tx pause frames.

### Example

```
DellEMC(conf-if-Te-1/1/1)# show config
!
interface TenGigabitEthernet 1/1/1
no ip address
switchport
no negotiation auto
flowcontrol rx off tx on
no shutdown
...
```

### Example (Monitor Session)

```
DellEMC(conf-if-te-1/1/1)#show config
!
interface TenGigabitEthernet 1/1/1
no ip address
shutdown
flowcontrol monitor 5
```

**Example (Values)** This Example shows how Dell EMC Networking OS negotiates the flow control values between two Dell EMC Networking chassis connected back-to-back using 1G copper ports.

## interface

Configure a physical or virtual interface on the switch.

**Syntax** `interface interface`

**Parameters** ***interface*** Enter one of the following keywords and the interface information:

- For a null interface, enter the keyword `null` then the slot/port information. The Null interface number is 0.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** Not configured.

<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.4.1.0</b>	Introduced

### Usage Information

You cannot delete a physical interface.

By default, physical interfaces are disabled (`shutdown`) and are not assigned to an IP address or switchport. To place an interface in Layer 2 mode, ensure that the interface's configuration does not contain an IP address and enter the `switchport` command.

You can create up to 64 tunnel interfaces. The tunnel is added as a logical interface with no default configuration. To delete a tunnel interface, use the `no interface tunnel tunnel-id` command.

The tunnel interface operates as an ECMP (equal cost multi path) only when the next hop to the tunnel destination is over a physical interface. If you select any other interface as the next hop to the tunnel destination, the tunnel interface does not operate as an ECMP.

### Example

```
DelleMC(conf)# int tengigabitethernet 1/10/1
DelleMC(conf-if-te-1/10/1)# exit
DelleMC(conf)#
```

```
DelleMC(conf)# int HundredGigE 1/10
DelleMC(conf-if-hu-1/10)# exit
DelleMC(conf)#
```

```
DelleMC(conf)# int FortyGigE 1/10/1
DelleMC(conf-if-hu-1/10/1)# exit
DelleMC(conf)#
```

```
DelleMC(conf)# int TwentyfiveGigE 1/10/2
DelleMC(conf-if-tf-1/10/2)# exit
DelleMC(conf)#
```

### Related Commands

- [interface loopback](#) — configure a Loopback interface.
- [interface null](#) — configure a Null interface.
- [interface port-channel](#) — configure a port channel.
- [interface vlan](#) — configure a VLAN.

## interface group

Create or delete group of VLANs with a single command. You can also use this command to apply a set of configurations on a group of interfaces.

**Syntax** `interface group [interface | vlan vlanid {- vlanid } ]`

To delete a range of VLANs, use the following command:

`no interface group vlan vlanid {- vlanid}`

### Parameters

***interface,***  
***interface,...***

Enter the keywords `interface group` and one of the interfaces — slot/port or VLAN number. Select the range of interfaces for bulk configuration. Spaces are not required between the commas. Comma-separated ranges can include VLANs and physical interfaces.

Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10.

Slot/Port information need not contain a space before and after the dash. For example, both of the following commands are valid: `interface group tengigabitethernet 1/1/1 - 1/1/4`; `interface group tengigabitethernet 1/1/1-1/1/5` .

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.

### Usage Information

The `interface group` command will create all the non-existent VLANs specified in the range. On successful command execution, the CLI switches to the interface group context.

The configuration commands inside the group context will be the similar to that of the existing range command.

Note: For release 9.4(0.0), the group command is supported only for VLANs and physical interfaces.

## Example

```
DellEMC(conf)# interface group ?
fortyGigE          FortyGigabit Ethernet interface
gigabitethernet   GigabitEthernet interface IEEE 802.3z
tengigabitethernet TenGigabit Ethernet interface
twentyFiveGigE    TwentyFiveGigabit Ethernet interface
vlan               VLAN keyword

DellEMC(conf)# interface group vlan 1 - 2 , tengigabitethernet 1/1
DellEMC(conf-if-group-vl-1-2,tw-1/1)# no shutdown
DellEMC(conf-if-group-vl-1-2,tw-1/1)# end
```

## Related Commands

- [interface range](#) — configure a range of interfaces.
- [interface vlan](#) — configures a VLAN.

# interface loopback

Configure a Loopback interface.

**Syntax** `interface loopback number`

To remove a loopback interface, use the `no interface loopback number` command.

**Parameters** *number* Enter a number as the interface number. The range is from 0 to 16383.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.4.1.0</b>	Introduced

## Example

```
DellEMC(conf)# interface loopback 1655
DellEMC(conf-if-lo-1655)#
```

- Related Commands**
- [interface](#) — configure a physical interface.
  - [interface null](#) — configure a Null interface.
  - [interface port-channel](#) — configure a port channel.
  - [interface vlan](#) — configure a VLAN.

## interface managementEthernet

Configure the Management port on the system (either the Primary or Standby RPM).

**Syntax** `interface managementEthernet slot/port`

**Parameters** `slot/port`

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S55, S60, and S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

**Usage Information** You cannot delete a Management port.

The Management port is enabled by default (`no shutdown`). To assign an IP address to the Management port, use the `ip address` command.

### Example

```
DellEMC(conf)# interface managementethernet 1/1
DellEMC(conf-if-ma-1/1)#
```

- Related Commands**
- [management route](#) — configure a static route that points to the Management interface or a forwarding router.
  - [speed \(Management interface\)](#) — Set the speed for the Management interface.

# interface null

Configure a Null interface on the switch.

**Syntax** `interface null number`

**Parameters** *number* Enter zero (0) as the Null interface number.

**Defaults** Not configured; number = 0

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

**Usage Information** You cannot delete the Null interface. The only configuration command possible in a Null interface is `ip unreachable`.

## Example

```
DellEMC(conf)# interface null 0
DellEMC(conf-if-nu-0)#
```

## Related Commands

- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a Loopback interface.
- [interface port-channel](#) — configure a port channel.
- [interface vlan](#) — configure a VLAN.
- [ip unreachable](#) — enable generation of internet control message protocol (ICMP) unreachable messages.

# interface range

This command permits configuration of a range of interfaces to which subsequent commands are applied (bulk configuration). Using the `interface range` command, you can enter identical commands for a range of interface.

**Syntax** `interface range interface {slot/port[subport] | port} - {slot/port[subport] | port}, interface {slot/port[/subport] | port} - {slot/port[/subport] | port},...`

**Parameters** `interface {slot/port[subport] | port} — {slot/port[subport] | port}, interface {slot/port[subport] | port} — {slot/port[subport] | port},...`

Enter `interface range` and one of the interfaces and then the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. The ranges can include VLANs, port-channels, and physical interfaces.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword `Tunnel` then a number from 1 to 16383.

**Defaults** None

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(0.0)	Updated the error message when no ports are configured within the specified interface range.
9.13(0.0)	Introduced the Configuration Terminal Batch mode on C9010.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P2)	Introduced on the S4038-ON.
9.8(0.0P5)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.2.1.0	Added support for 4093 VLANs on E-Series. Prior releases supported 2094.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Usage Information

When creating an interface range, interfaces appear in the order they are entered; they are not sorted. The command verifies that interfaces are present (physical) or configured (logical).

#### Important Points to Remember:

- Bulk configuration is created if at least one interface is valid.
- Non-existing interfaces are excluded from the bulk configuration with a warning message.
- The `interface range` prompt includes interface types with slot/port[/subport] information for valid interfaces. The prompt allows for a maximum of 32 characters. If the bulk configuration exceeds 32 characters, it is represented by an ellipsis ( ... ).
- When the `interface range` prompt has multiple port ranges, the smaller port range is excluded from the prompt.
- If overlapping port ranges are specified, the port range is extended to the smallest start port and the biggest end port.

### Example (If at least one port is configured)

```
DelleMC(conf)# interface range tengigbitethernet 1/10/1 - 1/12/4,
fortyGigE 1/13/1, tengigbitethernet 1/15/1
% Warning: Non-existing ports (not configured) are ignored by
interface-range
```

```
DelleMC(conf)# interface range fortyGigE 1/10/1 - 1/12/4, HundredGigE
1/13, fortyGigE 1/15/1
% Warning: Non-existing ports (not configured) are ignored by
interface-range
```

### Example (If no ports are configured within the specified interface range)

```
DelleMC(conf)# interface range tengigbitethernet 1/10/1 - 1/12/4,
fortyGigE 1/13/1, tengigbitethernet 1/15/1
% Error: No port is configured in interface range
```

```
DelleMC(conf)# interface range fortyGigE 1/10/1 - 1/12/4, HundredGigE
1/13, fortyGigE 1/15/1
% Error: No port is configured in interface range
```

### Example (Configuration Terminal Batch Mode)

```
DelleMC(conf-b)#interface range te 1/1-4
DelleMC(conf-if-range-te-1/1-4)#
```

### Example (Multiple Ports)

```
DelleMC(conf)# interface range tengigabitethernet 1/1/1 - 1/12/3,
tengigabitethernet 1/3/2 - 1/9/4
DelleMC(conf-if-range-te-1/1/1-1/12/3)#
```

### Example (Overlapping Ports)

```
DelleMC(conf)# interface range tengigabitethernet 1/1/1 - 1/10/1,
tengigabitethernet 1/1/1 - 1/20/3
DelleMC(conf-if-range-te-1/1/1-1/20/3)#
```

### Usage Information

Only VLAN and port-channel interfaces created using the `interface vlan` and `interface port-channel` commands can be used in the `interface range` command.

Use the `show running-config` command to display the VLAN and port-channel interfaces. VLAN or port-channel interfaces that are not displayed in the `show running-config` command cannot be used with the bulk configuration feature of the `interface range` command. You cannot create virtual interfaces (VLAN, Port-channel) using the `interface range` command.

**NOTE:** If a range has VLAN, physical and port-channel interfaces, only commands related to physical interfaces can be bulk configured. To configure commands specific to VLAN and port-channel only those respective interfaces should be configured in a particular range.

#### Example (Single Range)

This example shows a single range bulk configuration.

```
DellEMC(config)# interface range tengigabitethernet 1/1/1 - 1/7/3
DellEMC(config-if-range-te-1/1/1-1/7/3)# no shutdown
```

#### Example (Multiple Range)

This example shows how to use commas to add different interface types to a range of interfaces.

```
DellEMC(config-if)# interface range tengigabitethernet 1/1/1 - 1/20/3,
hundredGigE 1/24 - 1/29
DellEMC(config-if-range-te-1/1/1-1/20/3,hu-1/24-1/29)# no shutdown
```

#### Example (Multiple Range)

This example shows how to use commas to add VLAN and port-channel interfaces to the range.

```
DellEMC(config-if)# interface range tengigabitethernet 1/1/1 - 1/20/3,
tengigabitethernet 1/23/1 -1/24/4,
Vlan 2-100, Port 1-25
DellEMC(config-if-range-
te-1/1/1-1/20/3,te-1/23/1-1/24/4,vl-2-100,po-1-25)# no shutdown
DellEMC(config-if-range)#
```

#### Example (Batch Mode Configuration)

Primary VLT

```
DellEMC(conf-b)#int range Tengigabitethernet 3/0 - 5
DellEMC(conf-if-range-te-3/0-5)#mtu 4500
DellEMC(conf-if-range-te-3/0-5)#exit
DellEMC(conf-b)#show conf
interface range tengigabitethernet 3/0 - 5
mtu 4500
DellEMC(conf-b)#commit
DellEMC(conf-b)#Dec 6 11:30:45 %RPM1-P:CP %CLIBATCH-6-
CLI_BATCH_CONFIG_IN_PROGRESS_TRAP: Batch configuration commit is in
progress
Dec 6 11:30:45 %RPM1-P:CP %CLIBATCH-6-CLI_BATCH_CONFIG_COMPLETE_TRAP:
Batch configuration commit is success
```

Secondary VLT

```
Dec 6 10:43:17 %RPM1-P:CP %CLIBATCH-6-
CLI_BATCH_CONFIG_IN_PROGRESS_TRAP: Batch configuration commit is in
progress
Dec 6 10:43:18 %RPM1-P:CP %CLIBATCH-6-CLI_BATCH_CONFIG_COMPLETE_TRAP:
Batch configuration commit is success
```

#### Related Commands

- [interface port-channel](#) — configure a port channel group.
- [interface vlan](#) — configure a VLAN interface.
- [show config \(from INTERFACE RANGE mode\)](#) — display the bulk configuration interfaces.
- [show range](#) — display the bulk configuration ranges.
- [interface range macro \(define\)](#) — define a macro for an interface-range.

## interface range macro (define)

Defines a macro for an interface range and then saves the macro in the running configuration.

**Syntax** `define interface range macro name interface , interface , ...`

**Parameters**

<b><i>name</i></b>	Enter up to 16 characters for the macro name.
<b><i>interface</i>, <i>interface</i>,...</b>	Enter the keywords <code>interface range</code> and the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. Comma-separated ranges can include VLANs, port-channels, and physical interfaces. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a Tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID. The range is from 1 to 16383.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
<b>pre-Version 6.1.1.0</b>	Introduced on the E-Series.

### Example (Single Range)

This example shows how to define an interface range macro named test. Execute the `show running-config` command to display the macro definition.

```
DelleMC(config)# define interface-range test tengigabitethernet 1/1/1 - 1/3/1,
tengigabitethernet 1/5/1 - 1/7/4, tengigabitethernet 1/11/1 - 1/18/3

DelleMC# show running-config | grep define
define interface-range test tengigabitethernet 1/1/1 - 1/3/1,
tengigabitethernet 1/5/1 - 1/7/4,
tengigabitethernet 1/11/1 - 1/18/3
DelleMC(config)# interface range macro test
DelleMC(config-if-range-te-1/1/1-1/3/1,te-1/5/1-1/7/4,te-1/11/1-1/18/3)#
```

```
DelleMC(config)# define interface-range test HundredGigE 1/1 - 1/3,
HundredGigE 1/7 - 1/17, HundredGigE 1/19 - 1/22

DelleMC# show running-config | grep define
define interface-range test HundredGigE 1/1 - 1/3, HundredGigE 1/7 - 1/17,
HundredGigE 1/19 - 1/22
DelleMC(config)# interface range macro test
DelleMC(config-if-range-hu-1/1-1/3,hu-1/7-1/17,hu-1/19-1/22)#
```

### Related Commands

- [interface range](#) – configure a range of command (bulk configuration).
- [interface range macro name](#) – run an interface range macro.

## interface range macro name

Run the interface-range macro to automatically configure the pre-defined range of interfaces.

**Syntax** `interface range macro name`

**Parameters** *name* Enter the name of an existing macro.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.0	Introduced

### Example (Single Range)

This example shows the macro named *test* that was defined earlier.

```
DellEMC(config)# interface range macro test
DellEMC(config-if-range-te-1/1/1-1/1/3,te-1/3/1-1/4/4,te-1/11/1-1/22/1) #
Dell
```

### Related Commands

- [interface range](#) — configure a range of command (bulk configuration).
- [interface range macro \(define\)](#) — define a macro for an interface range (bulk configuration).

## interface vlan

Configure a VLAN. You can configure up to 4094 VLANs.

### Syntax

```
interface vlan vlan-id [of-instance{of-id}]
```

### Parameters

***vlan-id***

Enter a number as the VLAN Identifier. The range is from 1 to 4094.

***of-instance*{*of-id*}**

Enter the keyword **of-instance** then the OpenFlow instance ID to add the VLAN to the specified OpenFlow instance. The range is from 1 to 8.

**NOTE:** Associate the OpenFlow instance with the VLAN when the VLAN is created. An existing VLAN cannot be associated with an OpenFlow instance.

### Defaults

Not configured, except for the Default VLAN, which is configured as VLAN 1.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.1.(0.0)	Introduced on the S4810; added support for OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

## Usage Information

For more information about VLANs and the commands to configure them, see [Virtual LAN \(VLAN\) Commands](#).

FTP, TFTP, and SNMP operations are not supported on a VLAN. MAC ACLs and IP ACLs are supported. For more information, see [Access Control Lists \(ACL\)](#).

The following features are not supported on VLANs associated with an OpenFlow instance:

- IPv4
- IPv6
- MTU

If OpenFlow VLANs are configured on the switch, spanning-tree protocols cannot be enabled simultaneously.

## Example (Single Range)

```
DellEMC(conf)# int vlan 3
DellEMC(conf-if-vl-3)#
```

## Related Commands

- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a loopback interface.
- [interface null](#) — configure a null interface.
- [interface port-channel](#) — configure a port channel group.
- [show vlan](#) — display the current VLAN configuration on the switch.
- [shutdown](#) — disable/enable the VLAN.
- [tagged](#) — add a Layer 2 interface to a VLAN as a tagged interface.
- [untagged](#) — add a Layer 2 interface to a VLAN as an untagged interface.

## intf-type cr1 autoneg

Enable Clause 73 autonegotiation on a 25G CR1 interface.

**Syntax** `intf-type cr1 autoneg`

**Defaults** To disable Clause 73 autonegotiation on a 25G CR1 interface, use the `no intf-type cr1 autoneg` command.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the Z9100-ON.

## Example

```
DellEMC(conf-if-tf-1/1/1)#intf-type cr1 autoneg
DellEMC(conf-if-tf-1/1/1)#no intf-type cr1 autoneg
```

## intf-type cr2 autoneg

Enable Clause 73 autonegotiation on a 50G CR2 interface.

**Syntax** `intf-type cr2 autoneg`

To disable Clause 73 autonegotiation on a 50G CR2 interface, use the `no intf-type cr2 autoneg` command.

**Defaults** Not configured

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced on the Z9100-ON.

**Example**

```
DellEMC(conf-if-fi-1/1/1)#intf-type cr2 autoneg
DellEMC(conf-if-fi-1/1/1)#no intf-type cr2 autoneg
```

## intf-type cr4 autoneg

Set the interface type as CR4 with auto-negotiation enabled. To set the interface type as CR4 with autonegotiation disabled, use the `no intf-type cr4 autoneg` command.

**Syntax** `intf-type cr4 autoneg`

**Defaults** Enabled on the 100G interfaces

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.16.1	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** You can configure the interface type as CR4 with auto-negotiation enabled. If a DAC cable link is down, you can resolve the issue by setting the interface type as CR4.

If the CR4 optic fails to come up, use the `autoneg` option.

On 100-Gigabit Ethernet interfaces, CR4 auto-negotiation is enabled by default.

- Related Commands**
- [Interfaces](#) — configure a physical interface.
  - [interface loopback](#) — configure a loopback interface.
  - [interface null](#) — configure a null interface.
  - [interface port-channel](#) — configure a port channel group.

## keepalive

Send keepalive packets periodically to keep an interface alive when it is not transmitting data.

**Syntax** `keepalive`

To stop sending keepalive packets, use the `no keepalive` command.

<b>Defaults</b>	Enabled.
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.2</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-Version 6.1.1.0</b>	Introduced on the E-Series.

<b>Usage Information</b>	When you configure <code>keepalive</code> , the system sends a self-addressed packet out of the configured interface to verify that the far end of a WAN link is up. When you configure <code>no keepalive</code> , the system does not send keepalive packets and so the local end of a WAN link remains up even if the remote end is down.
--------------------------	--

## monitor interface

Monitor counters on a single interface or all interfaces. The screen is refreshed every five seconds and the CLI prompt disappears.

<b>Syntax</b>	<code>monitor interface [interface]</code>
	To disable monitoring and return to the CLI prompt, press the <code>q</code> key.

<b>Parameters</b>	<b><i>interface</i></b> (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For the Management interface on the stack-unit, enter the keyword <code>managementEthernet</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keyword <code>port-channel</code> and then a number.</li> <li>• For a Tunnel interface, enter the keyword <code>tunnel</code> then the slot/port. The range is from 1 to 16383.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> </ul>
-------------------	--

- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-Version 6.2.1.0</b>	Introduced on the E-Series.

**Usage Information** In the Example, the delta column displays changes since the last screen refresh. The following are the `monitor` command menu options.

Key	Description
<b>sysstest-3</b>	Displays the host name assigned to the system.
<b>monitor time</b>	Displays the amount of time since the <code>monitor interface</code> command was entered.
<b>time</b>	Displays the amount of time the chassis is up (since last reboot).
<b>m</b>	Change the view from a single interface to all interfaces on the line card or visa-versa.
<b>c</b>	Refresh the view.
<b>b</b>	Change the counters displayed from Packets on the interface to Bytes.
<b>r</b>	Change the [delta] column from change in the number of packets/bytes in the last interval to rate per second.
<b>l</b>	Change the view to the next interface on the line card, or if in line card mode, the next line card in the chassis.

Key	Description
a	Change the view to the previous interface on the line card, or if in line card mode, the previous line card in the chassis.
T	Increase the screen refresh rate.
t	Decrease the screen refresh rate.
q	Return to the CLI prompt.

### Example (Single Interface)

```

systest-3 Monitor time: 00:00:06 Refresh Intvl.: 2s Time: 03:26:26

## mtu

Set the link maximum transmission unit (MTU) (frame size) for an Ethernet interface.

**Syntax** `mtu value`

To return to the default MTU value, use the `no mtu` command.

**Parameters** **value** Enter a maximum frame size in bytes. The range is from 594 to 9416. The default is **1554**.

**Defaults** **1554**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Reduced the maximum size of the maximum transmission unit (MTU) to 9216 bytes on S6000, S6000-ON, S4048-ON, Z9500, and C9010. Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-Version</b>	Introduced on the E-Series.
<b>6.2.1.0</b>	

**Usage Information** If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (`ip mtu` command) must be enough bytes to include the Layer 2 header.

When you enter the `no mtu` command, Dell EMC Networking OS reduces the IP MTU value to 1536 bytes.

Link MTU and IP MTU considerations for port channels and VLANs are as follows.

**port channels:**

- All members must have the same link MTU value and the same IP MTU value.
- The port channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the port channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

#### VLANs:

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following shows the difference between Link MTU and IP MTU.

Layer 2 Overhead	Link MTU and IP MTU Delta
Ethernet (untagged)	18 bytes
VLAN Tag	22 bytes
Untagged Packet with VLAN-Stack Header	22 bytes
Tagged Packet with VLAN-Stack Header	26 bytes

## negotiation auto

Enable auto-negotiation on an interface.

**Syntax** `negotiation auto`

To disable auto-negotiation, use the `no negotiation auto` command.

**Defaults** Enabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>pre-6.2.1.0</b>	Introduced on the E-Series.

### Usage Information

This command is supported on 10/100/1000 Base-T Ethernet interfaces.

You can use the `negotiation auto` command on the 10G ports on the device.

The `no negotiation auto` command is only available if you first manually set the speed of a port to **10Mbits** or **100Mbits**.

The `negotiation auto` command provides a `mode` option for configuring an individual port to forced-master/forced slave after you enable auto-negotiation.

If you do not use the `mode` option, the default setting is **slave**. If you do not configure forced-master or forced-slave on a port, the port negotiates to either a master or a slave state. Port status is one of the following:

- Forced-master
- Force-slave
- Master
- Slave
- Auto-neg Error — typically indicates that both ends of the node are configured with forced-master or forced-slave.

**CAUTION:** Ensure that one end of your node is configured as forced-master and one is configured as forced-slave. If both are configured the same (that is, forced-master or forced-slave), the `show interfaces` command flaps between an auto-neg-error and forced-master/slave states.

You can display master/slave settings with the `show interfaces` command.

### Example (Master/Slave)

```
DelleMC(conf)# interface tengigabitethernet 1/1/1
DelleMC(conf-if)# neg auto
DelleMC(conf-if-autoneg)# ?

end          Exit from configuration mode
exit        Exit from autoneg configuration mode
mode        Specify autoneg mode
no          Negate a command or set its defaults
show        Show autoneg configuration information
DelleMC(conf-if-autoneg)# mode ?
forced-master Force port to master mode
forced-slave Force port to slave mode
DelleMC(conf-if-autoneg)#
```

### Example (Configured)

```
DelleMC# show interfaces configured
TenGigabitEthernet 1/3/4 is up, line protocol is up
Hardware is DelleMCEth, address is 00:01:e8:05:f7:fc
Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00

**User Information** Both sides of the link must have auto-negotiation enabled or disabled for the link to come up.

The following details the possible speed and auto-negotiation combinations for a line between two 10/100/1000 Base-T Ethernet interfaces.

#### Port 0

- auto-negotiation enabled\* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled\* speed 1000 or auto

#### Port 1

- auto-negotiation enabled\* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100

#### Link Status Between Port 1 and Port 2

- Up at 1000 Mb/s
- Up at 100 Mb/s
- Up at 100 Mb/s
- Down
- Down

\* You cannot disable auto-negotiation when the speed is set to 1000 or auto.

## portmode hybrid

To accept both tagged and untagged frames, set a physical port or port-channel. A port configured this way is identified as a hybrid port in report displays.

**Syntax** `portmode hybrid`

To return a port to accept either tagged or untagged frames (non-hybrid), use the `no portmode hybrid` command.

**Defaults** non-hybrid

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `interface` command shown in the following example. This example sets a port as hybrid, makes the port a tagged member of VLAN 20, and an untagged member of VLAN 10, which becomes the native VLAN of the port. The port now accepts:

- untagged frames and classify them as VLAN 10 frames
- VLAN 20 tagged frames

The following describes the `do show interfaces` command shown in the following example. This example shows output with "Hybrid" as the newly added value for 802.1QTagged. The options for this field are:

- True — port is tagged
- False — port is untagged
- Hybrid — port accepts both tagged and untagged frames

The following describes the `interface vlan` command shown in the following example. This example shows unconfiguration of the hybrid port using the `no portmode hybrid` command.

**i** **NOTE:** Remove all other configurations on the port before you can remove the hybrid configuration from the port.

### Example

```
DellEMC(conf)# interface tengigabitethernet 1/1/1
DellEMC(conf-if-te-1/1/1)# portmode hybrid
DellEMC(conf-if-te-1/1/1)# interface vlan 10
DellEMC(conf-if-vl-10)# untagged tengigabitethernet 1/1/1
DellEMC(conf-if-vl-10)# interface vlan 20
DellEMC(conf-if-vl-20)# tagged tengigabitethernet 1/1/1
DellEMC(conf-if-vl-20)#
```

### Example

```
DellEMC(conf-if-vl-20)# do show interfaces switchport
Name: TenGigabitEthernet 1/1/1
802.1QTagged: Hybrid
Vlan membership:
Vlan 10, Vlan 20
Native VlanId: 10
DellEMC(conf-if-vl-20)#
```

### Example (Vlan)

```
DellEMC(conf-if-vl-20)# interface vlan 10
DellEMC(conf-if-vl-10)# no untagged tengigabitethernet 1/1/1
DellEMC(conf-if-vl-10)# interface vlan 20
DellEMC(conf-if-vl-20)# no tagged tengigabitethernet 1/1/1
DellEMC(conf-if-vl-20)# interface tengigabitethernet 1/1/1
DellEMC(conf-if-te-1/1/1)# no portmode hybrid
DellEMC(conf-if-vl-20)#
```

## rate-interval

Configure the traffic sampling interval on the selected interface.

**Syntax** `rate-interval seconds`

**Parameters** **seconds** Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

**NOTE:** Because polling occurs every 15 seconds, the number of seconds designated here rounds to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45.

**Defaults** 299 seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced

**Usage Information** The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

## rate-interval (Configuration Mode)

Configure the traffic sampling interval for all physical and logical port-channel interfaces globally. The support to configure rate-interval globally enables you to modify the default interval rate for all physical and logical interfaces at one time.

**Syntax** `rate-interval seconds`

Use the `no rate-interval` command to remove the sampling interval configuration.

**Parameters** **seconds** Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

**NOTE:** Because polling occurs every 15 seconds, the number of seconds designated here round to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45. If you configure this value to be less than 5, then the

entire buffer is cleared; the `show int stats` command shows the rate information to be 0 as the polling interval is less than 5.

**Defaults** 299 seconds

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11.0.0	Introduced on all Dell EMC Networking OS platforms.

**Usage Information**

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

When rate-interval is not configured in the global configuration mode or interface mode, the default value of 299 seconds is applied.

When rate-interval is configured only in the global configuration mode and not in the interface mode, the global rate-interval value is applied at the interface level also.

When rate-interval is configured at the interface level and not in the global configuration mode, the interface level rate-interval value is applied for an interface.

When rate interval is configured in both global configuration mode as well as interface mode, then the rate-interval value configured at interface level is applied as it takes precedence over the global value.

## show config

Display the interface configuration.

**Syntax** `show config`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
<b>pre-Version</b> <b>6.2.1.0</b>	Introduced on the E-Series.

#### Example

```
DellEMC(conf-if-hu-1/4)# show config
!
interface HundredGigE 1/4
 no ip address
 mtu 9416
 switchport
 no shutdown
DellEMC(conf-if-hu-1/4)#
```

## show config (from INTERFACE RANGE mode)

Display the bulk configured interfaces (`interface range`).

**Syntax** `show config`

**Command Modes** CONFIGURATION INTERFACE (`conf-if-range`)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.1.1.0</b>	Introduced on the E-Series.

#### Example

```
DellEMC(conf)# interface range tengigabitethernet 1/1/1 - 1/1/2
DellEMC(conf-if-range-te-1/1-1/1/2)# show config
!
interface TenGigabitEthernet 1/1/1
 no ip address
 switchport
 no shutdown
!
interface TenGigabitEthernet 1/1/2
```

```
no ip address
switchport
no shutdown
DellEMC(conf-if-range-te-1/1/1-1/1/2) #
```

## show interfaces

Display information on a specific physical interface or virtual interface.

**Syntax** `show interfaces interface-type[-range]`

**Parameters**

***interface*** Enter one of the following keywords and the interface information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For stack-units, enter the keywords `stack-unit` then the slot/port information.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.

 **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

***-range*** (Optional) Enter the range of interfaces for which you want to view the information. The format is `interface-type slot/port/[subport]-slot/port/[subport]`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(1.3)	Included the FEC types in the output for 25G, 50G, and 100G interfaces of the Z9100-ON.
9.14(0.0)	Included the FEC counter details in the output for 25 and 50G interfaces of the S5048-ON.
9.12(1.0)	Introduced on the S5048F-ON.
9.12(0.0)	Added the OUI value in the command output for the Z9100-ON.
9.11(0.0)	Included the FEC BER details in the output for 100G interfaces of S6100-ON and Z9100-ON.

