

Dell Command | Monitor

Version 10.2.1 Reference Guide

Remarques, précautions et avertissements

 **REMARQUE** : Une REMARQUE indique des informations importantes qui peuvent vous aider à mieux utiliser votre produit.

 **PRÉCAUTION** : Une PRÉCAUTION indique un risque d'endommagement du matériel ou de perte de données et vous indique comment éviter le problème.

 **AVERTISSEMENT** : Un AVERTISSEMENT indique un risque d'endommagement du matériel, de blessures corporelles ou même de mort.

Introduction for Dell Command | Monitor

10.2.1

The Dell Command | Monitor software enables remote management of client systems by using application programs to access information, monitor the status, or change the state of the system, such as remotely shutting down the system. Dell Command | Monitor exposes, through standard interfaces, key system parameters that enable administrators to manage, inventory, monitor system health, and gather information about deployed Dell client systems. Dell Command | Monitor is designed for Dell Enterprise client systems, Dell IoT Gateway systems, and for Dell Embedded PCs. For more information on supported Dell systems see Release notes available at dell.com/dellclientcommandssuite/manuals.

NOTE: Dell Command | Monitor was formerly Dell OpenManage Client Instrumentation (OMCI). After the OMCI version 8.2.1, OMCI is rebranded as Dell Command | Monitor.

NOTE: All classes or properties that are listed in the reference guide may not be supported on all Dell systems.

Dell Command | Monitor 10.2.1 Namespaces

Namespaces are standards-based with implementation of multiple profiles as defined by the Distributed Management Task Force (DMTF). The following namespaces are available in Dell Command | Monitor:

- **root\dcim\sysman** - The CIM schema for this namespace is 2.17 and provides all the functionality of Dell Command | Monitor for Windows. Dell Command | Monitor for Windows, uses DASH-compliant namespace conventions. A DASH-compliant implementation uses a CIM-based data model for representing managed resources and services.
- **root/dcim/sysman** - The CIM schema for this namespace is 2.32.0 and provides all the functionality of Dell Command | Monitor for Linux.

Profiles for Dell Command | Monitor 10.2.1

Dell Command | Monitor running on Microsoft Windows operating system uses industry standard profiles to represent the management data provided. These profiles are implemented either as defined or sometimes have Dell-specific extensions.

The following is a list of profiles that are implemented for Dell Command | Monitor for Windows:

Non-extended profiles:

- **Base Metrics**—The Base Metrics Profile is a component profile that defines the minimum object model that is needed to provide dynamic metrics that are associated to existing managed elements and related associations.
- **Battery**—The Battery Profile extends the management capabilities of referencing profiles by adding the capability to represent batteries for manageability. The battery as a logical device is modeled as referencing the battery physical package for physical asset information, the sensor for sensor-reading information, and the profile registration for the schema implementation version information.
- **BIOS Management**—The BIOS Management Profile extends the management capabilities of referencing profiles by adding the capability to represent and configure BIOS settings, such as a Network Controller or IDE Controller. The individual BIOS settings' relationship with a respective device is also described.
- **Boot Control**—The Boot Control Profile describes the classes, associations, properties, and methods that are used to manage the boot control configurations of a physical or virtual computer system.
- **CPU**—The CPU Profile extends the management capability of referencing profiles by adding the capability to represent CPUs or processors in a managed system . CPU cache memory and associations with CPU physical aspects, and profile implementation version information, are modeled in this profile.
- **Fan**—The Fan Profile extends the management capabilities of referencing profiles by adding the capability to represent fans for manageability and describe fans in a redundant configuration. The fan as a logical device is modeled as referencing the fan physical package for physical asset information, a sensor for sensor reading information.
- **Indications**—The Indications Profile defines the CIM elements that are used to subscribe for indications of unsolicited events, to advertise the possible indications, and to represent indications used to report events in a managed system.
- **IP Interface**—The IP Interface Profile extends the management capability of referencing profiles by adding the capability to represent an IP interface of a managed system.
- **Operating system Status**—The operating system Status Profile extends the management capabilities of referencing profiles by adding the capability to perform basic management of operating systems installed on a system.
- **PCI Device**—The PCI Device Profile extends the management capabilities of referencing profiles by adding the capability to represent PCI devices for manageability, including PCI, PCI-X, PCI Express, bridge, and switch devices.
- **Physical Asset**—The Physical Asset Profile extends the management capability of the referencing profiles by adding the capability to describe the physical aspects of logical elements that the implementation is instantiating.
- **Power State Management**—The Power State Management Profile describes the classes, associations, properties, and methods that are used to manage the power of a computer system.
- **Profile Registration**—The Profile Registration extends the management capability of the referencing profiles by adding the capability to describe the registration and versioning of CIM profiles that are implemented by CIM-based system and component management instrumentations.
- **RecordLog**—The Record Log Profile is an autonomous profile that provides the management capabilities to represent logs of a managed system element.
- **Sensors**—The Sensors Profile extends the management capabilities of referencing profiles by adding the capability to represent sensors.
- **Software Inventory**—The Software Inventory Profile describes the CIM schema elements that are required to provide an inventory of installed BIOS, firmware, drivers, and related software in a managed system.
- **Device Tray**—The Device Tray Profile is a component profile for modeling a device tray of a modular system.
- **Software Update**—The Software Update Profile describes the classes, associations, properties, and methods used to support the installation and update of BIOS, firmware, drivers, and related software on a managed element within a managed system.
- **Base Desktop and Mobile**—The Base Desktop and Mobile Profile is an autonomous profile that defines the classes that are used to describe monolithic desktop or mobile computer hardware and related software. The scope of this profile is limited to monolithic desktop or mobile computer hardware and related software that are directly realized in physical components.

Extended profiles:

- Asset Profile
- Ethernet Port Profile
- Event Configuration

- Serial Port
- Service processor Profile
- System Memory
- USB
- Docking Station
- Human Computer Interaction
- Display Controller

For more information about Profiles, see the website - dmtf.org/standards/profiles.

Classes for Dell Command | Monitor 10.2.1

Classes and properties are defined by the CIM schema. The profiles identify mandatory classes and properties to implement the profile.

For more information about CIM schema, classes and properties, see to the website - dmtf.org/standards/cim

Dell Command | Monitor 10.2.1 classes and properties

Dell Command | Monitor provides information for a namespace through different classes.

Topics:

- [Classes supported for systems running Linux](#)
- [Classes supported for systems running Windows](#)

Classes supported for systems running Linux

For systems running Linux operating system, only the following classes are currently supported:

- [DCIM_AlertIndication](#)
- [DCIM_AssetOwnerInformation](#)
- [DCIM_BIOSElement](#)
- [DCIM_BIOSEnumeration](#)
- [DCIM_BIOSPassword](#)
- [DCIM_BIOSService](#)
- [DCIM_Card](#)
- [DCIM_Chassis](#)
- [DCIM_ComputerSystem](#)
- [DCIM_ControllerView](#)
- [DCIM_Docked](#)
- [DCIM_Fan](#)
- [DCIM_LogEntry](#)
- [DCIM_Memory](#)
- [DCIM_Location](#)
- [DCIM_NumericSensor](#)
- [DCIM_PhysicalDiskView](#)
- [DCIM_Processor](#)
- [DCIM_VirtualDiskView](#)

Classes supported for systems running Windows

The namespace to access the Dell Command | Monitor DMTF profiles is `root\dcim\sysman`.

The following tables describe the classes and properties associated with each class.

DCIM_AlertIndication

Table 1. AlertIndication

Property	Description	Supported Operating System(s)
AlertingElementFormat	The format of the AlertingManagedElement property is interpretable based on the value of this property. Possible values are:	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
AlertingManagedElement	<ul style="list-style-type: none"> • 0 = Unknown — The format is unknown or not meaningfully interpretable by a CIM client application. • 1 = Other — The format is defined by the value of the OtherAlertingElementFormat property. • 2 = CIMObjectPath — The format is a CIMObjectPath, with format NamespacePath:ClassName.Prop1 = Value1, Prop2=Value2, . . . specifying an instance in the CIM Schema. <p>The identifying information of the entity (that is, the instance) for which this Indication is generated. The property contains the path of an instance, encoded as a string parameter — if the instance is modeled in the CIM Schema. If it is not a CIM instance, the property contains some identifying string that names the entity for which the Alert is generated. The path or identifying string is formatted per the AlertingElementFormat property.</p>	Microsoft Windows, Linux
AlertType	<p>Primary classification of the Indication.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other — The Indication's OtherAlertType property conveys its classification. Use of Other in an enumeration is a standard CIM convention. It means that the current Indication does not fit into the categories described by this enumeration. • 2 = Communications Alert — An Indication of this type is principally associated with the procedures and/or processes required to convey information from one point to another. • 3 = Quality of Service Alert — An Indication of this type is principally associated with a degradation or errors in the performance or function of an entity. • 4 = Processing Error — An Indication of this type is principally associated with a software or processing fault. • 5 = Device Alert — An Indication of this type is principally associated with an equipment or hardware fault. • 6 = Environmental Alert — An Indication of this type is principally associated with a condition relating to an enclosure in which the hardware resides, or other environmental considerations. • 7 = Model Change — The Indication addresses changes in the Information Model. For example, it may embed a Lifecycle Indication to convey the specific model change being alerted. • 8 = Security Alert — An Indication of this type is associated with security violations, detection of viruses, and similar issues. 	Microsoft Windows, Linux
EventID	<p>An instrumentation or provider-specific value that describes the underlying real-world event represented by the Indication. Two Indications with the same, non NULL EventID value are considered, by the creating entity, to represent the same event. The comparison of two EventID values is only defined for</p>	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	Alert Indications with identical, non NULL values of SystemCreateClassName, SystemName, and ProviderName.	
IndicationIdentifier	<p>An identifier for the Indication. This property is similar to a key value in that it can be used for identification, when correlating Indications (see the CorrelatedIndications array). Its value SHOULD be unique as long as correlations are reported, but MAY be reused or left NULL if no future Indications will reference it in their CorrelatedIndications array. To ensure uniqueness, the value of IndicationIdentifier should be constructed using the following preferred algorithm:</p> <p><OrgID>:<LocalID></p> <p>Where <OrgID> and <LocalID>are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the IndicationIdentifier or that is a recognized ID that is assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness must not contain a colon (:). When using this algorithm, the first colon to appear in IndicationIdentifier must appear between <OrgID>and <LocalID> is chosen by the business entity and should not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity should assure that the resulting IndicationIdentifier is not reused across any IndicationIdentifiers that are produced by this or other providers for the NameSpace of this instance.</p>	Microsoft Windows
IndicationTime	<p>The time and date of creation of the Indication. The property may be set to NULL if the entity creating the Indication is not capable of determining this information.</p> <p>NOTE: IndicationTime may be the same for two Indications that are generated in rapid succession.</p>	Microsoft Windows
Message	<p>The formatted message. This message is constructed by combining some or all of the dynamic elements specified in the MessageArguments property with the static elements uniquely identified by the MessageID in a message registry or other catalog associated with the OwningEntity.</p>	Microsoft Windows
MessageArguments	<p>An array containing the dynamic content of the message.</p>	Microsoft Windows, Linux
MessageID	<p>A string that uniquely identifies, within the scope of the OwningEntity, the format of the Message.</p>	Microsoft Windows
OtherAlertingElementFormat	<p>A string defining Other values for AlertingElementFormat. This value MUST be set to a non NULL value when AlertingElementFormat is set to</p>	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	a value of 1 (Other). For all other values of AlertingElementFormat, the value of this string must be set to NULL.	
OtherAlertType	A string describing the Alert type — used when the AlertType property is set to 1, Other State Change .	Microsoft Windows, Linux
OtherSeverity	Holds the value of the user-defined severity value when PerceivedSeverity is 1 (Other).	Microsoft Windows, Linux
OwningEntity	A string that uniquely identifies the entity that owns the definition of the format of the Message described in this instance. OwningEntity MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity or standards body defining the format.	Microsoft Windows, Linux
PerceivedSeverity	<p>An enumerated value that describes the severity of the Alert Indication from the notifier's point of view:</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 and 0 — Information and Unknown (respectively) follow common usage. Literally, the AlertIndication is purely informational or its severity is unknown. • 1 = Other — By CIM convention, is used to indicate that the Severity's value can be found in the OtherSeverity property. • 3 = Degraded/Warning — Is used when it is appropriate to let the user decide if action is needed. • 4 = Minor — Is used to indicate that action is needed, but the situation is not serious now. • 5 = Major — Is used to indicate that action is needed NOW. • 6 = Critical — Is used to indicate that action is needed NOW and the scope is broad (perhaps an imminent outage to a critical resource results). • 7 = Fatal/Non recoverable — Is used to indicate that an error occurred, but it is too late to take remedial action. 	Microsoft Windows, Linux
ProbableCause	<p>An enumerated value that describes the probable cause of the situation that resulted in the AlertIndication.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Adapter/Card Error • 3 = Application Subsystem Failure • 4 = Bandwidth Reduced • 5 = Connection Establishment Error • 6 = Communications Protocol Error • 7 = Communications Subsystem Failure • 8 = Configuration/Customization Error • 9 = Congestion • 10 = Corrupt Data 	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> · 11 = CPU Cycles Limit Exceeded · 12 = Dataset/Modem Error · 13 = Degraded Signal · 14 = DTE-DCE Interface Error · 15 = Enclosure Door Open · 16 = Equipment Malfunction · 17 = Excessive Vibration · 18 = File Format Error · 19 = Fire Detected · 20 = Flood Detected · 21 = Framing Error · 22 = HVAC Problem · 23 = Humidity Unacceptable · 24 = I/O Device Error · 25 = Input Device Error · 26 = LAN Error · 27 = Non-Toxic Leak Detected · 28 = Local Node Transmission Error · 29 = Loss of Frame · 30 = Loss of Signal · 31 = Material Supply Exhausted · 32 = Multiplexer Problem · 33 = Out of Memory · 34 = Output Device Error · 35 = Performance Degraded · 36 = Power Problem · 37 = Pressure Unacceptable · 38 = Processor Problem (Internal Machine Error) · 39 = Pump Failure · 40 = Queue Size Exceeded · 41 = Receive Failure · 42 = Receiver Failure · 43 = Remote Node Transmission Error · 44 = Resource at or Nearing Capacity · 45 = Response Time Excessive · 46 = Retransmission Rate Excessive · 47 = Software Error · 48 = Software Program Abnormally Terminated · 49 = Software Program Error (Incorrect Results) · 50 = Storage Capacity Problem · 51 = Temperature Unacceptable · 52 = Threshold Crossed · 53 = Timing Problem · 54 = Toxic Leak Detected · 55 = Transmit Failure · 56 = Transmitter Failure · 57 = Underlying Resource Unavailable · 58 = Version MisMatch · 59 = Previous Alert Cleared · 60 = Login Attempts Failed · 61 = Software Virus Detected · 62 = Hardware Security Breached · 63 = Denial of Service Detected

Property	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> 117 = Authentication Failure 118 = Breach of Confidentiality 119 = Cable Tamper 120 = Delayed Information 121 = Duplicate Information 122 = Information Missing 123 = Information Modification 124 = Information Out of Sequence 125 = Key Expired 126 = Non-Repudiation Failure 127 = Out of Hours Activity 128 = Out of Service 129 = Procedural Error 130 = Unexpected Information 	
ProviderName	The name of the Provider generating this Indication.	Microsoft Windows, Linux
SystemCreationClassName	The scoping of the creation class name of the system for the provider, generating this indication.	Microsoft Windows, Linux
SystemName	The scoping name of the system for the provider, generating this indication.	Microsoft Windows, Linux
Trending	<p>Provides information on trending — trending up, down, or no change.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Not Applicable 2 = Trending Up 3 = Trending Down 4 = No Change 	Microsoft Windows, Linux

DCIM_ApplicationProxySetting

Table 2. ApplicationProxySetting

Property	Description
Proxy Address	Proxy Hostname used by application
Port Number	Proxy Port used by application
ChangeProxySetting (Method)	<p>This method changes the proxy hostname and port number to be used by Dell Command Monitor</p> <p>Parameters:</p> <ul style="list-style-type: none"> New Hostname value to be set New Port value to be set <p>Return Values:</p> <ul style="list-style-type: none"> A return code of 0 indicates the proxy settings that were updated successfully. A return code of 1 indicates the proxy settings that were not updated successfully.

