Base Server and Physical Asset Profile

1 Scope

97 The *Base Server Profile* is the autonomous profile that defines the classes used to describe basic server
98 hardware and its related software. The scope of this profile is limited to simple servers that are directly
99 realized in physical components. The profiles referenced by the *Base Server Profile* extend the
100 management capabilities by adding the capability to represent server configuration, boot control,
101 provisioning, and hardware.

184 **6 Description**

185 The *Base Server Profile* is an autonomous profile that defines the minimum top-level object model
186 needed to model simple server hardware and related software. Other profiles add additional management
187 objects to this basic server model to provide system configuration, boot control, and other provisioning
188 capabilities. DCIM_ComputerSystem represents the server system

347 **8 Methods**

348 This section details the requirements for supporting extrinsic methods for the DCIM_ComputerSystem
349 class.

350 **8.1 DCIM_ComputerSystem.RequestStateChange()**

351 Invoking the DCIM_ComputerSystem.RequestStateChange() method changes the element’s state to the
352 value specified in the RequestedState parameter.

- 353 • A value of 2 (Enabled) shall correspond to a request to power on the system.
- 354 • A value of 3 (Disabled) shall correspond to a request to power off the system.
- 355 • A value of 11 (Reset) shall correspond to a request to power cycle the system.

356 The method shall be successful, if upon the completion of the method the system has been requested to
357 transition to the desired state indicated by the RequestedState parameter. An actual change in the state
358 may not occur, even if the the method was executed sucessfully. The EnabledState property shall
359 indicate the current state of the system.

360 Detailed requirements of the RequestStateChange() method are specified in Table 17 and Table 18.

361 Invoking the DCIM_ComputerSystem.RequestStateChange() method multiple times could result in earlier
362 requests being overwritten or lost.

363 **Table 17 – DCIM_ComputerSystem.RequestStateChange() Method: Return Code Values**

Value	Description
0	Request was successfully executed.
2	Error occurred

364 **Table 18 – DCIM_ComputerSystem.RequestStateChange() Method: Parameters**

Qualifiers	Name	Type	Description/Values
IN, REQ	RequestedState	uint16	Valid state values : 2 (Enabled) 3 (Disabled) 11 (Reset)
OUT	MessageID	string	Error Message ID- can be used to index into Dell Message registry files
OUT	Message	string	Error Message in English corresponding to MessageID is returned if the method fails to execute
OUT	MessageArguments[]	string	Substitution variables for dynamic error messages

365 **Table 19 – DCIM_ComputerSystem.RequestStateChange() Method: Standard Messages**

MessageID (OUT parameter)	Message	MessageArguments[]
SYS002	The command failed	
SYS003	Missing parameter(s) %s	RequestedState
SYS004	Invalid parameter value for %s	RequestedState
SYS021	The command failed to set %s	RequestedState

366 **8.1.1 DCIM_ComputerSystem.RequestStateChange() Conditional Support**

367 When the DCIM_CSEnabledLogicalElementCapabilities.RequestedStatesSupported property contains at
 368 least one value, the DCIM_ComputerSystem.RequestStateChange() method shall be implemented and
 369 supported. The DCIM_ComputerSystem.RequestStateChange() method shall not return a value of 1 (Not
 370 Supported).

371 **9 Use Cases**

372 See *Lifecycle Controller (LC) Integration Best Practices Guide*.

373 **10 CIM Elements**

374 No additional details specified.

375 **11 Privilege and License Requirement**

376 The following table describes the privilege and license requirements for the listed operations . For the
 377 detailed explanation of the privileges and licenses, refer to the Dell WSMAN Licenses and Privileges
 378 specification.