Version	Description
	Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
	Included display information about EEE on the S3048-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON. Included display information about EEE on the S3100 series, S4820T, and S5000.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Added support for the tunnel interface type.
9.1(0.0)	Updated Management Ethernet output to include two global IPv6 addresses on S4810 and Z9000 and added output example showing OpenFlow instance ID.
8.3.12.1	Updated command output to support multiple IPv6 addresses on S4810.
8.3.11.4	Output expanded to support eSR4 optics in Z9000.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.2	Included SFP and SFP+ optics power detail in the E-Series and C-Series output.
8.2.1.0	Added support for 4093 VLANs on the E-Series. Prior releases supported 2094.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Output expanded to include SFP+ media on the C-Series.
7.6.1.0	Introduced on the S Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Changed the organization of the display output.
6.3.1.0	Added the Pluggable Media Type field in the E-Series output.

### Usage Information

Use the `show interfaces` command for details on a specific interface.

**NOTE:** In the CLI output, the power value is rounded to a 3-digit value. For receive/transmit power that is less than 0.000, an `snmp query` returns the corresponding dbm value even though the CLI displays as 0.000.

**NOTE:** After the counters are cleared, the line-rate continues to increase until it reaches the maximum line rate. When the maximum line rate is reached, there is no change in the line-rate.

**User Information** The following table describes the `show interfaces` command shown in the 10G example.

Line	Description
<b>TenGigabitEthernet 1/1...</b>	Interface type and administrative and line protocol status.
<b>Hardware is...</b>	Interface hardware information, assigned MAC address, and current address.
<b>Pluggable media present...</b>	<p>Present pluggable media wavelength, type, and rate. The error scenarios are:</p> <ul style="list-style-type: none"> <li>• Wavelength, unknown — Unable to determine the optics type</li> <li>• Unknown — If the wavelength is reading an error</li> </ul> <p>Dell EMC Networking allows unsupported SFP and XFP transceivers to be used, but Dell EMC Networking OS might not be able to retrieve some data about them. In that case, typically when the output of this field is “Pluggable media present, Media type is unknown”, the Medium and the XFP/SFP receive power reading data might not be present in the output.</p>
<b>Interface index...</b>	Displays the interface index number the SNMP uses to identify the interface.
<b>Internet address...</b>	States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.
<b>MTU 1554...</b>	Displays link and IP MTU information.
<b>LineSpeed</b>	Displays the interface’s line speed, duplex mode, and negotiation mode.
<b>Energy Efficient Ethernet</b>	Displays whether Energy Efficient Ethernet has been enabled or not.
<b>ARP type:...</b>	Displays the ARP type and the ARP timeout value for the interface.
<b>Last clearing...</b>	Displays the time when the <code>show interfaces</code> counters were cleared.
<b>Queuing strategy...</b>	States the packet queuing strategy. FIFO means first in first out.
<b>Input Statistics:</b>	<p>Displays all the input statistics including:</p> <ul style="list-style-type: none"> <li>• Number of packets and bytes into the interface</li> <li>• Number of packets with VLAN tagged headers</li> <li>• Packet size and the number of those packets inbound to the interface</li> <li>• Number of Multicast and Broadcast packets: <ul style="list-style-type: none"> <li>○ Multicasts = number of MAC multicast packets</li> <li>○ Broadcasts = number of MAC broadcast packets</li> </ul> </li> <li>• Number of runts, giants, and throttles packets: <ul style="list-style-type: none"> <li>○ runts = number of packets that are less than 64B</li> <li>○ giants = packets that are greater than the MTU size</li> <li>○ throttles = packets containing PAUSE frames</li> </ul> </li> <li>• Number of CRC, overrun, and discarded packets: <ul style="list-style-type: none"> <li>○ CRC = packets with CRC/FCS errors</li> <li>○ overrun = number of packets discarded due to FIFO overrun conditions</li> <li>○ discarded = the sum of runts, giants, CRC, and overrun packets discarded without any processing</li> </ul> </li> <li>• Number of FEC bit errors and uncorrected code words: <ul style="list-style-type: none"> <li>○ FEC bit errors = Number of Forward Error Correction Bit errors occurred.</li> <li>○ FEC uncorrected code words = Number of uncorrected Forward Error Correction packets.</li> </ul> </li> </ul>
<b>Output Statistics:</b>	<p>Displays output statistics sent out of the interface including:</p> <ul style="list-style-type: none"> <li>• Number of packets, bytes, and underruns out of the interface</li> <li>• Packet size and the number of the packets outbound to the interface</li> <li>• Number of Multicast, Broadcast, and Unicast packets: <ul style="list-style-type: none"> <li>○ Multicasts = number of MAC multicast packets</li> <li>○ Broadcasts = number of MAC broadcast packets</li> <li>○ Unicasts = number of MAC unicast packets</li> </ul> </li> <li>• Number of VLANs, throttles, discards, and collisions:</li> </ul>

Line	Description
	<ul style="list-style-type: none"> <li>○ Vlans = number of VLAN tagged packets</li> <li>○ throttles = packets containing PAUSE frames</li> <li>○ discarded = number of packets discarded without any processing</li> <li>○ collisions = number of packet collisions</li> <li>○ wred=count both packets discarded in the MAC and in the hardware-based queues</li> </ul>
<b>Rate information...</b>	Estimate of the input and output traffic rate over a designated interval (30 to 299 seconds). Traffic rate is displayed in bits, packets per second, and percent of line rate.
<b>Time since...</b>	Elapsed time since the last interface status change (hh:mm:ss format).

### Example

```
DelleMC# show interfaces
TenGigabitEthernet 1/1/1 is down, line protocol is down
Hardware is DellForce10Eth, address is 00:01:e8:8b:3d:e7
Current address is 00:01:e8:8b:3d:e7
Pluggable media present, Media type is unknown
Wavelength unknown
Interface index is 100992002
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
Flowcontrol rx on tx off
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 3d17h53m
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 throttles, 0 discarded, 0 collisions, 0 wredrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 3d17h51m
```

### Example

```
DelleMC# show interfaces
TenGigabitEthernet 1/1/1 is down, line protocol is down
Hardware is DelleMCeth, address is 00:a0:c9:00:00:0b
Current address is 00:a0:c9:00:00:0b
Pluggable media present, QSFP type is 40GBASE-CR4-1M
Interface index is 2097156
Internet address is not set
Mode of IPv4 Address Assignment : NONE
DHCP Client-ID :00a0c900000b
MTU 1554 bytes, IP MTU 1500 bytes

Last clearing of "show interface" counters 1d18h54m

```

### Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the `ip` address command to assign an IP address to the Management port. If two RPMs are installed in your system, use the `show redundancy` command to display which RPM is the Primary RPM.

### Example

```

Dell#show interfaces twe 1/3/1
twentyFiveGigE 1/3/1 is down, line protocol is down
Hardware is DelleMCeEth, address is 4c:76:25:e5:32:c2
    Current address is 4c:76:25:e5:32:c2
Pluggable media not present
    Forward Error Correction(FEC) configured is c174 (BaseR-FEC)
    FEC status is ON
    OUI is 0x6a737d
Interface index is 2098188
Internet address is not set
Mode of IPv4 Address Assignment : NONE

Queueing strategy: fifo
Time since last interface status change: 00:05:12

```

**Related Commands**

- [show interfaces configured](#) – display any interface with a non-default configuration.
- [show ip interface](#) – display Layer 3 information about the interfaces.
- [show range](#) – display all interfaces configured using the interface range command.

## show interfaces configured

Display any interface with a non-default configuration.

**Syntax** `show interfaces configured`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.4.1.0</b>	Changed the organization of the display output.

**Example**

```

DelleMC# show interfaces configured
TenGigabitEthernet 1/18/1 is up, line protocol is up
Hardware is DelleMCeth, address is 00:01:e8:05:f7:fc
  Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo

```

```

Input Statistics:
  10 packets, 10000 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 10 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  1 packets, 64 bytes, 0 underruns
  1 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 1 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 00:04:59
DellEMC#

```

## show interfaces dampening

Display interface dampening information.

**Syntax** `show interfaces dampening [[interface] [summary] [detail]]`

**Parameters**

***interface***

(Optional) Enter one of the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**i** **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**summary**

(OPTIONAL) Enter the keyword `summary` to display the current summary of dampening data, including the number of interfaces configured and the number of interfaces suppressed, if any.

**detail**

(OPTIONAL) Enter the keyword `detail` to display detailed interface dampening data.

**Defaults** None

**Command Modes** EXEC

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

## Example

```
DellEMC# show interfaces dampening
Interface Supp   Flaps Penalty Half-Life Reuse Suppress Max-Sup
          State
Te 1/2/1      Up      0      0      20      800    4500    120
Te 1/10/1     Up      0      0      5       750    2500    20
DellEMC#
```

## Related Commands

- [dampening](#) — configure dampening on an interface.
- [show interfaces configured](#) — display any interface with a non-default configuration.

## show interfaces stack-unit

Display information on all interfaces on a specific S-Series or Z-Series stack member.

**Syntax** `show interfaces stack-unit unit-number`

**Parameters** *unit-number* Enter the stack member number.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

!-----output truncated -----!
```

### Related Commands

- [show hardware stack-unit](#) — display data plane and management plane input/output statistics.

## show interfaces status

To display status information on a specific interface only, display a summary of interface information or specify a stack-unit slot and interface.

**Syntax** `show interfaces [interface | stack-unit slot-number] status`

## Parameters

### *interface*

(OPTIONAL) Enter one of the following keywords the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

 **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

### **stack-unit** *slot-number*

(OPTIONAL) Enter the keyword `stack-unit` then the slot number. The range is from 0 to 5.

## Defaults

None

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

```

## show interfaces vlan

Display VLAN statistics.

**Syntax** `show interfaces vlan {vlan-id} [LINE] {description}`

**Parameters**

- vlan-id** Enter the interface VLAN number. The range is from 1 to 4094.
- LINE** (OPTIONAL) Enter the name of the VLAN.
- description** Displays the VLAN interface information with description.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series and Z-Series.

### Usage Information

- NOTE:** This command also enables you to view information corresponding to a range of ports.
- You can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1 - 4`.

### Example

```
DellEMC# show interfaces vlan 10
Vlan 10 is up, line protocol is down
Address is 90:b1:1c:f4:99:ce, Current address is 90:b1:1c:f4:99:ce
Interface index is 1107787786
Internet address is not set
Mode of IPv4 Address Assignment: NONE
DHCP Client-ID: 90b11cf499ce
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 2d17h26m
Queueing strategy: fifo
Time since last interface status change: 2d17h26m
Input Statistics:
    0 packets, 0 bytes
Output Statistics:
    0 packets, 0 bytes, 0 underruns
```

## show system stack-unit fanout configured

Displays the details about the fanned-out ports.

**Syntax** `show system stack-unit stack-unit-number fanout configured`

**Parameters**

- stack-unit *stack-unit-number*** The stack Unit ID of the device.
- fanout configured** Enter the keywords `fanout configured` to display the details about the fanned-out ports.

**Defaults** None.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(1.0)	Introduced on the Z9100-ON.

### Example

```
DellEMC#show system stack-unit 1 fanout configured
Configured fan out ports in stack-unit 1
  Mod/Port      Mode      Speed
    1/1         Quad     10G
    1/3         Quad     10G
```

1/5	Quad	10G
1/7	Quad	10G
1/9	Quad	10G
1/11	Quad	10G
1/13	Quad	10G
1/15	Quad	10G
2/1	Quad	10G
2/3	Quad	10G
2/5	Quad	10G
2/7	Quad	10G
2/9	Quad	10G
2/11	Quad	10G
2/13	Quad	10G
2/15	Quad	10G

## show interfaces switchport

Display only virtual and physical interfaces in Layer 2 mode. This command displays the Layer 2 mode interfaces' IEEE 802.1Q tag status and VLAN membership.

**Syntax** `show interfaces switchport [interface-type | stack-unit unit-id ]`

- Parameters**
- interface-type** (OPTIONAL) Enter one of the following keywords and the interface information:
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
    - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
    - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
    - For a backup interface for this interface, enter the keyword `backup`.
- NOTE:** This command also enables you to view information corresponding to a range of ports.
- For physical interfaces, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
  - For port-channel interfaces, you can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.

**stack-unit unit-id** (OPTIONAL) Enter the keywords `stack-unit` then the stack member number.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
<b>9.9(0.0)</b>	Added support to display the interface configurations corresponding to a range of ports.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.2.1.0</b>	Added support for 4093 VLANs on E-Series.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Support added for hybrid port/native VLAN, introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series legacy command</b>	

### Usage Information

The following describes the `show interfaces switchport` command for the following example.

Items	Description
<b>Name</b>	Displays the interface's type, slot/port number.
<b>802.1QTagged</b>	Displays whether if the VLAN tagged ("True"), untagged ("False"), or hybrid ("Hybrid"), which supports both untagged and tagged VLANs by the port.
<b>Vlan membership</b>	Lists the VLANs to which the interface is a member. Starting with Dell EMC Networking OS version 7.6.1, this field can display native VLAN membership by the port.

### Example

```
DellEMC# show interfaces switchport
Name: TenGigabitEthernet 1/1/1
802.1QTagged: Hybrid
Vlan membership:
Vlan 2, Vlan 20
Native VlanId: 20

Name: TenGigabitEthernet 1/2/1
802.1QTagged: True
Vlan membership:
Vlan 2

Name: TenGigabitEthernet 1/3/1
802.1QTagged: True
Vlan membership:
Vlan 2

Name: TenGigabitEthernet 1/4/1
802.1QTagged: True
Vlan membership:
Vlan 2
--More--
```

**Related  
Commands**

- [interface](#) — configure a physical interface on the switch.
- [show ip interface](#) — display Layer 3 information about the interfaces.
- [show interfaces transceiver](#) — display the physical status and operational status of an installed transceiver. The output also displays the transceiver's serial number.

## show interfaces transceiver

Display the details of an installed transceiver.

**Syntax**

```
show interfaces [interface number] transceiver
```

**Parameters**

- interfaces** (OPTIONAL) Enter one of the following keywords and then the interface information:
- interface number***
- For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- i** **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.
- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
  - For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes**

- EXEC
- EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Output augmented with diagnostic data for pluggable media.
7.7.1.0	Removed three fields in the output: Vendor Name, Vendor OUI, and Vendor PN.
7.6.1.0	Introduced on the C-Series and S-Series.
6.5.4.0	Introduced on the E-Series.

### Usage Information

Use the `show interfaces transceiver` command to view the status of transceivers on all the interfaces in the system.

The following describes the columns displayed in the output of the `show interfaces transceiver` command:

Line	Description
<b>Rx Power measurement type</b>	Output depends on the vendor, typically either "Average" or "OMA" (Receiver optical modulation amplitude).
<b>Tx Power measurement type</b>	Output depends on the vendor, typically either "Supported" or "Not supported".
<b>Temp High Alarm threshold</b>	Factory-defined setting, typically in Centigrade. Value differs between SFPs and SFP+.
<b>Voltage High Alarm threshold</b>	Displays the interface index number used by SNMP to identify the interface.
<b>Bias High Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>TX Power High Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>RX Power High Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Temp Low Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Voltage Low Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Bias Low Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>TX Power Low Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>RX Power Low Alarm threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.

<b>Line</b>	<b>Description</b>
<b>Temp High Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Voltage High Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Bias High Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>TX Power High Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>RX Power High Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Temp Low Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Voltage Low Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Bias Low Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>TX Power Low Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Power Low Warning threshold</b>	Factory-defined setting. Value can differ between SFP and SFP+.
<b>Temperature</b>	Current temperature of the SFPs. If this temperature crosses Temp High alarm/warning thresholds, the temperature high alarm/warning flag is set to true.
<b>Voltage</b>	Current voltage of the SFPs. If this voltage crosses voltage high alarm/warning thresholds, the voltage high alarm/warning flag is set to true.
<b>Tx Bias Current</b>	Present transmission (Tx) bias current of the SFP. If this crosses bias high alarm/warning thresholds, the TX bias high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the TX bias low alarm/warning flag is set to true.
<b>Tx Power</b>	Present Tx power of the SFP. If this crosses Tx power alarm/warning thresholds, the Tx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Tx power low alarm/warning flag is set to true.
<b>Rx Power</b>	Present receiving (Rx) power of the SFP. This value is either average Rx power or OMA. This depends on the Rx Power measurement type displayed above. If this crosses Rx power alarm/warning thresholds, the Rx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Rx power low alarm/warning flag is set to true.
<b>Data Ready state Bar</b>	This field indicates that the transceiver has achieved power up and data is ready. This is set to true if data is ready to be sent and set to false if data is being transmitted.
<b>Rx LOS state</b>	This is the digital state of the Rx_LOS output pin. This is set to true if the operating status is down.
<b>Tx Fault state</b>	This is the digital state of the Tx Fault output pin.
<b>Rate Select state</b>	This is the digital state of the SFP rate_select input pin.

<b>Line</b>	<b>Description</b>
<b>RS state</b>	This is the reserved digital state of the pin AS(1) per SFF-8079 and RS(1) per SFF-8431.
<b>Tx Disable state</b>	If the admin status of the port is down then this flag is set to true.
<b>Temperature High Alarm Flag</b>	This can be either true or false, depending on the Current voltage value displayed above.
<b>Voltage High Alarm Flag</b>	This can be either true or false, depending on the Current Temperature value displayed above.
<b>Tx Bias High Alarm Flag</b>	This can be either true or false, depending on the present Tx bias current value displayed above.
<b>Tx Power High Alarm Flag</b>	This can be either true or false, depending on the Current Tx bias power value displayed above.
<b>Rx Power High Alarm Flag</b>	This can be either true or false, depending on the Current Rx power value displayed above.
<b>Temperature Low Alarm Flag</b>	This can be either true or false, depending on the Current Temperature value displayed above.
<b>Voltage Low Alarm Flag</b>	This can be either true or false, depending on the Current voltage value displayed above.
<b>Tx Bias Low Alarm Flag</b>	This can be either true or false, depending on the Tx bias current value displayed above.
<b>Tx Power Low Alarm Flag</b>	This can be either true or false, depending on the Current Tx power value displayed above.
<b>Rx Power Low Alarm Flag</b>	This can be either true or false, depending on the Current Rx power value displayed above.
<b>Temperature High Warning Flag</b>	This can be either true or false, depending on the Current Temperature value displayed above.
<b>Voltage High Warning Flag</b>	This can be either true or false, depending on the Current Voltage value displayed above.
<b>Tx Bias High Warning Flag</b>	This can be either true or false, depending on the Tx bias current value displayed above.
<b>Tx Power High Warning Flag</b>	This can be either true or false, depending on the Current Tx power value displayed above.
<b>Rx Power High Warning Flag</b>	This can be either true or false, depending on the Current Tx power value displayed above.
<b>Temperature Low Warning Flag</b>	This can be either true or false, depending on the Current Temperature value displayed above.
<b>Voltage Low Warning Flag</b>	This can be either true or false, depending on the Current Voltage value displayed above.
<b>Tx Bias Low Warning Flag</b>	This can be either true or false, depending on the present Tx bias current value displayed above.
<b>Tx Power Low Warning Flag</b>	This can be either true or false, depending on the Current Tx power value displayed above.
<b>Rx Power Low Warning Flag</b>	This can be either true or false, depending on the Current Rx power value displayed above.

### Example

```
DelleMC#show interfaces tengigabitethernet 1/1/2 transceiver

**Related  
Commands**

- [interface](#) — configure a physical interface on the switch.
- [show ip interface](#) — display Layer 3 information about the interfaces.

## show range

Display all interfaces configured using the `interface range` command.

**Syntax** `show range`

**Command Modes** INTERFACE RANGE (config-if-range)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Added support for 4093 VLANs on E-Series.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced.

### Example

```
DellEMC(conf-if-range-te-1/2/1,fo-1/2/6)# show range
2/2/1 - 0
2/56 - 0
```

### Related Commands

- [interface](#) — configure a physical interface on the switch.
- [show ip interface](#) — display Layer 3 information about the interfaces.

## shutdown

Disable an interface.

**Syntax** `shutdown`  
To activate an interface, use the `no shutdown` command.

**Defaults** The interface is disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

### E-Series legacy command

### Usage Information

The `shutdown` command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the `show ip interface brief` command. Disabled interfaces are listed as down.

Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the `shutdown`

command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter `no shutdown` on the port channel interface and at least one interface within that port channel.

The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port channel.

#### Related Commands

- [interface port-channel](#) — create a port channel interface.
- [interface vlan](#) — create a VLAN.
- [show ip interface](#) — display the interface routing status. Add the keyword `brief` to display a table of interfaces and their status.

## speed (for 10/100/1000/10000 interfaces)

Set the speed for 10/100/1000/10000 interfaces. Set both sides of a link to the same speed (10/100/1000/10000) or to `auto` or the link may not come up.

**Syntax** `speed {10 | 100 | 1000 | 10000 | auto}`

To return to the default setting, use the `no speed {10 | 100 | 1000 | 10000}` command.

#### Parameters

<b>10</b>	Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s. <b>i</b> <b>NOTE:</b> This interface speed is not supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card. If the command is entered for these interfaces, an error message appears.
<b>100</b>	Enter the keyword <code>100</code> to set the interface's speed to 10/100 Mb/s. <b>i</b> <b>NOTE:</b> When this setting is enabled, only 100Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
<b>1000</b>	Enter the keyword <code>1000</code> to set the interface's speed to 1000 Mb/s. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> . <b>i</b> <b>NOTE:</b> When this setting is enabled, only 1000Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
<b>10000</b>	Enter the keyword <code>10000</code> to set the interface's speed to 10000 Mb/s. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> .
<b>auto</b>	Enter the keyword <code>auto</code> to set the interface to auto-negotiate its speed. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> .

**Defaults** `auto`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.14.1.2</b>	Introduced the option <code>10000</code> speed setting on the S5048F-ON.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Added support for fanned-out 1 Gigabit SFP port.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Supported on LC-EH-GE-50P or the LC-EJ-GE-50P cards.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

### E-Series legacy command

#### Usage Information

This command is found on the 10/100/1000/10000 Base-T Ethernet interfaces.

When you enable `auto`, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000/10000 interface, confirm the negotiation `auto` command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or `auto`, the software sets the link to auto-negotiation and you cannot change that setting.

**NOTE:** Starting with Dell EMC Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the `speed` command. When you set the speed to **10** or **100 Mbps**, you can also use the `duplex` command.

If you use an active optical cable (AOC), you can convert the QSFP+ port to a 10 Gigabit SFP+ port or 1 Gigabit SFP port. Use the `speed` command to enable the required speed.

#### Related Commands

- [duplex \(10/100 Interfaces\)](#) — configures duplex mode on physical interfaces.
- [negotiation auto](#) — enable or disable auto-negotiation on an interface.

## speed (Management interface)

Set the speed for the Management interface.

**Syntax** `speed {10 | 100 | 1000 | auto}`

To return to the default setting, use the `no speed` command.

Parameters		
<b>10</b>	Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s.	
<b>100</b>	Enter the keyword <code>100</code> to set the interface's speed to 100 Mb/s.	
<b>1000</b>	Enter the keyword <code>1000</code> to set the interface's speed to 1000 Mb/s.	
<b>auto</b>	Enter the keyword <code>auto</code> to set the interface to auto-negotiate its speed.	

**Defaults** `auto`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-Version 6.2.1.0</b>	Introduced on the E-Series.

#### Usage Information

This command is found on the Management interface only.

#### Related Commands

- [interface ManagementEthernet](#) — configure the Management port on the system (either the Primary or Standby RPM).
- [management route](#) — configure a static route that points to the Management interface or a forwarding router.

## stack-unit portmode

Convert a single 40G port into 4x10G ports in a 16x40G module and a single 100G port into 2x50G ports, 1x40G port, 4x25G ports or 4x10G ports in an 8x100G module.

#### Syntax

```
stack-unit stack-unit-number port number portmode {dual speed 50G | quad speed {25G | 10G} | single speed 40G} [no-confirm]
```

#### Parameters

<b><i>stack-unit</i></b>	Enter the stack member unit identifier of the stack member to reset.
<b>port</b>	Enter the keyword <code>port</code> then the port number to specify the port where fanout mode is specified.
<b>single</b>	Convert a single 100G port into one 40G port.
<b>dual</b>	Split a single 100G port into two 50G ports.
<b>quad</b>	Split a single 100G port into four 10G or four 25G ports or split a single 40G port into four 10G ports
<b>no-confirm</b>	(OPTIONAL) Enter the keywords <code>no-confirm</code> to reset any previous configuration and apply the new configuration immediately. If you this option, the system does not prompt you to confirm the deletion of any existing configuration.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.7(0.0)	Added support for dynamically fanning-out of interfaces on S6000. Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.1	Introduced on the S4810.

### Usage Information

You can split a 100G port into two 50G, one 40G, four 10G, or four 25G ports.

You can use the `stack-unit portmode` command to dynamically fan-out 100G ports into two 50G, one 40G, four 10G, or four 25G ports and vice-versa without reloading a switch.

The port must be in a default configuration before it can be split. As the 100G port is lost in the configuration when the port is split, ensure that you remove the port from other L2/L3 feature configurations.

If you use a 40G LR4 or 40G LM4 optics, you can only convert a 100G port into a 1x40G port. LR4 and LM4 optics do not support dual mode or quad mode configurations.

To convert a fanned-out port back to 100G, use the `no` form of the `stack-unit portmode` command.

### Example

Example of converting a 100G port to 1x40G

```
DellEMC(conf)#stack-unit 1 module 1 port 1 portmode single speed 40G
Warning: Enabling Single mode on stack-unit 1 module 1 port 1. Please
verify whether the configs related to interface Hu 1/1/1 are cleaned up
before proceeding further.
[confirm yes/no]:yes
Single mode is enabled on stack-unit 1 module 1 port 1
DellEMC(conf)#Sep 18 05:16:49: %STKUNIT1-M:CP %IFMGR-5-DYNAMIC_FANOUT:
Port 1 in slot 1 has been fanned-out
```

## switchport

Place an interface in Layer 2 mode.

### Syntax

```
switchport [[backup interface {interface | port-channel number}] | mode
private-vlan {host | promiscuous | trunk}]
```

To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a switchport backup interface is configured, first remove the backup configuration. To remove a switchport backup interface, enter the `no switchport backup interface` command.

### Parameters

- backup** (OPTIONAL) Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keyword `backup` configures a backup port so that if the primary port fails, the backup port changes to the up state. If the primary later comes up, it becomes the backup.
- interface *interface*** (OPTIONAL) Enter any of the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

<b>port-channel</b>	(OPTIONAL) Enter the keywords <code>port-channel</code> if the backup port is a static or dynamic port channel.
<b>mode</b>	(OPTIONAL) Enter the keyword <code>mode</code> to set the interface mode.
<b>private-vlan</b>	(OPTIONAL) Enter the keywords <code>private-vlan</code> to set the interface mode to private VLAN mode.
<b>host</b>	(OPTIONAL) Enter the keyword <code>host</code> to set the private VLAN interface to host mode.
<b>promiscuous</b>	(OPTIONAL) Enter the keyword <code>promiscuous</code> to set the private VLAN interface to promiscuous mode.
<b>trunk</b>	(OPTIONAL) Enter the keyword <code>trunk</code> to set the private VLAN interface to trunk mode.

**Defaults** Disabled — interface is in Layer 3 mode.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.4.1.0</b>	Added support for port-channel interfaces (the <code>port-channel number</code> option).
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.7.1.0</b>	Added the <code>backup interface</code> option.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-Version 6.2.1.0</b>	Introduced on the E-Series.

## Usage Information

If an IP address or VRRP group is assigned to the interface, you cannot use the `switchport` command on the interface. To use the `switchport` command on an interface, only the `no ip address` and `no shutdown` statements must be listed in the `show config` output.

When you enter the `switchport` command, the interface is automatically added to the default VLAN.

To use the `switchport backup interface` command on a port, first enter the `switchport` command. For more information, see “Configuring Redundant Links” in the Layer 2 section in the *Dell EMC Networking OS Configuration Guide*.

## wavelength

Set the wavelength for tunable 10-Gigabit SFP+ optics.

### Syntax

`wavelength`

To retain the existing wavelength, use the `no wavelength` command.

### Defaults

none

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

#### Version

#### Description

##### 9.10(0.1)

Introduced on the S6010-ON and S4048T-ON.

##### 9.10(0.0)

Introduced on the S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, M I/O Aggregator, FN I/O Module, MXL, C9010, S3100 series, and Z9100-ON.

## Usage Information

The wavelength can be configured only on a tunable 10-Gigabit SFP+ optic. The wavelength range is from 1528.3 nm to 1568.77nm.

If you configure the wavelength on a non-tunable optic, there is no change to the existing wavelength. The configured wavelength is saved in the running configuration and is applicable, when a tunable optic is used.

If you do not configure the wavelength on an inserted tunable optic, the existing wavelength is used.

## Example

The following example shows the wavelength set for a tunable 10-Gigabit SFP+ optic:

```
DellEMC(conf-if-te-1/1/1) # wavelength 1528.30
```

## Related Commands

- [show config](#) — displays the interface configuration.

## Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell EMC Networking OS, a LAG is referred to as a Port Channel.

- The platform supports 4096 port channels and 16 members per port channel.

As each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed.

**NOTE:** The Dell EMC Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell EMC Networking OS link aggregation control protocol (LACP) for dynamic LAGs, refer to the [Link Aggregation Control Protocol \(LACP\)](#) chapter. For more information about configuring and using Port Channels, refer to the *Dell EMC Networking OS Configuration Guide*.

# channel-member

Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

**Syntax** `channel-member interface`

To delete an interface from a Port Channel, use the `no channel-member interface` command.

**Parameters** **interface** (OPTIONAL) Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**Defaults** Not configured.

**Command Modes** INTERFACE PORTCHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

**Usage Information** Use the `interface port-channel` command to access this command.

You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the `shutdown`, `description`, `mtu`, and `ip mtu` commands can be configured on an interface if it is added to a Port Channel. The `mtu` and `ip mtu` commands are only available when the chassis is in Jumbo mode.

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

You can have 16 interfaces per port channel. The interfaces can be located on different line cards but must be the same physical type and speed (for example, all 10-Gigabit Ethernet interfaces).

For more information about Port Channels, refer to the *Dell EMC Networking OS Configuration Guide*.

#### Related Commands

- [description](#) — assign a descriptive text string to the interface.
- [interface port-channel](#) — create a Port Channel interface.
- [shutdown](#) — disable/enable the port channel.

## group

Group two LAGs in a supergroup ("fate-sharing group" or "failover group").

#### Syntax