DCIM_BaseMetricDefinition

Table 3. BaseMetricDefinition

Property	Description
Caption	The Caption property is a short textual description (one- line string) of the object.
Description	The Description property provides a textual description of the object.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
Accuracy	Indicates the accuracy of the values reported for this metric.
AccuracyUnits	The accuracy is expressed as the value of theAccuracy property in the units specified by the AccuracyUnits property.
BreakdownDimensions	Defines one or more strings that can be used to refine (break down) queries against the BaseMetricValues along a certain dimension. An example is a transaction name, allowing the break down of the total value for all transactions into a set of values, one for each transaction name. Other examples might be application system or user group name. The strings are free format and should be meaningful to the end users of the metric data. The strings indicate which break down dimensions are supported for this metric definition, by the underlying instrumentation.
Calculable	<p>An enumerated value that describes the characteristics of the metric, for purposes of performing calculations.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 1 = Non-calculable• 2 = Summable• 3 = Non-summable
ChangeType	<p>ChangeType indicates how the metric value changes, in the form of typical combinations of finer grain attributes such as direction change, minimum and maximum values, and wrapping semantics.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 2 = N/A• 3 = Counter• 4 = Gauge• 5..32767 = DMTF Reserved• 32768..65535 = Vendor Reserved• 3 = Counter
DataType	<p>The data type of the metric. These types represent the datatypes defined for CIM.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> • 1 = boolean • 2 = char16 • 3 = datetime • 4 = real32 • 5 = real64 • 6 = sint16 • 7 = sint32 • 8 = sint64 • 9 = sint8 • 10 = string • 11 = uint16 • 12 = uint32 • 13 = uint64 • 14 = uint8
GatheringType	<p>GatheringType indicates how the metric values are gathered by the underlying instrumentation. This allows the client application to choose the right metric for the purpose.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = OnChange • 3 = Periodic • 4 = OnRequest • 5..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Id	A string that uniquely identifies the metric definition. The use of OSF UUID/ GUIDs is recommended.
IsContinuous	True
Name	The name of the metric. This name does not have to be unique, but should be descriptive and may contain blanks.
ProgrammaticUnits	Identifies the specific units of a value. The value of this property shall be a legal value of the Programmatic Units qualifier as defined in Appendix C.1 of DSP0004 V2.4 or later.
SampleInterval	If metric values are collected at regular intervals, the SampleInterval property indicates the length of the interval. If non-null, the value of the SampleInterval shall be expressed in interval notation. A value of NULL shall indicate the SampleInterval is unknown. A value of 99990101000000.000000+000 shall indicate the sampling interval is irregular.
TimeScope	<p>TimeScope indicates the time scope to which the metric value applies.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Point • 3 = Interval • 4 = StartupInterval • 5..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Units	Identifies the specific units of a value. Examples are Bytes, Packets, Jobs, Files, Milliseconds, and Amps.

DCIM_Card

Table 4. Card

Property	Description
CanBeFRUed	Boolean that indicates whether this PhysicalElement can be FRUed (TRUE) or not (FALSE).
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
HostingBoard	Boolean indicating that this Card is a Motherboard or, more generically, a baseboard in a Chassis.
Manufacturer	The name of the organization responsible for producing the PhysicalElement. This organization may be the entity from whom the Element is purchased, but it is not necessarily true. The latter information is contained in the Vendor property of CIM_Product.
Model	The name by which the PhysicalElement is known.
PackageType	<p>Enumeration defining the type of the PhysicalPackage.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown — Indicates that the package type is not known.• 1 = Other — The package type does not correspond to an existing enumerated value. The value is specified using the OtherPackageType property.• 2 = Rack• 3 = Chassis/Frame• 4 = Cross Connect/Backplane• 5 = Container/Frame Slot• 6 = Power Supply• 7 = Fan• 8 = Sensor• 9 = Module/Card• 10 = Port/Connector• 11 = Battery• 12 = Processor• 13 = Memory• 14 = Power Source/Generator• 15 = Storage Media Package (e.g., Disk or Tape Drive)• 16 = Blade• 17 = Blade Expansion

Property	Description
	<p>NOTE: This enumeration expands on the list in the Entity MIB (the attribute, <code>entPhysicalClass</code>). The numeric values are consistent with CIM's enum numbering guidelines, but are slightly different than the MIB's values.</p> <p>The values Rack through Port/Connector are defined per the Entity-MIB (where the semantics of rack are equivalent to the MIB's stack value). The other values (for battery, processor, memory, power source/generator and storage media package) are self-explanatory. A value of Blade should be used when the <code>PhysicalPackage</code> contains the operational hardware aspects of a <code>ComputerSystem</code>, without the supporting mechanicals such as power and cooling. For example, a Blade Server includes processor(s) and memory, and relies on the containing chassis to supply power and cooling. In many respects, a Blade can be considered a Module/Card. However, it is tracked differently by inventory systems and differs in terms of service philosophy. For example, a Blade is intended to be hot-plugged into a hosting enclosure without requiring additional cabling, and does not require a cover to be removed from the enclosure for installation. Similarly, a Blade Expansion has characteristics of a Blade and a Module/Card. However, it is distinct from both due to inventory tracking and service philosophy, and because of its hardware dependence on a Blade. A Blade Expansion must be attached to a Blade prior to inserting the resultant assembly into an enclosure.</p>
PartNumber	The part number assigned by the organization that is responsible for producing or manufacturing the <code>PhysicalElement</code> .
SKU	The stock-keeping unit number for this <code>PhysicalElement</code> .
Tag	An arbitrary string that uniquely identifies the Physical Element and serves as the key of the Element. The Tag property can contain information such as asset tag or serial number data. The key for <code>PhysicalElement</code> is placed very high in the object hierarchy to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on. For example, a hotswappable or removable component can be taken from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for <code>PhysicalElement</code> is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.

DCIM_Chassis

Table 5. Chassis

Property	Description
BreachDescription	A free-form string providing more information if the <code>SecurityBreach</code> property indicates that a breach or some other security-related event occurred.
CanBeFRUed	Boolean that indicates whether this <code>PhysicalElement</code> can be FRUed (TRUE) or not (FALSE).
ChassisPackageType	Indicates the physical form factor for the type of Chassis. Possible values are:

Property	Description
	<ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = SMBIOS Reserved • 3 = Desktop • 4 = Low Profile Desktop • 5 = Pizza Box • 6 = Mini Tower • 7 = Tower • 8 = Portable • 9 = LapTop • 10 = Notebook • 11 = Hand Held • 12 = Docking Station • 13 = All in One • 14 = Sub Notebook • 15 = Space-Saving • 16 = Lunch Box • 17 = Main System Chassis • 18 = Expansion Chassis • 19 = SubChassis • 20 = Bus Expansion Chassis • 21 = Peripheral Chassis • 22 = Storage Chassis • 23 = SMBIOS Reseved • 24 = Sealed-Case PC • 25 = SMBIOS Reserved • 26 = CompactPCI • 27 = AdvancedTCA • 28 = Blade Enclosure • 29 = SMBIOS Reserved • 30 = Tablet • 31 = Convertible • 32 = Detachable • 33 = IoT Gateway • .. = DMTF Reserved • 0x8000..0xFFFF = Vendor Reserved <p>This property may have a value when the PackageType property contains the value 3 Chassis Frame. A value of 28 Blade Enclosure indicates that the Chassis is designed to contain one or more PhysicalPackage(s) of PackageType 16 Blade or PackageType 17 Blade Expansion.</p>
ChassisTypeDescription	A string providing more information on the ChassisPackageType.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.
	<p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly</p>

Property	Description
LockPresent	Boolean indicating whether the Frame is protected with a lock.
Manufacturer	The name of the organization responsible for producing the PhysicalElement. This organization may be the entity from whom the Element is purchased, but this is not necessarily true. The latter information is contained in the Vendor property of CIM_Product.
Model	The name by which the PhysicalElement is generally known.
Name	The Name property defines the label by which the object is known. When sub-classed, the Name property can be overridden to be a Key property.
PackageType	<p>Enumeration defining the type of the PhysicalPackage.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the package type is not known. • 1 = Other — The package type does not correspond to an existing enumerated value. The value is specified using the OtherPackageType property. • 2 = Rack • 3 = Chassis/Frame • 4 = Cross Connect/Backplane • 5 = Container/Frame Slot • 6 = Power Supply • 7 = Fan • 8 = Sensor • 9 = Module/Card • 10 = Port/Connector • 11 = Battery • 12 = Processor • 13 = Memory • 14 = Power Source/Generator • 15 = Storage Media Package (example, Disk or Tape Drive) • 16 = Blade • 17 = Blade Expansion
	<p>NOTE: This enumeration expands on the list in the Entity MIB (the attribute, entPhysicalClass). The numeric values are consistent with CIM's enum numbering guidelines, but are slightly different than the MIB's values.</p>
	<p>The values Rack through Port/Connector are defined per the Entity-MIB (where the semantics of rack are equivalent to the MIB's stack value).</p> <p>The other values (for battery, processor, memory, power source/generator and storage media package) are self-explanatory. A value of Blade should be used when the PhysicalPackage contains the operational hardware aspects of a ComputerSystem, without the supporting mechanicals such as power and cooling. For example, a Blade Server includes processor(s) and memory, and relies on the containing chassis to supply power and cooling.</p>

Property	Description
	<p>In many respects, a Blade can be considered a Module/Card. However, it is tracked differently by inventory systems and differs in terms of service philosophy. For example, a Blade is intended to be hot-plugged into a hosting enclosure without requiring additional cabling, and does not require a cover to be removed from the enclosure for installation. Similarly, a Blade Expansion has characteristics of a Blade and a Module/Card. However, it is distinct from both due to inventory tracking and service philosophy, and because of its hardware dependence on a Blade. A Blade Expansion must be attached to a Blade prior to inserting the resultant assembly into an enclosure.</p>
PartNumber	<p>The part number assigned by the organization that is responsible for producing or manufacturing the PhysicalElement.</p>
PropertyOwnershipTag	<p>Property Ownership Tag of a system.</p>
SecurityBreach	<p>An enumerated, integer-valued property indicating whether a physical breach of the Frame was attempted but unsuccessful (value = 4) or attempted and successful (value = 5).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 1 = Other · 2 = Unknown · 3 = No Breach · 4 = Breach Attempted · 5 = Breach Successful
SKU	<p>The stock-keeping unit number for this PhysicalElement.</p>
Serial Number	<p>Manufacturer-allocated number is used to identify the physical element.</p>
Version	<p>Indicates the version of the identified physical element.</p>
Tag	<p>An arbitrary string that uniquely identifies the Physical Element and serves as the key of the Element. The Tag property can contain information such as asset tag or serial number data. The key for PhysicalElement is placed very high in the object hierarchy in order to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on. For example, a hotswappable or removable component can be taken from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for Physical Element is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.</p>
VendorCompatibilityStrings	<p>An array of strings that identify the component that is compatible with, and can be inserted in a slot that reports this string as one of the array element in the VendorCompatibilityStrings. This allows system administrators to determine whether it is appropriate to insert a package into a slot to ensure uniqueness within the NameSpace, each value defined by the vendor for use in the VendorCompatibilityStrings property SHOULD be constructed using the following preferred algorithm: : Where and are separated by a colon ':', and where MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority</p>

Property	Description
	(This is similar to the _ structure of Schema class names.) In addition, to ensure uniqueness MUST NOT contain a colon (':'). When using this algorithm, the first colon to appear in InstanceID MUST appear between and . is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements.
ChangePropertyOwnershipTag (Method)	This method allows a user to change the Property Ownership Tag of a system.
ChangeAssetTag (Method)	This method allows a user to change the Asset Tag of a system.

DCIM_Chip

Table 6. Chip

Property	Description
CanBeFRUed	Boolean that indicates whether this PhysicalElement can be FRUed (TRUE) or not (FALSE).
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often sub classed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
Manufacturer	The name of the organization responsible for producing the PhysicalElement. This organization may be the entity from where the Element is purchased, but this is not necessarily true. The latter information is contained in the Vendor property of CIM_Product.
Model	The name by which the PhysicalElement is generally known.
PartNumber	The part number assigned by the organization that is responsible for producing or manufacturing the PhysicalElement.
SerialNumber	A manufacturer-allocated number used to identify the Physical Element.
SKU	The stock-keeping unit number for this PhysicalElement.
Tag	An arbitrary string that uniquely identifies the Physical Element and serves as the key of the Element. The Tag property can contain information such as asset tag or serial number data. The key for PhysicalElement is placed very high in the object hierarchy to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on.

Property	Description
	For example, a hotswappable or removable component can be taken from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for Physical Element is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.

