Statement of Volatility – Dell DR4100 and DR6000

Dell DR4100 and DR6000 contain both volatile and non-volatile (NV) components. Volatile components lose their data immediately upon removal of power from the component. Non-volatile components continue to retain their data even after the power has been removed from the component. Components chosen as user-definable configuration options (those not soldered to the motherboard) are not included in the Statement of Volatility. Configuration option information (pertinent to options such as microprocessors, remote access controllers, and storage controllers) is available by component separately. The following NV components are present in the Dell DR4100 and DR6000 systems. Note that the Dell DR6000 system will always have a **WAM 2** NVRAM card; whereas, the DR 4100 may have a **WAM 1** or a **WAM 2** card installed.