```
group group_number port-channel number port-channel number
```

To remove an existing LAG supergroup, use the `no group group_number` command.

#### Parameters

**group\_number** Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group.

**port-channel number** Enter the keywords `port-channel` then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs.

#### Defaults

None

#### Command Modes

PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.12.0	Introduced on S4810.
8.3.11.1	Introduced on Z9000.
8.1.1.0	Introduced on E-Series.
7.6.1.0	Introduced on S-Series.
7.5.1.0	Introduced on C-Series.
<b>pre-Version</b>	Introduced on E-Series.
6.2.1.0	

**Usage Information**

Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the `switchport` command) or Layer 3 mode (by configuring an IP address). You can add a Port Channel in Layer 2 mode to a VLAN.

The `shutdown`, `description`, and `name` commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel,

the interface can only have the `shutdown`, `description`, and `name` commands configured. The Port Channel's configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain any physical interface. Based on the first interface configured in the Port Channel and enabled, Dell EMC Networking OS determines the common speed. For more information, refer to [channel-member](#).

If the line card is in a Jumbo mode chassis, you can also configure the `mtu` and `ip mtu` commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

If the stack—unit card is in a Jumbo mode chassis, you can also configure the `mtu` and `ip mtu` commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

**NOTE:** In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

### Example

```
DellEMC(conf)# int port-channel 2
DellEMC(conf-if-po-2)#
```

### Related Commands

- [channel-member](#) — add a physical interface to the LAG.
- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a Loopback interface.
- [interface null](#) — configure a null interface.
- [interface vlan](#) — configure a VLAN.
- [shutdown](#) — disable/enable the port channel.

## minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in “oper up” status for the LAG to be also in “oper up” status.

<b>Syntax</b>	<code>minimum-links number</code>
<b>Parameters</b>	<b>number</b> Enter the number of links in a LAG that must be in “oper up” status. The range is from 1 to 16. The default is <b>1</b> .
<b>Defaults</b>	<b>1</b>
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

**Usage Information**

If you use this command to configure the minimum number of links in a LAG that must be in “oper up” status, the LAG must have at least that number of “oper up” links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.

## port-channel failover-group

To configure a LAG failover group, access PORT-CHANNEL FAILOVER-GROUP mode.

**Syntax** `port-channel failover-group`  
 To remove all LAG failover groups, use the `no port-channel failover-group` command.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.

**Usage Information**

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, see the “Port Channel” section in the *Dell EMC Networking OS Configuration Guide*.

**Related Command**

- [group](#) — group two LAGs in a supergroup (“fate-sharing group”).
- [show interfaces port-channel](#) — display information on configured Port Channel groups.

## show interfaces port-channel

Display information on configured Port Channel groups.

**Syntax**

```
show interfaces port-channel [channel-number] [brief] [description]
```

**Parameters**

- channel-number** For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 4096.
-  **NOTE:** This command also enables you to view information corresponding to a range of ports.
- For port-channel interfaces, you can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.
- brief** (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.
- description** (OPTIONAL) Displays the port-channel information with description.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the number of port channels to 4096.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series. Modified to display the LAG failover group status.
7.5.1.0	Introduced on the C-Series.

## Version Description

### E-Series legacy command

#### Usage Information

The following describes the `show interfaces port-channel` command shown in the following example.

## Field Description

<b>Port-Channel 1...</b>	Displays the LAG's status. In the Example, the status of the LAG's LAG fate-sharing group ("Failover-group") is listed.
<b>Hardware is...</b>	Displays the interface's hardware information and its assigned MAC address.
<b>Port-channel is part...</b>	Indicates whether the LAG is part of a LAG fate-sharing group ("Failover-group").
<b>Internet address...</b>	States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.
<b>MTU 1554...</b>	Displays link and IP MTU.
<b>LineSpeed</b>	Displays the interface's line speed. For a port channel interface, it is the line speed of the interfaces in the port channel.
<b>Members in this...</b>	Displays the interfaces belonging to this port channel.
<b>ARP type:...</b>	Displays the ARP type and the ARP timeout value for the interface.
<b>Last clearing...</b>	Displays the time when the <code>show interfaces</code> counters were cleared.
<b>Queueing strategy.</b>	States the packet queuing strategy. FIFO means first in first out.
<b>packets input...</b>	Displays the number of packets and bytes into the interface.
<b>Input 0 IP packets...</b>	Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet.
<b>0 64-byte...</b>	Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.
<b>Received 0...</b>	Displays the type and number of errors or other specific packets received. This information is displayed over three lines.
<b>Output 0...</b>	Displays the type and number of packets sent out the interface. This information is displayed over three lines.
<b>Rate information...</b>	Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.
<b>Time since...</b>	Displays the time since the last change in the configuration of this interface.

#### Example

```
DellEMC# show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1 is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Hu 2/5 Hu 2/18
ARP type: ARPA, ARP timeout 04:00:00
Last clearing of "show interfaces" counters 00:00:00
Queueing strategy: fifo
 44507301 packets input, 3563070343 bytes
Input 44506754 IP Packets, 0 Vlans 0 MPLS
 41 64-byte pkts, 44502871 over 64-byte pkts, 249 over 127-byte pkts
 407 over 255-byte pkts, 3127 over 511-byte pkts, 606 over 1023-byte
pkts
```

```

Received 0 input symbol errors, 0 runts, 0 giants, 0 throttles
0 CRC, 0 IP Checksum, 0 overrun, 0 discarded
1218120 packets output, 100745130 bytes, 0 underruns
Output 5428 Multicasts, 4 Broadcasts, 1212688 Unicasts
1216142 IP Packets, 0 Vlans, 0 MPLS
0 throttles, 0 discarded
Rate info (interval 299 sec):
  Input 01.50Mbits/sec, 2433 packets/sec
  Output 00.02Mbits/sec, 4 packets/sec
Time since last interface status change: 00:22:34

DellEMC#

```

**User Information** The following describes the `show interfaces port-channel brief` command shown in the following example.

Field	Description
<b>LAG</b>	Lists the port channel number.
<b>Mode</b>	Lists the mode: <ul style="list-style-type: none"> <li>• L3 — for Layer 3</li> <li>• L2 — for Layer 2</li> </ul>
<b>Status</b>	Displays the status of the port channel. <ul style="list-style-type: none"> <li>• down — if the port channel is disabled (<code>shutdown</code>)</li> <li>• up — if the port channel is enabled (<code>no shutdown</code>)</li> </ul>
<b>Uptime</b>	Displays the age of the port channel in hours:minutes:seconds.
<b>Ports</b>	Lists the interfaces assigned to this port channel.
<b>(untitled)</b>	Displays the status of the physical interfaces (up or down). <ul style="list-style-type: none"> <li>• In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU.</li> <li>• In Layer 3 port channels, the primary port is not indicated.</li> </ul>

### Example

```

DellEMC# show interfaces port-channel 1 brief

LAG Mode Status Uptime Ports
1 L2 up 00:00:08 Te 3/1/1 (Up) *
Te 3/2/1 (Down)
Te 3/3/1 (Up)

DellEMC#

```

### Related Commands

- [show lacp](#) — display the LACP matrix.

## show port-channel-flow

Display an egress port in a given port-channel flow.

### Syntax

```

show port-channel-flow outgoing-port-channel number incoming-interface
interface {source-ip address destination-ip address} | {source-port number
destination-port number} | {source-mac address destination-mac address
{vlan vlanid | ether-type}}

```

### Parameters

<b>outgoing-port-channel <i>number</i></b>	Enter the keywords <code>outgoing-port-channel</code> then the number of the port channel to display flow information. <ul style="list-style-type: none"> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 4096.</li> </ul>
<b>incoming-interface <i>interface</i></b>	Enter the keywords <code>incoming-interface</code> then the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

<b>source-ip address</b>	Enter the keywords <code>source-ip</code> then the IP source address in IP address format.
<b>destination-ip address</b>	Enter the keywords <code>destination-ip</code> then the IP destination address in IP address format.
<b>source-port number</b>	Enter the keywords <code>source-port</code> then the source port number. The range is from 1 to 65536. The default is <b>None</b> .
<b>destination-port number</b>	Enter the keywords <code>destination-port</code> then the destination port number. The range is from 1 to 65536. The default is <b>None</b> .
<b>source-mac address</b>	Enter the keywords <code>source-mac</code> then the MAC source address in the <code>nn:nn:nn:nn:nn:nn</code> format.
<b>destination-mac address</b>	Enter the keywords <code>destination-mac</code> then the MAC destination address in the <code>nn:nn:nn:nn:nn:nn</code> format.
<b>vlan vlan-id</b>	Enter the keywords <code>vlan</code> then the VLAN-id. The range is from 0 to 4094.
<b>ether-type</b>	Enter the keywords <code>ether-type</code> in the <code>XX:XX</code> format.

**Command Modes** EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Increased the number of port channels to 4096.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.10.0</b>	Introduced on the S4810.

**Usage Information**

Because this command calculates based on a Layer 2 hash algorithm, use this command to display flows for switched Layer 2 packets, not for routed packets (use the `show ip flow` command to display routed packets).

The `show port-channel-flow` command returns the egress port identification in a given port-channel if a valid flow is entered. A mismatched flow error occurs if MAC-based hashing is configured for a Layer 2 interface and you are trying to display a Layer 3 flow.

The output displays three entries:

- Egress port for unfragmented packets.
- In the event of fragmented packets, the egress port of the first fragment.
- In the event of fragmented packets, the egress port of the subsequent fragments.

**i** **NOTE:** In the `show port channel flow` command output, the egress port for an unknown unicast, multicast, or broadcast traffic is not displayed.

The following example shows the `show port-channel-flow outgoing-port-channel number incoming-interface interface source-mac address destination-mac address`

- Load-balance is configured for MAC
- Load-balance is configured for IP 4-tuple/2-tuple
- A non-IP payload is going out of Layer 2 LAG interface that is a member of VLAN with an IP address

### Example

```
DellEMC# show port-channel-flow outgoing-port-channel 1 incoming-
interface te 1/1/3
source-mac 00:00:50:00:00:00 destination-mac 00:00:a0:00:00:00

Egress Port for port-channel 1, for the given flow, is Te 1/2/2
```

## Enhanced Validation of Interface Ranges

You can avoid specifying spaces between the range of interfaces, separated by commas, that you configure by using the `interface range` command. For example, if you enter a list of interface ranges, such as `interface range hu 1/1,fo 1/2/1`, this configuration is considered valid. The comma-separated list is not required to be separated by spaces in between the ranges. You can associate multicast MAC or hardware addresses to an interface range and VLANs by using the `mac-address-table static multicast-mac-address vlan vlan-id output-range interface` command.

## ip http source-interface

Specify an interface as the source interface for HTTP connections.

**Syntax** `ip http source-interface interface`

To delete an interface, use the `no ip http source-interface interface` command.

**Parameters** `interface`

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

<b>9.3(0.1)</b>	Introduced on the S4810, S4820T, S6000, and Z9000.
<b>8.3.11.1</b>	Introduced on the Z9000
<b>8.2.1.0</b>	Increased number of VLANs to 4094 (was 2094)
<b>8.1.1.0</b>	Introduced on E-Series
<b>7.6.1.0</b>	Support added for S-Series
<b>7.5.1.0</b>	Introduced on C-Series

## IPv4 Routing

The basic IPv4 commands are supported by Dell EMC Networking OS on the platform.

### Topics:

- arp
- arp backoff-time
- arp learn-enable
- arp max-entries
- arp retries
- arp timeout
- clear arp-cache
- clear host
- clear ip fib stack-unit
- clear ip route
- clear tcp statistics
- debug arp
- debug ip dhcp
- debug ip icmp
- debug ip packet
- ip address
- ip directed-broadcast
- ip domain-list
- ip domain-lookup
- ip domain-name
- ip helper-address
- ip helper-address hop-count disable
- ip host
- ip icmp source-interface
- ipv6 icmp source-interface
- ip max-frag-count
- ip name-server
- ip proxy-arp
- ip route
- ip source-route
- ip tcp initial-time
- ip unknown-unicast
- ipv4 unicast-host-route
- show ip tcp initial-time
- ip unreachable
- load-balance
- load-balance hg
- management route
- show arp
- show arp retries
- show hosts
- show ip cam stack-unit
- show ip fib stack-unit
- show ip flow
- show ip interface
- show ip management-route

- [show ipv6 management-route](#)
- [show ip protocols](#)
- [show ip route](#)
- [show ip route list](#)
- [show ip route summary](#)
- [show ip traffic](#)
- [show tcp statistics](#)

## arp

To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

**Syntax** `arp [vrf vrf-name] ip-address mac-address interface`

To remove an ARP address, use the `no arp ip-address` command.

<b>Parameters</b>	<b>vrf vrf-name</b>	Enter a VRF name to configure an ARP entry for that VRF. Use the VRF option after the keyword <code>arp</code> to configure a static arp on that particular VRF.
	<b>ip-address</b>	Enter an IP address in dotted decimal format.
	<b>mac-address</b>	Enter a MAC address in nnnn.nnnn.nnnn format.
	<b>interface</b>	Enter any of the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul>

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.0	Introduced on the E-Series.

### Usage Information

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

You can use the `vrf` attribute of this command to create a static ARP entry on either a default or a non-default VRF. You cannot use this parameter to create any static ARPs corresponding to management VRFs. When a VRF is deleted using the `no ip vrf` command, all the static ARP configurations that belong to that VRF are removed automatically.

Although static ARP entries take precedence over dynamically-learned ARP entries, a static ARP entry that points to a wrong port is not included in the FIB or ARP entries.

### Related Commands

- [clear arp-cache](#) — clear dynamic ARP entries from the ARP table.
- [show arp](#) — display the ARP table.

## arp backoff-time

Set the exponential timer for resending unresolved ARPs.

<b>Syntax</b>	<code>arp backoff-time seconds</code>	
<b>Parameters</b>	<b>seconds</b>	Enter the number of seconds an ARP entry is black-holed. The range is from 1 to 3600. The default is <b>30</b> .
<b>Defaults</b>	<b>30</b>	
<b>Command Mode</b>	CONFIGURATION	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information**

This timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.

**Related Commands**

- `show arp retries` — display the configured number of ARP retries.

## arp learn-enable

Enable ARP learning using gratuitous ARP.

**Syntax** `arp learn-enable`

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced.

**Usage Information**

In Dell EMC Networking OS versions prior to 8.3.1.0, if a gratuitous ARP is received some time after an ARP request is sent, only RP2 installs the ARP information. For example:

1. At time  $t=0$ , Dell EMC Networking OS sends an ARP request for IP *A.B.C.D*.
2. At time  $t=1$ , Dell EMC Networking OS receives an ARP request for IP *A.B.C.D*.
3. At time  $t=2$ , Dell EMC Networking OS installs an ARP entry for *A.B.C.D* only on RP2.

Beginning with Dell EMC Networking OS version 8.3.1.0, when a gratuitous ARP is received, Dell EMC Networking OS installs an ARP entry on all three CPUs.

## arp max-entries

Enables you to configure the maximum number of ARP entries per VRF that are allowed for IPv4..

<b>Syntax</b>	<code>arp max-entries [vrf vrf-name] max-number</code>																				
<b>Parameters</b>	<table><tr><td><b>vrf vrf-name</b></td><td>Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows.</td></tr><tr><td><b>max-number</b></td><td>Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.</td></tr></table>	<b>vrf vrf-name</b>	Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows.	<b>max-number</b>	Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.																
<b>vrf vrf-name</b>	Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows.																				
<b>max-number</b>	Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.																				
<b>Defaults</b>	Not configured.																				
<b>Command Modes</b>	CONFIGURATION																				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .																				
	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td><b>9.10(0.1)</b></td><td>Introduced on the S6010-ON and S4048T-ON.</td></tr><tr><td><b>9.10(0.0)</b></td><td>Introduced on the S3148.</td></tr><tr><td><b>9.10(0.0)</b></td><td>Introduced on the S6100-ON.</td></tr><tr><td><b>9.8(2.0)</b></td><td>Introduced on the S3100 series.</td></tr><tr><td><b>9.8(1.0)</b></td><td>Introduced on the Z9100-ON.</td></tr><tr><td><b>9.8(0.0P5)</b></td><td>Introduced on the S4048-ON.</td></tr><tr><td><b>9.8(0.0P2)</b></td><td>Introduced on the S3048-ON.</td></tr><tr><td><b>9.7(0.0)</b></td><td>Introduced on the S6000-ON.</td></tr><tr><td><b>9.4.(0.0)</b></td><td>Introduced on the S4810 and S4820T.</td></tr></tbody></table>	Version	Description	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.	<b>9.10(0.0)</b>	Introduced on the S3148.	<b>9.10(0.0)</b>	Introduced on the S6100-ON.	<b>9.8(2.0)</b>	Introduced on the S3100 series.	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.	<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.	<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.	<b>9.7(0.0)</b>	Introduced on the S6000-ON.	<b>9.4.(0.0)</b>	Introduced on the S4810 and S4820T.
Version	Description																				
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.																				
<b>9.10(0.0)</b>	Introduced on the S3148.																				
<b>9.10(0.0)</b>	Introduced on the S6100-ON.																				
<b>9.8(2.0)</b>	Introduced on the S3100 series.																				
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.																				
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.																				
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.																				
<b>9.7(0.0)</b>	Introduced on the S6000-ON.																				
<b>9.4.(0.0)</b>	Introduced on the S4810 and S4820T.																				
<b>Usage Information</b>	Use this command to specify the maximum number of ARP entries that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.																				

## arp retries

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

<b>Syntax</b>	<code>arp retries number</code>		
<b>Parameters</b>	<table><tr><td><b>number</b></td><td>Enter the number of retries. The range is from 1 to 20. The default is <b>5</b>.</td></tr></table>	<b>number</b>	Enter the number of retries. The range is from 1 to 20. The default is <b>5</b> .
<b>number</b>	Enter the number of retries. The range is from 1 to 20. The default is <b>5</b> .		
<b>Defaults</b>	<b>5</b>		
<b>Command Modes</b>	CONFIGURATION		
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .		

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced.

#### Usage Information

Retries are 20 seconds apart.

#### Related Commands

- [show arp retries](#) — display the configured number of ARP retries.

## arp timeout

Set the time interval for an ARP entry to remain in the ARP cache.

#### Syntax

`arp timeout minutes`

#### Parameters

***minutes*** Enter the number of minutes. The range is from 0 to 35790. The default is **240 minutes**.

#### Defaults

**240 minutes** (4 hours)

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

## clear arp-cache

Clear the dynamic ARP entries from a specific interface or optionally delete (`no-refresh`) ARP entries from the content addressable memory (CAM).

<b>Syntax</b>	<code>clear arp-cache [vrf vrf-name   interface   ip ip-address] [no-refresh]</code>
<b>Parameters</b>	
<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear the ARP cache corresponding to that VRF.
<b>interface</b>	(OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>
<b>ip ip-address</b>	(OPTIONAL) Enter the keyword <code>ip</code> then the IP address of the ARP entry you wish to clear.
<b>no-refresh</b>	(OPTIONAL) Enter the keywords <code>no-refresh</code> to delete the ARP entry from CAM. Or use this option with <code>interface</code> or <code>ip ip-address</code> to specify which dynamic ARP entries you want to delete. <p> <b>NOTE:</b> Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and re-installed in CAM. Use this option with extreme caution.</p>
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.9.1.0</b>	Introduced VRF on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.2.1.1</b>	Introduced on the E-Series.

## clear host

Remove one or all dynamically learned host table entries.

**Syntax** `clear host name`

**Parameters** **name** Enter the name of the host to delete. Enter \* to delete all host table entries.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

## clear ip fib stack-unit

Clear all FIB entries in the specified stack unit (use this command with caution, refer to *Usage Information*.)

**Syntax** `clear ip fib stack-unit unit-number vrf vrf-name`

**Parameters**

- unit-number*** Enter the number of the stack unit.
- vrf vrf-name*** Enter the keyword `vrf` followed by the name of the VRF to clear all FIB entries corresponding to that VRF.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.19.0	Introduced on the S4820T.

**Usage Information** To clear Layer 3 CAM inconsistencies, use this command.

 **CAUTION: Executing this command causes traffic disruption.**

**Related Commands**

- [show ip fib stack-unit](#) — show FIB entries on a specified stack-unit.

# clear ip route

Clear one or all routes in the routing table.

**Syntax** `clear ip route [vrf vrf-name] {* | ip-address mask}`

**Parameters**

- vrf vrf-name** (Optional) Enter the keyword `vrf` and then the name of the VRF to clear the routes corresponding to that VRF.
- \*** Enter an asterisk (\*) to clear all learned IP routes.
- ip-address mask** Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Usage Information** Use the `vrf vrf-name` attribute of this command to clear routes corresponding to either a specific VRF or the default VRF.

You cannot use this attribute to clear routes corresponding to a management VRF.

**Related Commands**

- [ip route](#) — assign an IP route to the switch.
- [show ip route](#) — view the routing table.
- [show ip route summary](#) — view a summary of the routing table.

# clear tcp statistics

Clear TCP counters.

**Syntax** `clear tcp statistics [all | cp]`

**Parameters**

<b>all</b>	Enter the keyword <code>all</code> to clear all TCP statistics maintained on all switch processors.
<b>cp</b>	(OPTIONAL) Enter the <code>cp</code> to clear only statistics from the Control Processor.
<b>rp</b>	(OPTIONAL) Enter the keyword <code>rp</code> to clear only the statistics from Route Processor.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

# debug arp

View information on ARP transactions.

**Syntax** `debug arp [interface] [count value]`

To stop debugging ARP transactions, use the `no debug arp` command.

**Parameters**

<b>interface</b>	(OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li></ul>
------------------	---

- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**count value** (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series(the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the <code>count</code> option.

**Usage Information** To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

# debug ip dhcp

Enable debug information for dynamic host configuration protocol (DHCP) relay transactions and display the information on the console.

**Syntax**                `debug ip dhcp`  
To disable debug, use the `no debug ip dhcp` command.

**Defaults**              Debug disabled

**Command Modes**      EXEC Privilege

**Command History**     This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Related  
Commands**

- [ip helper-address](#) – specify the destination broadcast or host address for the DHCP server request.
- [ip helper-address hop-count disable](#) – disable the hop-count increment for the DHCP relay agent.

## debug ip icmp

View information on the internal control message protocol (ICMP).

**Syntax**

```
debug ip icmp [interface] [count value]
```

To disable debugging, use the `no debug ip icmp` command.

**Parameters**

***interface***

(OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

***count value***

(OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is **Infinity**.

**Command Modes** EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version**

**Description**

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the count option.

### Example

```
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
```

### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

## debug ip packet

View a log of IP packets sent and received.

### Syntax

```
debug ip packet [access-group name] [count value] [interface]
```

To disable debugging, use the `no debug ip packet [access-group name] [count value] [interface]` command.

### Parameters

- access-group name** Enter the keyword `access-group` then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL.
- count value** (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is `Infinity`.
- interface** (OPTIONAL) Enter the following keywords and the interface information:
  -

- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Added the <code>access-group</code> option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the <code>count</code> option.

**Usage Information** The following describes the `debug ip packet` command in the following example.

Field	Description
<b>s=</b>	Lists the source address of the packet and the name of the interface (in parentheses) that received the packet.
<b>d=</b>	Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.
<b>len</b>	Displays the packet's length.
<b>sending, rcvd, fragment, sending broad/multicast proto, unroutable</b>	The last part of each line lists the status of the packet.
<b>TCP src=</b>	Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.

Field	Description
<b>UDP src=</b>	Displays the source and destination ports for the UDP packets.
<b>ICMP type=</b>	Displays the ICMP type and code.
<b>IP Fragment</b>	States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram.

### Example

```
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 54, sending
    TCP src=23, dst=40869, seq=2112994894, ack=606901739, win=8191 ACK
PUSH
IP: s=10.1.2.206 (Ma 1/1), d=10.1.2.62, len 40, rcvd
    TCP src=0, dst=0, seq=0, ack=0, win=0
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 226, sending
    TCP src=23, dst=40869, seq=2112994896, ack=606901739, win=8192 ACK
PUSH
IP: s=10.1.2.216 (Ma 1/1), d=10.1.2.255, len 78, rcvd
    UDP src=0, dst=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 1/1), len 1500, sending fragment
    IP Fragment, Ident = 4741, fragment offset = 0
    ICMP type=0, code=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 1/1), len 1500, sending fragment
    IP Fragment, Ident = 4741, fragment offset = 1480
IP: s=40.40.40.40 (local), d=224.0.0.5 (Te 4/11/1), len 64, sending
    broad/multicast
    proto=89
IP: s=40.40.40.40 (local), d=224.0.0.6 (Te 4/11/1), len 28, sending
    broad/multicast
    proto=2
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0
```

### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

The `access-group` option supports only the equal to (`eq`) operator in TCP ACL rules. Port operators not equal to (`neq`), greater than (`gt`), less than (`lt`), or range are not supported in `access-group` option (refer to the following example). ARP packets (`arp`) and Ether-type (`ether-type`) are also not supported in the `access-group` option. The entire rule is skipped to compose the filter.

The `access-group` option pertains to:

- IP protocol number: from 0 to 255
- Internet control message protocol (`icmp`) but not the ICMP message type (from 0 to 255)
- Any internet protocol (`ip`)
- Transmission Control Protocol (`tcp`) but not on the `rst`, `syn`, or `urg` bits
- User Datagram Protocol (`udp`)

In the case of ambiguous access control list rules, the `debug ip packet access-control` command is disabled. A message appears identifying the error (refer to the Example below).

### Example (Error Messages)

```
DellEMC# debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug

DellEMC#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not
supported in access-list debug, access-list debugging is turned off
DellEMC#
```

# ip address

Assign a primary and secondary IP address to the interface.

**Syntax** `ip address ip-address mask [secondary]`

To delete an IP address from an interface, use the `no ip address [ip-address]` command.

**Parameters**

<b><i>ip-address</i></b>	Enter an IP address in dotted decimal format.
<b><i>mask</i></b>	Enter the mask of the IP address in slash prefix format (for example, /24).
<b><i>secondary</i></b>	(OPTIONAL) Enter the keyword <i>secondary</i> to designate the IP address as the secondary address.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.

**Usage Information** You must be in INTERFACE mode before you add an IP address to an interface. Assign an IP address to an interface prior to entering ROUTER OSPF mode.

# ip directed-broadcast

Enables the interface to receive directed broadcast packets.

**Syntax** `ip directed-broadcast`

To disable the interface from receiving directed broadcast packets, use the `no ip directed-broadcast` command.

**Defaults** Disabled (that is, the interface does not receive directed broadcast packets)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

## ip domain-list

Configure names to complete unqualified host names.

**Syntax** `ip domain-list name`

To remove the name, use the `no ip domain-list name` command.

**Parameters** *name* Enter a domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

### Usage Information

To configure a list of possible domain names, configure the `ip domain-list` command up to six times.

If you configure both the `ip domain-name` and `ip domain-list` commands, the software tries to resolve the name using the `ip domain-name` command. If the name is not resolved, the software goes through the list of names configured with the `ip domain-list` command to find a match.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command. To view a DNS-related configuration, use the `show running-config resolve` command.

### Related Commands

- [ip domain-name](#) — specify a DNS server.

## ip domain-lookup

To address resolution (that is, DNS), enable dynamic host-name.

### Syntax

`ip domain-lookup`

To disable DNS lookup, use the `no ip domain-lookup` command.

### Defaults

Disabled.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**Usage Information**

To fully enable DNS, also specify one or more domain name servers with the `ip name-server` command.

Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out all other interfaces, including the Management port.

To view current bindings, use the `show hosts` command.

**Related Commands**

- `ip name-server` — specify a DNS server.
- `show hosts` — view the current bindings.

## ip domain-name

Configure one domain name for the switch.

**Syntax**

`ip domain-name name`

To remove the domain name, use the `no ip domain-name` command.

**Parameters**

**name** Enter one domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

### Usage Information

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

### Related Commands

- [ip domain-list](#) — configure additional names.

## ip helper-address

Specify the address of a DHCP server so that DHCP broadcast messages can be forwarded when the DHCP server is not on the same subnet as the client.

### Syntax

```
ip helper-address ip-address
```

To remove a DHCP server address, use the `no ip helper-address` command.

### Parameters

**ip-address** Enter an IP address in dotted decimal format (A.B.C.D).

### Defaults

Not configured.

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Added support for IPv6.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

### Usage Information

You can add multiple DHCP servers by entering the `ip helper-address` command multiple times. If multiple servers are defined, an incoming request is sent simultaneously to all configured servers and the reply is forwarded to the DHCP client.

Dell EMC Networking OS uses standard DHCP ports, that is UDP ports 67 (server) and 68 (client) for DHCP relay services. It listens on port 67 and if it receives a broadcast, the software converts it to unicast, and forwards to it to the DHCP-server with source port=68 and destination port=67.

The server replies with source port=67, destination port=67 and Dell EMC Networking OS forwards to the client with source port=67, destination port=68.

## ip helper-address hop-count disable

Disable the hop-count increment for the DHCP relay agent.

### Syntax

```
ip helper-address hop-count disable
```

To re-enable the hop-count increment, use the `no ip helper-address hop-count disable` command.

### Defaults

Enabled; the hops field in the DHCP message header is incremented by default.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

6.3.1.0	Introduced for the E-Series.

**Usage Information**

This command disables the incrementing of the hops field when boot requests are relayed to a DHCP server through Dell EMC Networking OS. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

**Related Commands**

- [ip helper-address](#) — specify the destination broadcast or host address for DHCP server requests.
- [show running-config](#) — display the current configuration and changes from the default values.

## ip host

Assign a name and an IP address to the host-to-IP address mapping table.

**Syntax**

`ip host name ip-address`

To remove an IP host, use the `no ip host name [ip-address]` command.

**Parameters**

- name** Enter a text string to associate with one IP address.
- ip address** Enter an IP address, in dotted decimal format, to be mapped to the name.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced for the E-Series.

## ip icmp source-interface

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv4 packets.

**Syntax** `ip icmp source-interface interface`

**Parameters**

***interface***

Enter one of the following keywords and slot/port or number information:

- For a Management Ethernet interface, enter the keyword `managementethernet`.

**NOTE:**

- When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configured without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.
  - For ICMP, a user can specify one source-interface for each VRF and let it be the default, management or any other VRF created. For other protocols (Telnet, SSH, FTP, TFTP), where the source interface can be specified, only one interface can be chosen. This is for all VRFs combined.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S4820T, S6000, and Z9000 platforms.

## Usage Information

You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the `ping` and `traceroute` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

## Example