DCIM_DesktopMonitor

Table 7. DesktopMonitor

Property	Description
Bandwidth	Monitor's bandwidth in Mega Hertz. If unknown, enter 0.
Brightness	This property represents the brightness/Luminance of the video output. The property value is from 0 to the MaxBrightness property value. If the Brightness property is implemented but the brightness is unknown at the time, the property has a value 0x80000000.
Caption	The Caption property is a short textual description (one- line string) of the object.
ColorCodeFormatSupported	Color code format supported.
ColorDepthBits	Color Bit Depth.
ColorModePreset	This property defines a specified color temperature of the display. Possible values are: <ul style="list-style-type: none"> • 0 = Unknown • 2 = sRGB • 3 = Display Native • 4 = 4000K • 5 = 5000K • 6 = 6500K • 7 = 7500K • 8 = 8200K • 9 = 9300K • 1011 = 10000K • 12 = 11500K • 13 = User 1 • 14 = User • 2 .. = User 3 • 32768..65535 = DMTF Reserved
ColorModePresetCapabilities	This property lists the allowed values for ColorModePreset. Possible values are: <ul style="list-style-type: none"> • 0 = Unknown • 2 = sRGB • 3 = Display Native • 4 = 4000K • 5 = 5000K • 6 = 6500K • 7 = 7500K

Property	Description
	<ul style="list-style-type: none"> 8 = 8200K 9 = 9300K 1011 = 10000K 12 = 11500K 13 = User 1 14 = User .. = User 3 32768..65535 = DMTF Reserved
CommunicationStatus	<p>Indicates the ability of the instrumentation to communicate with the underlying ManagedElement. A Null return indicates the implementation (provider) does not implement this property.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — Indicates that the implementation is in general capable of returning this property, but is unable to do so now. 1 = Not Available — Indicates that the implementation (provider) is capable of returning a value for this property, but not ever for this particular piece of hardware/software or the property is intentionally not used because it adds no meaningful information (as in the case of a property that is intended to add additional info to another property). 2 = Communication OK — indicates that communication is established with the element, but does not convey any quality of service. 3 = Lost Communication — Indicates that the Managed Element is known to exist and has been contacted successfully in the past, but is unreachable. 4 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. .. = DMTF Reserved 0x8000.. = Vendor Reserved
CompositSyncSignalOnGreenVideoSupported	Composite Sync Signal on Green video is supported.
CompositSyncSignalOnHorizontalSupported	Composite Sync Signal on Horizontal is supported.
ContinuousFrequency	For EDID 1.3, this bit indicated support for or no support for GTF(using the default GTF parameter values). For EDID 1.4 this bit has been redefined to indicate Continuous frequency(1) or Non-Continuous Frequency(0).
Contrast	This property represents the contrast of the video output. The property value is from 0 to the MaxContrast property value. If the Contrast property is implemented but the contrast is unknown at the time, the property has a value 0x80000000.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
CurrentResolutionH	This property indicated the current horizontal resolution in pixels.
CurrentResolutionV	This property indicated the current vertical resolution in pixels.
Description	Provides a textual description of the object.

Property	Description
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
DisplayCharacteristics	<p>This array property represents various characteristics of a video output device. value.</p> <ul style="list-style-type: none"> • StandbyModeSupported: the video output device can go into a stand by mode, • SuspendModeSupported: the video output device can go into a suspend mode, • VeryLowPowerSupported: the video output goes into a low power mode. If DisplayCharacteristics is implemented but the value is unknown, the property has an Unknown <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = StandbyModeSupported • 3 = SuspendModeSupported • 4 = VeryLowPowerSupported • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
DisplayMode	<p>This property permits the selection of a preset optimized by manufacturer for an application type or the selection of a user-defined setting.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Standard/default mode • 3 = Productivity • 4 = Mixed • 5 = Movie • 6 = User defined • 7 = Games • 8 = Sports • 9 = Professional • 10 = Standard (intermediate power) • 11 = Standard(low power) • 12 = demonstration • 13 = Dynamic contrast • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
DisplayModeCapabilities	<p>This property lists the allowed values for DisplayMode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Standard/default mode • 3 = Productivity • 4 = Mixed • 5 = Movie • 6 = User defined • 7 = Games • 8 = Sports • 9 = Professional • 10 = Standard (intermediate power) • 11 = Standard(low power) • 12 = demonstration • 13 = Dynamic contrast • .. = DMTF Reserved

Property	Description
EDIDGamma	<ul style="list-style-type: none"> 32768..65535 = Vendor Reserved <p>Display transfer characteristics(GAMMA).Range is from 1.00->3.54. GAMMA = (EDID Value + 100) / 100</p>
EDIDVersionNumber	EDID version and reversion number.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. 3 = Disabled — Indicates that the element will not run commands and drops any new requests. 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. 5 = Not Applicable — Indicates that the element does not support being enabled or disabled. 6 = Enabled but Offline — Indicates that the element may be completing commands, and drops any new requests. 7 = In Test — Indicates that the element is in a test state. 8 = Deferred — Indicates that the element may be completing commands, but queues any new requests. 9 = Quiesce — Indicates that the element is enabled but in a restricted mode.

Property	Description
	<ul style="list-style-type: none"> 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. 11..32767 = DMTF Reserved 32768..65535 = Vendor Reserved
FrequencyH	This property is a horizontal synchronization signal frequency in Hz as determined by the display.
FrequencyV	This property is a vertical synchronization signal frequency in Hz as determined by the display.
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — The implementation cannot report on HealthState now. DMTF has reserved the unused portion of the continuum for additional HealthStates in the future. 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. 15 = Minor failure — All functionality is available but some may be degraded. 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. 25 = Critical failure — The element is nonfunctional and recovery may not be possible. 30 = Non-recoverable error — The element has failed, and recovery is not possible. All functionality provided by this element has been lost. .. = DMTF Reserved
IdentifyingDescriptions	An array of free-form strings providing explanations and details behind the entries in the OtherIdentifyingInfo array. Each entry of this array is related to the entry in OtherIdentifyingInfo that is located at the same index.
InputAnalog	Input is an analog video signal interface.
InputDigital	Input is a digital video signal interface.
InputDisplayPort	DisplayPort is supported.
InputDVI	DVI is supported.
InputHDMI	HDMI is supported.
InputSource	<p>An enumerated value identifying the current input source. Writing a new value into this property changes the device's input source to the specified value, if the value is supported as specified in InputSourceCapabilities. If the requested value is not in InputSourceCapabilities, then the current value of InputSource is unchanged.</p> <p>Possible values are:</p>

Property	Description
InputSourceCapabilities	<ul style="list-style-type: none"> • 0 = Unknown • 2 = Analog Video (R/G/B) #1 • 3 = Analog Video (R/G/B) #2 • 4 = Digital Video (TMDS) #1 • 5 = Digital Video (TMDS) #2 • 6 = Composite Video #1 • 7 = Composite Video #2 • 8 = S-video #1 • 9 = S-video #2 • 1011 = Tuner - Analog #1 • 12 = Tuner - Analog #2 • 13 = Tuner - Digital #1 • 14 = Tuner - Digital #2 • 15 = Component Video #1 • 16 = Component Video #2 • 17 = Component Video #3 • 18 = Digital Video (DisplayPort) • #1 .. = Digital Video (DisplayPort) • #2 32768..65535 = DMTF Reserved <p>This property lists the allowed values for InputSource.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Analog Video (R/G/B) #1 • 3 = Analog Video (R/G/B) #2 • 4 = Digital Video (TMDS) #1 • 5 = Digital Video (TMDS) #2 • 6 = Composite Video #1 • 7 = Composite Video #2 • 8 = S-video #1 • 9 = S-video #2 • 1011 = Tuner - Analog #1 • 12 = Tuner - Analog #2 • 13 = Tuner - Digital #1 • 14 = Tuner - Digital #2 • 15 = Component Video #1 • 16 = Component Video #2 • 17 = Component Video #3 • 18 = Digital Video (DisplayPort) • #1 .. = Digital Video (DisplayPort) • #2 32768..65535 = DMTF Reserved
MaxBrightness	<p>This property defines the maximum value of brightness of the video output device. Different manufacturers may have different values.</p>
MaxContrast	<p>This property represents the maximum value of contrast of the video output device. Different manufacturers may have different values.</p>
MaxQuiesceTime	<p>The use of this property has been deprecated. When evaluating the use of Quiesce, it was determined that this single property is not adequate for describing when a device will automatically exit a quiescent state. In fact, the most likely scenario for a device to exit a quiescent state was determined to be based on the number of outstanding requests queued rather than on a maximum time. This decision is reevaluated and later. Deprecated description: Maximum time, in milliseconds, that a Device can run in a Quiesced state.</p>

Property	Description
MCCSVersionNumber	<p>The state is defined in its Availability and AdditionalAvailability properties, where Quiesced is conveyed by the value 21. What occurs at the end of the time limit is device-specific. The Device can unquiesce, can be offline, or can take other actions. A value of 0 indicates that a Device can remain quiesced indefinitely.</p> <p>This property represents the version number of the Monitor Command and Control Set (MCCS) standard recognized by the display.</p>
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = OK • 3 = Degraded • 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. • 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure soon. • 6 = Error • 7 = Non-Recoverable Error • 8 = Starting • 9 = Stopping • 10 = Stopped — Implies a clean and orderly stop • 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. • 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. • 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is unreachable. • 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. • 15 = Dormant — Indicates that the element is inactive or quiesced. • 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. • 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). • 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved <p>OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array</p>

Property	Description
PhysicalSizeH	Horizontal screen size in cm.
PhysicalSizeV	Vertical screen size in cm.
PrimaryStatus	<p>Provides a high-level status value, intended to align with Red-Yellow-Green type representation of status. It should be used with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>PrimaryStatus consists of one of the following values:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the implementation is in general capable of returning this property, but is unable to do so now • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
ProductCode	Product code of this monitor.
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. Unknown (0) indicates that the last requested state for the element is unknown.</p>
	<p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). Offline (6) indicates that the element has been requested to transition to the Enabled but Offline EnabledState. There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on</p>

Property	Description
	<p>CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
	<p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
ScalerManufacturer	<p>The name of the manufacturer of the controller chip used in a particular display.</p>
	<p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Conexant • 3 = Genesis • 4 = Macronix • 5 = MRT • 6 = Mstar • 7 = Myson • 8 = Philips • 9 = Pixelworks • 10 = RealTek • 11 = Sage • 12 = SiliconImage • 13 = SmartASIC • 14 = STMicroelectronics • 15 = Topro • 16 = Trumpion • 17 = WellTrend • 18 = Samsung • 19 = Novatek • 20 = STK • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SerialNumber	<p>Serial number of the monitor. Come from EDID.</p>
SeparateSyncHVSsupported	<p>Separate Sync H & V Signals are supported.</p>

Property	Description
sRGBStandardDefaultColorSpace	If this bit is set to 1, the display uses the sRGB standard default color space as its primary color space.
StandbyModeSupported	<p>This property represents if the video output device can go into a stand by mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Supported 3 = Not Supported .. = DMTF Reserved 32768..65535 = Vendor Reserved
SuspendModeSupported	<p>This property represents if the video output device can go into a suspend mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Supported 3 = Not Supported .. = DMTF Reserved 32768..65535 = Vendor Reserved
SystemCreationClassName	The creation class name of the scoping system.
SystemName	The system name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
VeryLowPowerSupported	<p>This property represents if the video output device can go into a low power mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Supported 3 = Not Supported .. = DMTF Reserved 32768..65535 = Vendor Reserved

DCIM_DHCPProtocolEndpoint

Table 8. DHCPProtocolEndpoint

Property	Description
ClientState	<p>ClientState represents the current state of the DHCP client. See RFC1541 for more information on the meaning of each state.</p> <p>Possible values are:</p> <ul style="list-style-type: none">· 0 = Unknown· 1 = DMTF Reserved· 2 = Init· 3 = Selecting· 4 = Requesting· 5 = Rebinding· 6 = Init-Reboot· 7 = Rebooting· 8 = Bound· 9..32767 = DMTF Reserved· 32768..65535 = Vendor specified
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none">· 2 = Enabled· 3 = Disabled· 5 = Not Applicable· 6 = Enabled but Offline· 7 = No Default· 9 = Quiesce· .. = DMTF Reserved· 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none">· 0 = Unknown· 1 = Other· 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests.

Property	Description
	<ul style="list-style-type: none"> · 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. · 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. · 5 = Not Applicable — Indicates the element does not support being enabled or disabled. · 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. · 7 = In Test — Indicates that the element is in a test state. · 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. · 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. · 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. · 11..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved
Name	A string that identifies this ProtocolEndpoint with either a port or an interface on a device. To ensure uniqueness, the Name property should be prepended or appended with information from the Type or OtherTypeDescription properties. The method selected is described in the NameFormat property of this class.
NameFormat	Contains the naming heuristic that is selected to ensure that the value of the Name property is unique. For example, you may choose to prepend the name of the port or interface with the Type of ProtocolEndpoint (for example, IPv4) of this instance followed by an underscore.
OtherTypeDescription	A string that describes the type of ProtocolEndpoint when the Type property of this class (or any of its subclasses) is set to 1 (Other). This property should be set to null when the Type property is any value other than 1 .
ProtocolIFType	<p>An enumeration that is synchronized with the IANA ifType MIB. The ifType MIB is maintained at the URL, iana.org/assignments/ianaiftype-mib. Also, additional values defined by the DMTF are included. The property is used to categorize and classify instances of the ProtocolEndpoint class.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Regular 1822 · 3 = HDH 1822 · 4 = DDN X.25 · 5 = RFC877 X.25 · 6 = Ethernet CSMA/CD · 7 = ISO 802.3 CSMA/CD · 8 = ISO 802.4 Token Bus · 9 = ISO 802.5 Token Ring · 10 = ISO 802.6 MAN · 11 = StarLAN · 12 = Proteon 10Mbit · 13 = Proteon 80Mbit · 14 = HyperChannel · 15 = FDDI · 16 = LAP-B · 17 = SDLC · 18 = DS1 · 19 = E1 · 20 = Basic ISDN

NOTE: If the `ProcollFType` is set to 1 (Other), then the type information should be provided in the `OtherTypeDescription` string property.

RequestedState

An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by `EnabledState`. This property is provided to compare the last requested and current enabled or disabled states.

NOTE: When `EnabledState` is set to 5 (Not Applicable), then this property has no meaning. See the `EnabledState` property description for explanations of the values in the `RequestedState` enumeration.

NOTE: The value `No Change (5)` has been deprecated instead of indicating the last requested state is `Unknown (0)`. If the last requested or desired state is unknown, `RequestedState` should have the value `Unknown (0)`, but may have the value `No Change (5)`.

There are two new values in `RequestedState` that build on the statuses of `EnabledState`. These are **Reboot (10)** and **Reset (11)**.

Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as `Start` or `StopService` on `CIM_Service`), or can be overridden and defined as `WRITEable` in a subclass. The method approach is considered superior to a `WRITEable` property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last `RequestedState` is not supported for the `EnabledLogicalElement`, the property is `NULL` or has the value **12 Not Applicable**.

Possible values are:

- 0 = Unknown — Indicates the last requested state for the element is unknown.
- 2 = Enabled

Property	Description
	<ul style="list-style-type: none"> 3 = Disabled 4 = Shut Down 5 = No Change 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. 7 = Test 8 = Deferred 9 = Quiesce 10 = Reboot — Refers to performing a Shut Down and then moving to an Enabled state. 11 = Reset — Indicates that the element is first Disabled and then Enabled. 12 = Not Applicable .. = DMTF Reserved 32768..65535 = Vendor Reserved
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_EthernetPort

Table 9. EthernetPort

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of</p>

Property	Description
	<p>LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
<p>EnabledDefault</p>	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
<p>EnabledState</p>	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. SystemCreationClassName	The creation classname of the scoping system.
SystemName	The system name of the scoping system.
TOEEnabledState	<p>An integer enumeration that indicates the enabled and disabled states of the TOE.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Enabled — Indicates that the TOE is enabled and running. 3 = Disabled — Indicates that the TOE is disabled. 4 = Not Applicable — Indicates that the ethernet port does not have TOE capability. 5..32767 = DMTF Reserved 32768..65535 = Vendor Reserved

Property	Description
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_FlatPanel

Table 10. FlatPanel

Property	Description
Brightness	<p>The percentage (0 – 100) of total brightness of the video output device for system running on battery and AC power. The property is in the format BatteryBrightness:ACBrightness BuiltIn Defines whether the video output device is built in. True indicates that flat panel is directly attached to a portable computer and False means that flat panel is externally connected through graphics cable (such as VGA) to a computer.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = True • 3 = False • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
DeviceID	<p>An address or other identifying information used to uniquely name the LogicalDevice.</p>
DisplayType	<p>An integer enumeration describing the type of flat panel display.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Passive Matrix LCD • 3 = Active Matrix LCD • 4 = Cholesteric LCD • 5 = Field Emission Display • 6 = Electro Luminescent Display • 7 = Gas Plasma 8 = LED
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p>

Property	Description
	<p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
HorizontalResolution	The horizontal resolution in Pixels of the flat panel.
MaxQuiesceTime	The use of this property has been deprecated. When evaluating the use of Quiesce , it was determined that this single property is not adequate for describing when a device will automatically exit a quiescent state. In fact, the most likely scenario for a device to exit a quiescent state was determined to be based on the number of outstanding requests queued rather than on a maximum time. This decision will be re-evaluated and repositioned later. Deprecated description: Maximum time, in milliseconds, that a Device can run in a Quiesced state. The state is defined in its Availability and Additional Availability properties, where Quiesced is conveyed by the value 21 . What occurs at the end of the time limit is device-specific. The Device can unquiesce, can be offline, or can take other actions. A value of 0 indicates that a Device can remain quiesced indefinitely.
ScanMode	<p>The scan mode of a flat panel indicating either single (value = 2) or dual scan 3.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Single Scan · 3 = Dual Scan
SystemCreationClassName	The creation class name of the scoping system.
SystemName	The system name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change — Indicates that no transition is in progress. · 6 = Offline · 7 = Test · 8 = Defer · 9 = Quiesce · 10 = Reboot · 11 = Reset · 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
VerticalResolution	Vertical resolution in Pixels of a flat panel.

DCIM_IPProtocolEndpoint

Table 11. IPProtocolEndpoint

Property	Description
AddressOrigin	<p>Identifies the method by which the IP Address, Subnet Mask, and Gateway were assigned to the IPProtocolEndpoint.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = Not Applicable• 3 = Static — Indicates the values were assigned manually.• 4 = DHCP — Indicates the values were assigned utilizing the Dynamic Host Configuration Protocol. See RFC 2131 and related.• 5 = BOOTP — Indicates the values were assigned utilizing BOOTP. See RFC 951 and related.• 6 = IPv4 Link Local — Indicates the values were assigned using the IPv4 Link Local protocol. See RFC 3927.• 7 = DHCPv6 — Indicates the values were assigned using DHCPv6. See RFC 3315.• 8 = IPv6AutoConfig — Indicates the values were assigned using the IPv6 AutoConfig Protocol. See RFC 4862.• .. = DMTF Reserved• 32768..65535 = Vendor Reserved
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 2 = Enabled• 3 = Disabled• 5 = Not Applicable• 6 = Enabled but Offline• 7 = No Default• 9 = Quiesce• .. = DMTF Reserved• 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>

Property	Description
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
IPv4Address	The IPv4 address that this ProtocolEndpoint represents.
IPv6Address	The IPv6 address that this ProtocolEndpoint represents.
IPv6AddressType	<p>Identifies the type of address found in the IPv6Address property. The values of this property are interpreted according to RFC4291, Section 2.4</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Unspecified • 3 = Loopback • 4 = Multicast • 5 = Link Local Unicast • 6 = Global Unicast • 7 = Embedded IPv4 Address • 8 = Site Local Unicast • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
IPv6SubnetPrefixLength	Identifies the prefix length of the IPv6Address property that is used to specify a subnet
IPVersionSupport	<p>This property explicitly defines support for different versions of the IP protocol, for this Endpoint. It is deprecated since the ProtocolIFType also provides this functionality by describing an endpoint as IPv4 only (value = 4096), IPv6 only (value = 4097), or IPv4/v6 (value = 4098).</p> <p>Possible values are:</p>

Property	Description
Name	<ul style="list-style-type: none"> • 0 = Unknown • 1 = IPv4 Only • 2 = IPv6 Only • 3 = Both IPv4 and IPv6 <p>A string that identifies this ProtocolEndpoint with either a port or an interface on a device. To ensure uniqueness, the Name property should be prepended or appended with information from the Type or OtherTypeDescription properties. The method selected is described in the NameFormat property of this class.</p>
NameFormat	<p>Contains the naming heuristic that is selected to ensure that the value of the Name property is unique. For example, you may choose to prepend the name of the port or interface with the Type of ProtocolEndpoint (for example, IPv4) of this instance followed by an underscore.</p>
ProtocolIFType	<p>ProtocolIFType's enumeration is limited to IP-related and reserved values for this subclass of ProtocolEndpoint.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 225..4095 = IANA • Reserved 4096 = IPv4 • 4097 = IPv6 • 4098 = IPv4/v6 • 4301..32767 = DMTF Reserved • 32768.. = Vendor Reserved
ProtocolType	<p>This property is deprecated instead of the ProtocolIFType enumeration. This deprecation was done to have better alignment between the IF-MIB of the IETF and this CIM class. Deprecation description: ProtocolType is an enumeration that provides information to categorize and classify different instances of this class. For most instances, information in this enumeration and the definition of the subclass overlap. However, there are several cases where a specific subclass of ProtocolEndpoint is not required (for example, there is no Fibre Channel subclass of ProtocolEndpoint). Therefore, this property is needed to define the type of Endpoint.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = IPv4 • 3 = IPv6 • 4 = IPX • 5 = AppleTalk • 6 = DECnet • 7 = SNA • 8 = CONP • 9 = CLNP • 10 = VINES • 11 = XNS • 12 = ATM • 13 = Frame Relay • 14 = Ethernet • 15 = TokenRing • 16 = FDDI

Property

Description

RequestedState

- 17 = Infiniband
- 18 = Fibre Channel
- 19 = ISDN BRI Endpoint
- 20 = ISDN B Channel Endpoint
- 21 = ISDN D Channel Endpoint
- 22 = IPv4/v6
- 23 = BGP
- 24 = OSPF
- 25 = MPLS
- 26 = UDP
- 27 = TCP

An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.

Possible values are:

- 0 = Unknown — Indicates the last requested state for the element is unknown.
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change
- 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState.
- 7 = Test
- 8 = Deferred
- 9 = Quiesce
- 10 = Reboot — Refers to performing a **Shut Down** and then moving to an **Enabled** state.
- 11 = Reset — Indicates that the element is first **Disabled** and then **Enabled**.
- 12 = Not Applicable
- .. = DMTF Reserved
- 32768..65535 = Vendor Reserved

NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. See the EnabledState property description for explanations of the values in the RequestedState enumeration.

NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).

Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because

Property	Description
Status	<p>it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or have the value 12 Not Applicable.</p> <p>A string indicating the current status of the object. Various operational and non-operational statuses are defined. This property is deprecated instead of OperationalStatus, which includes the same semantics in its enumeration. This change is made for the following reasons:</p> <ul style="list-style-type: none"> • Status is more correctly defined as an array. This definition overcomes the limitation of describing status using a single value, when it is really a multi-valued property (for example, an element may be OK AND Stopped). • A MaxLen of 10 is too restrictive and leads to unclear enumerated values. • The change to a uint16 data type was discussed when CIM V2.0 was defined. However, existing V1.0 implementations used the string property and did not want to modify their code. Therefore, Status was grandfathered into the Schema. Use of the deprecated qualifier allows the maintenance of the existing property, but also permits an improved definition using OperationalStatus. <p>Possible values are:</p> <ul style="list-style-type: none"> • OK • Error • Degraded • Unknown • Pred Fail • Starting • Stopping • Service • Stressed • NonRecover • No Contact • Lost • Comm • Stopped
SubnetMask	The mask for the IPv4 address of this ProtocolEndpoint, if one is defined.
SystemCreationClassName	The creation class name of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer

Property	Description
	<ul style="list-style-type: none"> 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_ImprovementProgramConsent

Table 12. ImprovementProgramConsent

Property	Description
CurrentValue	<p>CurrentValue displays the User's Consent to participate in the Dell Command Monitor improvement program.</p> <p> NOTE: Improvement Program is available for DCM 10.2.1 x64 bit version only.</p>
OverrideImprovementProgramConsent (Method)	<p>This method sets the User consent for the Dell Command Monitor improvement program.</p> <p>Parameters and the current value:</p> <ul style="list-style-type: none"> 0 - I don't want to participate in the program 1 - I want to participate in the program <p> NOTE: Default Value is 0 (By default, you are not enrolled in Improvement Program).</p> <p>Return Values:</p> <ul style="list-style-type: none"> A return code of 0 indicates that the user consent was updated successfully A return code of 1 indicates that the user consent was not updated successfully

DCIM_ControllerView

Table 13. ControllerView

Property	Description
BusType	<p>The property represents the type of the PCI bus.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 =Unknown 3 = PCI Bus 4 = PCMCIA Bus 0x8000 = DMTF Reserved 0xffff = Vendor Reserved
ControllerFirmwareVersion	<p>This property represents the firmware version.</p>
Device	<p>This property represents the device name.</p>
Driver Version	<p>This property represents the version of the driver.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p>

Property	Description
	<p>i NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often sub-classed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	This property contains the value of the Fully Qualified Device Description (FQDD).
PrimaryStatus	<p>This property represents the status of the device.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = OK · 2 = Degraded · 3 = Error
ProductName	This property represents the family name of the controller.

DCIM_PhysicalDiskView

Table 14. PhysicalDiskView

Property	Description
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>i NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often sub-classed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	The property contains the value of the Fully Qualified Device Description (FQDD).
PrimaryStatus	<p>This property represents the status of the device.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = OK · 2 = Degraded · 3 = Error · 4 = Rebuilding · 5 = Offline · 0x8000 = DMTF Reserved · 0xFFFF = Vendor Reserved
DriveUsage	<p>This property indicates if the physical disk is in a RAID set.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> 0 = Not in a RAID Set 1 = In a RAID Set 2 = Hot Spare
Model	This property represents the model name of the physical disk.
SerialNumber	This property represents the serial number of the physical disk.
DriveAFStatus	<p>This property indicates if the physical disk is an advanced format drive.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 - Non AF Drive 1 - AF Drive 2 - Unknown

DCIM_VirtualDiskView

Table 15. VirtualDiskView

Property	Description
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	The property contains the value of the Fully Qualified Device Description (FQDD).
PrimaryStatus	<p>This property represents the status of the device.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = OK 2 = Degraded 3 = Error 4 = Rebuilding 5 = Offline
RAIDStatus	<p>This property represents the RAID specific status.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Ready 2 = Online 3 = Foreign 4 = Offline 5 = Blocked 6 = Failed

Property	Description
	<ul style="list-style-type: none"> 7 = Degraded 8 = Rebuilding
RAIDTypes	<p>This property represents the current RAID level.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 1 = No RAID 2 = RAID-0 4 = RAID-1 64 = RAID-5 128 = RAID- 6 2048 = RAID-10 8192 = RAID-50 16384 = RAID- 60
SizeinMegabytes	<p>The property represents the size of the virtual disk in megabytes.</p>
StripeSize	<p>This property represents the current strip size.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Default 1 = 512Bytes 2 = 1KB 4 = 2KB 8 = 4 KB 16 = 8 kB 32 = 16 KB 64 = 32 KB 128 = 64 KB 256 = 128 KB 512 = 256 KB 1024 = 512 KB 2048 = 1 MB 4096 = 2 MB 8192 = 4 MB 16384 = 8 MB 32768 = 16 MB
PhysicalDiskIDs	<p>The property represents the array of physical disk FQDDs.</p>

DCIM_PhysicalMemory

Table 16. PhysicalMemory

Property	Description
BankLabel	<p>A string identifying the physically labeled bank where the Memory is located. For example, Bank 0 or Bank A.</p>
CanBeFRUed	<p>Boolean that indicates whether this PhysicalElement can be FRUed (TRUE) or not (FALSE).</p>
Capacity	<p>The total capacity of this PhysicalMemory, in bytes.</p>
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this</p>

Property	Description
DataWidth	<p>class, this property allows all instances of this class and its subclasses to be uniquely identified.</p> <p>Data width of the PhysicalMemory, in bits. A data width of 0 and a TotalWidth of 8 would indicate that the Memory is solely used to provide error correction bits.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
FormFactor	<p>The implementation form factor for the Chip.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = SIP • 3 = DIP 4 = ZIP • 5 = SOJ • 6 = Proprietary • 7 = SIMM • 8 = DIMM • 9 = TSOP • 10 = PGA • 11 = RIMM • 12 = SODIMM • 13 = SRIMM • 14 = SMD • 15 = SSMP • 16 = QFP • 17 = TQFP • 18 = SOIC • 19 = LCC • 20 = PLCC • 21 = BGA • 22 = FPBGA • 23 = LGA <p>For example, values such as SIMM (7), TSOP (9), or PGA (10) can be specified.</p>
IsSpeedInMhz	<p>Indicates if the Speed property or the MaxMemorySpeed contains the value of the memory speed. A value of TRUE indicates that the speed is represented by the MaxMemorySpeed property. A value of FALSE indicates that the speed is represented by the Speed property.</p>
ManufactureDate	<p>The date this PhysicalElement was manufactured.</p>

Property	Description
Manufacturer	The name of the organization responsible for producing the PhysicalElement. This organization may be the entity from where the Element is purchased, but this is not necessarily true. The latter information is contained in the Vendor property of CIM_Product.
MemoryType	<p>The type of PhysicalMemory. Synchronous DRAM is also known as SDRAM. Cache DRAM is also known as CDRAM. BRAM is also known as Block RAM.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = DRAM • 3 = Synchronous DRAM • 4 = Cache DRAM • 5 = EDO • 6 = EDRAM • 7 = VRAM • 8 = SRAM • 9 = RAM • 10 = ROM • 11 = Flash • 12 = EEPROM • 13 = FEPRAM • 14 = EPROM • 15 = CDRAM • 16 = 3DRAM • 17 = SDRAM • 18 = SGRAM • 19 = RDRAM • 20 = DDR • 21 = DDR-2 • 22 = BRAM • 23 = FB-DIMM • 24 = DDR3 • 25 = FBD2 • 26 = DDR4 • 27 = LPDDR • 28 = LPDDR2 • 29 = LPDDR3 • 30 = LPDDR4 • 31..32567 = DMTF Reserved • 32568..65535 = Vendor Reserved
Model	The name by which the PhysicalElement is generally known.
PartNumber	The part number assigned by the organization that is responsible for producing or manufacturing the PhysicalElement.
SerialNumber	A manufacturer-allocated number used to identify the Physical Element.
SKU	The stock-keeping unit number for this PhysicalElement.
Speed	The speed of the PhysicalMemory, in nanoseconds.