```
DellEMC(conf)# ip icmp source-interface tengigabitethernet 1/1/1
DellEMC(conf)#
```

# ipv6 icmp source-interface

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv6 packets.

**Syntax** `ipv6 icmp source-interface interface`

**Parameters** *interface*

Enter one of the following keywords and slot/port or number information:

- For a Management Ethernet interface, enter the keyword `managementethernet`.

**NOTE:** When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configurable only without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.

- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, S6000, and Z9000 platforms.

**Usage Information** You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the `ping` and `traceroute` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

**Example**

```
DellEMC(conf) # ipv6 icmp source-interface tengigabitethernet 1/1/1
DellEMC(conf) #
```

# ip max-frag-count

Set the maximum number of fragments allowed in one packet for packet re-assembly.

<b>Syntax</b>	<code>ip max-frag-count count</code> To place no limit on the number of fragments allowed, use the <code>no ip max-frag-count</code> command.
<b>Parameters</b>	<b>count</b> Enter a number for the number of fragments allowed for re-assembly. The range is from 2 to 256.
<b>Defaults</b>	No limit is set on number of fragments allowed.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced for the E-Series.

<b>Usage Information</b>	To avoid denial of service (DOS) attacks, keep the number of fragments allowed for re-assembly low.
--------------------------	---

# ip name-server

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

<b>Syntax</b>	<code>ip name-server ipv4-address [ipv4-address2...ipv4-address6]</code> To remove a name server, use the <code>no ip name-server ip-address</code> command.
---------------	---

**Parameters**

***ipv4-address*** Enter the IPv4 address, in dotted decimal format, of the name server to be used.

***ipv4-address2...*** (OPTIONAL) Enter up five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space.

***ipv4-address6***

**Defaults** No name servers are configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information** Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port.

You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the ip name-server command is configured.

## ip proxy-arp

Enable proxy ARP on an interface.

**Syntax** `ip proxy-arp`

To disable proxy ARP, use the `no ip proxy-arp` command.

**Defaults** Enabled.

**Command Modes** INTERFACE

## Command History

pre-6.1.1.0	Introduced on the E-Series.

## Related Commands

- [show ip interface](#) — display the interface routing status and configuration.

# ip route

Assign a static route to the switch.

## Syntax

```
ip route [vrf vrf-name] ip-address mask {ip-address | interface [ip-address]} [distance] [name description] [permanent] [tag tag-value] [vrf vrf-name] [weight weight-value]
```

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

## Parameters

<b>vrf vrf-name</b>	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the <code>ip route</code> keyword to configure a static route on that particular VRF.
<b>destination</b>	Enter the IP address in dotted decimal format of the destination device.
<b>mask</b>	Enter the mask in the slash prefix format (/x) of the destination IP address.
<b>ip-address</b>	Enter the IP address of the forwarding router in dotted decimal format.
<b>interface</b>	Enter one of the following keyword followed by the interface information <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li></ul>

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.

<b>interface <i>ip-address</i></b>	Enter the keyword <code>interface</code> then the IP address.
<b>distance</b>	(OPTIONAL) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.
<b>name <i>description</i></b>	(OPTIONAL) Enter the keyword <code>name</code> and the description for the IPv4 static route configuration.
<b>permanent</b>	(OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.
<b>tag <i>tag-value</i></b>	(OPTIONAL) Enter the keyword <code>tag</code> then a number to assign to the route. The range is from 1 to 4294967295.
<b>vrf <i>vrf-name</i></b>	Enter the keyword <code>vrf</code> followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. See "Route Leaking VRFs" in the Virtual Routing and Forwarding (VRF) section of the Configuration guide.
<b>weight <i>weight-value</i></b>	Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.
	 <b>NOTE:</b> Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.14(1.2)</b>	Added the keyword <code>name</code> for static routes.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.7(0.0)</b>	Included the <code>weighted</code> parameter to support weighted ECMP feature.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.2.(0.0)</b>	Added support for tunnel interface type.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.9.1.0</b>	Introduced VRF on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

## Usage Information

Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1/1 172.31.5.43`

- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface's configured subnet. In the example, if `tengigabitethernet 1/1/1` has an ip address on subnet `2.2.2.0` and if `172.31.5.43` recursively resolves to `2.2.2.0`, Dell EMC Networking OS installs the static route.
- When the interface goes down, Dell EMC Networking OS withdraws the route.
- When the interface comes up, Dell EMC Networking OS re-installs the route.
- When recursive resolution is "broken," Dell EMC Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell EMC Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

## Example

```
DellEMC(conf)# ip route 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# do show running-config | grep route ip route 1.1.1.0/24
4.4.4.2 weight 100 ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)#
DellEMC(conf)# do show running-config | grep route ip route vrf test
```

```
1.1.1.0/24 4.4.4.2 weight 100 ip route vrf test 1.1.1.0/24 6.6.6.2
weight 200
```

### Related Commands

- [show ip route](#) — view the switch routing table.

## ip source-route

Enable Dell EMC Networking OS to forward IP packets with source route information in the header.

### Syntax

```
ip source-route
```

To drop packets with source route information, use the `no ip route-source` command.

### Defaults

Enabled.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

## ip tcp initial-time

Define the wait duration in seconds for the TCP connection to be established. This command is supported on the , , , and platforms.

### Syntax

```
ip tcp initial-time <8-75>
```

To restore the default behavior, which causes the wait period to be set as 8 seconds, use the `no ip tcp initial-time` command.

**Parameters** <8-75> Wait duration in seconds for the TCP connection to be established.

**Command Modes** CONFIGURATION

**Command History**

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S4820T, S6000, and Z9000 platforms.

**Usage Information** You can configure the amount of time for which the device must wait before it attempts to establish a TCP connection. Using this capability, you can limit the wait times for TCP connection requests. Upon responding to the initial SYN packet that requests a connection to the router for a specific service (such as SSH or BGP) with a SYN ACK, the router waits for a period of time for the ACK packet to be sent from the requesting host that will establish the TCP connection.

## ip unknown-unicast

Enable IPv4 catch-all route.

**Syntax** `ip unknown-unicast [vrf vrf-name]`

To remove the IPv4 catch-all route (0.0.0.0/0) from the LPM route forwarding table in hardware which gets added as a default configuration after the initialization of FIB Agent module, use the `no ip unknown-unicast` command.

**Defaults** None

**Parameters** `vrf vrf-name` (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable catch-all routes corresponding to that VRF.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Introduced on the S-Series.

**Usage Information** Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the `no ip unknown-unicast` command previously. This will be the default configuration after reload.

## ipv4 unicast-host-route

Enable programming of IPv4 /32 route prefixes in L3 host table.

**Syntax** `[no] ipv4 unicast-host-route`

**Defaults** Disabled by default. By default, all the IPv4 route prefixes are installed only in the LPM table.

**Command Modes** CONFIGURATION

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.8(0.0)</b>	Introduced on the S3048-ON and S4048-ON.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.3(0.1)</b>	Introduced on the S6000.
	<b>9.2(1.0)</b>	Introduced on the Z9500.

**Usage Information** A warning message is displayed when you enter this command stating that this setting takes effect for existing routes only when IPv4 route prefixes are cleared from the routing table (RTM). To disable this functionality, use `no ipv4 unicast-host-route` command.

### Example

```
DelleMC(conf)#ip unicast-host-route
Warning: Command will take effect for existing routes only when IPv4
route prefixes are cleared from RTM
DelleMC(conf)#no ip unicast-host-route
```

## show ip tcp initial-time

Displays the interval that you configured for the device to wait before the TCP connection is attempted to be established.

**Syntax** `show ip tcp initial-time`

**Command Modes** EXEC  
EXEC Privilege

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.7(0.1)</b>	Introduced on the S3048-ON.
	<b>9.7(0.1)</b>	Introduced on the S4048-ON.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms.

# ip unreachable

Enable the generation of internet control message protocol (ICMP) unreachable messages.

**Syntax** `ip unreachable`

To disable the generation of ICMP messages, use the `no ip unreachable` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

# load-balance

By default, for C-Series and S-Series, Dell EMC Networking OS uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the `load-balance` command.

**Syntax** `load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}`

To return to the default setting (IP 4-tuple), use the `no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}` command.

## Parameters

<b>ip-selection</b> <b>{dest-ip  </b> <b>source-ip}</b>	Enter the keywords to distribute IP traffic based on the following criteria: <ul style="list-style-type: none"><li>• <code>dest-ip</code> — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-ip</code> — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li></ul>
<b>mac {dest-mac  </b> <b>source-dest-mac</b> <b>  source-mac}</b>	Enter the keywords to distribute MAC traffic based on the following criteria: <ul style="list-style-type: none"><li>• <code>dest-mac</code> — Uses the destination MAC address, VLAN, EtherType, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-dest-mac</code> — Uses the destination and source MAC address, VLAN, EtherType, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-mac</code> — Uses the source MAC address, VLAN, EtherType, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li></ul>
<b>tcp-udp enable</b>	Enter the keywords to distribute traffic based on the following: <ul style="list-style-type: none"><li>• <code>enable</code> — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.</li></ul>
<b>ingress-port</b> <b>enable</b>	Enter the keywords to distribute traffic based on the following: <ul style="list-style-type: none"><li>• <code>enable</code> — Takes the source port into consideration when doing hash computations. This option is disabled by default.</li></ul>

## Defaults

IP 4-tuple (IP source address, IP destination address, VLAN, Protocol, Source Port, Destination Port)

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.10.0</b>	Added the <code>ingress-port</code> parameter for the S4810.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.

## Usage Information

By default, Dell EMC Networking OS distributes incoming traffic based on a hash algorithm using the following criteria:

- IP source address
- IP destination address
- VLAN
- Protocol
- TCP/UDP source port
- TCP/UDP destination port

## load-balance hg

Choose the traffic flow parameters the hash calculation uses while distributing the traffic across internal higit links.

**Syntax** `[no] load-balance hg {ip-selection | ipv6-selection [source-ip | source-ipv6 | source-port-id | source-module-id | dest-ip | dest-ipv6 | dest-port-id | dest-module-id | protocol | vlan | L4-source-port | L4-dest-port ] | mac [source-mac | source-port-id | source-module-id | dest-mac | dest-port-id | dest-module-id | vlan | ethertype | source-dest-mac ] | tunnel [ipv4-over-ipv4 | ipv4-over-gre-ipv4 | mac-in-mac]}`

**Parameters**

<p><b>ip-selection</b> <b>ipv6-selection</b> <b>[ source-ip   source-ipv6   source-port-id   source-module-id   dest-ip   dest-ipv6   dest-port-id   dest-module-id   protocol   vlan   L4-source-port   L4-dest-port ]</b></p>	<p>To use IPv4 key fields in hash computation, enter the keyword <code>ip-selection</code> then one of the parameters. To use IPv6 key fields in hash computation, enter the keyword <code>ipv6-selection</code> then one of the parameters.</p> <ul style="list-style-type: none"> <li>• <code>source-ip</code> — Use IPv4 src-ip field in hash calculation.</li> <li>• <code>source-ipv6</code> — Use IPv6 src-ip field in hash calculation</li> <li>• <code>source-port-id</code> — Use src-port-id field in hash calculation.</li> <li>• <code>source-module-id</code> — Use src-module-id field in hash calculation.</li> <li>• <code>dest-ip</code> — Use IPv4 dest-ip field in hash calculation.</li> <li>• <code>dest-ipv6</code> — Use IPv6 dest-ip field in hash calculation</li> <li>• <code>dest-port-id</code> — Use dest-port-id field in hash calculation.</li> <li>• <code>dest-module-id</code> — Use dest-module-id field in hash calculation.</li> <li>• <code>protocol</code> — Use IPv4 protocol field in hash calculation.</li> <li>• <code>vlan</code> — Use vlan field in hash calculation.</li> <li>• <code>L4-source-port</code> — Use IPv4 L4-source-port field in hash calculation.</li> <li>• <code>L4-dest-port</code> — Use IPv4 L4-dest-port field in hash calculation.</li> </ul>
<p><b>mac [ source-mac   source-port-id   source-module-id   dest-mac   dest-port-id   dest-module-id   vlan   ethertype   source-dest-mac ]</b></p>	<p>To use MAC key fields in hash computation, enter the keyword <code>mac</code> then one of the parameters:</p> <ul style="list-style-type: none"> <li>• <code>source-mac</code> — Use source-mac field in hash calculation.</li> <li>• <code>source-port-id</code> — Use src-port-id field in hash calculation.</li> <li>• <code>source-module-id</code> — Use src-module-id field in hash calculation.</li> <li>• <code>dest-mac</code> — Use dest-mac field in hash calculation.</li> <li>• <code>dest-port-id</code> — Use dest-port-id field in hash calculation.</li> <li>• <code>dest-module-id</code> — Use dest-module-id field in hash calculation.</li> <li>• <code>vlan</code> — Use vlan field in hash calculation .</li> <li>• <code>ethertype</code> — Use Ethertype field in hash calculation.</li> <li>• <code>source-dest-mac</code> — Use SMAC and DMAC fields in hash calculation.</li> </ul>
<p><b>tunnel [ ipv4-over-ipv4   ipv4-over-gre-ipv4   mac-in-mac ]</b></p>	<p>To use tunnel key fields in hash computation, enter the keyword <code>tunnel</code> then one of the parameters:</p> <ul style="list-style-type: none"> <li>• <code>ipv4-over-ipv4</code> — Use <code>ipv4-over-ipv4</code> field in hash calculation.</li> <li>• <code>ipv4-over-gre-ipv4</code> — Use <code>ipv4-over-gre-ipv4</code> field in hash calculation.</li> <li>• <code>mac-in-mac</code> — Use <code>mac-in-mac</code> field in hash calculation.</li> </ul>

**Defaults** IP selection 5-tuples (source-ip dest-ip vlan protocol L4-source-port L4-dest-port).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Added support for IPv6.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

## management route

Configure a static route that points to the Management interface or a forwarding router.

**Syntax** `management route {ip-address mask | ipv6-address 1.1.1.1prefix-length} {forwarding-router-address | managementethernet | fortyGigE | vlan | tengigabitethernet }`

To remove a static route, use the `no management route` command.

### Parameters

<b><i>ip-address mask</i></b>	Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.
<b><i>ipv6-address prefix-length</i></b>	Enter an IPv6 address (x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format.  The range is from /0 to /128.
	 <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
<b><i>forwarding-router-address</i></b>	Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x format) of a forwarding router.
<b><i>managementethernet</i></b>	Enter the keyword <code>managementethernet</code> for the Management interface on the Primary RPM.
<b><i>fortyGigE</i></b>	Enter the keyword <code>fortyGigE</code> to specify a forty Gigbit Ethernet interface.
<b><i>vlan</i></b>	Enter the keyword <code>vlan</code> to specify a vlan interface.
<b><i>tengigabitethernet</i></b>	Enter the keyword <code>tengigabitethernet</code> to specify a ten Gigabit Ethernet interface.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for forty gigabit, vlan, and tengigabit ethernet interfaces. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000 and added support for IPv6.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

#### Usage Information

When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

#### Related Commands

- [interface ManagementEthernet](#) — configure the Management port on the system (either the Primary or Standby RPM).
- [speed \(Management interface\)](#) — set the speed for the Management interface.

## show arp

Display the ARP table.

#### Syntax

```
show arp [vrf vrf-name] [interface interface | ip ip-address [mask] |
macaddress mac-address [mac-address mask]] [retries] [static | dynamic]
[inspection {database | statistics}][summary]
```

#### Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF.
- i** **NOTE:** Use this attribute to start a BGP instance for either a specific address family corresponding to the default VRF or an IPv4 address family corresponding to a non-default VRF.
- interface interface** (OPTIONAL) Enter the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

<b>ip <i>ip-address mask</i></b>	(OPTIONAL) Enter the keyword <code>ip</code> then an IP address in the dotted decimal format. Enter the optional IP address mask in the slash prefix format ( <code>/ x</code> ).
<b>inspection</b>	Enter the keyword <code>inspection</code> with one of the following keywords to view ARP entries: <ul style="list-style-type: none"> <li>• <code>database</code> — view a list of ARP entries learned using DAI</li> <li>• <code>statistics</code> — view DAI statistics</li> </ul>
<b>macaddress <i>mac-address mask</i></b>	(OPTIONAL) Enter the keyword <code>macaddress</code> then a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format. Enter the optional MAC address mask in <code>nn:nn:nn:nn:nn:nn</code> format also.
<b>static</b>	(OPTIONAL) Enter the keyword <code>static</code> to view entries entered manually.
<b>retries</b>	(OPTIONAL) Enter the keyword <code>retries</code> to show the number of ARP retries before a 20-second back off.
<b>dynamic</b>	(OPTIONAL) Enter the keyword <code>dynamic</code> to view dynamic entries.
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view a summary of ARP entries.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4.(0.0)</b>	Added support for VRF and added usage information for the <code>clear arp-cache</code> command.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.9.1.0</b>	Introduced VRF on the E-Series.
<b>7.8.1.0</b>	Augmented to display local ARP entries learned from private VLANs (PVLANS).

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

### Usage Information

The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to [Private VLAN \(PVLAN\)](#)).

If you have entered the `clear arp-cache` command to remove a large number of ARP entries and the command is still being processed in the background, an error message display if you attempt to enter the `show arp` command:

```
Clear arp in-progress. Please try after sometime!
```

The following describes the `show arp` command shown in the following example.

### Description

<b>Protocol</b>	Displays the protocol type.
<b>Address</b>	Displays the IP address of the ARP entry.
<b>Age(min)</b>	Displays the age (in minutes) of the ARP entry.
<b>Hardware Address</b>	Displays the MAC address associated with the ARP entry.
<b>Interface</b>	Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry.
<b>VLAN</b>	Displays the VLAN ID, if any, associated with the ARP entry.
<b>CPU</b>	Lists which CPU the entries are stored on.

### Example

```
DelleMC> show arp
Protocol  Address  Age(min)  Hardware Address  Interface  VLAN  CPU
-----
Internet  192.2.1.254  1  00:00:c0:02:01:02  Te 1/1/1/1  -  CP
Internet  192.2.1.253  1  00:00:c0:02:01:02  Te 1/1/1/2  -  CP
Internet  192.2.1.252  1  00:00:c0:02:01:02  Te 1/1/1/3  -  CP
Internet  192.2.1.251  1  00:00:c0:02:01:02  Te 1/1/1/4  -  CP
Internet  192.2.1.250  1  00:00:c0:02:01:02  Te 1/1/2/1  -  CP
Internet  192.2.1.251  1  00:00:c0:02:01:02  Te 1/1/2/2  -  CP
Internet  192.2.1.250  1  00:00:c0:02:01:02  Te 1/1/2/3  -  CP
Internet  192.2.1.249  1  00:00:c0:02:01:02  Te 1/1/2/4  -  CP
Internet  192.2.1.248  1  00:00:c0:02:01:02  Te 1/1/3/1  -  CP
Internet  192.2.1.247  1  00:00:c0:02:01:02  Te 1/1/3/2  -  CP
Internet  192.2.1.246  1  00:00:c0:02:01:02  Te 1/1/3/3  -  CP
Internet  192.2.1.245  1  00:00:c0:02:01:02  Te 1/1/3/4  -  CP
```

### Example (Private VLAN)

**NOTE:** In this example, Line 1 shows community VLAN 200 (in primary VLAN 10) in a PVLAN. Line 2 shows primary VLAN 10.

```
DelleMC# show arp
Protocol  Address  Age(min)  Hardware Address  Interface  VLAN  CPU
-----
Internet  5.5.5.1  -  00:01:e8:43:96:5e  -  V1 10 pv 200  CP
Internet  5.5.5.10  -  00:01:e8:44:99:55  -  V1 10  CP
Internet  10.1.2.4  1  00:01:e8:d5:9e:e2  Ma 1/1  -  CP
Internet  10.10.10.4  1  00:01:e8:d5:9e:e2  Ma 1/1  -  CP
Internet  10.16.127.53  1  00:01:e8:d5:9e:e2  Ma 1/1  -  CP
Internet  10.16.134.254  20  00:01:e8:d5:9e:e2  Ma 1/1  -  CP
Internet  133.33.33.4  1  00:01:e8:d5:9e:e2  Ma 1/1  -  CP
```

### Usage Information

The following describes the `show arp summary` command shown in the following example.

## Description

<b>Total Entries</b>	Lists the total number of ARP entries in the ARP table.
<b>Static Entries</b>	Lists the total number of configured or static ARP entries.
<b>Dynamic Entries</b>	Lists the total number of learned or dynamic ARP entries.
<b>CPU</b>	Lists which CPU the entries are stored on.

### Example (Summary)

```
DellEMC# show arp summary

TotalEntries Static Entries Dynamic Entries CPU
-----
83           0           83           CP
DellEMC#
```

### Related Commands

- [ip local-proxy-arp](#) — enable/disable Layer 3 communication in secondary VLANs.
- [switchport mode private-vlan](#) — set PVLAN mode of the selected port.

## show arp retries

Display the configured number of ARP retries.

**Syntax** `show arp retries`

**Command Modes**

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.1.0</b>	Introduced.

### Related Commands

- [arp retries](#) — set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

# show hosts

View the host table and DNS configuration.

**Syntax** `show hosts`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Added support for IPv6 addresses.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** The following describes the `show hosts` command in the following example.

Field	Description
<b>Default domain...</b>	Displays the domain name (if configured).
<b>Name/address lookup...</b>	States if DNS is enabled on the system. <ul style="list-style-type: none"><li>• If DNS is enabled, the Name/Address lookup is domain service.</li><li>• If DNS is not enabled, the Name/Address lookup is static mapping</li></ul>
<b>Name servers are...</b>	Lists the name servers, if configured.
<b>Host</b>	Displays the host name assigned to the IP address.
<b>Flags</b>	Classifies the entry as one of the following: <ul style="list-style-type: none"><li>• perm — the entry was manually configured and will not time out</li><li>• temp — the entry was learned and will time out after 72 hours of inactivity.</li></ul> Also included in the flag is an indication of the validity of the route: <ul style="list-style-type: none"><li>• ok — the entry is valid.</li><li>• ex — the entry expired.</li></ul>

Field	Description
	<ul style="list-style-type: none"> <li>• ?? — the entry is suspect.</li> </ul>
TTL	Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only.
Type	Displays IP as the type of entry.
Address	Displays the IP addresses assigned to the host.

### Example

```
DellEMC# show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host      Flags      TTL      Type      Address
-----
ks        (perm, OK) -       IP        2.2.2.2
4200-1    (perm, OK) -       IP        192.68.69.2
1230-3    (perm, OK) -       IP        192.68.99.2
ZZr       (perm, OK) -       IP        192.71.18.2
Z10-3     (perm, OK) -       IP        192.71.23.1
DellEMC#
```

### Related Commands

- [traceroute](#) — view the DNS resolution.
- [ip host](#) — configure a host.

## show ip cam stack-unit

Display CAM entries for a port-pipe of a stack-unit on a S-Series or Z-Series switch.

### Syntax

```
show ip cam stack-unit {stack-unit-number} [port-set {pipe-number} | vrf
vrf-name {ip-address mask [longer-prefixes [ecmp-group detail]]} | ecmp-group
{detail | member-info [detail [group-index index-number]]} | summary]
```

### Parameters

<b>stack-unit-number</b>	Enter the stack-unit ID. The unit ID range is from 1 to 6.
<b>port-set pipe-number</b>	Enter the keyword <code>port-set</code> then the number of the stack unit's port-pipe.
<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to display CAM entries corresponding to that VRF.
<b>network mask [longer-prefixes [ecmp-group detail]]</b>	(OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. You can enter one of the following keywords to filter results. <ul style="list-style-type: none"> <li>• Enter the keyword <code>longer-prefixes</code> to view routes with a common prefix.</li> <li>• Enter the keyword <code>ecmp-group detail</code> to view the ECMP group index.</li> </ul>
<b>ecmp-group {detail   member-info [detail [group-index index-number]]}</b>	(OPTIONAL) Enter the keyword <code>ecmp-group</code> then one of the following keywords to filter results. <ul style="list-style-type: none"> <li>• Enter the keyword <code>detail</code> to view the ECMP group index.</li> <li>• Enter the keyword <code>member-info</code> to view the member information for the ECMP group. <ul style="list-style-type: none"> <li>• Enter the keyword <code>member-info detail</code> to view detailed ECMP membership and n-hop information.</li> <li>• Enter the keyword <code>group-index</code> then the index number to show ECMP membership per group. The range is from 0 to 1022.</li> </ul> </li> </ul>
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view a table listing route prefixes and the total number routes which can be entered in to CAM.

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Increased the stacking range to 12 units in S3100 series.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for up to seven stack members.
7.6.1.0	Introduced on the S-Series.

## Usage Information

The following describes the `show ip cam` command shown in the following example.

Field	Description
<b>Destination</b>	Displays the destination route of the index.
<b>EC</b>	Displays 1 if the route is an ECMP route. Else, displays 0.
<b>C</b>	This is the CPU bit. If it displays 1, then it indicates that a packet hitting this entry will be forwarded to the CPU.
<b>V Id</b>	Displays the VLAN ID. If the entry is 0, the entry is not part of a VLAN.
<b>Mac Addr</b>	Displays the next-hop router's MAC address.
<b>Port</b>	Displays the egress interface. <ul style="list-style-type: none"><li>• CP = control processor</li><li>• Gi = Gigabit Ethernet interface</li><li>• Te = 10-Gigabit Ethernet interface</li></ul>

## Example

```
DellEMC# show ip cam stack-unit 3 po 0 1.1.1.0/24 longer-prefixes
```

Destination	EC	C	VId	Mac-Addr	Port
1.1.1.2/32	0	0	3000	00:05:00:00:00:02	Te 1/14/1
1.1.1.1/32	0	1	0	00:00:00:00:00:00	CP
1.1.1.0/24	0	1	0	00:00:00:00:00:00	CP

```
DellEMC#
```

## Example (ECMP-Group)

```
DellEMC# show ip cam stack-unit 3 po 0 ecmp-group detail
```

Destination	EC	C	VId	Mac-Addr	Port	ECMP Group-Index
1.1.1.2/32	0	0	1000	00:01:00:00:00:02	Te 3/12/1	-
2.1.1.2/32	0	0	20	00:03:00:00:00:02	Po 10	-
2.1.1.1/32	0	1	0	00:00:00:00:00:00	CP	-
1.1.1.1/32	0	1	0	00:00:00:00:00:00	CP	-
2.1.1.0/24	0	1	0	00:00:00:00:00:00	CP	-
1.1.1.0/24	0	1	0	00:00:00:00:00:00	CP	-
100.1.1.0/24	1	0	20	00:03:00:00:00:02	Po 10	0

```

100.1.1.0/24      1 0 1000 00:01:00:00:00:02 Te 3/12/1 0
0.0.0.0/0        0 1 0 00:00:00:00:00:00 CP -
DellEMC#

```

### Example (Member-Info)

```

DellEMC# show ip cam stack-unit 3 po 0 ecmp-group member-info detail
-----
Group Index  Member Count  Mac-Addr          Port          VLan ID
-----
0            2             00:03:00:00:00:02 Po 10         20
              00:01:00:00:00:02 Te 1/12/1     1000
DellEMC#

```

## show ip fib stack-unit

View all Forwarding Information Base (FIB) entries of a specific stack-unit.

**Syntax** `show ip fib stack-unit stack-unit-number vrf vrf-name [ip-address [mask] [longer-prefixes] | summary]`

<b>Parameters</b>	<p><b><i>stack-unit-number</i></b> Enter the stack unit ID.</p> <p><b><i>vrf vrf-name</i></b> Enter the keyword <code>vrf</code> followed by the name of the VRF to view FIB entries corresponding to that VRF.</p> <p><b><i>ip-address mask</i></b> (OPTIONAL) Enter the IP address of the network destination to view only information on that destination. Enter the IP address in dotted decimal format (A.B.C.D). Enter the mask in slash prefix format (/X).</p> <p><b><i>longer-prefixes</i></b> (OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.</p> <p><b><i>summary</i></b> (OPTIONAL) Enter the keyword <code>summary</code> to view the total number of prefixes in the FIB.</p>
-------------------	---

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for up to seven stack members.
7.6.1.0	Introduced on the S-Series.

### Usage Information

The following describes the `show ip fib stack-unit` command shown in the following example.

Field	Description
<b>Destination</b>	Lists the destination IP address.
<b>Gateway</b>	Displays either the word "direct" and an interface for a directly connected route or the remote IP address used to forward the traffic.
<b>First-Hop</b>	Displays the first hop IP address.
<b>Mac-Addr</b>	Displays the MAC address.
<b>Port</b>	Displays the egress-port information.
<b>Vid</b>	Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed.
<b>EC</b>	Displays the number of ECMP paths.

If weighted ECMP is enabled, then the `show ip fib stack-unit` command display a new column named W-EC (Weighted ECMP). This column displays either a value of *1* or *0* depending on whether or not a route is assigned with a weight.

### Example

```
DellEMC# show ip fib stack-unit 1
Destination Gateway First-Hop Mac-Addr Port Vid EC
-----
1.1.1.2/32 via 1.1.1.2, V1 1000 1.1.1.2 00:01:00:00:00:02 Te 3/12/1 1000 0
2.1.1.2/32 via 2.1.1.2, V1 20 2.1.1.2 00:03:00:00:00:02 Po 10 20 0
0.0.0.0/0 - 0.0.0.0 00:00:00:00:00:00 CP 0 0 0
1.1.1.0/24 Direct, V1 1000 0.0.0.0 00:00:00:00:00:00 CP 1000 0
1.1.1.1/32 via 127.0.0.1 127.0.0.1 00:00:00:00:00:00 CP 0 0 0
2.1.1.0/24 Direct, V1 20 0.0.0.0 00:00:00:00:00:00 CP 20 0 0
2.1.1.1/32 via 127.0.0.1 127.0.0.1 00:00:00:00:00:00 CP 0 0 0
100.1.1.0/24 via 1.1.1.2, V1 1000 1.1.1.2 00:01:00:00:00:02 Te 3/12/1 1000 1
100.1.1.0/24 via 2.1.1.2, V1 20 2.1.1.2 00:03:00:00:00:02 Po 10 20 1
DellEMC#