Property	Description
Tag	An arbitrary string that uniquely identifies the Physical Element and serves as the key of the Element. The Tag property can contain information such as asset tag or serial number data. The key for PhysicalElement is placed very high in the object hierarchy to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on. For example, a hotswappable or removable component can be taken from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for Physical Element is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.

DCIM_PhysicalPackage

Table 17. PhysicalPackage

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information. NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.
ManufactureDate	The date that this PhysicalElement was manufactured.
Manufacturer	The name of the organization responsible for producing the PhysicalElement. This organization may be the entity from whom the Element is purchased, but this is not necessarily true. The latter information is contained in the Vendor property of CIM_Product.
Model	The name by which the PhysicalElement is generally known.
Name	The Name property defines the label by which the object is known. When subclassed, the Name property can be overridden to be a Key property.
OtherPackageType	A string describing the package when the instance's PackageType property is 1 (Other).
PackageType	Enumeration defining the type of the PhysicalPackage. Possible values are: <ul style="list-style-type: none"> 0 = Unknown — Indicates that the package type is not known. 1 = Other — The package type does not correspond to an existing enumerated value. The value is specified using the OtherPackageType property.

Property	Description
	<ul style="list-style-type: none"> · 2 = Rack · 3 = Chassis/Frame · 4 = Cross Connect/Backplane · 5 = Container/Frame Slot · 6 = Power Supply · 7 = Fan · 8 = Sensor · 9 = Module/Card · 10 = Port/Connector · 11 = Battery · 12 = Processor · 13 = Memory · 14 = Power Source/Generator · 15 = Storage Media Package (example, Disk or Tape Drive) · 16 = Blade · 17 = Blade Expansion
	<p>NOTE: This enumeration expands on the list in the Entity MIB (the attribute, <code>entPhysicalClass</code>). The numeric values are consistent with CIM's enum numbering guidelines, but are slightly different than the MIB's values. The values Rack through Port/Connector are defined per the Entity-MIB (where the semantics of rack are equivalent to the MIB's stack value). The other values (for battery, processor, memory, power source/generator and storage media package) are self-explanatory.</p>
	<p>A value of Blade should be used when the <code>PhysicalPackage</code> contains the operational hardware aspects of a <code>ComputerSystem</code>, without the supporting mechanicals such as power and cooling. For example, a Blade Server includes processor(s) and memory, and relies on the containing chassis to supply power and cooling. In many respects, a Blade can be considered a Module/Card. However, it is tracked differently by inventory systems and differs in terms of service philosophy. For example, a Blade is intended to be hot-plugged into a hosting enclosure without requiring additional cabling, and does not require a cover to be removed from the enclosure for installation. Similarly, a Blade Expansion has characteristics of a Blade and a Module/Card. However, it is distinct from both due to inventory tracking and service philosophy, and because of its hardware dependence on a Blade. A Blade Expansion must be attached to a Blade prior to inserting the resultant assembly into an enclosure.</p>
PartNumber	<p>The part number assigned by the organization that is responsible for producing or manufacturing the <code>PhysicalElement</code>.</p>
SerialNumber	<p>A manufacturer-allocated number used to identify the <code>PhysicalElement</code>.</p>
SKU	<p>The stock-keeping unit number for this <code>PhysicalElement</code>.</p>
Tag	<p>An arbitrary string that uniquely identifies the <code>PhysicalElement</code> and serves as the key of the <code>Element</code>. The <code>Tag</code> property can contain information such as asset tag or serial number data. The key for <code>PhysicalElement</code> is placed very high in the object hierarchy in order to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on. For example, a hotswappable or removable component can be taken</p>

Property	Description
	from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for PhysicalElement is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.
Version	A string that indicates the version of the PhysicalElement.

DCIM_ParallelPort

Table 18. ParallelPort

Property	Description
BaseIOAddress	An integer value that represents the base I/O address used by the parallel port.
ConnectorType	<p>ConnectorType is defined to force consistent naming of the 'connector type' property in subclasses and to guarantee unique enum values for all instances of ParallelPort. When set to 3 (Proprietary), the related property OtherConnectorType contains a string description of the type of port.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Centronics • 2 = Mini-Centronics • 3 = Proprietary • 4 = DB-25 Female • 5 = DB-25 Male • .. = DMTF Reserved • 32768.. = Vendor Reserved
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled

Property	Description
EnabledState	<ul style="list-style-type: none"> • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p> <p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value= 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. Starting (10) indicates that the element is in the process of going to an Enabled state. New requests are queued. • 10 = Starting • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
IRQLevel	<p>An integer value that represents the IRQ level used by the parallel port.</p>
Pinout	<p>The pinout used by the I/O device on this parallel port.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = XT/AT • 2 = PS/2 • 3 = ECP • 4 = EPP • 5 = IEEE 1284 • 25 = PC-98 • 26 = PC-98-Hireso • .. = DMTF Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is</p>

Property

Description

represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to **5 (Not Applicable)**, then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. **Unknown (0)** indicates the last requested state for the element is unknown.

NOTE: The value **No Change (5)** has been deprecated instead of indicating the last requested state is **Unknown (0)**. If the last requested or desired state is unknown, **RequestedState** should have the value **Unknown (0)**, but may have the value **No Change (5)**. **Offline (6)** indicates that the element has been requested to transition to the **Enabled** but **Offline EnabledState**. There are two new values in **RequestedState** that build on the statuses of **EnabledState**. These are **Reboot (10)** and **Reset (11)**. **Shut Down** requests an orderly transition to the **Disabled** state, and may involve removing power, to completely erase any existing state. The **Disabled** state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as **Start** or **StopService** on **CIM_Service**), or can be overridden and defined as **WRITEable** in a subclass. The method approach is considered superior to a **WRITEable** property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last **RequestedState** is not supported for the **EnabledLogicalElement**, the pro

Possible values are:

- 0 = Unknown
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change
- 6 = Offline
- 7 = Test
- 8 = Deferred
- 9 = Quiesce
- 10 = Reboot — Refers to doing a **Shut Down** and then moving to an **Enabled** state.
- 11 = Reset — Indicates that the element is first **Disabled** and then **Enabled**.
- 12 = Not Applicable
- .. = DMTF Reserved
- 32768..65535 = Vendor Reserved

Security

An enumeration indicating the operational security for the Controller. For example, information that the Device's external interface is locked out (valuemap = **3**) or **Boot Bypass (valuemap = 5)** can be described using this property.

Possible values are:

- 0 = Unknown
- 1 = Other

Property	Description
	<ul style="list-style-type: none"> • 2 = None • 3 = External Interface Locked Out • 4 = External Interface Enabled • 5 = Boot Bypass • .. = DMTF Reserved • 32768.. = Vendor Reserved
Speed	The bandwidth of the Port in Bits per Second.
SystemCreationClassName	The creation class name of the scoping system.
SystemName	The system name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_RemoteServiceAccessPoint

Table 19. RemoteServiceAccessPoint

Property	Description
AccessContext	<p>The AccessContext property identifies the role this RemoteServiceAccessPoint is playing in the hosting system.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Default Gateway • 3 = DNS Server • 4 = SNMP Trap Destination • 5 = MPLS Tunnel Destination • 6 = DHCP Server • 7 = SMTP Server • 8 = LDAP Server • 9 = Network Time Protocol (NTP) Server • .. = DMTF Reserved • 32768..65535 = Vendor Reserved

Property	Description
AccessInfo	Access or addressing information or a combination of this information for a remote connection. This information can be a host name, network address, or similar information.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode.

Property	Description
InfoFormat	<ul style="list-style-type: none"> • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>An enumerated integer that describes the format and interpretation of the AccessInfo property.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Host Name • 3 = IPv4 Address • 4 = IPv6 Address • 5 = IPX Address • 6 = DECnet Address • 7 = SNA Address • 8 = Autonomous System Number • 9 = MPLS Label • 10 = IPv4 Subnet Address • 11 = IPv6 Subnet Address • 12 = IPv4 Address Range • 13 = IPv6 Address Range • 100 = Dial String • 101 = Ethernet Address • 102 = Token Ring Address • 103 = ATM Address • 104 = Frame Relay Address • 200 = URL 201 = FQDN • 202 = User FQDN • 203 = DER ASN1 DN • 204 = DER ASN1 GN • 205 = Key ID .. = DMTF Reserved • 32768..65535 = Vendor Reserved
Name	<p>The Name property uniquely identifies the ServiceAccessPoint and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>(i) NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. See the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>(i) NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p>

Property	Description
	<p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning. A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in-progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions

DCIM_Slot

Table 20. Slot

Property	Description
ConnectorLayout	<p>Describes the type of packaging normally associated with this type of connector.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = RS232• 3 = BNC• 4 = RJ11• 5 = RJ45• 6 = DB9• 7 = Slot• 8 = SCSI High Density• 9 = SCSI Low Density• 10 = Ribbon• 11 = AUI• 12 = Fiber SC• 13 = Fiber ST• 14 = FDDI-MIC• 15 = Fiber-RTMJ• 16 = PCI — Describes the generic PCI connector layout.• 17 = PCI-X — Describes the PCI Extended connector layout.• 18 = PCI-E — Describes the PCI Express connector layout, where the actual layout with respect to the length is unknown.• 19 = PCI-E x1• 20 = PCI-E x2• 21 = PCI-E x4• 22 = PCI-E x8• 23 = PCI-E x16• 24 = PCI-E x32• 25 = PCI-E x64• 26..32567 = DMTF Reserved• 32568..65535 = Vendor Reserved <p>19 — 25 (PCI-E xN) — Describes the PCI Express connector layout, where N is the lane count that appropriately describes the length of the PCI-E connector.</p>
ConnectorType	<p>An array of integers defining the type of PhysicalConnector. An array is specified to allow the description of combinations of Connector information.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = Male• 3 = Female• 4 = Shielded• 5 = Unshielded• 6 = SCSI (A) High-Density (50 pins)• 7 = SCSI (A) Low-Density (50 pins)• 8 = SCSI (P) High-Density (68 pins)• 9 = SCSI SCA-I (80 pins)

Property	Description
	<ul style="list-style-type: none"> • 118 = LC • 119 = HSSC • 120 = VHDCI Shielded (68 pins) • 121 = InfiniBand • 122 = AGP8X <p>For example, one array entry could specify RS-232 (value = 25), another DB-25 (value = 23) and a third entry define the Connector as Male (value = 2). This single property is being deprecated instead of using separate properties to describe the various aspects of the connector. The separation allows for a more generic means of describing the connectors. Obsolete connectors were intentionally removed from the new list.</p>
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
Number	The Number property indicates the physical slot number, which can be used as an index into a system slot table, whether or not that slot is physically occupied.
SupportsHotPlug	Boolean indicating whether the Slot supports hot-plug of adapter Cards.
Tag	An arbitrary string that uniquely identifies the Physical Element and serves as the key of the Element. The Tag property can contain information such as asset tag or serial number data. The key for PhysicalElement is placed very high in the object hierarchy to independently identify the hardware or entity, regardless of physical placement in or on Cabinets, Adapters, and so on. For example, a hotswappable or removable component can be taken from its containing (scoping) Package and be temporarily unused. The object still continues to exist and can even be inserted into a different scoping container. Therefore, the key for Physical Element is an arbitrary string and is defined independently of any placement or location-oriented hierarchy.
VendorCompatibilityStrings	An array of strings that identify the components that are compatible and can be inserted in a slot. This allows vendors to provide clues to the system administrators by providing sufficient information to request the appropriate hardware that can populate the slot. To ensure uniqueness within the NameSpace, each value defined by the vendor for use in the VendorCompatibilityStrings property SHOULD be constructed using the following 'preferred' algorithm: : Where and are separated by a colon ':', and where MUST include a copyrighted, trademarked or otherwise unique

Property	Description
	name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the _ structure of Schema class names.) In addition, to ensure uniqueness MUST NOT contain a colon ':'. When using this algorithm, the first colon to appear in InstanceID MUST appear between and . is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements.

DCIM_SerialPort

Table 21. SerialPort

Property	Description
BaseIOAddress	An integer value that represents the base I/O address used by the serial port. Caption The Caption property is a short textual description (one- line string) of the object.
ConnectorType	<p>ConnectorType is defined to force consistent naming of the connector type property in subclasses and to guarantee unique enum values for all instances of SerialPort. When set to 1 (Other), related property OtherConnectorType contains a string description of the type of port. A range of values, DMTF_Reserved, has been defined that allows subclasses to override and define their specific types of ports.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Not Applicable • 3..15999 = DMTF Reserved • 16003 = DB9Male • 16004 = DB9Female • 16005 = DB25Male1 • 16006 = DB25Female1 • 16007 = RJ11 • 16008 = RJ45 • 16009 = Proprietary • 16010 = CircularDIN8Male • 16011 = CircularDIN8Female • 16160 = MiniCentronicsType14 • 16161 = MiniCentronicsType26 • 16162..65535 = Vendor Reserved
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p> NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often</p>

Property	Description
EnabledDefault	<p data-bbox="842 226 1469 412">subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. EnabledState	<p data-bbox="804 887 1481 1032">An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p data-bbox="804 1048 1002 1075">Possible values are:</p> <ul data-bbox="804 1093 1481 1767" style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, processes any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not run commands and drops any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates that the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and drops any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but queues any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
HealthState	<p data-bbox="804 1794 1481 1883">Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p data-bbox="804 1899 1002 1926">Possible values are:</p>

Property	Description
IRQLevel	<p>An integer value that represents the IRQ level used by the serial port.</p>
MaxSpeed	<p>The maximum bandwidth of the Port in Bits per Second.</p>
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory. However, a few are not and are described here in more detail.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = OK • 3 = Degraded • 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. • 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure soon. • 6 = Error • 7 = Non-Recoverable Error • 8 = Starting • 9 = Stopping • 10 = Stopped — Implies a clean and orderly stop. • 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. • 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. • 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is unreachable. • 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated.

Property

Description

- 15 = Dormant — Indicates that the element is inactive or quiesced.
- 16 = Supporting Entity in Error — Indicates that this element may be **OK** but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems.
- 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error).
- 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association.
- .. = DMTF Reserved
- 0x8000.. = Vendor Reserved

OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.

PortType

PortType is defined to force consistent naming of the **type** property in subclasses and to guarantee unique enum values for all instances of NetworkPort. When set to 1 (**Other**), related property OtherPortType contains a string description of the type of port. A range of values, DMTF_Reserved, has been defined that allows subclasses to override and define their specific types of ports.