DellEMC#show ip route
S 10.1.1.0/24 via 1.1.1.2, V1 10
via 2.1.1.2, V1 20
S 20.1.1.0/24 via 3.1.1.2, V1 30
S 100.1.1.0/24 via 10.1.1.0, weight 7
via 20.1.1.0, weight 1
```

### Example (Show command output with Weighted ECMP Enabled)

```
DellEMC# show ip fib stack-unit 1
Destination Gateway First-Hop Mac-Addr Port Vid EC RC W
-----
0.0.0.0/0 - 0.0.0.0 00:00:00:00:00:00 CP 0 0 - -
1.1.0/24 Direct, Lo 0 0.0.0.0 00:00:00:00:00:00 CP 0 0 - -
1.1.1.1/32 via 127.0.0.1 127.0.0.1 00:00:00:00:00:00 CP 0 0 - -
```

The RC and W columns in the show output appear only if the weighted ECMP is enabled using the `ip ecmp weighted` command.

### Related Commands

- [clear ip fib stack-unit](#) — clear FIB entries on a specified stack-unit.
- [ip ecmp weighted](#) — enable weighted ECMP calculations.

## show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

### Syntax

```
show ip flow interface interface {source-ip address destination-ip address}
{protocol number [tcp | udp]} {src-port number destination-port number}
```

### Parameters

**interface**  
*interface* Enter the keyword *interface* then one of the following interface keywords.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

<b>source-ip address</b>	Enter the keywords <code>source-ip</code> then the IP source address in IP address format.
<b>destination-ip address</b>	Enter the keywords <code>destination-ip</code> then the IP destination address in IP address format.
<b>protocol number [tcp   udp]</b>	Enter the keyword <code>protocol</code> then one of the protocol type keywords: <code>tcp</code> , <code>udp</code> , or <code>protocol number</code> . The protocol number range is from 0 to 255. .
<b>src-port number</b>	Enter the keywords <code>src-port</code> then the source port number.
<b>destination-port number</b>	Enter the keywords <code>destination-port</code> then the destination port number.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.10.0</b>	Introduced on the S4810.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.9.1.0</b>	Introduced VRF on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use

this command for routed packets only. For switched packets, use the `show port-channel-flow` command.

The `show ip flow` command does not compute the egress port information when `load-balance mac hashing` is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: `%Error: Unable to read IP route table.`

### Example

```
DellEMC# show ip flow interface te 1/4/1 20.1.1.1 100.1.1.2 protocol tcp
Flow: 20.1.1.1 100.1.1.2 6
Ingress interface: Te 1/4/1
Egress Interface: Te 1/5/2
DellEMC#
```

## show ip interface

View IP-related information on all interfaces.

### Syntax

```
show ip interface [interface | brief] [configured]
```

### Parameters

***interface*** (OPTIONAL)

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a stack-unit interface, enter the keyword `stack-unit` then the stack unit number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

***brief*** (OPTIONAL) Enter the keyword `brief` to view a brief summary of the interfaces and whether an IP address is assigned.

***configured*** (OPTIONAL) Enter the keyword `configured` to display the physical interfaces with non-default configurations only.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Updated the command output to include the unicast reverse path forwarding (uRPF) status.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.2	Supported on the E-Series E600i.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

### Example

```
DellEMC# show ip interface tengigabitethernet 1/1/1
TenGigabitEthernet 1/1/1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DellEMC#
```

```
DellEMC# show ip interface port-channel 128
Port-channel 128 is down, line protocol is down
Internet address is 10.1.1.1/16
Broadcast address is 10.1.255.255
Address determined by user input
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DellEMC#
```

```
DellEMC#show ip interface vlan 1
Vlan 1 is down, line protocol is down
```

```

Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DellEMC#

```

### Usage Information

The following describes the `show ip interface brief` command shown in the following example.

Fields	Description
<b>Interface</b>	Displays type of interface and the associated slot and port number.
<b>IP-Address</b>	Displays the IP address for the interface, if configured.
<b>Ok?</b>	Indicates if the hardware is functioning properly.
<b>Method</b>	Displays "Manual" if the configuration is read from the saved configuration.
<b>Status</b>	States whether the interface is enabled (up) or disabled (administratively down).
<b>Protocol</b>	States whether IP is enabled (up) or disabled (down) on the interface.

### Example (Brief)

```

DellEMC# show ip interface brief
Interface                               IP-Address  OK? Method  Status
Protocol
TenGigabitEthernet 1/1/1  unassigned NO  Manual  administratively down
down
TenGigabitEthernet 1/1/2  unassigned NO  Manual  administratively down
down
TenGigabitEthernet 1/1/3  unassigned YES Manual  up
up
TenGigabitEthernet 1/1/4  unassigned YES Manual  up
up
TenGigabitEthernet 1/2/1  unassigned YES Manual  up
up
TenGigabitEthernet 1/2/2  10.10.10.1 YES Manual  up
up
TenGigabitEthernet 1/2/3  unassigned NO  Manual  administratively down
down

```

## show ip management-route

View the IP addresses assigned to the Management interface.

### Syntax

```
show ip management-route [all | connected | summary | static]
```

### Parameters

<b>all</b>	(OPTIONAL) Enter the keyword <code>all</code> to view all IP addresses assigned to all Management interfaces on the switch.
<b>connected</b>	(OPTIONAL) Enter the keyword <code>connected</code> to view only routes directly connected to the Management interface.
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view a table listing the number of active and non-active routes and their sources.
<b>static</b>	(OPTIONAL) Enter the keyword <code>static</code> to view non-active routes also.

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## Example

```
DellEMC# show ip management-route

Destination      Gateway          State
-----
10.1.2.0/24      ManagementEthernet 0/0  Connected
172.16.1.0/24    10.1.2.4        Active
DellEMC#
```

# show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

## Syntax

```
show ipv6 management-route [all | connected | summary | static]
```

## Parameters

<b>all</b>	(OPTIONAL) Enter the keyword <code>all</code> to view all IP addresses assigned to all Management interfaces on the switch.
<b>connected</b>	(OPTIONAL) Enter the keyword <code>connected</code> to view only routes directly connected to the Management interface.
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view a table listing the number of active and non-active routes and their sources.
<b>static</b>	(OPTIONAL) Enter the keyword <code>static</code> to view non-active routes also.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.4.1.0	Introduced on the C- and E-Series.
8.3.7.0	Introduced on the S4810.

### Example

```
DellEMC# show ipv6 management-route
IPv6 Destination      Gateway                State
-----
2001:34::0/64         ManagementEthernet 1/1 Connected
2001:68::0/64         2001:34::16          Active
DellEMC#
```

## show ip protocols

View information on all routing protocols enabled and active on the switch.

**Syntax** `show ip protocols`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Regular evaluation optimization enabled/disabled added to display output.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

### Example

```
DellEMC# show ip protocols
Routing Protocol is "bgp 1"
  Cluster Id is set to 20.20.20.3
  Router Id is set to 20.20.20.3
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE_REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200
  Neighbor(s):
    Address : 20.20.20.2
    Filter-list in : foo
    Route-map in : foo
    Weight : 0
    Address : 5::6
    Weight : 0
DellEMC#
```

## show ip route

View information, including how they were learned, about the IP routes on the switch.

### Syntax

```
show ip route [vrf vrf-name] hostname | ip-address [mask] [longer-prefixes]
| list prefix-list | protocol [process-id | routing-tag] | all | connected
| static | summary]
```

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the VRF name to list the routes in the route table of a specific VRF.
<b>ip-address</b>	(OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.
<b>mask</b>	(OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.
<b>longer-prefixes</b>	(OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.
<b>list prefix-list</b>	(OPTIONAL) Enter the keyword <code>list</code> and the name of a configured prefix list. For more information, refer to the <a href="#">show ip route list</a> command.
<b>protocol</b>	(OPTIONAL) Enter the name of a routing protocol ( <code>bgp</code> , <code>isis</code> , <code>ospf</code> , <code>rip</code> ) or the keywords <code>connected</code> or <code>static</code> .

**i** | **NOTE:** `bgp`, `isis`, `ospf`, and `rip`.

- If you enter `bgp`, you can include the BGP `as-number`.
- If you enter `isis`, you can include the ISIS `routing-tag`.
- If you enter `ospf`, you can include the OSPF `process-id`.

<b><i>process-id</i></b>	(OPTIONAL) Specify that only OSPF routes with a certain process ID must be displayed.
<b><i>routing-tag</i></b>	(OPTIONAL) Specify that only ISIS routes with a certain routing tag must be displayed.
<b><i>connected</i></b>	(OPTIONAL) Enter the keyword <code>connected</code> to view only the directly connected routes.
<b><i>all</i></b>	(OPTIONAL) Enter the keyword <code>all</code> to view both active and non-active routes.
<b><i>static</i></b>	(OPTIONAL) Enter the keyword <code>static</code> to view only routes the <code>ip route</code> command configures.
<b><i>summary</i></b>	(OPTIONAL) Enter the keyword <code>summary</code> . For more information, refer to the <a href="#">show ip route summary</a> command.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.9.1.0</b>	Introduced VRF on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** The following describes the `show ip route all` command in the following example.

<b>Field</b>	<b>Description</b>
<b>(undefined)</b>	Identifies the type of route:

Field	Description
	<ul style="list-style-type: none"> <li>● C = connected</li> <li>● S = static</li> <li>● R = RIP</li> <li>● B = BGP</li> <li>● IN = internal BGP</li> <li>● EX = external BGP</li> <li>● LO = Locally Originated</li> <li>● O = OSPF</li> <li>● IA = OSPF inter area</li> <li>● N1 = OSPF NSSA external type 1</li> <li>● N2 = OSPF NSSA external type 2</li> <li>● E1 = OSPF external type 1</li> <li>● E2 = OSPF external type 2</li> <li>● i = IS-IS</li> <li>● L1 = IS-IS level-1</li> <li>● L2 = IS-IS level-2</li> <li>● IA = IS-IS inter-area</li> <li>● * = candidate default</li> <li>● &gt; = non-active route</li> <li>● + = summary routes</li> </ul> <p>The weight for weighted ECMP route calculations is displayed for each path in the route in <code>show ip route</code> command. The ECMP weight is displayed only if weighted ECMP is enabled using the <code>ip ecmp weighted</code> command is enabled.</p> <p>If weighted ECMP is disabled, the <code>show ip route</code> command does not show the weighted ECMP route information.</p>
<b>Destination</b>	Identifies the route's destination IP address
<b>Gateway</b>	Identifies whether the route is directly connected and on which interface the route is configured.
<b>Dist/Metric</b>	Identifies if the route has a specified distance or metric.
<b>Last Change</b>	Identifies when the route was last changed or configured.

### Example

```
DelleMC# show ip route all

Codes:C- connected, S - static, R - RIP
      B- BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated
      O- OSPF, IA - OSPF inter area N1 - OSPF NSSA external type 1
      N2- OSPF NSSA external type 2, E1 - OSPF external type 1
      E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1
      L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default
      >- non-active route + - summary route

Gateway of last resort is not set

      Destination      Gateway      Dist/Metric Last Change
-----
R    3.0.0.0/8        via 100.10.10.10, Te 1/8/1 120/1    00:07:12
      via 101.10.10.10, Te 1/8/2
      100.10.10.0/24   Direct, Te 1/8/1          0/0      00:08:54
> R  100.10.10.0/24   Direct, Te 1/8/2          120/0    00:08:54
C    101.10.10.0/24   Direct, Te 1/8/1          0/0      00:09:15
> R  101.10.10.0/24   Direct, Te 1/8/2          120/0    00:09:15
DelleMC#
```

### Example (Summary)

```
DelleMC# show ip route summary
```

```

Route Source   Active Routes   Non-active Routes
connected      2                0
static         1                0
Total          3                0
Total 3 active route(s) using 612 bytes
R1_E600i>show ip route static ?
|
| Pipe through a command
<cr>
R1_E600i>show ip route static
  Destination   Gateway           Dist/Metric Last Change
-----
*S 0.0.0.0/0    via 10.10.91.9, Te 1/2/1    1/0        3d2h
DelleMC>

```

### Example (vrf)

```

DelleMC# show ip route vrf test1

Codes: C - connected, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated,
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default,
> - non-active route, + - summary route

Gateway of last resort is not set

  Destination   Gateway           Dist/Metric Last Change
-----
C 13.0.0.0/24   Direct, Te 1/17/1    0/0        00:00:04

```

### Example (With Weighted ECMP Enabled)

```

DelleMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 100
DelleMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200
DelleMC(conf)# do show ip route
Codes: C - connected, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO - Locally Originated,
O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default,
> - non-active route, + - summary route

Gateway of last resort is not set
  Destination   Gateway

## show ip route list

Display IP routes in an IP prefix list.

**Syntax** `show ip route [vrf vrf-name] list prefix-list`

**Parameters**

- prefix-list** Enter the name of a configured prefix list.
- vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to display IP routes in an IP prefix list corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

```

## Related Commands

- [ip prefix-list](#) — enter CONFIGURATION-IP PREFIX-LIST mode and configures a prefix list.
- [show ip prefix-list summary](#) — display a summary of the configured prefix lists.

# show ip route summary

View a table summarizing the IP routes in the switch.

**Syntax** `show ip route [vrf vrf-name] [summary]`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to view information on the IP routes corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for VRF.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

### Usage Information

The following describes the `show ip route summary` shown in the following example.

Column Heading	Description
<b>Route Source</b>	Identifies how the route is configured in Dell EMC Networking OS.
<b>Active Routes</b>	Identifies the best route if a route is learned from two protocol sources.
<b>Non-active Routes</b>	Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route.
<b>ospf 100</b>	If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.
<b>Total 1388 active...</b>	Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the Dell EMC Networking OS, this line does not appear.

### Example

```
DellEMC> show ip route summary

Route Source    Active Routes    Non-active Routes
connected       17                0
static          3                 0
ospf 100        1368              2
Intra-area: 762 Inter-area: 1 External-1: 600 External-2: 5
Total           1388              2
Total 1388 active route(s) using 222440 bytes
Total 2 non-active route(s) using 128 bytes
DellEMC>
```

### Related Commands

- [show ip route](#) — display information about the routes found in the switch.

## show ip traffic

View IP, ICMP, UDP, TCP and ARP traffic statistics.

### Syntax

```
show ip traffic [all | cp | rp1 | rp2]
```

 **NOTE:** These options are supported only on the E-Series.

### Parameters

<b>all</b>	(OPTIONAL) Enter the keyword <code>all</code> to view statistics from all processors. If you do not enter a keyword, you also view all statistics from all processors.
<b>cp</b>	(OPTIONAL) Enter the keyword <code>cp</code> to view only statistics from the Control Processor.
<b>rp1</b>	(OPTIONAL) Enter the keyword <code>rp1</code> to view only the statistics from Route Processor 1.

**rp2** (OPTIONAL) Enter the keyword `rp2` to view only the statistics from Route Processor 2.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>6.5.1.0</b>	F10 Monitoring MIB available for the <code>ip traffic statistics</code> command.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** The following describes the `show ip traffic` summary shown in the following example.

<b>Keyword</b>	<b>Definition</b>
<b>unknown protocol...</b>	No receiver for these packets. Counts packets whose protocol type field is not recognized by Dell EMC Networking OS.
<b>not a gateway...</b>	Packets can not be routed; the host/network is unreachable.
<b>security failures...</b>	Counts the number of received unicast/multicast packets that could not be forwarded due to: <ul style="list-style-type: none"><li>● route not found for unicast/multicast; ingress interfaces do not belong to the destination multicast group</li><li>● destination IP address belongs to reserved prefixes; the host/network is unreachable</li></ul>
<b>bad options...</b>	Unrecognized IP option on a received packet.
<b>Fragments:</b>	IP fragments received.
<b>... reassembled</b>	Number of IP fragments that were reassembled.
<b>... timeouts</b>	Number of times a timer expired on a reassembled queue.
<b>... too big</b>	Number of invalid IP fragments received.
<b>... couldn't fragment</b>	Number of packets that could not be fragmented and forwarded.

Keyword	Definition
<b>...encapsulation failed</b>	Counts packets which could not be forwarded due to ARP resolution failure. Dell EMC Networking OS sends an arp request prior to forwarding an IP packet. If a reply is not received, Dell EMC Networking OS repeats the request three times. These packets are counted in encapsulation failed.
<b>Rcvd:</b>	
<b>...short packets</b>	The number of bytes in the packet are too small.
<b>...bad length</b>	The length of the packet was not correct.
<b>...no port broadcasts</b>	The incoming broadcast/multicast packet did not have any listener.
<b>...socket full</b>	The applications buffer is full and the incoming packet are dropped.

The Dell Monitoring MIB provides access to the following statistics.

- **IP Statistics: Bcast: Received:** Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent:** Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received:** Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent:** Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request:** Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies:** Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3
- **ARP Statistics: Sent: Request:** Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Replies:** Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy:** Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5

## Example

```
DellEMC# show ip traffic
Control Processor IP Traffic:

IP statistics:
  Rcvd: 23857 total, 23829 local destination
        0 format errors, 0 checksum errors, 0 bad hop count
        0 unknown protocol, 0 not a gateway
        0 security failures, 0 bad options
  Frags: 0 reassembled, 0 timeouts, 0 too big
        0 fragmented, 0 couldn't fragment
  Bcast: 28 received, 0 sent; Mcast: 0 received, 0 sent
  Sent: 16048 generated, 0 forwarded
        21 encapsulation failed, 0 no route
ICMP statistics:
  Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0 unreachable
        0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0 quench
        0 parameter, 0 timestamp, 0 info request, 0 other
  Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
        0 mask requests, 0 mask replies, 0 quench, 0 timestamp
        0 info reply, 0 time exceeded, 0 parameter problem
UDP statistics:
  Rcvd: 0 total, 0 checksum errors, 0 no port
        0 short packets, 0 bad length, 0 no port broadcasts, 0 socket full
  Sent: 0 total, 0 forwarded broadcasts
TCP statistics:
  Rcvd: 23829 total, 0 checksum errors, 0 no port
  Sent: 16048 total
ARP statistics:
  Rcvd: 156 requests, 11 replies
  Sent: 21 requests, 10 replies (0 proxy)
Routing Processor1 IP Traffic:
```

# show tcp statistics

View information on TCP traffic through the switch.

**Syntax** `show tcp statistics {all | cp}`

**Parameters**

<b>all</b>	Enter the keyword <code>all</code> to view all TCP information.
<b>cp</b>	Enter the keyword <code>cp</code> to view only TCP information from the Control Processor.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
6.4.1.0	Introduced

**Usage Information** The following describes the `show tcp statistics cp` command shown in the following example.

Field	Description
<b>Rcvd:</b>	Displays the number and types of TCP packets received by the switch. <ul style="list-style-type: none"><li>• Total = total packets received</li><li>• no port = number of packets received with no designated port</li></ul>
<b>0 checksum error...</b>	Displays the number of packets received with the following: <ul style="list-style-type: none"><li>• checksum errors</li><li>• bad offset to data</li><li>• too short</li></ul>
<b>329 packets...</b>	Displays the number of packets and bytes received in sequence.
<b>17 dup...</b>	Displays the number of duplicate packets and bytes received.
<b>0 partially...</b>	Displays the number of partially duplicated packets and bytes received.
<b>7 out-of-order...</b>	Displays the number of packets and bytes received out of order.

Field	Description
<b>0 packets with data after window</b>	Displays the number of packets and bytes received that exceed the switch's window size.
<b>0 packets after close</b>	Displays the number of packet received after the TCP connection was closed.
<b>0 window probe packets...</b>	Displays the number of window probe and update packets received.
<b>41 dup ack...</b>	Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.
<b>10184 ack...</b>	Displays the number of acknowledgement packets and bytes received.
<b>Sent:</b>	Displays the total number of TCP packets sent and the number of urgent packets sent.
<b>25 control packets...</b>	Displays the number of control packets sent and the number retransmitted.
<b>11603 data packets...</b>	Displays the number of data packets sent.
<b>24 data packets retransmitted</b>	Displays the number of data packets resent.
<b>355 ack..</b>	Displays the number of acknowledgement packets sent and the number of packet delayed.
<b>0 window probe...</b>	Displays the number of window probe and update packets sent.
<b>7 Connections initiated...</b>	Displays the number of TCP connections initiated, accepted, and established.
<b>14 Connections closed...</b>	Displays the number of TCP connections closed, dropped.
<b>20 Total rxmt...</b>	Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period.
<b>0 Keepalive....</b>	Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.

### Example

```
DellEMC# show tcp stat cp

Control Processor TCP:
Rcvd: 10585 Total, 0 no port
    0 checksum error, 0 bad offset, 0 too short
    329 packets (1263 bytes) in sequence
    17 dup packets (6 bytes)
    0 partially dup packets (0 bytes)
    7 out-of-order packets (0 bytes)
    0 packets ( 0 bytes) with data after window
    0 packets after close
    0 window probe packets, 41 window update packets
    41 dup ack packets, 0 ack packets with unsend data
    10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
    25 control packets (including 24 retransmitted)
    11603 data packets (12439677 bytes)
    24 data packets (7638 bytes) retransmitted
    355 ack only packets (41 delayed)
    0 window probe packets, 0 window update packets
    7 Connections initiated, 8 connections accepted, 15 connections established
    14 Connections closed (including 0 dropped, 0 embryonic dropped)
    20 Total rxmt timeout, 0 connections dropped in rxmt timeout
    0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in keepalive
```

## IPv6 Basics

IPv6 basic commands are supported on the Dell EMC Networking OS.

**NOTE:** For information about the Dell EMC Networking OS version and platform that supports IPv6 in each software feature, see the *IPv6 Addressing* section in the *Dell EMC Networking OS Configuration Guide*.

### Topics:

- [cam-ipv6 extended-prefix](#)
- [clear ipv6 route](#)
- [maximum dynamic-routes-ipv6](#)
- [show cam-ipv6 extended-prefix](#)
- [ipv6 unicast-host-route](#)
- [ipv6 nd disable-reachable-timer](#)
- [ipv6 nd dns-server](#)
- [ipv6 nd reachable-time](#)
- [ipv6 route](#)
- [show ipv6 route](#)

## cam-ipv6 extended-prefix

Enable LPM partitioning to support IPv6 /65 to /128 route prefixes to be stored in Partition 1.

<b>Syntax</b>	<code>cam-ipv6 extended-prefix &lt;Max-IPv6-prefixes&gt;</code>	
	To remove LPM partitioning configuration, use no <code>cam-ipv6 extended-prefix</code> .	
<b>Parameters</b>	<b><i>Max-IPv6-Prefix</i></b>	Maximum number of IPv6 prefixes in the mask length of /65 to /128. The possible values are 1024, 2048, and 3072.
<b>Defaults</b>	LPM is not partitioned with Partition 1 and therefore /65 to /128 prefixes are not converted to /64 prefixes and are installed and saved in LPM. All the packets for those routes traverse through the default route path.	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
	<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.5(0.1)</b>	Introduced on the Z9500.
	<b>9.3(0.1)</b>	Introduced on the S6000.
<b>Usage Information</b>	You can partition the LPM table to store IPv6 prefixes greater than /64 mask length. Requires reboot of the switch to take effect as the SDK handles this only during its initialization.	

# clear ipv6 route

Clear (refresh) all or a specific route from the IPv6 routing table.

**Syntax** `clear ipv6 route [vrf vrf-name] { * | ipv6-address prefix-length }`

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to clear the IPv6 routes corresponding to that VRF.
<b>*</b>	Enter the <code>*</code> to clear (refresh) all routes from the IPv6 routing table.
<b>ipv6-address prefix-length</b>	Enter the IPv6 address in the <code>x:x:x::x</code> format then the prefix length in the <code>/x</code> format. The range is from <code>/0</code> to <code>/128</code> .

 **NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

# maximum dynamic-routes-ipv6

Specify the maximum number of dynamic (protocol) IPv6 routes a VRF can have.

**Syntax** `maximum dynamic-routes-ipv6 limit { warn-threshold threshold-value | warning-only }`

To remove the limit on the maximum number of IPv6 routes used, use the `no maximum dynamic-routes-ipv6` command.

**Parameters**

<b>limit</b>	Maximum number of IPv6 routes allowed in a VRF. Valid range is from 1 to 8000 (or maximum allowable for that platform if smaller value).
<b>warning-threshold</b>	Warning threshold value is expressed as a percentage of the limit value. When the number of IPv6 routes reaches the specified percentage of the limit, a warning

message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional routes will not be allowed into the RTM ( route table manager ) itself.

**warning-only** When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic IPv6 routes reaches the limit. Additional dynamic IPv6 routes will still be allowed.

**Defaults** No limit is set on the maximum number of dynamic IPv6 routes for a VRF.

**Command Modes** CONFIGURATION-VRF  
CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.

**Usage Information** If the maximum IPv6 route limit is not specified for a VRF (valid range is from 1 to 8000), then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.

## show cam-ipv6 extended-prefix

Display the current settings and next-boot settings for cam-ipv6 extended-prefix configuration. Display the cam-ipv6 extended-prefix configuration.

**Syntax** `show cam-ipv6 extended-prefix`

**Defaults** None

**Command Modes** EXEC  
EXEC **Privilege**

Command History	Version	Description
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
	<b>9.10(0.0)</b>	Introduced on the S6100-ON.
	<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.5(0.1)</b>	Introduced on the Z9500.
	<b>9.3(0.1)</b>	Introduced on the S6000.

**Usage Information** You can use this command to view the number of supported extended prefix entries in LPM configured. The output also displays the current applied value and the new value that is applicable after the reboot of the device.

**Example**

```
DellEMC# show cam-ipv6 extended-prefix
Cam-Ipv6-LPM Extended Prefix
-----
Current Settings
cam-ipv6-max-/65-to-/128-Prefix : 2048
DellEMC(conf) #
```

## ipv6 unicast-host-route

Enable programming of IPv6 /128 route prefixes in L3 host table.

**Syntax** [no] ipv6 unicast-host-route

**Defaults** Enabled by default. By default, all the IPv6/128 route prefixes are installed only in L3 host table.

**Command Modes** CONFIGURATION

**Command History**

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.3(0.1)	Introduced on the S6000.

**Usage Information** You can use this command to enable programming of /128 route prefixes in L3 host table or in LPM table. A warning message is displayed when you enter this command stating that this setting takes effect for existing routes only when IPv6 route prefixes are cleared from the routing table (RTM). To enable programming of /128 route prefixes in LPM table, use no ipv6 unicast-host-route command.

**Example**

```
DellEMC(conf)# ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
DellEMC(conf)#no ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
DellEMC(conf) #
```

## ipv6 nd disable-reachable-timer

Keep the learnt neighbor discovery entries stateless so that the entries do not time out.

**Syntax** ipv6 nd disable-reachable-timer

To restore to default, use the no ipv6 nd disable-reachable-timer command.

**Default** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11.0.1	Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S4810, S4820, S5000, S6000, S6010-ON, S6000-ON, S6100-ON, Z9100-ON, C9010, Z9500, MXL, and FN IOM.

## ipv6 nd dns-server

Configures Recursive DNS Server (RDNSS) addresses to be distributed via IPv6 router advertisements to an IPv6 device.

**Syntax** `ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`  
 To remove the IPv6 RDSS configuration, use `no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`

**Parameters**

**ipv6-RDNSS-address** Enter the IPv6 Recursive DNS Server's (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.

**lifetime** Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or *infinite*, the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the *lifetime* or *infinite* parameter.

**infinite** Enter the keyword *infinite* to specify that the RDNSS lifetime does not expire.

**Defaults** Not Configured

**Command Modes** INTERFACE CONFIG

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9000, S6000, S4810, S4820T, and MXL..

**Usage Information** Use this command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the *lifetime* or *infinite* parameter.

**Example**

```
DellEMC(conf-if-te-1/1/1)# ipv6 nd dns-server 1000::1 1
```

## ipv6 nd reachable-time

Configure the amount of time before an IPv6 neighbor is considered unreachable.

**Syntax** `ipv6 nd reachable-time reachable-time`

To restore to default, use the `no ipv6 nd reachable-time` command.

<b>Parameters</b>	<b><i>reachable-time</i></b>	Enter the reachable time in milliseconds. The value is from 0 to 3600000. The default value is 0.
<b>Default</b>	Disabled	
<b>Command Modes</b>	INTERFACE	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>
	<b>9.12(1.0)</b>	Introduced on the S5048F-ON.
	<b>Legacy version</b>	Introduced on the S series and Z series.

## ipv6 route

Establish a static IPv6 route.

**Syntax**

```
ipv6 route [vrf vrf-name] ipv6-address prefix-length {ipv6-address | interface | interface ipv6-address} [distance] [name description] [tag value] [permanent] [weight weight-value]
```

To remove the IPv6 route, use the `no ipv6 route` command.

<b>Parameters</b>	<b><i>vrf vrf-name</i></b>	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.
	<b><i>ipv6-address prefix-length</i></b>	Enter the IPv6 address in the <code>x:x:x::x</code> format then the prefix length in the <code>/x</code> format. The range is from <code>/0</code> to <code>/128</code> .  <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zeros.
	<b><i>interface</i></b>	(OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel interface number. The range is from 1 to 16383.</li><li>• For a VLAN interface, enter the keyword <code>VLAN</code> then the vlan number. The range is from 1 to 4094.</li></ul>

If you configure a static IPv6 route using an egress interface and enter the `ping` command to reach the destination IPv6 address, the ping operation may not work.

Configure the IPv6 route using a next-hop IPv6 address in order for the `ping` command to detect the destination address.

<b><i>ipv6-address</i></b>	(OPTIONAL) Enter the forwarding router IPv6 address in the x:x:x:x format.  <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
<b><i>distance</i></b>	(OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.
<b><i>name description</i></b>	(OPTIONAL) Enter the keyword <code>name</code> and the description for the IPv6 static route configuration.
<b><i>tag value</i></b>	(OPTIONAL) Enter the keyword <code>tag</code> then a tag value number. The range is from 1 to 4294967295.
<b><i>permanent</i></b>	(OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route is not to be removed, even if the interface assigned to that route goes down.  <b>NOTE:</b> If you disable the interface with an IPv6 address associated with the keyword <code>permanent</code> , the route disappears from the routing table.
<b><i>weight weight-value</i></b>	Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.  <b>NOTE:</b> Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.14(1.2)</b>	Added the keyword <code>name</code> for static routes.
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Also included the <code>weight</code> parameter to support weighted ECMP feature. Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.2.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series.
<b>7.4.1.0</b>	Introduced on the E-Series.

**Usage Information** When the interface goes down, Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the interface comes back up. When a recursive resolution is “broken,”

Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

### Example

```
DelleMC(conf)# ipv6 route 44::/64 33::1 weight 100
DelleMC(conf)# ipv6 route 44::/64 33::2 weight 200
DelleMC(conf)# do show running-config | grep ipv6 route
DelleMC(conf)# ipv6 route vrf vrf_test 44::/64 33::1 weight 100
DelleMC(conf)# ipv6 route vrf vrf_test 44::/64 33::2 weight 200
DelleMC(conf)# do show running-config | grep ipv6 route vrf
```

### Related Commands

- [show ipv6 route](#) — view the IPv6 configured routes.

## show ipv6 route

Displays the IPv6 routes.

### Syntax

```
show ipv6 route [ipv6-address prefix-length] [vrf vrf-name] [hostname]
[all] [bgp as number] [connected] [isis tag] [list prefix-list name] [ospf
process-id] [rip] [static] [summary]
```

### Parameters

<b><i>ipv6-address</i></b>	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
<b><i>prefix-length</i></b>	 <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
<b><i>vrf vrf-name</i></b>	(Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 routes corresponding to that VRF.  <b>NOTE:</b> If you do not specify this option, routes corresponding to the default VRF are displayed.
<b><i>hostname</i></b>	(OPTIONAL) View information for this IPv6 routes with Host Name.
<b><i>all</i></b>	(OPTIONAL) View information for all IPv6 routes.
<b><i>bgp</i></b>	(OPTIONAL) View information for all IPv6 BGP routes.
<b><i>connected</i></b>	(OPTIONAL) View only the directly connected IPv6 routes.
<b><i>isis</i></b>	(OPTIONAL) View information for all IPv6 IS-IS routes.
<b><i>list</i></b>	(OPTIONAL) View the IPv6 prefix list.
<b><i>ospf</i></b>	(OPTIONAL) View information for all IPv6 OSPF routes.
<b><i>rip</i></b>	(OPTIONAL for E-Series only) View information for all IPv6 RIP routes.
<b><i>static</i></b>	(OPTIONAL) View only routes configured by the <code>ipv6 route</code> command.
<b><i>summary</i></b>	(OPTIONAL) View a brief list of the configured IPv6 routes.

### Defaults

none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information**

The following describes the `show ipv6 route` command shown in the following examples.

Field	Description
<b>(undefined)</b>	Identifies the type of route: <ul style="list-style-type: none"> <li>• L = Local</li> <li>• C = connected</li> <li>• S = static</li> <li>• R = RIP</li> <li>• B = BGP</li> <li>• IN = internal BGP</li> <li>• EX = external BGP</li> <li>• LO = Locally Originated</li> <li>• O = OSPF</li> <li>• IA = OSPF inter-area</li> <li>• N1 = OSPF NSSA external type 1</li> <li>• N2 = OSPF NSSA external type 2</li> <li>• E1 = OSPF external type 1</li> <li>• E2 = OSPF external type 2</li> <li>• i = IS-IS</li> <li>• L1 = IS-IS level-1</li> <li>• L2 = IS-IS level-2</li> <li>• IA = IS-IS inter-area</li> <li>• * = candidate default</li> <li>• &gt; = non-active route</li> <li>• + = summary routes</li> </ul>
<b>Destination</b>	Identifies the route's destination IPv6 address.
<b>Gateway</b>	Identifies whether the route is directly connected and on which interface the route is configured.

Field	Description
<b>Dist/Metric</b>	Identifies if the route has a specified distance or metric.
<b>Last Change</b>	Identifies when the route was last changed or configured.

**Example (S-Series)**

```
DelleMC# show ipv6 route

Codes: C - connected, L - local, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated,
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
       L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default,
Gateway of last resort is not set

      Destination  Dist/Metric,      Gateway,      Last Change
      -----
C      100::/64 [0/0]
      Direct, Te 1/12/1, 20:00:18
C      400::/64 [0/0]
      Direct, Tu 1, 00:09:02
S      800::/64 [1/0]
      via 100::1, Te 1/12/1, 00:00:50
L      fe80::/10 [0/0]
      Direct, Nu 0, 20:00:18
DelleMC#
```

**Example (Summary)**

```
show ipv6 route summary:
=====
DelleMC# show ipv6 route summary

Route Source           Active Routes   Non-active Routes
connected              3                0
static                 1                0
Total                  4                0
Total 4 active route(s) using 928 bytes
DelleMC#
```

# IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell EMC Networking OS.

**NOTE:** For IPv4 ACL commands, see [Access Control Lists \(ACL\)](#).

## Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, see [cam-acl](#).
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

### Topics:

- [show cam-acl-egress](#)
- [show cam-acl](#)
- [show ipv6 accounting access-list](#)
- [permit icmp](#)
- [permit](#)
- [ipv6 control-plane egress-filter](#)

- [cam-acl-egress](#)
- [cam-acl](#)

## show cam-acl-egress

Show information on FP groups allocated for egress ACLs.

**Syntax** `show cam-acl-egress`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.4.2.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series.

### Example

### Related Commands

- [cam-acl](#) — configure CAM profiles to support IPv6 ACLs.

## show cam-acl

Show space allocated for IPv6 ACLs.

**Syntax** `show cam-acl`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.4.2.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series.

### Example

### Example (Manual Profiles)

```
DellEMC# show cam-acl

-- Chassis Cam ACL --
      Current Settings(in block sizes)
L2Acl   :      2
Ipv4Acl :      2
Ipv6Acl :      4
Ipv4Qos :      2
L2Qos   :      3

-- Line card 4 --
      Current Settings(in block sizes)
L2Acl   :      2
Ipv4Acl :      2
Ipv6Acl :      4
Ipv4Qos :      2
L2Qos   :      3

DellEMC#
```

### Related Commands

- [cam-acl](#) — configure CAM profiles to support IPv6 ACLs.

## show ipv6 accounting access-list

View the IPv6 access-lists created on the E-Series and the sequence of filters.

### Syntax

```
show ipv6 accounting access-list [access-list-name [cam_count | interface
interface {in | out}]
```

### Parameters

- access-list-name*** Enter the name of the ACL to be displayed, up to 140 characters.
- cam\_count*** List the count of the CAM rules for this ACL.
- interface*** Enter the keyword `interface` followed by the interface type and slot/port or number information:
- interface***
- For a Port Channel interface, enter the keywords `port-channel` followed by a number. For the C-Series and S-Series, the range is 1 to 128. For the E-Series, the range is 1 to 255 for TeraScale and 1 to 512 for ExaScale.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` followed by the slot/port information.
  - For a 25-Gigabit interface, enter the keyword `twentyfiveGigE` then the slot/port/subport information.
  - For a 50-Gigabit interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit interface, enter the keyword `hundredGigE` then the slot/port information.
- in | out*** Identify whether ACL is applied on ingress or egress side.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long.
7.4.1.0	Introduced on the E-Series TeraScale.

### Usage Information

Field	Description
“Ingress IPv6...”	Displays the name of the IPv6 ACL, in this Example “AcList1”.
“seq 10...”	Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes processed by the filter is displayed at the end of the line.

### Example

```
DellEMC#show ipv6 accounting access-list
!
Ingress IPv6 access list AcList1 on GigabitEthernet 9/0
Total cam count 15
  seq 10 permit icmp host 3333:: any mobile-advertisement log
  seq 15 deny tcp any any rst
  seq 20 permit udp any any gt 101 count (0 packets)
!
DellEMC#
```

## permit icmp

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```
permit icmp {source address mask | any | host ipv6-address} {destination
address | any | host ipv6-address} [count [byte]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

### Parameters

<b>source address</b>	Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128. The :: notation specifies successive hexadecimal fields of zero.
<b>mask</b>	Enter a network mask in /prefix format (/x).
<b>host ipv6-address</b>	Enter the keyword <code>host</code> then the IPv6 address of the host in the x:x:x:x:x format. The :: notation specifies successive hexadecimal fields of zero.
<b>destination address</b>	Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128. The :: notation specifies successive hexadecimal fields of zero.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to have the information kept in an ACL log file.

**monitor** (OPTIONAL) Enter the keyword `monitor` to monitor traffic on the monitoring interface specified in the flow-based monitoring session along with the filter operation.

**Defaults** Not configured.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series. Added the <code>monitor</code> option.

## permit

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

**Syntax** `permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

Parameters	
<b><i>ip-protocol-number</i></b>	Enter an IPv6 protocol number. The range is from 0 to 255.
<b>icmp</b>	Enter the keyword <code>icmp</code> to filter internet Control Message Protocol version 6.
<b>ipv6</b>	Enter the keyword <code>ipv6</code> to filter any internet Protocol version 6.
<b>tcp</b>	Enter the keyword <code>tcp</code> to filter the Transmission Control protocol.
<b>udp</b>	Enter the keyword <code>udp</code> to filter the User Datagram Protocol.

**Defaults** Not configured.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.10.0</b>	Introduced on the S4810.

# ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

**Syntax** `ipv6 access-list access-list-name cpu-qos`  
To delete an access list, use the `no ipv6 access-list access-list-name` command.

**Parameters**

- access-list-name** Enter the access list name as a string, up to 140 characters.
- cpu-qos** Enter the keyword `cpu-qos` to assign this ACL to control plane traffic only (CoPP).
- permit** Enter the keyword `permit` to configure a filter to forward packets meeting this condition.
- deny** Enter the keyword `deny` to configure a filter to drop packets meeting this condition.
- ospfv3** Specify that this ACL is for OSPFv3 control plane traffic

**Defaults** All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for CoPP for OSPFv3 on the S4810, S4820T, S6000, and Z9000 platforms.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000
8.3.11.1	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long.
7.4.1.0	Introduced on the E-Series.

**Usage Information** The number of entries allowed per ACL is hardware-dependent. For detailed specification on entries allowed per ACL, refer to your line card documentation. You can create an IPv6 ACL for control-plane traffic policing for OSPFv3, in addition to the CoPP support for VRRP, BGP, and ICMP.

# cam-acl-egress

Allocate space for IPv6 egress ACLs.

<b>Syntax</b>	<code>cam-acl-egress {default   l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4}</code>				
<b>Parameters</b>	<table><tr><td><b>default</b></td><td>Use the default CAM profile settings, and set the CAM as follows:<ul style="list-style-type: none"><li>• L2 ACL(l2acl): <b>1</b></li><li>• L3 ACL (ipv4acl): <b>1</b></li><li>• IPv6 L3 ACL (ipv6acl): <b>2</b></li></ul></td></tr><tr><td><b>l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4</b></td><td>Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The <code>ipv6acl</code> range must be a factor of 2.</td></tr></table>	<b>default</b>	Use the default CAM profile settings, and set the CAM as follows: <ul style="list-style-type: none"><li>• L2 ACL(l2acl): <b>1</b></li><li>• L3 ACL (ipv4acl): <b>1</b></li><li>• IPv6 L3 ACL (ipv6acl): <b>2</b></li></ul>	<b>l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4</b>	Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The <code>ipv6acl</code> range must be a factor of 2.
<b>default</b>	Use the default CAM profile settings, and set the CAM as follows: <ul style="list-style-type: none"><li>• L2 ACL(l2acl): <b>1</b></li><li>• L3 ACL (ipv4acl): <b>1</b></li><li>• IPv6 L3 ACL (ipv6acl): <b>2</b></li></ul>				
<b>l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4</b>	Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The <code>ipv6acl</code> range must be a factor of 2.				

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.4.2.0</b>	Introduced on the E-Series.
<b>8.2.1.0</b>	Introduced on the S-Series.
<b>7.8.1.0</b>	Introduced on the C-Series.

**Usage Information** For the new settings to take effect, save the new CAM settings to the startup-config (`write mem` or `copy run start`), then reload the system.

The total amount of space allowed is 4 FP Blocks.

## Example

```
DellEMC# configure
DellEMC(conf)# cam-acl-egress ?
default      Reset Egress CAM ACL entries to default setting
l2acl        Set L2-ACL entries
DellEMC(conf)# cam-acl-egress l2acl ?
<1-4>        Number of FP blocks for l2acl
DellEMC(conf)# cam-acl-egress l2acl 1 ?
ipv4acl      Set IPV4-ACL entries
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ?
ipv6acl      Set IPV6-ACL entries
```

```
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl ?
<0-4>          Number of FP blocks for IPV6 (multiples of 2)
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl 2
DellEMC(conf)#
```

## cam-acl

Allocate space for IPv6 ACLs.

**Syntax** `cam-acl {default | l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10}`

**Parameters**

**default** Use the default CAM profile settings, and set the CAM as follows:

- L3 ACL (ipv4acl): **2**
- L2 ACL(l2acl): **2**
- IPv6 L3 ACL (ipv6acl): **0**
- L3 QoS (ipv4qos): **2**
- L2 QoS (l2qos): **2**

**l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10** Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 9. The `ipv6acl` range must be a factor of 3 (0,3,6,9).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.4.2.0	Introduced on the E-Series.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

**Usage Information** For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from 0 to 8.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 9.

The `ipv6acl` allocation must be a factor of 3 (0,3,6,9).

# Intermediate System to Intermediate System (IS-IS)

IS-IS is an interior gateway protocol that uses shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing through both IP and OSI traffic.

A router is considered as an intermediate system. Networks are partitioned into manageable routing domains called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the *Dell EMC Networking OS Configuration Guide*.

**i** **NOTE:** The fundamental mechanisms of IS-IS are the same for IPv4 and IPv6. However some command modes might vary when applied to IPV4 and IPV6. These variations have been explicitly explained for such commands. If the variation is not mentioned, then the information applies to both the protocol versions.

## adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

**Syntax** `adjacency-check`

To disable adjacency check, use the `no adjacency-check` command.

**Defaults** Enabled.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced on the E-Series.

### Usage Information

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

## advertise

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

### Syntax

```
advertise {level1-into-level2 | level2-into-level1} prefix-list-name
```

To return to the default, use the `no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name]` command.

### Parameters

<b>level1-into-level2</b>	Enter the keywords <code>level1-into-level2</code> to advertise Level 1 routes into Level 2 LSPs. This setting is the default.
<b>level2-into-level1</b>	Enter the keywords <code>level2-into-level1</code> to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966.
<b>prefix-list-name</b>	Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.

### Defaults

**level1-into-level2** (Level 1 to Level 2 leaking is enabled.)

**level2-into-level1** (Level 2 to Level 1) leaking is disabled.

### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Version 6.3.1.0 Introduced

### Usage Information

You cannot disable leaking from Level 1 to Level 2. Also, you cannot enable leaking from Level 2 to Level 1. However, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all Level 1 routes are leaked.

You can find more information in IETF RFC 2966, *Domain-wide Prefix Distribution with Two-Level IS-IS*.

## area-password

Configure a hash message authentication code (HMAC) password for an area.

**Syntax** `area-password [hmac-md5 | encryption-type] password`

To delete a password, use the `no area-password` command.

**Parameters**

- hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password.
- encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- password** Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.

**Usage Information**

To prevent the link state database from receiving incorrect routing information from unauthorized routers, use the `area-password` command on routers within an area.

The configured password injects into Level 1 LSPs, CSNPs, and PSNPs.

**Related Commands**

- [domain-password](#) — set the authentication password for a routing domain.
- [isis password](#) — configure an authentication password for an interface.

## clear config

Clear IS-IS configurations that display under the *router isis* heading of the `show running-config` command output.

**Syntax** `clear config`

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.1	Introduced on the S4810.

**Usage Information**

 **CAUTION: Use caution when you enter this command. Back up your configuration prior to using this command or your IS-IS configuration will be erased.**

## clear isis

Restart the IS-IS process. All IS-IS data is cleared.

**Syntax** `clear isis [vrf vrf-name] [tag] {* | database | traffic}`

**Parameters** `vrf vrf-name` (Optional) Enter the keyword `vrf` followed by the name of the VRF to restart the IS-IS process corresponding to that VRF.

<b>tag</b>	(Optional) Enter an alphanumeric string to specify the IS-IS routing tag area.
*	Enter the keyword * to clear all IS-IS information and restart the IS-IS process. This command removes IS-IS neighbor information and IS-IS LSP database information and the full SPF calculation is done.
<b>database</b>	Clears IS-IS LSP database information.
<b>traffic</b>	Clears IS-IS counters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

## clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

**Syntax** `clns host name nsap`

**Parameters**

<b>name</b>	Enter an alphanumeric string to identify the name-to-NSAP mapping.
<b>nsap</b>	Enter a specific NSAP address that is associated with the name parameter.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information**

To configure a shortcut name that you can use instead of entering a long string of numbers associated with an NSAP address, use this command.

**Related Commands**

- [hostname dynamic](#) — enable dynamic learning of host names from routers in the domain and allows the routers to advertise the host names in LSPs.

## debug isis

Enable debugging for all IS-IS operations.

**Syntax**

`debug isis`

To disable debugging of IS-IS, use the `no debug isis` command.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information**

Entering `debug isis` enables all debugging parameters.

To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate `no` forms of each command. To disable all debug messages for IS-IS at once, enter the `no debug isis` command.

# debug isis adj-packets

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

**Syntax** `debug isis [vrf vrf-name] adj-packets [interface]`  
To turn off debugging, use the `no debug isis [vrf vrf-name]adj-packets [interface]` command.

**Parameters**

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable the debug information on IS-IS for an adjacency tied to that VRF. This command displays the IIH related debug details.

**interface** (OPTIONAL) Identifies the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

# debug isis local-updates

To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

**Syntax** `debug isis [vrf vrf-name] local-updates [interface]`  
To turn off debugging, use the `no debug isis [vrf vrf-name] updates [interface]` command.

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable the debugging information on IS-IS corresponding to that VRF. This information contains local updates tied to the VRF that you specify. This command displays the local LSP debugging details of the current unit.

**interface** (OPTIONAL) Identifies the interface type as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.12.0	Introduced on the S4810.
6.3.1.0	Introduced.

# debug isis snp-packets

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a specific interface and provides diagnostic information.

**Syntax**            `debug isis [vrf vrf-name] snp-packets [interface]`  
To turn off debugging, use the `no debug isis [vrf vrf-name] snp-packets [interface]` command.

**Parameters**

**vrf vrf-name**            (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable debugging information on ISIS for CSNP/PSNP packets tied to that VRF. The command displays the SNP (CSNP/PSNP) related debugging information.

**interface**            (OPTIONAL) Identifies the interface type as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**    EXEC Privilege

**Command History**    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
6.3.1.0	Introduced.

# debug isis spf-triggers

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

<b>Syntax</b>	<code>debug isis [vrf vrf-name] spf-triggers</code> To turn off debugging, use the <code>no debug isis [vrf vrf-name] spf-triggers</code> command.
<b>Parameters</b>	<b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains SPF trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

# debug isis update-packets

Enable debugging on link state PDUs (LSPs) that a router detects.

<b>Syntax</b>	<code>debug isis [vrf vrf-name] update-packets [interface]</code> To turn off debugging, use the <code>no debug isis update-packets [interface]</code> command.
<b>Parameters</b>	<b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors. <b>interface</b> (OPTIONAL) Identifies the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>6.3.1.0</b>	Introduced.

## default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

**Syntax** `default-information originate [always] [metric metric] [route-map map-name]`  
 To disable the generation of a default route into the specified IS-IS routing domain, use the `no default-information originate [always] [metric metric] [route-map map-name]` command.

**Parameters**

- always** (OPTIONAL) Enter the keyword `always` to have the default route always advertised.
- metric *metric*** (OPTIONAL) Enter the keyword `metric` then a number to assign to the route. The range is from 0 to 16777215.
- route-map *map-name*** (OPTIONAL) A default route the routing process generates if the route map is satisfied.

<b>Defaults</b>	Not configured.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• ROUTER ISIS (for IPv4)</li> <li>• CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)</li> </ul>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.5.1.0</b>	Added IPv6 ISIS support.
<b>6.3.1.0</b>	Introduced.

<b>Usage Information</b>	<p>When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.</p> <p>How a metric value assigned to a default route advertises depends on the <code>metric-style</code> command configuration. If the <code>metric-style</code> command is set for Narrow mode and the metric value in the <code>default-information originate</code> command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the <code>metric-style</code> command is set for Wide mode, the metric value in the <code>default-information originate</code> command is advertised.</p>
--------------------------	---

<b>Related Commands</b>	<ul style="list-style-type: none"> <li>• <a href="#">redistribute</a> — redistribute routes from one routing domain to another routing domain.</li> </ul>
-------------------------	---

## description

Enter a description of the IS-IS routing protocol.

<b>Syntax</b>	<pre>description {description}</pre> <p>To remove the description, use the <code>no description {description}</code> command.</p>
---------------	---

<b>Parameters</b>	<b><i>description</i></b> Enter a description to identify the IS-IS protocol (80 characters maximum).
-------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	ROUTER ISIS
----------------------	-------------

<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .
------------------------	---

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
pre-7.7.1.0	Introduced.

#### Related Commands

- [router isis](#) — enter ROUTER mode on the switch.

## distance

Define the administrative distance for learned routes.

**Syntax** `distance weight [ip-address mask [prefix-list]]`  
 To return to the default values, use the `no distance weight` command.

**Parameters**

**weight** The administrative distance value indicates the reliability of a routing information source. The range is from 1 to 255. (A higher relative value indicates lower reliability. Routes with smaller values are given preference.) The default is **115**.

**ip-address mask** (OPTIONAL) Enter the next-hop address in dotted decimal format and enter a mask in either dotted decimal or /prefix format.

**prefix-list** (OPTIONAL) Enter the name of a prefix list name.

**Defaults** weight = 115

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

### Usage Information

The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

## distribute-list in

Filter network prefixes received in updates.

### Syntax

```
distribute-list prefix-list-name in [interface]
```

To return to the default values, use the `no distribute-list prefix-list-name in [interface]` command.

### Parameters

- prefix-list-name*** Specify the prefix list to filter prefixes in routing updates.
- interface*** (OPTIONAL) Identifies the interface type and the interface following:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Defaults

Not configured.

### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

**Related Commands**

- [distribute-list out](#) — suppress networks from being advertised in updates.
- [redistribute](#) — redistribute routes from one routing domain to another routing domain.

## distribute-list out

Suppress network prefixes from being advertised in outbound updates.

**Syntax**

```
distribute-list prefix-list-name out [connected | bgp as number | ospf process-id | rip | static]
```

To return to the default values, use the `no distribute-list prefix-list-name out [bgp as number connected | ospf process-id | rip | static]` command.

**Parameters**

- prefix-list-name*** Specify the prefix list to filter prefixes in routing updates.
- connected*** (OPTIONAL) Enter the keyword `connected` for directly connected routing process.
- ospf process-id*** (OPTIONAL) Enter the keyword `ospf` then the OSPF process-ID number. The range is from 1 to 65535.
- bgp as number*** (OPTIONAL) Enter the BGP then the AS Number. The range is from 1 to 65535.
- rip*** (OPTIONAL) Enter the keyword `rip` for RIP routes.
- static*** (OPTIONAL) Enter the keyword `static` for user-configured routing process.

**Defaults**

Not configured.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

**Usage Information**

You can assign a name to a routing process so a prefix list IS applied to only the routes derived from the specified routing process.

**Related Commands**

- [distribute-list in](#) — filter the networks received in updates.
- [redistribute](#) — redistribute routes from one routing domain to another routing domain.

## distribute-list redistributed-override

Suppress flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

**Syntax**

`distribute-list redistributed-override in`

To return to the default, use the `no distribute-list redistributed-override in` command.

**Defaults**

none

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

**Usage Information** When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.

## domain-password

Set the authentication password for a routing domain.

**Syntax** `domain-password [hmac-md5 | encryption-type] password`

To disable the password, use the `no domain-password` command.

**Parameters**

- hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- password** Enter an alphanumeric string up to 16 characters long. If you do not specify an `encryption-type` or `hmac-md5` keywords, the password is processed as plain text which provides limited security.

**Defaults** No default password.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

**Usage Information** The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

**Related Commands**

- [area-password](#) — configure an IS-IS area authentication password.
- [isis priority](#) — configure the authentication password for an interface.

## graceful-restart ietf

Enable graceful restart on an IS-IS router.

**Syntax** `graceful-restart ietf`

To return to the default, use the `no graceful-restart ietf` command.

<b>Parameters</b>	<b>ietf</b>	Enter <code>ietf</code> to enable graceful restart on the IS-IS router.
<b>Defaults</b>	Graceful restart disabled.	
<b>Command Modes</b>	ROUTER ISIS	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>6.3.1.0</b>	Introduced on the E-Series.

<b>Usage Information</b>	<p>Every graceful restart enabled router's HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.</p> <p>The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.</p>
--------------------------	---

## graceful-restart interval

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

<b>Syntax</b>	<code>graceful-restart interval minutes</code>	To return to the default, use the <code>no graceful-restart interval</code> command.
<b>Parameters</b>	<b>minutes</b>	Enter the graceful-restart interval minutes. The range is from 1 to 20 minutes. The default is <b>5 minutes</b> .
<b>Defaults</b>	<b>5 minutes</b>	
<b>Command Modes</b>	ROUTER ISIS	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	<b>Version</b>	<b>Description</b>
	<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

## graceful-restart restart-wait

Enable the graceful restart maximum wait time before a restarting peer comes up.

### Syntax

 **NOTE:** Set the t3 timer to `adjacency` on the restarting router when implementing this command.

```
graceful-restart restart-wait seconds
```

To return to the default, use the `no graceful-restart restart-wait` command.

### Parameters

**seconds** Enter the graceful restart time in seconds. The range is from 5 to 300 seconds. The default is **30 seconds**.

### Defaults

**30 seconds**

### Command Modes

ROUTER ISIS

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

**Related Commands**

- [graceful-restart t3](#) — configure the overall wait time before graceful restart completes.

## graceful-restart t1

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

**Syntax** `graceful-restart t1 {interval seconds | retry-times value}`  
 To return to the default, use the `no graceful-restart t1` command.

**Parameters**

**interval** Enter the keyword `interval` to set the wait time. The range is from 5 to 120 seconds. The default is **5 seconds**.

**retry-times** Enter the keywords `retry-times` to set the number of times the request interval is extended until a CSNP is received from the helping router. The range is from 1 to 10 attempts. The default is **1**.

**Defaults** See *Parameters*.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

## graceful-restart t2

Configure the wait time for the graceful restart timer T2 that a restarting router uses as the wait time for each database to synchronize.

<b>Syntax</b>	<code>graceful-restart t2 {level-1   level-2} seconds</code> To return to the default, use the <code>no graceful-restart t2</code> command.
<b>Parameters</b>	<p><b>level-1, level-2</b> Enter the keywords <code>level-1</code> or <code>level-2</code> to identify the database instance type to which the wait interval applies.</p> <p><b>seconds</b> Enter the <code>graceful-restart t2</code> time in seconds. The range is from 5 to 120 seconds. The default is <b>30 seconds</b>.</p>
<b>Defaults</b>	<b>30 seconds</b>
<b>Command Modes</b>	ROUTER ISIS
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.1.0</b>	Introduced on the E-Series.

## graceful-restart t3

Configure the overall wait time before graceful restart completes.

<b>Syntax</b>	<code>graceful-restart t3 {adjacency   manual} seconds</code> To return to the default, use the <code>no graceful-restart t3</code> command.
<b>Parameters</b>	<p><b>adjacency</b> Enter the keyword <code>adjacency</code> so that the restarting router receives the remaining time value from its peer and adjusts its T3 value so if you have configured this option.</p> <p><b>manual</b> Enter the keyword <code>manual</code> to specify a time value that the restarting router uses. The range is from 50 to 120 seconds. The default is <b>30 seconds</b>.</p>
<b>Defaults</b>	<code>manual</code> , <b>30 seconds</b>

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

**Usage Information** The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.

Override the default restart-wait time by entering the `no graceful-restart restart-wait` command. When you disable `restart-wait`, the current adjacency hold time is used.

Set the `t3` timer to `adjacency` on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured `graceful-restart t3 adjacency`.

**Related Commands**

- [graceful-restart restart-wait](#) — enable the graceful restart maximum wait time before a restarting peer comes up.

## hello padding

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

**Syntax** `hello padding [multi-point | point-to-point]`

To return to the default, use the `no hello padding [multi-point | point-to-point]` command.

**Parameters**

<b>multi-point</b>	(OPTIONAL) Enter the keywords <code>multi-point</code> to pad only LAN hello PDUs.
<b>point-to-point</b>	(OPTIONAL) Enter the keywords <code>point-to-point</code> to pad only point-to-point PDUs.

**Defaults** Both LAN and point-to-point hello PDUs are padded.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

#### Usage Information

IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

#### Related Commands

- [isis hello padding](#) — turn ON or OFF hello padding on an interface basis.

## hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

#### Syntax

`hostname dynamic`

To disable this command, use the `no hostname dynamic` command.

#### Defaults

Enabled.

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information**

To build name-to-systemID mapping tables through the protocol, use this command. All `show` commands that display systems also display the hostname.

**Related Commands**

- `clns host` — define a name-to-NSAP mapping.

## ignore-lsp-errors

Ignore LSPs with bad checksums instead of purging those LSPs.

**Syntax**

`ignore-lsp-errors`

To return to the default values, use the `no ignore-lsp-errors` command.

**Defaults**

In IS-IS, the default deletes LSPs with internal checksum errors (`no ignore-lsp-errors`).

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information**

IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.

## ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

**Syntax**

`ip router isis [tag]`

To disable IS-IS on an interface, use the `no ip router isis [tag]` command.

**Parameters** **tag** (OPTIONAL) The tag you specify identifies a specific area routing process. If you do not specify a tag, a null tag is assigned.

**Defaults** No processes are configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced.

**Usage Information** To assign a network entity title to enable IS-IS, use the `net` command.

This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

 **NOTE:** IP address is not mandatory for forming IS-IS adjacency.

**Related Commands**

- `net` — configure an IS-IS network entity title (NET) for the routing process.
- `router isis` — enable the IS-IS routing protocol.

## ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

**Syntax** `ipv6 router isis [tag]`

To disable IS-IS routing, use the `no router isis [tag]` command.

**Parameters** **tag** (OPTIONAL) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** s

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced on the E-Series.

#### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

To establish adjacencies and establish dynamic routing, enable routing on one or more interfaces.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

#### Related Commands

- [net](#) — configure an IS-IS network entity title (NET) for the routing process.
- [is-type](#) — assign a type for a given area.

## isis circuit-type

Configure the adjacency type on interfaces.

#### Syntax

```
isis circuit-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no isis circuit-type` command.