Possible values are:

- 0 = Unknown
- 1 = Other
- 2 = Not Applicable
- 3..15999 = DMTF Reserved
- 16192 = Parallel Port
- 16193 = Serial Port
- 16194 = Pointing Device
- 16195 = Keyboard
- 16196 = Processor
- 16197 = Memory Device
- 16198 = USB
- 16199 = Monitor
- 16200 = SCSI
- 16201..65535 = Vendor Reserved

PrimaryStatus

Provides a high-level status value, intended to align with Red-Yellow-Green type representation of status. It should be used with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.

Possible values are:

Property	Description
PrimaryStatus	<ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Not Applicable • 3..15999 = DMTF Reserved • 16192 = Parallel Port • 16193 = Serial Port • 16194 = Pointing Device • 16195 = Keyboard • 16196 = Processor • 16197 = Memory Device • 16198 = USB • 16199 = Monitor • 16200 = SCSI • 16201..65535 = Vendor Reserved <p>Provides a high-level status value, intended to align with Red-Yellow-Green type representation of status. It should be used with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the implementation is in general capable of returning this property, but is unable to do so now. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
RequestedSpeed	<p>The requested bandwidth of the Port in Bits per Second. The actual bandwidth is reported in LogicalPort.Speed.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method</p>

Property	Description
	<p>approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
Security	<p>An enumeration indicating the operational security for the Controller. For example, information that the Device's external interface is locked out (value = 4) or Boot Bypass (value = 6) can be described using this property.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = None • 4 = External Interface Locked Out • 5 = External Interface Enabled • 6 = Boot Bypass
SerialPortCapabilities	<p>The capabilities of this Serial port.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = XT/AT compatible • 4 = 16450 compatible • 5 = 16550 compatible • 6 = 16550A compatible • 160 = 8251 compatible • 161 = 8251FIFO compatible
SystemCreationClassName	<p>The creation class name of the scoping system.</p>
SystemName	<p>The system name of the scoping system.</p>
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_USBPort

Table 22. USBPort

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating a configuration of an administrator for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>

Property	Description
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be running commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not run commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
HealthState	<p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. DMTF has reserved the unused portion of the continuum for additional HealthStates in the future. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded. • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. • .. = DMTF Reserved

Property	Description
IdentifyingDescriptions	An array of free-form strings providing explanations and details behind the entries in the OtherIdentifyingInfo array. Note that each entry of this array is related to the entry in OtherIdentifyingInfo that is located at the same index.
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. Unknown (0) indicates the last requested state for the element is unknown.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
Speed	USB Port Speed in bits per second. This speed is determined and set by the attached Device. The attached Device is indicated using the USBConnection association. At this time, only several Port speeds are valid. These are: 1.5Mbps and 12Mbps. The value 0

Property	Description
	can also be specified to indicate that the current speed is unknown or 1 to indicate that the speed is other than 1.5 or 12Mbps. Possible values are: 0, 1, 1500000, 12000000
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	Indicates the target state to which the instance is transitioning. Possible values are: <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.

DCIM_Memory

Table 23. Memory

Property	Description
Access	Access describes whether the media is readable (value = 1), writeable (value = 2), or both (value = 3). Unknown (0) and Write Once (4) can also be defined. Possible values are: <ul style="list-style-type: none"> • 0 = Unknown • 1 = Readable • 2 = Writeable • 3 = Read/Write Supported • 4 = Write Once
BlockSize	Size in bytes of the blocks which form this StorageExtent. If variable block size, then the maximum block size in bytes should be specified. If the block size is unknown or if a block concept is not valid (for example, for AggregateExtents, Memory or LogicalDisks), enter a 1.
ConsumableBlocks	The maximum number of blocks, of size BlockSize, which are available for consumption when layering StorageExtents using the BasedOn association. This property only has meaning when this StorageExtent is an Antecedent reference in a BasedOn relationship. For example, a StorageExtent could be composed of 120 blocks. However, the Extent itself may use 20 blocks for redundancy data. If another StorageExtent is BasedOn this Extent, only 100 blocks would be available to it. This information (100

Property	Description
CreationClassName	<p>blocks is available for consumption) is indicated in the ConsumableBlocks property.</p> <p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
DeviceID	<p>An address or other identifying information used to uniquely name the LogicalDevice.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768.65535 = Vendor Reserved
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state.

Property	Description
ErrorMethodology	<ul style="list-style-type: none"> • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>ErrorMethodology for Memory is a string property that indicates whether parity or CRC algorithms, ECC or other mechanisms are used. Details on the algorithm can also be supplied.</p>
FailOverState	<p>An integer enumeration indicating that active memory has failed and the spare or backup memory may have taken over.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = None • 3 = Active
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. DMTF has reserved the unused portion of the continuum for additional HealthStates in the future. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded. • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. • .. = DMTF Reserved
NumberOfBlocks	<p>Total number of logically contiguous blocks, of size Block Size, which form this Extent. The total size of the Extent can be calculated by multiplying BlockSize by NumberOfBlocks. If the BlockSize is 1, this property is the total size of the Extent.</p>
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p>Possible values are:</p>

Property

Description

- 0 = Unknown
- 1 = Other
- 2 = OK
- 3 = Degraded
- 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of **Stressed** states are overload, overheated, and so on.
- 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future.
- 6 = Error
- 7 = Non-Recoverable Error
- 8 = Starting
- 9 = Stopping
- 10 = Stopped
- 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered.
- 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it.
- 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable.
- 14 = Aborted
- 15 = Dormant — Indicates that the element is inactive or quiesced.
- 16 = Supporting Entity in Error — Indicates that this element may be **OK** but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems.
- 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error).
- 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association.
- .. = DMTF Reserved
- 0x8000.. = Vendor Reserved

OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.

OtherIdentifyingInfo

Captures data, in addition to DeviceID information, that could be used to identify a LogicalDevice. For example, you could use this property to hold the operating system's user-friendly name for the Device.

Property	Description
PrimaryStatus	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
Primordial	<p>If true, Primordial indicates that the containing System does not have the ability to create or delete this operational element. This is important because StorageExtents are assembled into higher-level abstractions using the BasedOn association. Although the higher-level abstractions can be created and deleted, the most basic, (that is, primordial), hardware-based storage entities cannot. They are physically realized as part of the System, or are actually managed by some other System and imported as if they were physically realized. In other words, a Primordial StorageExtent exists in, but is not created by its System and conversely a non-Primordial StorageExtent is created in the context of its System. For StorageVolumes, this property will generally be false. One use of this property is to enable algorithms that aggregate StorageExtent. ConsumableSpace across all, StorageExtents but that also want to distinguish the space that underlies Primordial StoragePools. Since implementations are not required to surface all Component StorageExtents of a StoragePool, this information is not accessible in any other way. Purpose A free form string describing the media and/or its use. RedundancyConfiguration is an integer enumeration indicating the redundancy configuration when active memory fails.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Disabled • 3 = Spared • 4 = Mirrored • 5 = LockStep
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown,</p>

Property

Description

RequestedState should have the value Unknown (0), but may have the value No Change (5).

There are two new values in RequestedState that build on the statuses of EnabledState. These are **Reboot (10)** and **Reset (11)**. Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value **12 (Not Applicable)**.

Possible values are:

- 0 = Unknown — Indicates the last requested state for the element is unknown.
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change
- 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState.
- 7 = Test
- 8 = Deferred
- 9 = Quiesce
- 10 = Reboot — Refers to doing a **Shut Down** and then moving to an **Enabled** state.
- 11 = Reset - Indicates that the element is first **Disabled** and then **Enabled**.
- 12 = Not Applicable
- .. = DMTF Reserved
- 32768..65535 = Vendor Reserved

SystemCreationClassName

The CreationClassName of the scoping system.

SystemName

The System Name of the scoping system.

TransitioningToState

Indicates the target state to which the instance is transitioning.

Possible values are:

- 0 = Unknown
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change — Indicates that no transition is in progress.
- 6 = Offline
- 7 = Test
- 8 = Defer
- 9 = Quiesce
- 10 = Reboot
- 11 = Reset
- 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions.

Property	Description
Volatile	A value other than 5 or 12 identifies the state to which the element is in the process of transitioning. Volatile is a property that indicates whether this memory is volatile or not.

DCIM_PCIDevice

Table 24. PCIDevice

Property	Description
BusNumber	The bus number where this PCI device resides.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
Description	Provides a textual description of the object.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
DeviceNumber	The device number assigned to this PCI device for this bus.
ElementName	A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information. NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.
EnabledDefault	An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. Possible values are: <ul style="list-style-type: none"> · 2 = Enabled · 3 = Disabled · 5 = Not Applicable · 6 = Enabled but Offline · 7 = No Default · 9 = Quiesce · .. = DMTF Reserved · 32768..65535 = Vendor Reserved By default, the element is Enabled (value = 2) .
EnabledState	A number enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and restarting (value = 10) are temporary states between enabled and disabled. Possible values are:

Property	Description
FunctionNumber	The function number for this PCI device.
HealthState	Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents. Possible values are:
StatusInfo	The use of this method is deprecated instead of a more clearly named property (EnabledState) that is inherited from ManagedSystemElement and that has additional enumerated values. Deprecated description: The StatusInfo property indicates whether the Logical Device is in an enabled state (value = 3), disabled state (value = 4), some other state (value = 1), or an

- 0 = Unknown
- 1 = Other
- 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests.
- 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests.
- 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state.
- 5 = Not Applicable — Indicates the element does not support being enabled or disabled.
- 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests.
- 7 = In Test — Indicates that the element is in a test state.
- 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests.
- 9 = Quiesce — Indicates that the element is enabled but in a restricted mode.
- 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued.
- 11..32767 = DMTF Reserved
- 32768..65535 = Vendor Reserved

- 0 = Unknown — The implementation cannot report on HealthState at this time. DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.
- 5 = OK — The element is fully functional and is operating within normal operational parameters and without error.
- 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors.
- 15 = Minor failure — All functionality is available but some may be degraded.
- 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working.
- 25 = Critical failure — The element is non-functional and recovery may not be possible.
- 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost.
- .. = DMTF Reserved

Property	Description
	<p>unknown state (value = 2). If this property does not apply to the LogicalDevice, the value 5 (Not Applicable) should be used. If a Device is Enabled (value = 3), it has been powered up and is configured and operational. The Device may or may not be functionally active, depending on whether its Availability (or AdditionalAvailability) indicates that it is Running/Full Power (value = 3) or Off line (value = 8). In an enabled but offline mode, a Device may be performing out-of-band requests, such as running Diagnostics. If StatusInfo is Disabled (value = 4), a Device can only be enabled or powered off. In a personal computer environment, disabled means that the driver of the device is not available in the stack. In other environments, a Device can be disabled by removing its configuration file. A disabled device is physically present in a System and consuming resources, but it cannot be communicated with until a driver is loaded, a configuration file is loaded, or some other enabling activity has occurred.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = Enabled • 4 = Disabled • 5 = Not Applicable
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_DisplayController

Table 25. DisplayController

Property	Description
CapabilityDescriptions	An array of free-form strings providing more detailed explanations for any of the video Accelerator features indicated in the Capabilities array. Note, each entry of this array is related to the entry in the Capabilities array that is located at the same index.

Property	Description
CommunicationStatus	<p>CommunicationStatus indicates the ability of the instrumentation to communicate with the underlying ManagedElement. CommunicationStatus consists of one of the following values: Unknown, None, Communication OK, Lost Communication, or No Contact. A Null return indicates the implementation (provider) does not implement this property.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. 1 = Not Available — Indicates that the implementation (provider) is capable of returning a value for this property, but not ever for this particular piece of hardware/software or the property is intentionally not used because it adds no meaningful information (as in the case of a property that is intended to add additional info to another property). 2 = Communication OK — Indicates communication is established with the element, but does not convey any quality of service. 3 = Lost Communication — Indicates that the Managed Element is known to exist and has been contacted successfully in the past, but is currently unreachable. 4 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. .. = DMTF Reserved 0x8000.. = Vendor Reserved
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
Description	<p>Provides a textual description of the object.</p>
DeviceID	<p>An address or other identifying information used to uniquely name the LogicalDevice.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. By default, the element is Enabled (value = 2).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Name	<p>The Name property defines the label by which the object is known. When subclassed, the Name property can be overridden to be a Key property.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests. This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code. If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved

Property	Description
	<ul style="list-style-type: none"> 32768..65535 = Vendor Reserved
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_Fan

Table 26. Fan

Property	Description
ActiveCooling	ActiveCooling is a Boolean that indicates that the Cooling Device provides active (as opposed to passive) cooling.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline

Property	Description
	<ul style="list-style-type: none"> · 7 = No Default · 9 = Quiesce · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. · 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. · 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. · 5 = Not Applicable — Indicates the element does not support being enabled or disabled. · 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. · 7 = In Test — Indicates that the element is in a test state. · 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. · 9 = Quiesce - Indicates that the element is enabled but in a restricted mode. · 10 = Starting - Indicates that the element is in the process of going to an Enabled state. New requests are queued. · 11..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved
ErrorCleared	<p>The use of this method is deprecated. Deprecated description: ErrorCleared is a Boolean property that indicates that the error reported in LastErrorCode is now cleared.</p>
ErrorDescription	<p>The use of this method is deprecated. Deprecated description: ErrorDescription is a free-form string that supplies more information about the error recorded in LastErrorCode and information on any corrective actions that can be taken.</p>
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — The implementation cannot report on HealthState at this time. DMTF has reserved the unused portion of the continuum for additional HealthStates in the future. · 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. · 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. · 15 = Minor failure — All functionality is available but some may be degraded. · 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. · 25 = Critical failure — The element is non-functional and recovery may not be possible. · 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. · .. = DMTF Reserved

Property	Description
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory. However, a few are not and are described here in more detail.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = OK • 3 = Degraded • 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. • 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. • 6 = Error • 7 = Non-Recoverable Error • 8 = Starting • 9 = Stopping • 10 = Stopped - Implies a clean and orderly stop. • 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. • 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. • 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable. • 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. • 15 = Dormant — Indicates that the element is inactive or quiesced. • 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. • 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). • 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
PrimaryStatus	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved •
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5</p>

Property	Description
	<p>(Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. Unknown (0) indicates the last requested state for the element is unknown.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). Offline (6) indicates that the element has been requested to transition to the Enabled but Offline EnabledState. There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Reboot refers to doing a Shut Down and then moving to an Enabled state. Reset indicates that the element is first Disabled and then Enabled. Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 (Not Applicable).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot

Property	Description
	<ul style="list-style-type: none"> 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
VariableSpeed	Indication of whether the fan supports variable speeds.