#### Parameters

<b>level-1</b>	You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.
<b>level-1-2</b>	You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default.
<b>level-2-only</b>	You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.

#### Defaults

**level-1-2**

**Command Modes** INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

### Usage Information

Because the default establishes Level 1 and Level 2 adjacencies, you do not need to configure this command. Routers in an IS-IS system must be configured as a Level 1-only, Level 1-2, or Level 2-only system.

Only configure interfaces as Level 1 or Level 2 on routers that are between areas (for example, a Level 1-2 router) to prevent the software from sending unused hello packets and wasting bandwidth.

## isis csnp-interval

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

### Syntax

```
isis csnp-interval seconds [level-1 | level-2]
```

To return to the default values, use the `no isis csnp-interval [seconds] [level-1 | level-2]` command.

### Parameters

<b>seconds</b>	Interval of transmission time between CSNPs on multi-access networks for the designated intermediate system. The range is from 0 to 65535. The default is <b>10</b> .
<b>level-1</b>	(OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 1.
<b>level-2</b>	(OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 2.

### Defaults

seconds = **10**; **level-1** (if not otherwise specified)

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

### Usage Information

The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.

You can configure Level 1 and Level 2 CSNP intervals independently.

## isis hello-interval

Specify the length of time between hello packets sent.

### Syntax

```
isis hello-interval seconds [level-1 | level-2]
```

To return to the default values, use the `no isis hello-interval [seconds] [level-1 | level-2]` command.

### Parameters

<b>seconds</b>	Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is <b>10</b> .
<b>level-1</b>	(OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.
<b>level-2</b>	(OPTIONAL) Select this value to configure the hello interval for Level 2.

### Defaults

seconds = **10**; level-1 (if not otherwise specified)

### Command Modes

9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

#### Usage Information

Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

#### Related Commands

- [isis hello-multiplier](#) — specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

## isis hello-multiplier

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

#### Syntax

```
isis hello-multiplier multiplier [level-1 | level-2]
```

To return to the default values, use the `no isis hello-multiplier [multiplier] [level-1 | level-2]` command.

#### Parameters

<b>multiplier</b>	Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is <b>3</b> .
<b>level-1</b>	(OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.
<b>level-2</b>	(OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.

#### Defaults

multiplier = **3**; **level-1** (if not otherwise specified)

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

#### Usage Information

The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.

## Related Commands

- [isis hello-interval](#) — specify the length of time between hello packets.

# isis hello padding

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

**Syntax** `isis hello padding`  
To return to the default, use the `no isis hello padding` command.

**Defaults** Padding of hello PDUs is enabled (ON).

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information** Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

**Related Commands** • [hello padding](#) — turn ON or OFF padding for LAN and point-to-point hello PDUs.

# isis ipv6 metric

Assign metric to an interface for use with IPv6 information.

**Syntax** `isis ipv6 metric default-metric [level-1 | level-2]`  
To return to the default values, use the `no ipv6 isis metric [default-metric] [level-1 | level-2]` command.

**Parameters**

<b>default-metric</b>	Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215. The default is <b>10</b> .
<b>level-1</b>	(OPTIONAL) Enter the keywords <code>level-1</code> to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This value is the default.

**level-2** (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

**Defaults** default-metric = **10**; **level-1** (if not otherwise specified)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.5.1.0</b>	Introduced on the E-Series.

**Usage Information** Dell EMC Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

## isis metric

Assign a metric to an interface.

**Syntax** `isis metric default-metric [level-1 | level-2]`

To return to the default values, use the `no isis metric [default-metric] [level-1 | level-2]` command.

**Parameters** **default-metric** Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is **10**.

If metric value is configured to more than 63, system throughs the following warning:Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.

If the metric style is WIDE, the metric values that are greater than 63 are only effective.

**level-1** (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.

**level-2** (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

**Defaults** default-metric = **10**; **level-1** (if not otherwise specified)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

**Usage Information** Dell EMC Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

## isis network point-to-point

Enable the software to treat a broadcast interface as a point-to-point interface.

**Syntax** `isis network point-to-point`  
To disable the feature, use the `no isis network point-to-point` command.

**Defaults** Not enabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.

<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

## isis password

Configure an authentication password for an interface.

**Syntax** `isis password [hmac-md5] password [level-1 | level-2]`  
 To delete a password, use the `no isis password [password] [level-1 | level-2]` command.

**Parameters**

- encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- password** Assign the interface authentication password.
- level-1** (OPTIONAL) Independently configures the authentication password for Level 1. The router acts as a station router for Level 1 routing. This setting is the default.
- level-2** (OPTIONAL) Independently configures the authentication password for Level 2. The router acts as an area router for Level 2 routing.

**Defaults** No default password. **level-1** (if not otherwise specified).

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information** To protect your network from unauthorized access, use this command to prevent unauthorized routers from forming adjacencies.

You can assign different passwords for different routing levels by using the keywords `level-1` and `level-2`.

The `no` form of this command disables the password for Level 1 or Level 2 routing, using the respective keywords `level-1` or `level-2`.

This password provides limited security as it is processed as plain text.

## isis priority

Set the priority of the designated router you select.

**Syntax** `isis priority value [level-1 | level-2]`  
To return to the default values, use the `no isis priority [value] [level-1 | level-2]` command.

**Parameters**

<b>value</b>	This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is <b>64</b> .
<b>level-1</b>	(OPTIONAL) Specify the priority for Level 1. This setting is the default.
<b>level-2</b>	(OPTIONAL) Specify the priority for Level 2.

**Defaults** value = **64**; **level-1** (if not otherwise specified).

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

### Usage Information

You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS).

 **NOTE:** Routers with a priority of 0 cannot be a designated router.

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.

# is-type

Configure IS-IS operating level for a router.

**Syntax** `is-type {level-1 | level-1-2 | level-2-only}`  
To return to the default values, use the `no is-type` command.

**Parameters**

<b>level-1</b>	Allows a router to act as a Level 1 router.
<b>level-1-2</b>	Allows a router to act as both a Level 1 and Level 2 router. This setting is the default.
<b>level-2-only</b>	Allows a router to act as a Level 2 router.

**Defaults** **level-1-2**

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

**Usage Information** The IS-IS protocol automatically determines area boundaries and are able to keep Level 1 and Level 2 routing separate. Poorly planned use of this feature may cause configuration errors, such as accidental area partitioning.

If you are configuring only one area in your network, you do not need to run both Level 1 and Level 2 routing algorithms. You can configure the IS type as Level 1.

# log-adjacency-changes

Generate a log messages for adjacency state changes.

**Syntax** `log-adjacency-changes`  
To disable this function, use the `no log-adjacency-changes` command.

**Defaults** Adjacency changes are not logged.

**Command Modes** ROUTER ISIS

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

## Usage Information

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system's error message facility.

# lsp-gen-interval

Set the minimum interval between successive generations of link-state packets (LSPs).

## Syntax

```
lsp-gen-interval [level-1 | level-2] interval seconds  
[initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

## Parameters

<b>level-1</b>	(OPTIONAL) Enter the keywords <code>level-1</code> to apply the configuration to generation of Level-1 LSPs.
<b>level-2</b>	(OPTIONAL) Enter the keywords <code>level-2</code> to apply the configuration to generation of Level-2 LSPs.
<b>interval seconds</b>	Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> .
<b>initial_wait_interval seconds</b>	(OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is <b>1 second</b> .
<b>second_wait_interval seconds</b>	(OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> .

## Defaults

See *Parameters*.

## Command Modes

ROUTER ISIS

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

### Usage Information

LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though throttling LSP generations slows down network convergence, no throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

## lsp-mtu

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router generates.

**Syntax** `lsp-mtu size`

To return to the default values, use the `no lsp-mtu` command.

**Parameters** **size** The maximum LSP size, in bytes. The range is from 512 to 16000 for Non-Jumbo mode and from 128 to 9195 for Jumbo mode. The default is **1497**.

 **NOTE:** The appropriate interface circuit is brought down and removed.

**Defaults** 1497 bytes.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

#### Usage Information

The link MTU and the LSP MTU size must be the same.

Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the `lsp-mtu` command.

## lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their `max-lsp-lifetime` reaches zero and then LSPs is purged.

**Syntax** `lsp-refresh-interval seconds`

To restore the default refresh interval, use the `no lsp-refresh-interval` command.

**Parameters** `seconds` The LSP refresh interval, in seconds. This value must be 300 seconds less than the value specified in the `max-lsp-lifetime` command. The range is from 1 to 65535 seconds. The default is **900**.

**Defaults** 900 seconds

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

#### Usage Information

The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.

The refresh interval must be less than the LSP lifetime specified with the `max-lsp-lifetime` command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.

#### Related Commands

- `max-lsp-lifetime` — set the maximum interval that LSPs persist without being refreshed.

## max-area-addresses

Configure manual area addresses.

**Syntax** `max-area-addresses number`

To return to the default values, use the `no max-area-addresses` command.

**Parameters** `number` Set the maximum number of manual area addresses. The range is from 3 to 6. The default is **3**.

**Defaults** 3 addresses

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

#### Usage Information

To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

# max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

<b>Syntax</b>	<code>max-lsp-lifetime seconds</code> To restore the default time, use the <code>no max-lsp-lifetime</code> command.
<b>Parameters</b>	<b>seconds</b> The maximum lifetime of LSP in seconds. This value must be greater than the <code>lsp-refresh-interval</code> command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is <b>1200</b> .
<b>Defaults</b>	<b>1200</b> seconds
<b>Command Modes</b>	ROUTER ISIS
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

**Usage Information** Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The `seconds` parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

**Related Commands**

- [lsp-refresh-interval](#) — set the link-state packet (LSP) refresh interval.

# maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

**Syntax** `maximum-paths number`  
To return to the default values, use the `no maximum-paths` command.

**Parameters** **number** Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is **4**.

**Defaults** 4

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Added support for multi-topology ISIS.
6.3.1.0	Introduced.

## metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

**Syntax** `metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]`

To return to the default values, use the `no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]` command.

**Parameters**

<b>narrow</b>	Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.
<b>transition</b>	Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.
<b>wide</b>	Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215.
<b>level-1</b>	Enables the metric style on Level 1.
<b>level-2</b>	Enables the metric style on Level 2.

**Defaults** **narrow**; if no Level is specified, Level-1 and Level-2 are configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.

### Usage Information

If you enter the `metric-style wide` command, the Dell EMC Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.

The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.

### Related Commands

- [isis metric](#) — configure a metric for an interface.

## multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

**Syntax** `multi-topology [transition]`

To return to a single topology configuration, use the `no multi-topology [transition]` command.

**Parameters** `transition`

**Defaults** Disabled

**Command Modes** CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced.

## net

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

**Syntax** `net network-entity-title`

To remove a net, use the `no net network-entity-title` command.

**Parameters** **network-entity-title** Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.

# passive-interface

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

**Syntax** `passive-interface interface`

To delete a passive interface configuration, use the `no passive-interface interface` command.

**Parameters** *interface* Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

**Usage Information** Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

# redistribute

Redistribute routes from one routing domain to another routing domain.

**Syntax** `redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]`

To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [metric metric-value] [metric-type {external | internal}] [level-1 | level-1-2 | level-2] [route-map map-name]` command.

<b>Parameters</b>	<b>connected</b>	Enter the keyword <code>connected</code> to redistribute active routes into IS-IS.
	<b>rip</b>	Enter the keyword <code>rip</code> to redistribute RIP routes into IS-IS.
	<b>static</b>	Enter the keyword <code>static</code> to redistribute user-configured routes into IS-IS.
	<b>metric <i>metric-value</i></b>	(OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is <b>0</b> . Use a value that is consistent with the destination protocol.
	<b>metric-type {external   internal}</b>	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following: <ul style="list-style-type: none"><li>• <code>external</code></li><li>• <code>internal</code></li></ul>
	<b>level-1</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.
	<b>level-1-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
	<b>level-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
	<b>route-map <i>map-name</i></b>	(OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.

- Defaults**
- `metric metric-value = 0`
  - `metric-type= internal; level-2`

- Command Modes**
- `ROUTER ISIS (for IPv4)`
  - `CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)`

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.

Version	Description
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added support for IPv6 ISIS.
6.3.1.0	Introduced.

### Usage Information

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell EMC Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the `redistribute` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `redistribute` command is advertised.

### Related Commands

- [default-information originate](#) — generate a default route for the IS-IS domain.
- [distribute-list out](#) — suppress networks from being advertised in updates. This command filters redistributed routing information.

## redistribute bgp

Redistribute routing information from a BGP process.

### Syntax

```
redistribute bgp AS number [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

### Parameters

<b>AS number</b>	Enter a number that corresponds to the autonomous system number. The range is from 1 to 65355.
<b>level-1</b>	(OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.
<b>level-1-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.
<b>level-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.
<b>metric metric-value</b>	(OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .
<b>metric-type {external   internal}</b>	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> <li>• external</li> <li>• internal</li> </ul>
<b>route-map map-name</b>	<code>map-name</code> is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol.  If you do not specify a <code>map-name</code> , all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

### Defaults

**IS-IS Level 2** routes only

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added support for IPv6 ISIS.
6.3.1.0	Introduced.

**Usage Information**

BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

**Example**

```
DellEMC(conf)# router is
DellEMC(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-
type
external route-map rmap-isis-to-bgp
DellEMC(conf-router_bgp)#show running-config isis
!
router isis
redistribute bgp 1 level-1 metric 32 metric-type external route-map
rmap-isis-to-bgp
```

## redistribute ospf

Redistribute routing information from an OSPF process.

**Syntax**

```
redistribute ospf process-id [level-1 | level-1-2 | level-2] [match
{internal | external}] [metric metric-value] [metric-type {external |
internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

**Parameters**

**process-id** Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65355.

<b>metric <i>metric-value</i></b>	(OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .
<b>metric-type {external   internal}</b>	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> <li>• external</li> <li>• internal</li> </ul>
<b>level-1</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.
<b>level-1-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
<b>level-2</b>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
<b>match {external   internal}</b>	(OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are <ul style="list-style-type: none"> <li>• internal</li> <li>• external</li> </ul>
<b>route-map <i>map-name</i></b>	<i>map-name</i> is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol.  If you do not specify a <i>map-name</i> , all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

#### Defaults

See *Parameters*.

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>7.5.1.0</b>	Added support for IPv6 ISIS.
<b>6.3.1.0</b>	Introduced.

#### Usage Information

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

# router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

<b>Syntax</b>	<code>router isis [vrf vrf-name] [tag]</code> To disable IS-IS routing, use the <code>no router isis [tag]</code> command.				
<b>Parameters</b>	<table><tr><td><b>vrf vrf-name</b></td><td>Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.</td></tr><tr><td><b>tag</b></td><td>(OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the <code>tag</code> option is not specified. The tag name must be unique for all IP router processes for a given router.</td></tr></table>	<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.	<b>tag</b>	(OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the <code>tag</code> option is not specified. The tag name must be unique for all IP router processes for a given router.
<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.				
<b>tag</b>	(OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the <code>tag</code> option is not specified. The tag name must be unique for all IP router processes for a given router.				
<b>Defaults</b>	Not configured.				
<b>Command Modes</b>	CONFIGURATION				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

<b>Usage Information</b>	Configure a network entity title (the <code>net</code> command) to specify the area address and the router system ID.  Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.  You can configure only one IS-IS routing process to perform Level 2 routing. A <code>level-1-2</code> designation performs Level 1 and Level 2 routing at the same time.
--------------------------	---

<b>Related Commands</b>	<ul style="list-style-type: none"><li><a href="#">ip router isis</a> — configure IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.</li><li><a href="#">net</a> — configure an IS-IS network entity title (NET) for a routing process.</li><li><a href="#">is-type</a> — assign a type for a given area.</li></ul>
-------------------------	--

# set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

<b>Syntax</b>	<code>set-overload-bit</code>
---------------	-------------------------------

To return to the default values, use the `no set-overload-bit` command.

**Defaults**

Not set.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Added support for multi-topology ISIS.
6.3.1.0	Introduced.

**Usage Information**

Set the overload bit when a router experiences problems, such as a memory shortage due to an incomplete link state database which can result in an incomplete or inaccurate routing table. If you set the overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovered.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 address.

## show config

Display the changes you made to the IS-IS configuration. Default values are not shown.

**Syntax**

`show config`

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.1</b>	Introduced on the S4810.

**Example (Router-Isis)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
DellEMC(conf-router_isis)# show config
!
router isis
  clns host ISIS 49.0000.0001.F100.E120.0013.00
  log-adjacency-changes
  net 49.0000.0001.F100.E120.0013.00
  !
  address-family ipv6 unicast
  maximum-paths 16
  multi-topology transition
  set-overload-bit
  spf-interval level-1 100 15 20
  spf-interval level-2 120 20 25
  exit-address-family
```

**Example (Address-Family\_IPv6)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
DellEMC(conf-router_isis-af_ipv6)# show conf
!
address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family
```

## show isis database

Display the IS-IS link state database.

**Syntax** `show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid]`

**Parameters**

- vrf *vrf-name*** (Optional) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.  
 **NOTE:** If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.
- level-1** (OPTIONAL) Displays the Level 1 IS-IS link-state database.
- level-2** (OPTIONAL) Displays the Level 2 IS-IS link-state database.

<b>local</b>	(OPTIONAL) Displays local link-state database information.
<b>detail</b>	(OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.
<b>summary</b>	(OPTIONAL) Displays the summary of link-state database information when specified.
<b>lspid</b>	(OPTIONAL) Display only the specified LSP.
<b>system-id</b>	(OPTIONAL) Displays the link-state database for system-id.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added supported for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.2(0.2)</b>	Introduced on the Z9000.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.7.1</b>	Introduced on the S4810.

**Usage Information** The following describes the `show isis database` command shown in the following example.

Field	Description
<b>IS-IS Level-1/ Level-2 Link State Database</b>	Displays the IS-IS link state database for Level 1 or Level 2.
<b>LSPID</b>	Displays the LSP identifier.  The first six octets are the System ID of the originating router.  The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.  The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.  The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.  An * after the LSPID indicates that the system originates an LSP where this command was issued.
<b>LSP Seq Num</b>	This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.

Field	Description
<b>LSP Checksum</b>	This is the checksum of the entire LSP packet.
<b>LSP Holdtime</b>	This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.
<b>ATT</b>	This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.
<b>P</b>	This value represents the P bit. This bit is always set to zero as Dell EMC Networking does not support area partition repair.
<b>OL</b>	This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.

### Example

The bold sections identify that MultiTopology IS-IS is enabled.

```
DelleMC# show isis database

IS-IS Level-1 Link State Database
LSPID      LSP Seq Num LSP Checksum LSP Holdtime ATT/P/OL

## show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

**Syntax** `show isis [vrf vrf-name] graceful-restart detail`

- Command Modes**
- EXEC
  - EXEC Privilege

**Parameters** `vrf vrf-name` (Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS graceful restart details corresponding to that VRF.

 **NOTE:** If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.1.0</b>	Introduced on the E-Series.

### Example

```

Dell EMC# show isis graceful-restart detail
Configured Timer Value

Graceful Restart      : Enabled
T3 Timer              : Manual
T3 Timeout Value     : 30

```

```

T2 Timeout Value      : 30 (level-1), 30 (level-2)
T1 Timeout Value      : 5, retry count: 1
Adjacency wait time   : 30

Operational Timer Value
=====
Current Mode/State    : Normal/RUNNING
T3 Time left          : 0
T2 Time left          : 0 (level-1), 0 (level-2)
Restart ACK rcv count : 0 (level-1), 0 (level-2)
Restart Req rcv count : 0 (level-1), 0 (level-2)
Suppress Adj rcv count : 0 (level-1), 0 (level-2)
Restart CSNP rcv count : 0 (level-1), 0 (level-2)
Database Sync count   : 0 (level-1), 0 (level-2)

```

## show isis hostname

Display IS-IS host names configured or learned on the switch.

**Syntax** `show isis [vrf vrf-name] hostname`

**Parameters** `vrf vrf-name` Enter the keyword vrf followed by the name of the VRF to display IS-IS host names corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

### Example

```

DellEMC# show isis hostname
System Id      Dynamic Name Static Name
*F100.E120.0013 Force10     ISIS
DellEMC#

```

# show isis interface

Display detailed IS-IS interface status and configuration information.

**Syntax** `show isis [vrf vrf-name] interface [interface]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.
  - interface** (OPTIONAL) Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
    - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
    - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Example**

```
DellEMC> show isis int
TenGigabitEthernet 1/7/1 is up, line protocol is up
  MTU 1497, Encapsulation SAP
  Routing Protocol: IS-IS
  Circuit Type: Level-1-2
```

```

Interface Index 37847070, Local circuit ID 1
Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.01
Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
Number of active level-1 adjacencies: 1
Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.01
Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
Number of active level-2 adjacencies: 1
Next IS-IS LAN Level-1 Hello in 2 seconds
Next IS-IS LAN Level-2 Hello in 1 seconds
LSP Interval: 33
TenGigabitEthernet 1/8/1 is up, line protocol is up
MTU 1497, Encapsulation SAP

Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
--More--

```

## show isis neighbors

Display information about neighboring (adjacent) routers.

**Syntax** `show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail] [interface]`

<b>Parameters</b>	<p><b>vrf vrf-name</b> (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display adjacent router information corresponding to that VRF.</p> <p><b>level-1</b> (OPTIONAL) Displays information about Level 1 IS-IS neighbors.</p> <p><b>level-2</b> (OPTIONAL) Displays information about Level 2 IS-IS neighbors.</p> <p><b>detail</b> (OPTIONAL) Displays detailed information about neighbors.</p> <p><b>interface</b> (OPTIONAL) Enter the following keywords and the interface information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>
-------------------	--

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

### Usage Information

Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

Field	Description
<b>System Id</b>	The value that identifies a system in an area.
<b>Interface</b>	The interface, slot, and port in which the router was discovered.
<b>State</b>	The value providing status about the adjacency state. The range is Up and Init.
<b>Type</b>	This value displays the adjacency type (Layer 2, Layer 2 or both).
<b>Priority</b>	IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface.
<b>Uptime</b>	Displays the interfaces uptime.
<b>Circuit Id</b>	The neighbor's interpretation of the designated router for the interface.

### Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
DellEMC# show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1/1 Up L1L2(M) 127 09:28:01 TEST.02
!
DellEMC#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es) :
49.0000.0001
  IP Address(es): 25.1.1.3*
  MAC Address: 0000.0000.0000
  Hold Time: 28
  Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6 , Common (IPv4 IPv6 )
Adjacency being used for MTs: IPv4 IPv6
DellEMC#
```

# show isis protocol

Display IS-IS routing information.

**Syntax** `show isis [vrf vrf-name] protocol`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Added support for VRF. Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.2(0.2)</b>	Introduced on the Z9000.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.

**Example** The bold section identifies that Multi-Topology IS-IS is enabled.

```
DellEMC# show isis protocol
IS-IS Router: <Null Tag>
  System Id: F100.E120.0013 IS-Type: level-1-2
  Manual area address(es):
    49.0000.0001
  Routing for area address(es):
    49.0000.0001
  Interfaces supported by IS-IS:
    TenGigabitEthernet 1/1/1 - IP - IPv6
    TenGigabitEthernet 1/2/1 - IP - IPv6
    TenGigabitEthernet 1/10/1 - IP - IPv6
    Loopback 0 - IP - IPv6
  Redistributing:
  Distance: 115
  Generate narrow metrics: level-1-2
  Accept narrow metrics:   level-1-2
  Generate wide metrics:   none
  Accept wide metrics:     none
Multi Topology Routing is enabled in transition mode.
DellEMC#
```

# show isis traffic

This command allows you to display IS-IS traffic interface information.

**Syntax** `show isis [vrf vrf-name] traffic [interface]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.
  - interface** (OPTIONAL) Identifies the interface type and the interface following:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
    - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
    - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage Information** The following describes the `show isis traffic` command shown in the following example.

Item	Description
Level-1/Level-2 Hellos (sent/rcvd)	Displays the number of Hello packets sent and received.

Item	Description
<b>PTP Hellos (sent/rcvd)</b>	Displays the number of point-to-point Hellos sent and received.
<b>Level-1/Level-2 LSPs sourced (new/refresh)</b>	Displays the number of new and refreshed LSPs.
<b>Level-1/Level-2 LSPs flooded (sent/rcvd)</b>	Displays the number of flooded LSPs sent and received.
<b>Level-1/Level-2 LSPs CSNPs (sent/ rcvd)</b>	Displays the number of CSNP LSPs sent and received.
<b>Level-1/Level-2 LSPs PSNPs (sent/ rcvd)</b>	Displays the number of PSNP LSPs sent and received.
<b>Level-1/Level-2 DR Elections</b>	Displays the number of times designated router elections ran.
<b>Level-1/Level-2 SPF Calculations</b>	Displays the number of shortest path first calculations.
<b>LSP checksum errors received</b>	Displays the number of checksum errors LSPs received.
<b>LSP authentication failures</b>	Displays the number of LSP authentication failures.

### Example

```
DellEMC# show is traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337
IS-IS: Level-1 DR Elections : 4
IS-IS: Level-2 DR Elections : 4
IS-IS: Level-1 SPF Calculations : 0
IS-IS: Level-2 SPF Calculations : 389
IS-IS: LSP checksum errors received : 0
IS-IS: LSP authentication failures : 0
DellEMC#
```

## spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

### Syntax

```
spf-interval [level-1 | level-2] interval seconds [initial_wait_interval
seconds [second_wait_interval seconds]]
```

To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

<b>Parameters</b>	<b>level-1</b>	(OPTIONAL) Enter the keyword <code>level-1</code> to apply the configuration to Level-1 SPF calculations.
	<b>level-2</b>	(OPTIONAL) Enter the keyword <code>level-2</code> to apply the configuration to Level-2 SPF calculations.
	<b><i>interval seconds</i></b>	Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is <b>10 seconds</b> .
	<b><i>initial_wait_interval seconds</i></b>	(OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> .
	<b><i>second_wait_interval seconds</i></b>	(OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> .

**Defaults** See *Parameters*.

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.5(0.1)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Added support for multi-topology ISIS.
<b>7.5.1.0</b>	Added support for SPF Throttling Enhancement.

**Usage Information** This command `spf-interval` in CONFIG-ROUTER-ISIS-AF-IPV6 mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in CONFIG-ROUTER-ISIS mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

# iSCSI Optimization

Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on Dell EMC Networking OS platforms.

To configure and verify the iSCSI optimization feature, use the following Dell EMC Networking OS commands.

## Topics:

- [advertise dcbx-app-tlv](#)
- [iscsi aging time](#)
- [iscsi cos](#)
- [iscsi enable](#)
- [iscsi priority-bits](#)
- [iscsi profile-compellant](#)
- [iscsi target port](#)
- [show iscsi](#)
- [show iscsi session](#)
- [show iscsi session detailed](#)
- [show run iscsi](#)

## advertise dcbx-app-tlv

Configure DCBX to send iSCSI TLV advertisements.

<b>Syntax</b>	<code>advertise dcbx-app-tlv iscsi</code> To disable DCBX iSCSI TLV advertisements, use the <code>no advertise dcbx-app-tlv iscsi</code> command.
<b>Defaults</b>	Disabled.
<b>Command Modes</b>	PROTOCOL LLDP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100–ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048–ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on MXL 10/40GbE Switch IO Module.

<b>Usage Information</b>	You can configure iSCSI TLVs to send either globally or on a specified interface. The interface configuration takes priority over global configuration.
--------------------------	---

# iscsi aging time

Set the aging time for iSCSI sessions.

<b>Syntax</b>	<code>iscsi aging time <i>time</i></code> To remove the iSCSI session aging time, use the <code>no iscsi aging time</code> command.
<b>Parameters</b>	<b><i>time</i></b> Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.
<b>Defaults</b>	<b>10 minutes</b>
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

# iscsi cos

Set the QoS policy that is applied to the iSCSI flows.

<b>Syntax</b>	<code>iscsi cos {enable   disable   dot1p <i>vlan-priority-value</i> [remark]   dscp <i>dscp-value</i> [remark]}</code> To disable the QoS policy, use the <code>no iscsi cos</code> command.
<b>Parameters</b>	<b>enable</b> Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default is: the iSCSI packets are handled with dotp1 priority 4 without remark. <b>disable</b> Enter the keyword <code>disable</code> to disable the application of preferential QoS treatment to iSCSI frames. <b>dot1p <i>vlan-priority-value</i></b> Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the <code>iscsi priority-bits</code> command. <b>dscp <i>dscp-value</i></b> Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed. <b>remark</b> Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1and DSCP values in egress packets are not changed.
<b>Defaults</b>	Disabled.
<b>Command Modes</b>	CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100–ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on MXL 10/40GbE Switch IO Module.

**Usage Information**

By default, iSCSI flows are assigned to dot1p priority 4.

## iscsi enable

Globally enable iSCSI optimization.

**Syntax**

```
iscsi enable
```

To disable iSCSI optimization, use the `no iscsi enable` command.

**Parameters**

**enable** Enter the keyword `enable` to enable the iSCSI optimization feature.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100–ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on MXL 10/40GbE Switch IO Module.

## iscsi priority-bits

Configure the priority bitmap that advertises in the iSCSI application TLVs.

**Syntax**

```
iscsi priority-bits
```

To remove the configured priority bitmap, use the `no iscsi priority-bits` command.

**Defaults**

**4** (0x10 in the bitmap)

**Command Modes** PROTOCOL LLDP (only on the global, not on the interface)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

## iscsi profile-compellant

Configure the auto-detection of Dell Compellent arrays on a port.

**Syntax** `iscsi profile-compellent`

**Defaults** Dell Compellent disk arrays are not detected.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

## iscsi target port

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

**Syntax** `iscsi target port [tcp-port-2...tcp-port-16]ip-address [ip-address]`  
To remove the configured iSCSI target ports or IP addresses, use the `no iscsi target port` command.

**Parameters** **tcp-port-2...tcpport-16** Enter the tcp-port number of the iSCSI target ports. The `tcp-port-n` is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is **860, 3260**.

**ip-address (Optional)** Enter the ip-address that the iSCSI monitors. The ip-address specifies the IP address of the iSCSI target.

**Defaults** 860, 3260

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

**Usage Information** You can configure up to 16 target TCP ports on the switch in one command or multiple commands.

When you use the `no iscsi target port` command and the TCP port you wish to delete is one bound to a specific IP address, the IP address value must be included in the command.

## show iscsi

Display the currently configured iSCSI settings.

**Syntax** `show iscsi`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

### Example

```
DelleMC# show iscsi
iscsi is enabled
iscsi session monitoring is disabled
iscsi COS : dot1p is 4 no-remark
Session aging time: 10
Maximum number of connections is 256
```

```
-----  
iSCSI Targets and TCP Ports:  
-----
```

```
TCP Port Target IP Address  
3260  
860
```

### Related Commands

- [show iscsi session](#) — display information about active iSCSI sessions on the switch.
- [show iscsi session detailed](#) — display detailed information about active iSCSI sessions on the switch.
- [show run iscsi](#) — show `run iscsi`.

## show iscsi session

Display information about active iSCSI sessions on the switch.

**Syntax** `show iscsi session`

- Command Modes**
- EXEC
  - EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on MXL 10/40GbE Switch IO Module.

### Example

```
DellEMC# show iscsi session  
Session 0:  
-----  
Target: iqn.2001-05.com.equallogic:0-8a0906-0e70c2002-10a0018426a48c94-  
iom010  
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg  
ISID: 400001370000  
  
Session 1:  
-----  
Target: iqn.2001-05.com.equallogic:0-8a0906-0f60c2002-0360018428d48c94-  
iom011  
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg  
ISID: 400001370000.
```

### Usage Information

Only sessions the switch observes are learned; sessions flowing through an adjacent switch are not learned.

After the switch is reloaded, any information exchanged during the initial handshake is not available. If the switch picks up the communication after reloading, it would detect a session was in progress but could not obtain complete information for it. Any incomplete information of this type would not be available in the `show` commands.

### Related Commands

- [show iscsi](#) — display the currently configured iSCSI settings.
- [show iscsi session detailed](#) — display detailed information about active iSCSI sessions on the switch.
- [show run iscsi](#) — show `run iscsi`.

# show iscsi session detailed

Display detailed information on active iSCSI sessions on the switch.

- Syntax** `show iscsi session detailed [session isid]`
- Parameters**
  - isid** Enter the session's iSCSI ID to display detailed information about the specified iSCSI session.
- Command Modes**
  - EXEC
  - EXEC Privilege
- Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description

  - [show iscsi](#) — display the currently configured iSCSI settings.
  - [show iscsi session](#) — display information about active iSCSI sessions on the switch.
  - [show run iscsi](#) — show run iscsi.

# show run iscsi

Display all globally configured non-default iSCSI settings in the current Dell EMC Networking OS session.

- Syntax** `show run iscsi`
- Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<b>Version</b>	<b>Description</b>
<b>9.10(0.0)</b>	Introduced on the S6100–ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100–ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on MXL 10/40GbE Switch IO Module.

**Related Commands**

- [show iscsi](#) — display the currently configured iSCSI settings.
- [show iscsi session](#) — display detailed information about active iSCSI sessions on the switch.
- [show iscsi session detailed](#) — display detailed information on active iSCSI sessions on the switch.

# Link Aggregation Control Protocol (LACP)

This section contains commands for Dell EMC Networks' implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as "port-channels" in the Dell EMC Networking OS.

**NOTE:** For static LAG commands based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications, see [Port Channel Commands](#).

## Topics:

- [clear lacp counters](#)
- [debug lacp](#)
- [lacp long-timeout](#)
- [lacp port-priority](#)
- [lacp system-priority](#)
- [port-channel-protocol lacp](#)
- [show lacp](#)

## clear lacp counters

Clear port channel counters.

**Syntax** `clear lacp port-channel-number counters`

**Parameters** *port-channel-number* Enter a port-channel number. The range is from 1 to 4096.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

### Related Commands

- [show lacp](#) — display the LACP configuration.

## debug lacp

Debug LACP (configuration, events, and so on).

### Syntax

```
debug lacp [config | events | pdu [interface-type [in | out]]]
```

To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

### Parameters

<b>config</b>	(OPTIONAL) Enter the keyword <code>config</code> to debug the LACP configuration.
<b>events</b>	(OPTIONAL) Enter the keyword <code>events</code> to debug the LACP event information.
<b>pdu</b>	(OPTIONAL) Enter the keyword <code>pdu</code> to debug the LACP Protocol Data Unit information.
<b>interface-type in   out</b>	<p>(OPTIONAL) Enter the following keywords and the interface information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> </ul> <p>Optionally, enter an <code>in</code> or <code>out</code> parameter:</p> <ul style="list-style-type: none"> <li>• Receive enter <code>in</code></li> <li>• Transmit enter <code>out</code></li> </ul>

### Defaults

None

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

## lacp long-timeout

Configure a long timeout period (30 seconds) for an LACP session.

<b>Syntax</b>	lacp long-timeout To reset the timeout period to a short timeout (1 second), use the no lacp long-timeout command.
<b>Defaults</b>	1 second
<b>Command Modes</b>	INTERFACE (conf-if-po-number)
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Usage Information**

This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect.

**Related Commands**

- `show lacp` — display the LACP configuration.

## lacp port-priority

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

**Syntax**

`lacp port-priority priority-value`

To return to the default setting, use the `no lacp port-priority priority-value` command.

**Parameters**

***priority-value*** Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is **32768**.

**Defaults**

**32768**

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
6.2.1.1	Introduced on the E-Series.

**Related Commands**

- [show lacp](#) — display the LACP information.
- [show interfaces port-channel](#) — display information on configured Port Channel groups.

## show lacp

Display the LACP matrix.

**Syntax** `show lacp port-channel-number [sys-id | counters]`

- Parameters**
- port-channel-number** Enter a port-channel number. The range is from 1 to 4096.
  - sys-id** (OPTIONAL) Enter the keywords `sys-id` and the value that identifies a system.
  - counters** (OPTIONAL) Enter the keyword `counters` to display the LACP counters.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

#### Example (Port-Channel- Number)

```
DellEMC# show lacp 1
Port-channel 1 admin up, oper up, mode lacp
Actor   System ID:Priority 32768, Address 0001.e800.a12b
Partner System ID:Priority 32768, Address 0001.e801.45a5
        Actor Admin Key 1, Oper Key 1, Partner Oper Key 1
        LACP LAG 1 is an aggregatable link

A-Active LACP, B-Passive LACP, C-Short Timeout, D-Long Timeout
E-Aggregatable Link, F-Individual Link, G-IN_SYNC, H-OUT_OF_SYNC
I-Collection enabled, J-Collection disabled, K-Distribution enabled L-
Distribution disabled,
M-Partner Defaulted, N-Partner Non-defaulted, O-Receiver is in expired
state,
P-Receiver is not in expired state

Port Te 1/6/1 is enabled, LACP is enabled and mode is lacp
  Actor   Admin: State ACEHJLMP Key 1   Priority 128
          Oper: State ACEGIKNP Key 1   Priority 128
  Partner Admin: State BDFHJLMP Key 0   Priority 0
          Oper: State BCEGIKNP Key 1   Priority 128
DellEMC#
```

#### Example (Sys-id)

```
DellEMC# show lacp 1 sys-id
Actor   System ID: Priority 32768, Address 0001.e800.a12b
Partner System ID: Priority 32768, Address 0001.e801.45a5

DellEMC#
```

#### Example (Counter)

```
DellEMC# show lacp 1 counters
-----
Port          LACP PDU      Marker PDU    Unknown      Illegal
              Xmit Recv    Xmit Recv    Pkts Rx      Pkts Rx
-----
Te 1/6/1     200  200        0    0           0           0
DellEMC#
```

## MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

### mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

<b>Syntax</b>	<code>mac-address-table aging-time seconds</code>	
<b>Parameters</b>	<b>seconds</b>	Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is <b>1800 seconds</b> .
<b>Defaults</b>	<b>1800 seconds</b>	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
8.3.1.0	On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Related Commands**

- [mac learning-limit](#) — set the MAC address learning limits for a selected interface.
- [show mac-address-table aging-time](#) — display the MAC aging time.

## mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

**Syntax** `mac-address-table aging-time seconds`

**Parameters** `seconds` Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is **1800 seconds**.

**Defaults** `1800 seconds`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

- Related Commands**
- [mac learning-limit](#) — set the MAC address learning limits for a selected interface.
  - [show mac-address-table aging-time](#) — display the MAC aging time.

## mac-address-table static

Associate specific MAC or hardware addresses to an interface and VLANs.

**Syntax** `mac-address-table static mac-address {multicast vlan vlan-id output-range interface}{output interface vlan vlan-id}`

To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.

### Parameters

- mac-address** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.
- multicast** Enter a vlan port to where L2 multicast MAC traffic is forwarded.
-  **NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.
- output interface** For a unicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
- output-range interface** For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
  - For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
- vlan vlan-id** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.1(0.0)	Added support for output range parameter for S4810 and Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Example (Unicast)**

```
mac-address-table static 00:01:00:00:00:01 {output Te 1/2/1 vlan 2}
```

**Example (Multicast)**

```
mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-range Te 1/2/1, Te 1/3/1}
```

**Related Commands**

- [show mac-address-table](#) — display the MAC address table.

## mac-address-table station-move refresh-arp

Ensure that address resolution protocol (ARP) refreshes the egress interface when a station move occurs due to a topology change.

**Syntax**

```
mac-address-table station-move refresh-arp
```

To disable the ARP refresh feature, use the `no mac-address-table station-move refresh-arp` command.

**Defaults**

Enabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Modified the default option from none to Enabled.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

**Usage Information**

For more information about using this command, see *NIC Teaming* in the Layer 2 section of the *Dell EMC Networking OS Configuration Guide*.

## mac learning-limit

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

**Syntax**

```
mac learning-limit address_limit [vlan vlan-id] [station-move-violation
[dynamic]] [dynamic [no-station-move| station-move]]
```

**Parameters**

- address\_limit** Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000.
- vlan vlan-id** Enter the keyword then the VLAN ID. The range is from 1 to 4094.
- dynamic** (OPTIONAL) Enter the keyword *dynamic* to allow aging of MACs even though a learning limit is configured.
- station-move-violation** (OPTIONAL) Enter the keywords *station-move* to allow a station move on learned MAC addresses.

**Defaults**

- On S-Series, the default behavior is dynamic.

 **NOTE:** “Static” means manually entered addresses, which do not age.

**Command Modes** INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Deprecated the <code>no-station-move</code> command (replaced by the <code>mac-learning-limit mac-address-sticky</code> command).
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the <code>vlan</code> option on the E-Series.
8.2.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added the <code>station-move</code> option.
6.5.1.0	Added support for MAC Learning-Limit on the LAG.

### Usage Information

This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the `vlan` option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword `no-station-move` option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the `dynamic` option. To clear statistics on MAC address learning, use the `clear counters` command with the `learning-limit` parameter.

**NOTE:** If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the `mac learning-limit` command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

### Related Commands

- [mac learning-limit mac-address-sticky](#) — replace deprecated `no-station-move` parameter.
- [show mac learning-limit](#) — display MAC learning-limit configuration.

## mac learning-limit learn-limit-violation

Configure an action for a MAC address learning-limit violation.

### Syntax

```
mac learning-limit learn-limit-violation {log | shutdown}
```

To return to the default, use the `no mac learning-limit learn-limit-violation {log | shutdown}` command.

### Parameters

- log** Enter the keyword `log` to generate a syslog message on a learning-limit violation.
- shutdown** Enter the keyword `shutdown` to shut down the port on a learning-limit violation.

### Defaults

None

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

**Usage Information** This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

- [show mac learning-limit](#) — display details of the mac learning-limit.

## mac learning-limit mac-address-sticky

Maintain the dynamically learned mac addresses as sticky MAC addresses on the selected port.

**Syntax** `mac learning-limit mac-address-sticky`

To convert the sticky MAC addresses to dynamic MAC addresses, use the `no mac learning-limit` command.

**Parameters** ***mac-address-sticky*** Configures the dynamic MAC addresses as sticky on an interface.

**Defaults** None

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.

**Usage Information**

If you configure `mac-learning-limit` and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port.

**Related Commands**

- [show mac learning-limit](#) — display the details of the mac learning-limit.

## mac learning-limit station-move-violation

Specify the actions for a station move violation.

**Syntax**

```
mac learning-limit station-move-violation {log | shutdown-both | shutdown-offending | shutdown-original}
```

To disable a configuration, use the `no mac learning-limit station-move-violation` command, then the configured keyword.

**Parameters**

<b>log</b>	Enter the keyword <code>log</code> to generate a syslog message on a station move violation.
<b>shutdown-both</b>	Enter the keyword <code>shutdown</code> to shut down both the original and offending interface and generate a syslog message.
<b>shutdown-offending</b>	Enter the keywords <code>shutdown-offending</code> to shut down the offending interface and generate a syslog message.
<b>shutdown-original</b>	Enter the keywords <code>shutdown-original</code> to shut down the original interface and generate a syslog message.

**Defaults**

None

**Command Modes**

INTERFACE (conf-if-interface-slot/port)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

**Usage Information**

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

- [show mac learning-limit](#) — display details of the mac learning-limit.

## mac learning-limit reset

Reset the MAC address learning-limit error-disabled state.

**Syntax** `mac learning-limit reset`

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.

9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

## mac port-security

Enable or disable the port security feature globally in the system.

**Syntax** `mac port-security`  
To disable the port security, use the `no mac port-security` command.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.14(1.0)	Introduced on the C9010, MXL, FN IOM, S3100 series, S4810, S4820T, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, and Z9500.

**Usage Information** Only if you enable the port security, you will be able to configure MAC address learning limit configurations on the interface level.

When you disable the port security, all the interface level configurations are reset. Also, all dynamically learnt MAC addresses on the interfaces configured with MAC address learning limit are cleared.

## show mac-address-table

Display the MAC address table.

**Syntax** `show mac-address-table [address mac-address | interface interface | vlan vlan-id] [aging-time] [dynamic | static] [count [vlan vlan-id] [interface interface-type [slot [/port[/subport]]]]]`

**Parameters**

- address *mac-address*** (OPTIONAL) Enter the keyword `address` then a MAC address in the `nn:nn:nn:nn:nn:nn` format to display information on that MAC address.
- dynamic** (OPTIONAL) Enter the keyword `dynamic` to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: `address/mac-address`, `interface/interface`, or `vlan vlan-id`.
- static** (OPTIONAL) Enter the keyword `static` to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: `address/mac-address`, `interface/interface`, or `vlan vlan-id`.
- aging-time** Enter the keyword `aging-time` to display only aging-time information.
- interface *interface*** (OPTIONAL) Enter the keyword `interface` and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**interface**  
**interface-type** (OPTIONAL) Instead of entering the keyword `interface` then the interface type, slot/port[/subport] information, as above, you can enter the interface type, then just a slot number.

**vlan vlan-id** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.

**count** (OPTIONAL) Enter the keyword `count`, then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Updated the output.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Usage Information** The following describes the `show mac-address-table` command shown in the following example.

Column Heading	Description
<b>VlanId</b>	Displays the VLAN ID number.
<b>Mac Address</b>	Displays the MAC address in nn:nn:nn:nn:nn:nn format.
<b>Type</b>	Lists whether the MAC address was manually configured (Static), learned dynamically (Dynamic), or associated with a specific port (Sticky).
<b>Interface</b>	Displays the interface type and slot/port[/subport] information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>• Po = port channel</li> <li>• Te = ten-gigabit Ethernet</li> <li>• Fo = forty-gigabit Ethernet</li> <li>• Tf = twentyfive-gigabit Ethernet</li> <li>• Fi = fifty-gigabit Ethernet</li> <li>• Hu = hundred-gigabit Ethernet</li> </ul>
<b>State</b>	Lists if the MAC address is in use (Active) or not in use (Inactive).

### Example

```
DelleMC(conf)# do show mac-address-table
Codes: *N - VLT Peer Synced MAC
VlanId   Mac Address           Type           Interface      State
2        00:00:00:00:00:01     Dynamic (N)    Po 128         Active
2        00:00:00:00:00:02     Dynamic (N)    Po 10          Active
2        00:00:00:00:00:03     Dynamic        Po 100         Active
2        00:00:00:00:00:04     Dynamic        Po 10          Active
```

### Usage Information

The following describes the `show mac-address-table count` command shown in the following example.

Line Beginning With	Description
<b>MAC Entries...</b>	Displays the number of MAC entries learned per VLAN.
<b>Dynamic Address...</b>	Lists the number of dynamically learned MAC addresses.
<b>Static Address...</b>	Lists the number of user-defined MAC addresses.
<b>Total MAC...</b>	Lists the total number of MAC addresses the switch uses.

### Example (Count)

```
DelleMC# show mac-address-table count
MAC Entries for all vlans :
Dynamic Address Count :           110
Static Address (User-defined) Count : 0
Sticky Address Count :             0
Total Synced Mac from Peer(N) :    100
Total MAC Addresses in Use:        110
DelleMC#
```

### Related Commands

- [show mac-address-table aging-time](#) — display MAC aging time.

## show mac-address-table aging-time

Display the aging times assigned to the MAC addresses on the switch.

**Syntax** `show mac-address-table aging-time [vlan vlan-id]`

**Parameters**      **vlan *vlan-id***      (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Added the <code>vlan</code> option on the E-Series.
<b>7.7.1.0</b>	Introduced on the C-Series and S-Series.
<b>pre-6.2.1.1</b>	Introduced on the E-Series.

**Example**

```
DellEMC# show mac-address-table aging-time
Mac-address-table aging time : 1800

DellEMC#
```

**Related Commands**

- [show mac-address-table](#) — display the current MAC address configuration.

## show mac learning-limit

Display MAC address learning limits set for various interfaces.

**Syntax**      `show mac learning-limit [violate-action] [detail] [interface interface]`

**Parameters**

**violate-action**      (OPTIONAL) Enter the keywords `violate-action` to display the MAC learning limit violation status.

**detail**      (OPTIONAL) Enter the keyword `detail` to display the MAC learning limit in detail.

**interface *interface***      (OPTIONAL) Enter the keyword `interface` with the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.

<b>7.5.1.0</b>	Added support for the <code>violate-action</code> and <code>detail</code> options.
<b>6.5.1.0</b>	Added support for Port Channel.

**Example**

```
DellEMC# show mac learning-limit
Interface      Learning  Dynamic   Static     Unknown SA
Slot/port     Limit    MAC count MAC count  Drops
Te 1/1/1      10       0         0         0
Te 1/2/1      5        0         0         0
DellEMC#show mac learning-limit interface tengigabithethernet 1/1/1
Interface      Learning  Dynamic   Static     Unknown SA
Slot/port     Limit    MAC count MAC count  Drops
Te 1/1/1      10       0         0         0
```

# Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

**NOTE:** For more information, refer to [VLAN Stacking](#) and VLAN-related commands, such as [portmode hybrid](#) in the [Interfaces](#) chapter.

## default vlan-id

Specify a VLAN as the Default VLAN.

**Syntax** `default vlan-id vlan-id`

To remove the default VLAN status from a VLAN and VLAN 1 does not exist, use the `no default vlan-id vlan-id` syntax.

**Parameters** ***vlan-id*** Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is **1**.

**Defaults** Default VLAN is VLAN **1**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.

<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.2.1.1</b>	Introduced on the E-Series.

**Usage Information** To return VLAN 1 as the Default VLAN, use this command syntax (`default-vlan-id 1`).

The Default VLAN contains only untagged interfaces.

**Related  
Commands**

- [interface vlan](#) — configure a VLAN.

## description

Add a description about the selected VLAN.

**Syntax** `description description`

**Parameters** **description** Enter a text string description to identify the VLAN (80 characters maximum).

**Defaults** none

**Command Modes** INTERFACE VLAN

**Command  
History**

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the C-Series and S-Series.
6.3.1.1	Introduced on the E-Series.

**Related  
Commands** [show vlan](#) – displays the VLAN configuration.

## default-vlan disable

Disable the default VLAN so that all switchports are placed in the Null VLAN until they are explicitly configured as a member of another VLAN.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command  
History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced

**Usage Information**

The `no default vlan disable` command is not listed in the running-configuration, but when the default VLAN is disabled, `default-vlan disable` is listed in the running-configuration.

## name

Assign a name to the VLAN.

**Syntax**

`name vlan-name`

To remove the name from the VLAN, use the `no name` command.

**Parameters**

***vlan-name*** Enter up to 32 characters as the name of the VLAN.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Usage Information**

To display information about a named VLAN, enter the `show vlan` command with the name parameter or the `show interfaces description` command.

**Related Commands**

- [interface vlan](#) — configure a VLAN.
- [show vlan](#) — display the current VLAN configurations on the switch.

## show config

Display the current configuration of the selected VLAN.

**Syntax** `show config`

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Example**

```
DellEMC(conf-if-vl-100)# show config
!
interface Vlan 100
  no ip address
  no shutdown
DellEMC(conf-if-vl-100)#
```

# show vlan

Display the current VLAN configurations on the switch.

**Syntax** `show vlan [brief | id vlan-id | name vlan-name]`

**Parameters**

- brief** (OPTIONAL) Enter the keyword `brief` to display the following information:
  - VLAN ID
  - VLAN name (left blank if none is configured)
  - Spanning Tree Group ID
  - MAC address aging time
  - IP address
- id *vlan-id*** (OPTIONAL) Enter the keyword `id` then a number from 1 to 4094. Only information on the VLAN specified is displayed.
- name *vlan-name*** (OPTIONAL) Enter the keyword `name` then the name configured for the VLAN. Only information on the VLAN named is displayed.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.1.(0.0)	Updated to support OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Augmented to display PVLAN data for the C-Series and S-Series and revised the output to include the Description field to display a user-entered VLAN description.
7.6.1.0	Introduced on the S-Series and revised the output to display Native VLAN.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

**Usage Information** The following describes the `show vlan` command shown in the following example.

Column Heading	Description
<b>(Column 1 — no heading)</b>	<ul style="list-style-type: none"> <li>• asterisk symbol (*) = Default VLAN</li> <li>• G = GVRP VLAN</li> <li>• P = primary VLAN</li> <li>• C = community VLAN</li> <li>• I = isolated VLAN</li> <li>• O = OpenFlow</li> </ul>
<b>NUM</b>	Displays existing VLAN IDs.
<b>Status</b>	Displays the word <i>Inactive</i> for inactive VLANs and the word <i>Active</i> for active VLANs.
<b>Q</b>	<ul style="list-style-type: none"> <li>• Displays G for GVRP tagged</li> <li>• M for member of a VLAN-Stack VLAN</li> <li>• T for tagged interface</li> <li>• U for untagged interface</li> <li>• x (not capitalized x) for Dot1x untagged</li> <li>• X (capitalized X) for Dot1x tagged</li> <li>• o (not capitalized o) for OpenFlow untagged</li> <li>• O (capitalized O) for OpenFlow tagged</li> <li>• H for VSN tagged</li> <li>• i (not capitalized i) for Internal untagged</li> <li>• I (capitalized I) for Internal tagged</li> <li>• v (not capitalized v) for VLT untagged</li> <li>• V (capitalized V) for VLT tagged</li> </ul>
<b>Ports</b>	Displays the type, slot, and port information. <ul style="list-style-type: none"> <li>• Po = port channel</li> <li>• Te = ten-gigabit Ethernet</li> <li>• Fo = forty-gigabit Ethernet</li> <li>• Tf = twentyfive-gigabit Ethernet</li> <li>• Fi = fifty-gigabit Ethernet</li> <li>• Hu = hundred-gigabit Ethernet</li> </ul>

### Example

```

DellEMC# show vlan

Codes: * - Default VLAN, G - GVRP VLANs, P - Primary, C - Community, I -
Isolated
Q: U - Untagged, T - Tagged, O - Openflow
   x - Dot1x untagged, X - Dot1x tagged
   o - OpenFlow untagged, O - OpenFlow tagged
   G - GVRP tagged, M - Vlan-stack
   i - Internal untagged, I - Internal tagged, v - VLT untagged, V - VLT
tagged
NUM  Status      Description      Q Ports
*   1   Inactive
   2   Active          U Po1(Te 1/1/1)
                               T Po20(Te 1/6/1), Te 1/25/1
                               T Te 1/7/1
   3   Active T Po20(Te 1/6/1)
                               T Te 1/7/1
                               U Te 1/1/1
   4   Active U Po2(Te 1/2/1)
                               T Po20(Te 1/6/1)
                               T Te 1/7/1
   5   Active T Po20(Te 1/6/1)
                               T Te 1/7/1
                               U Te 1/3/1
   6   Active U Po3(Te 1/4)
                               T Po20(Te 1/6/1)
                               T Te 1/7/1

```

```

7      Active T Po20(Te 1/6/1)
                                T Te 1/7/1
                                U Te 1/5/1
P 100  Active T Pol(Te 1/1/1)
                                T Te 1/2/1
C 101  Inactive T Te 1/3/1
I 102  Inactive T Te 1/4/1
DelleMC#

```

### Example (VLAN ID)

```

DelleMC# show vlan id 40

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
   x - Dot1x untagged, X - Dot1x tagged
   G - GVRP tagged, M - Vlan-stack

      NUM  Status Description Q Ports
      40   Active                M Te 1/47/1

DelleMC# show vlan id 41

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
   x - Dot1x untagged, X - Dot1x tagged
   G - GVRP tagged, M - Vlan-stack

      NUM  Status Description Q Ports
      41   Active                T Te 1/47/1

DelleMC# show vlan id 42

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
   x - Dot1x untagged, X - Dot1x tagged
   G - GVRP tagged, M - Vlan-stack

      NUM  Status Description Q Ports
      42   Active                U Te 1/47/1
DelleMC#

```

### Example (Brief)

```

DelleMC# show vlan br
VLAN  Name  STG  MAC Aging  IP Address
-----
1      0      1800      unassigned
2      0      1800      2.2.2.2/24
3      0      1800      3.3.3.2/24
DelleMC#

```

### Example (Name)

```

Dellconf)# interface vlan 222
DelleMC(conf-if-vl-222)#name test
DelleMC(conf-if-vl-222)#do show vlan name test

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
   x - Dot1x untagged, X - Dot1x tagged
   G - GVRP tagged, M - Vlan-stack

      NUM  Status Description Q Ports
      222  Inactive                U Te 1/22/1
DelleMC(conf-if-vl-222)#

```

### Example (OpenFlow instance)

	NUM	Status	Description	Q Ports
*	1	Inactive		
	3	Inactive		
0	6	Inactive		

0	8	Inactive	
0	12	Inactive	0 Te 1/10/1

**Related Commands**

- [vlan-stack compatible](#) — enable the Stackable VLAN feature on the selected VLAN.
- [interface vlan](#) — configure a VLAN.

## tagged

Add a Layer 2 interface to a VLAN as a tagged interface.

**Syntax**

`tagged interface`

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

**Parameters**

***interface***

Enter the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.5.1.0</b>	Added support for 4-port 40G line cards on the E-Series.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.6.1.0</b>	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

### Usage Information

When you use the `no tagged` command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

### Related Commands

- [interface vlan](#) — configure a VLAN.
- [untagged](#) — specify which interfaces in a VLAN are untagged.

## track ip

Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

### Syntax

```
track ip interface
```

To remove the tracking feature from the VLAN, use the `no track ip interface` command.

### Parameters

Parameter	Description
<b>interface</b>	Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul>

### Defaults

Not configured.

### Command Modes

INTERFACE VLAN

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

### Usage Information

When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and the Layer 2 traffic, is not affected by the `track ip` command configuration.

### Related Commands

- [interface vlan](#) — configure a VLAN.
- [tagged](#) — specify which interfaces in a VLAN are tagged.

## untagged

Add a Layer 2 interface to a VLAN as an untagged interface.

### Syntax

`untagged interface`

To remove an untagged interface from a VLAN, use the `no untagged interface` command.

### Parameters

<i>interface</i>	
	Enter the following keywords and the interface information:
	<ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li> <li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li> <li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port information.</li> </ul>

### Defaults

All interfaces in Layer 2 mode are untagged.

### Command Modes

INTERFACE VLAN

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

#### Usage Information

Untagged interfaces can only belong to one VLAN.

In the Default VLAN, you cannot use the `no untagged interface` command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the `no switchport` command.

#### Related Commands

- [interface vlan](#) — configure a VLAN.
- [tagged](#) — specify which interfaces in a VLAN are tagged.

## Far-End Failure Detection (FEFD)

The Dell EMC Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces of the platform.

The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

### debug fefd

Enable debugging of FEFD.

#### Syntax

```
debug fefd {events | packets} [interface]
```

To disable debugging of FEFD, use the `no debug fefd {events | packets} [interface]` command.

#### Parameters

- events** Enter the keyword `events` to enable debugging of FEFD state changes.
- packets** Enter the keyword `packets` to enable debugging of FEFD to view information on packets sent and received.
- interface** (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port/subport information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the slot/port information.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
<b>9.10(0.1)</b>	Introduced on the S6010-ON and S4048T-ON.
<b>9.10(0.0)</b>	Introduced on the S3148.
<b>9.10(0.0)</b>	Introduced on the S6100-ON.
<b>9.8(2.0)</b>	Introduced on the S3100 series.
<b>9.8(1.0)</b>	Introduced on the Z9100-ON.
<b>9.8(0.0P5)</b>	Introduced on the S4048-ON.
<b>9.8(0.0P2)</b>	Introduced on the S3048-ON.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.12.0</b>	Introduced on the S4810.

**Legacy E-Series command.**

- Related Commands**
- `fefd` — enable far-end failure detection on an interface.
  - `fefd reset` — enable FEFD globally on the system.

## fefd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

**Syntax** `fefd {disable|interval|mode {aggressive|normal}}`

**Parameters**

<b>disable</b>	Enter the keyword <b>disable</b> to disable FEFD for the specified interface.