DCIM_IndicatorLED

Table 27. IndicatorLED

Property	Description
Color	<p>Color This property indicates the current color of the LED. If the value of the ActivationState property is 4 (Off) this property indicates the color of the LED the last time it was lit, or has the value 2 (Not Applicable).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Not Applicable 3 = White 4 = Red 5 = Green 6 = Blue 7 = Orange 8 = Yellow 9 = Black .. = DMTF Reserved 32768..65535 = Vendor Reserved
ControlMode	<p>ControlMode indicates the current control mode for the LED.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Automatic — Indicates the state of the LED is being controlled by the management infrastructure. 3 = Manual — Indicates the state of the LED is being controlled by a management client. 4 = Test — Indicates the LED is in a test mode. .. = DMTF Reserved 32768..65535 = Vendor Reserved
ControlPattern	<p>An LED may exhibit a range of behavior from very simple (ex. solid on) to very complicated (ex. a series of blinks of alternating color and duration). ControlPattern specifies the vendor or standard behavior exhibited by the LED if it cannot be described using one of the standard behaviors listed for the ActivationState property.</p> <p>If ActivationState has the value 5 (ControlPattern), the ControlPattern property is not NULL.</p> <p>The value of ControlPattern is constructed using the following preferred algorithm:</p> <pre><OrgID>::<Pattern></pre> <p>Where <OrgID> and <Pattern> are separated by two colons (::), and where <OrgID> includes a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the ControlPattern or that is a registered ID assigned to the business entity by a recognized global authority. If the definition of the value is specified by the DMTF, the value of <OrgID> is DMTF. <Pattern> is chosen by the</p>

Property	Description
	business entity and is not reused to identify different underlying (real-world) behaviors. If the behavior specified for the LED adheres to a standard or proprietary specification, <Pattern> is a uniquely assigned value identifying the behavior. If the behavior for the LED is described using a standard or proprietary grammar, <Pattern> is prefixed with a uniquely assigned identifier for the grammar.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DefaultActivationState	Indicates the default state of an LED. See ActivationState for a description of the values. Possible values are: <ul style="list-style-type: none"> · 2 = Lit · 3 = Blinking · 4 = Off · 5 = Control Pattern · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	Specifies an identifier for the LED. The value of ElementName is constructed using the following preferred algorithm: <OrgID>::<LocalID> Where <OrgID> and <LocalID> are separated by two colons (::), and where <OrgID> includes a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the ControlPattern or that is a registered ID assigned to the business entity by a recognized global authority. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements.
EnabledDefault	An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. Possible values are: <ul style="list-style-type: none"> · 2 = Enabled · 3 = Disabled · 5 = Not Applicable · 6 = Enabled but Offline · 7 = No Default · 9 = Quiesce · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
EnabledState	By default, the element is Enabled (value = 2) . It is an integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled. Possible values are: <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. · 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests.

Property	Description
HealthState	<ul style="list-style-type: none"> • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded. • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p>

NOTE: The value **No Change (5)** has been deprecated instead of indicating the last requested state is **Unknown (0)**. If the last requested or desired state is unknown, **RequestedState** should have the value **Unknown (0)**, but may have the value **No Change (5)**.

There are two new values in RequestedState that build on the statuses of EnabledState. These are **Reboot (10)** and **Reset (11)**. This property is set as the result of a method

Property	Description
	<p>invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TotalOutputPower	Represents the total output power of the PowerSupply in milli Watts. 0 denotes unknown .
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
TypeOfRangeSwitching	<p>Describes the kind of input voltage range switching that is implemented in this PowerSupply.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = Manual • 4 = Autoswitch • 5 = Wide Range • 6 = Not Applicable <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_Battery

Table 29. Battery

Property	Description
BatteryStatus	<p>Description of the charge status of the Battery.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown

Property	Description
	<ul style="list-style-type: none"> • 3 = Fully Charged • 4 = Low • 5 = Critical • 6 = Charging • 7 = Charging and High • 8 = Charging and Low • 9 = Charging and Critical • 10 = Undefined • 11 = Partially Charged • 12 = Learning • 13 = Overcharged <p>Values such as Fully Charged (value = 3) or Partially Charged (value = 11) can be specified. The value, 10, is not valid in the CIM Schema because in DMI it represents that no battery is installed. In this case, this object should not be instantiated.</p>
ChargingStatus	<p>This property defines status information about the AC line in the notebook.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = Off- Line • 4 = On-Line • 5 = On Backup Power
Chemistry	<p>An enumeration that describes the chemistry of the Battery.</p> <ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = Lead Acid • 4 = Nickel Cadmium • 5 = Nickel Metal Hydride • 6 = Lithium-ion • 7 = Zinc air • 8 = Lithium Polymer
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
DesignCapacity	<p>The design capacity of the battery in m Watt-hours. If this property is not supported, enter 0.</p>
DesignVoltage	<p>The design voltage of the battery in mVolts. If this attribute is not supported, enter 0.</p>
DeviceID	<p>An address or other identifying information used to uniquely name the LogicalDevice.</p>
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
EstimatedChargeRemaining	<p>An estimate of the percentage of full charge remaining.</p>
EstimatedRunTime	<p>An estimate in minutes of the time that battery charge depletion will occur under the present load conditions if the utility power is off, or is lost and remains off, or a Laptop is disconnected from a power source.</p>
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded.

Property	Description
	<ul style="list-style-type: none"> • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. • .. = DMTF Reserved
IdentifyingDescriptions	<p>An array of free-form strings providing explanations and details behind the entries in the OtherIdentifyingInfo array. Note that each entry of this array is related to the entry in OtherIdentifyingInfo that is located at the same index.</p>
Name	<p>The Name property defines the label by which the object is known. When subclassed, the Name property can be overridden to be a Key property.</p>
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = OK • 3 = Degraded • 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. • 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. • 6 = Error • 7 = Non-Recoverable Error • 8 = Starting • 9 = Stopping • 10 = Stopped — Implies a clean and orderly stop • 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. • 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. • 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable. • 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. • 15 = Dormant — Indicates that the element is inactive or quiesced. • 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. • 17 = Completed - Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). • 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved <p>OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and</p>

Property	Description
OtherIdentifyingInfo	<p>OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.</p> <p>OtherIdentifyingInfo captures data, in addition to DeviceID information, that could be used to identify a LogicalDevice. For example, you could use this property to hold the operating system's user-friendly name for the Device.</p>
PrimaryStatus	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
RemainingCapacityMaxError	<p>The maximum error (as a percentage) in the mWatt-hour data reported by RemainingCapacity property.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
	<p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p>
	<p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p>
	<p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p>
	<p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate</p>

Property	Description
	<p>disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SmartBatteryVersion	<p>The Smart Battery Data Specification version number that is supported by this Battery. If the Battery does not support this function, the value should be left blank.</p>
Status	<p>A string indicating the current status of the object. Various operational and non-operational statuses are defined. This property is deprecated instead of OperationalStatus, which includes the same semantics in its enumeration. This change is made for three reasons:</p> <ol style="list-style-type: none"> 1. Status is more correctly defined as an array. This definition overcomes the limitation of describing status using a single value, when it is really a multi-valued property (for example, an element may be OK AND Stopped). 2. A MaxLen of 10 is too restrictive and leads to unclear enumerated values. 3. The change to a uint16 data type was discussed when CIM V2.0 was defined. However, existing V1.0 implementations used the string property and did not want to modify their code. Therefore, Status was grandfathered into the Schema. Use of the deprecated qualifier allows the maintenance of the existing property, but also permits an improved definition using OperationalStatus. <p>Possible values are:</p> <ul style="list-style-type: none"> • OK • Error • Degraded • Unknown • Pred Fail • Starting • Stopping • Service • Stressed • NonRecover • No Contact • Lost Comm • Stopped
SystemCreationClassName	<p>The CreationClassName of the scoping system.</p>
SystemName	<p>The System Name of the scoping system.</p>
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot

Property	Description
	<ul style="list-style-type: none"> 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_Processor

Table 30. Processor

Property	Description
Caption	The Caption property is a short textual description (one- line string) of the object.
CPUStatus	<p>The CPUStatus property that indicates the current status of the Processor.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = CPU Enabled 2 = CPU Disabled by User 3 = CPU Disabled By BIOS (POST Error) 4 = CPU Is Idle 7 = Other <p>For example, the Processor may be disabled by the user (value = 2), or disabled due to a POST error (value = 3). Information in this property can be obtained from SMBIOS, the Type 4 structure, and the Status attribute.</p>
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
CurrentClockSpeed	The current speed (in MHz) of this Processor.
Description	Provides a textual description of the object.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce

Property	Description
	<ul style="list-style-type: none"> · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. · 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. · 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. · 5 = Not Applicable — Indicates the element does not support being enabled or disabled. · 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. · 7 = In Test — Indicates that the element is in a test state. · 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. · 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. · 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. · 11..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
ExternalBusClockSpeed	<p>The speed (in MHz) of the external bus interface (also known as the front side bus).</p>
Family	<p>The Processor family type.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 1 = Other · 2 = Unknown · 3 = 8086 · 4 = 80286 · 5 = 80386 · 6 = 80486 · 7 = 8087 · 8 = 80287 · 9 = 80387 · 10 = 80487 · 11 = Pentium(R) brand · 12 = Pentium(R) Pro · 13 = Pentium(R) II · 14 = Pentium(R) processor with MMX(TM) technology · 15 = Celeron(TM) · 16 = Pentium(R) II Xeon(TM) · 17 = Pentium(R) III · 18 = M1 Family · 19 = M2 Family · 20 = Intel(R) Celeron(R) M processor · 21 = Intel(R) Pentium(R) 4 HT processor

HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — The implementation cannot report on HealthState at this time. 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. 15 = Minor failure — All functionality is available but some may be degraded. 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. 25 = Critical failure — The element is non-functional and recovery may not be possible. 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. .. = DMTF Reserved
MaxClockSpeed	The maximum speed (in MHz) of this Processor.
NumberOfEnabledCores	Number of processor cores enabled for processor.
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory. However, a few are not and are described here in more detail.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = OK 3 = Degraded 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. 6 = Error 7 = Non-Recoverable Error 8 = Starting 9 = Stopping 10 = Stopped — Implies a clean and orderly stop. 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable.

Property	Description
	<ul style="list-style-type: none"> 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. 15 = Dormant — Indicates that the element is inactive or quiesced. 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. .. = DMTF Reserved 0x8000.. = Vendor Reserved

OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.

PrimaryStatus

Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.

Possible values are:

- 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time.
- 1 = OK — Indicates the ManagedElement is functioning normally.
- 2 = Degraded — Indicates the ManagedElement is functioning below normal.
- 3 = Error - Indicates the ManagedElement is in an Error condition.
- .. = DMTF Reserved
- 0x8000.. = Vendor Reserved

RequestedState

An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.

Possible values are:

- 0 = Unknown
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change
- 6 = Offline
- 7 = Test
- 8 = Deferred
- 9 = Quiesce
- 10 = Reboot
- 11 = Reset
- 12 = Not Applicable
- .. = DMTF Reserved
- 32768..65535 = Vendor Reserved

Property	Description
	<p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. Unknown (0) indicates the last requested state for the element is unknown.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). Offline (6) indicates that the element has been requested to transition to the Enabled but Offline EnabledState. There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Reboot refers to doing a Shut Down and then moving to an Enabled state. Reset indicates that the element is first Disabled and then Enabled.</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
Stepping	Stepping is a free-form string that indicates the revision level of the Processor within the Processor.Family.
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
UniqueID	A global unique identifier for the processor. This identifier can be unique only within a processor family.
UpgradeMethod	<p>CPU socket information that includes data on how the processor can be upgraded (if upgrades are supported). This property is an integer enumeration.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> • 1 = Other • 2 = Unknown • 3 = Daughter Board • 4 = ZIF Socket • 5 = Replacement/Piggy Back • 6 = None • 7 = LIF Socket • 8 = Slot 1 • 9 = Slot 2 • 10 = 370 Pin Socket • 11 = Slot A • 12 = Slot M • 13 = Socket 423 • 14 = Socket A (Socket 462) • 15 = Socket 478 • 16 = Socket 754 • 17 = Socket 940 • 18 = Socket 939 • 19 = Socket mPGA604 • 20 = Socket LGA771 • 21 = Socket LGA775 • 22 = Socket S1 • 23 = Socket AM2 • 24 = Socket F (1207) • 25 = Socket LGA1366 • 26 = Socket G34 • 27 = Socket AM3 • 28 = Socket C32 • 29 = Socket LGA1156 • 30 = Socket LGA1567 • 31 = Socket PGA988A • 32 = Socket BGA1288 • 33 = rPGA988B • 34 = BGA1023 • 35 = BGA1224 • 36 = LGA1155 • 37 = LGA1356 • 38 = LGA2011 • 39 = Socket FS1 • 40 = Socket FS2 • 41 = Socket FM1 • 42 = Socket FM2 • 43 = Socket LGA2011-3 • 44 = Socket LGA1356-3 • 45 = Socket LGA1150 • 46 = Socket BGA1168

DCIM_NumericSensor

Table 31. NumericSensor

Property	Description	Supported Operating System(s)
BaseUnits	<p>The base unit of the values returned by this Sensor. All the values returned by this Sensor are represented in the units obtained by (BaseUnits * 10 raised to the power of the UnitModifier). For example, if BaseUnits is Volts and the UnitModifier is -6, then the units of the values returned are MicroVolts. However, if the RateUnits property is set to a value other than None, then the units are further qualified as rate units. In the above example, if RateUnits is set to Per Second, then the values returned by the Sensor are in MicroVolts/Second. The units apply to all numeric properties of the Sensor, unless explicitly overridden by the Units qualifier.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = Degrees C• 3 = Degrees F• 4 = Degrees K• 5 = Volts• 6 = Amps• 7 = Watts• 8 = Joules• 9 = Coulombs• 10 = VA• 11 = Nits• 12 = Lumens• 13 = Lux• 14 = Candelas• 15 = kPa• 16 = PSI• 17 = Newtons• 18 = CFM• 19 = RPM• 20 = Hertz• 21 = Seconds• 22 = Minutes• 23 = Hours• 24 = Days• 25 = Weeks• 26 = Mils• 27 = Inches• 28 = Feet• 29 = Cubic Inches• 30 = Cubic Feet• 31 = Meters• 32 = Cubic Centimeters• 33 = Cubic Meters• 34 = Liters• 35 = Fluid Ounces• 36 = Radians• 37 = Steradians• 38 = Revolutions• 39 = Cycles	Microsoft Windows, Linux

CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.	Microsoft Windows, Linux
CurrentReading	The current value indicated by the Sensor.	Microsoft Windows, Linux
CurrentState	The current state indicated by the Sensor. This is always one of the PossibleStates .	Microsoft Windows, Linux
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.	Microsoft Windows, Linux
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>i NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties. We have introduced new elements for Temperature sensor, Fan Speed Sensor, Current Supply and Voltage Numeric Sensor.</p>	Microsoft Windows, Linux
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p>	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
EnabledState	<ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p> <p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>	Microsoft Windows, Linux
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded. • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. 	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> .. = DMTF Reserved <p>DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p>	
LowerThresholdCritical	The Sensor's threshold values specify the ranges (min and max values) for determining whether the Sensor is operating under Normal, NonCritical or Critical conditions. The CurrentState is Critical once the CurrentReading is below LowerThresholdCritical.	Microsoft Windows, Linux
LowerThresholdNonCritical	<p>The Sensor's threshold values specify the ranges (min and max values) for determining whether the Sensor is operating under Normal, NonCritical, Critical conditions. If CurrentReading is between LowerThresholdNonCritical and Upper ThresholdNonCritical, then the Sensor is reporting a normal value. If CurrentReading is between LowerThresholdNonCritical and LowerThresholdCritical, then the CurrentState is NonCritical.</p> <p>Example for Set command: wmic /namespace:\\root\dcim\sysman path dcim_numericsensor Where ElementName like '%Temperature Sensor:%' set LowerThresholdNonCritical = 30. This sets the all temperature probes (lower threshold non critical) in the system to 30 degree Celsius.</p>	Microsoft Windows, Linux
NormalMax	NormalMax provides guidance for the user as to the normal maximum range for the NumericSensor.	Linux
NormalMin	NormalMin provides guidance for the user as to the normal minimum range for the NumericSensor.	Linux
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = OK 3 = Degraded 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. 6 = Error 7 = Non-Recoverable Error 8 = Starting 9 = Stopping 10 = Stopped — Implies a clean and orderly stop 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable. 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. 15 = Dormant - Indicates that the element is inactive or quiesced. 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or 	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	<p>Completed with Degraded (the operation finished, but it did not complete OK or did not report an error).</p> <ul style="list-style-type: none"> • 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved <p>OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.</p>	
PossibleStates	<p>Enumerates the string outputs of the Sensor.</p> <p>Example 1 - A Switch Sensor may output the states On, or Off. Another implementation of the Switch may output the states Open, and Close.</p> <p>Example 2 - Is a NumericSensor supporting thresholds. This Sensor can report the states like Normal, Upper Non-Critical, Lower Non-Critical, and so on. A NumericSensor that does not publish readings and thresholds, but stores this data internally, can still report its states.</p>	Microsoft Windows, Linux
RateUnits	<p>Specifies if the units returned by this Sensor are rate units. All the values returned by this Sensor are represented in the units obtained by (BaseUnits * 10 raised to the power of the UnitModifier). This is true unless this property (RateUnits) has a value different than None. For example, if BaseUnits is Volts and the UnitModifier is -6, then the units of the values returned are MicroVolts. But, if the RateUnits property is set to a value other than None, then the units are further qualified as rate units. In the above example, if RateUnits is set to Per Second, then the values returned by the Sensor are in MicroVolts/Second. The units apply to all numeric properties of the Sensor, unless explicitly overridden by the Units qualifier. Any implementation of CurrentReading should be qualified with either a Counter or a Gauge qualifier, depending on the characteristics of the sensor being modeled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = None • 1 = Per MicroSecond • 2 = Per MilliSecond • 3 = Per Second • 4 = Per Minute • 5 = Per Hour • 6 = Per Day • 7 = Per Week • 8 = Per Month • 9 = Per Year 	Microsoft Windows, Linux
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may</p>	Microsoft Windows, Linux

	<p>have the value No Change (5). Offline (6) indicates that the element has been requested to transition to the Enabled but Offline EnabledState.</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved 	
SensorType	<p>The Type of the Sensor, e.g. Voltage or Temperature Sensor. If the type is set to Other, then the OtherSensorType Description can be used to further identify the type, or if the Sensor has numeric readings, then the type of the Sensor can be implicitly determined by the Units. A description of the different Sensor types is as follows: A Temperature Sensor measures the environmental temperature. Voltage and Current Sensors measure electrical voltage and current readings. A Tachometer measures speed/revolutions of a Device. For example, a Fan Device can have an associated Tachometer which measures its speed. A Counter is a general purpose Sensor that measures some numerical property of a Device. A Counter value can be cleared, but it never decreases. A Switch Sensor has states like Open/Close, On/Off, or Up/Down. A Lock has states of Locked/Unlocked. Humidity, Smoke Detection and Air Flow Sensors measure the equivalent environmental characteristics. A Presence Sensor detects the presence of a PhysicalElement. A Power Consumption Sensor measures the instantaneous power consumed by a managed element. A Power Production Sensor measures the instantaneous power produced by a managed element such as a power supply or a voltage regulator. A pressure sensor is used to report pressure. Intrusion sensor reports an intrusion of an enclosure regardless whether it was authorized or not.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Temperature • 3 = Voltage • 4 = Current 	Microsoft Windows, Linux

If the CurrentReading is above UpperThresholdCritical, then the Current State is critical.	Microsoft Windows, Linux
UpperThresholdNonCritical	The Sensor's threshold values specify the ranges (min and max values) for determining whether the Sensor is operating under Normal, NonCritical or Critical conditions. If the	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	<p>CurrentReading is between LowerThresholdNonCritical and UpperThresholdNonCritical, then the Sensor is reporting a normal value. If the CurrentReading is between UpperThreshold NonCritical and UpperThresholdCritical, then the CurrentState is NonCritical.</p> <p>Example for Set command: wmic /namespace:\\root\dcim\sysman path dcim_numericsensor Where ElementName like '%Temperature Sensor:%' set UpperThresholdNonCritical = 70</p>	
ValueFormulation	<p>Indicates the method used by the sensor to produce its reading.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Measured - Indicates the value is measured directly by the sensor. • 3 = Derived - Indicates the value is derived from other measured values that are not reported discretely by this sensor. • .. = DMTF Reserved • 32768..65535 = Vendor Reserved 	Microsoft Windows, Linux
SupportedThresholds	<p>SupportedThresholds property is an array that contains the list of the implemented thresholds: LowerThresholdNonCritical, UpperThresholdNonCritical, LowerThresholdCritical, UpperThresholdCritical. When the implementation does not support any of these threshold properties, the CIM_NumericSensor.SupportedThresholds property shall be an empty array.</p>	Microsoft Windows, Linux
SettableThresholds	<p>SettableThresholds property is an array that contains the list of the settable implemented thresholds: LowerThresholdNonCritical, UpperThresholdNonCritical. The CIM_NumericSensor.SettableThresholds array shall contain the subset of values in the CIM_NumericSensor.SupportedThresholds array. When the implementation does not support any of the settable threshold properties, the CIM_NumericSensor.SettableThresholds property shall be an empty array.</p>	Microsoft Windows, Linux
Caption	A short textual description of an object.	Microsoft Windows, Linux
Description	A short textual description of an object.	Microsoft Windows, Linux

DCIM_Sensor

Table 32. Sensor

Property	Description
Caption	The Caption property is a short textual description (one- line string) of the object.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
CurrentState	The current state indicated by the Sensor. This is always one of the PossibleStates .
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name,</p>

Property	Description
EnabledDefault	<p data-bbox="590 224 1503 313">without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p> <p data-bbox="542 336 1503 403">An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p data-bbox="542 414 1503 448">Possible values are:</p> <ul data-bbox="542 459 1503 716" style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p data-bbox="542 728 1503 761">By default, the element is Enabled (value = 2).</p>
EnabledState	<p data-bbox="542 784 1503 851">An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p data-bbox="542 862 1503 896">Possible values are:</p> <ul data-bbox="542 907 1503 1500" style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p data-bbox="542 1512 1503 1568">For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
HealthState	<p data-bbox="542 1590 1503 1657">Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p data-bbox="542 1668 1503 1736">DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p> <p data-bbox="542 1747 1503 1780">Possible values are:</p> <ul data-bbox="542 1792 1503 1993" style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors.

Property

Description

- 15 = Minor failure — All functionality is available but some may be degraded.
- 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working.
- 25 = Critical failure — The element is non-functional and recovery may not be possible.
- 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost.
- .. = DMTF Reserved

OperationalStatus

Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory. However, a few are not and are described here in more detail.

Stressed, Predictive Failure, In Service, No Contact, Lost Communication, Stopped and **Aborted** are similar, although the former , while the latter **Dormant, Supporting Entity in Error, Completed, Power Mode, OperationalStatus** replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.

Possible values are:

- 0 = Unknown
- 1 = Other
- 2 = OK
- 3 = Degraded
- 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of **Stressed** states are overload, overheated, and so on.
- 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future.
- 6 = Error
- 7 = Non-Recoverable Error
- 8 = Starting
- 9 = Stopping
- 10 = Stopped — Implies a clean and orderly stop.
- 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered.
- 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it.
- 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable.
- 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated.
- 15 = Dormant — Indicates that the element is inactive or quiesced.
- 16 = Supporting Entity in Error — Indicates that this element may be **OK** but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems.
- 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error).
- 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association.
- .. = DMTF Reserved
- 0x8000.. = Vendor Reserved

Property	Description
PossibleStates	Enumerates the string outputs of the Sensor. For example, a Switch Sensor may output the states On , or Off . Another implementation of the Switch may output the states Open , and Close . Another example is a NumericSensor supporting thresholds. This Sensor can report the states like Normal , Upper Fatal , Lower Non-Critical , and so on. A NumericSensor that does not publish readings and thresholds, but stores this data internally, can still report its states.
PrimaryStatus	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration. Unknown (0) indicates the last requested state for the element is unknown.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). Offline (6) indicates that the element has been requested to transition to the Enabled but Offline EnabledState. There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Reboot refers to doing a Shut Down and then moving to an Enabled state. Reset indicates that the element is first Disabled and then Enabled.</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline • 7 = Test • 8 = Deferred • 9 = Quiesce

Property	Description
SensorType	<ul style="list-style-type: none"> · 10 = Reboot · 11 = Reset · 12 = Not Applicable · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>The Type of the Sensor, e.g. Voltage or Temperature Sensor. If the type is set to Other, then the OtherSensorType Description can be used to further identify the type, or if the Sensor has numeric readings, then the type of the Sensor can be implicitly determined by the Units. A description of the different Sensor types is as follows: A Temperature Sensor measures the environmental temperature. Voltage and Current Sensors measure electrical voltage and current readings. A Tachometer measures speed/revolutions of a Device. For example, a Fan Device can have an associated Tachometer which measures its speed. A Counter is a general purpose Sensor that measures some numerical property of a Device. A Counter value can be cleared, but it never decreases. A Switch Sensor has states like Open/Close, On/Off, or Up/Down. A Lock has states of Locked/Unlocked. Humidity, Smoke Detection and Air Flow Sensors measure the equivalent environmental characteristics. A Presence Sensor detects the presence of a PhysicalElement. A Power Consumption Sensor measures the instantaneous power consumed by a managed element. A Power Production Sensor measures the instantaneous power produced by a managed element such as a power supply or a voltage regulator. A pressure sensor is used to report pressure. Intrusion sensor reports an intrusion of an enclosure regardless whether it was authorized or not.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Temperature · 3 = Voltage · 4 = Current · 5 = Tachometer · 6 = Counter · 7 = Switch · 8 = Lock · 9 = Humidity · 10 = Smoke Detection · 11 = Presence · 12 = Air Flow · 13 = Power Consumption · 14 = Power Production · 15 = Pressure · 16 = Intrusion · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change — Indicates that no transition is in progress. · 6 = Offline

DCIM_DeviceBay

Table 33. DeviceBay

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
Description	Defines the physical location of the device bay. Provides a textual description of the object.
DeviceBayLocation	<p>Defines the type of Device Bay.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Other 1 = Unknown 2 = Proprietary Bay 3 = Standard Desktop Device Bay 4 = Standard Mobile Device Bay 5 = Standard Ultra-Mobile Device Bay 6..32767 = DMTF Reserved 32768..65535 = Vendor Reserved
DeviceBayType	<p>Defines the type of Device Bay.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Other 1 = Unknown 2 = Proprietary Bay 3 = Standard Desktop Device Bay 4 = Standard Mobile Device Bay 5 = Standard Ultra-Mobile Device Bay 6..32767 = DMTF Reserved 32768..65535 = Vendor Reserved
DeviceCurrentlyAttached	An address or other identifying information used to uniquely name the LogicalDevice.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
DeviceSupported	Defines a string containing a list of devices supported in this bay separated by commas.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name,</p>

Property	Description
EnabledDefault	<p data-bbox="590 224 1503 313">without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p> <p data-bbox="542 336 1503 403">An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p data-bbox="542 414 1503 448">Possible values are:</p> <ul data-bbox="542 459 1503 716" style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p data-bbox="542 728 1503 761">By default, the element is Enabled (value = 2).</p>

SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_VideoHead

Table 34. VideoHead

Property	Description
Caption	The Caption property is a short textual description (one- line string) of the object.
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
CurrentBitsPerPixel	The number of bits used to display each pixel.
CurrentHorizontalResolution	Current number of horizontal pixels.
CurrentNumberOfColumns	If in character mode, number of columns for this DisplayController. Otherwise, enter 0.
CurrentNumberOfRows	If in character mode, number of rows for this Video Controller. Otherwise, enter 0.
CurrentScanMode	<p>Current scan mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Not Supported • 3 = Non-Interlaced Operation • 4 = Interlaced Operation
CurrentVerticalResolution	Current number of vertical pixels.
Description	Provides a textual description of the object.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Property	Description
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline - Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot - Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p>

Property	Description
	<p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_LCDPanel

Table 36. LCDPanel

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
DeviceID	An address or other identifying information used to uniquely name the LogicalDevice.
DisplayDataCategory	<p>Identifies the category of data to be displayed on the LCD Panel.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = None • 3 = User Specified • 4 = Default • 5 = IPv4 Address • 6 = IDRAC MAC Address • 7 = Service Tag • 8 = System Name

Property	Description
	<ul style="list-style-type: none"> 9 = IPv6 Address 10 = Ambient 11 = System Power
DisplayModeUserString	Contains a user configurable string to be displayed on the LCD panel if DisplayDataCategory has the value 3 .
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. 5 = Not Applicable — Indicates the element does not support being enabled or disabled. 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. 7 = In Test — Indicates that the element is in a test state. 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. 11..32767 = DMTF Reserved 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
LocalConfigurationEnabled	Indicates if the LCD panel may be used to modify the system configuration. A value of true indicates system configuration via the LCD panel is enabled. A value of false indicates system configuration via the LCD panel is disabled.
SystemCreationClassName	The CreationClassName of the scoping system.
SystemName	The System Name of the scoping system.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_NetworkPortConfigurationService

Table 37. NetworkPortConfigurationService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not run commands and drops any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates that the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and drops any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but queues any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p>
Name	<p>The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p>

Property	Description
	<p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 (Not Applicable).</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_TimeService

Table 38. TimeService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties. EnabledDefault An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Name	<p>The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled.

Property	Description
	<ul style="list-style-type: none"> 12 = Not Applicable .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>① NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>① NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5). SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions.

Property	Description
	A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.

DCIM_RoleBasedAuthorizationService

Table 40. RoleBasedAuthorizationService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
Name	The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce

Property	Description
	<ul style="list-style-type: none"> • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_PowerManagementService

Table 41. PowerManagementService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 2 = Enabled• 3 = Disabled• 5 = Not Applicable• 6 = Enabled but Offline• 7 = No Default• 9 = Quiesce• .. = DMTF Reserved• 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = Enabled — Indicates that the element is or could be executing commands, processes any queued commands, and queues new requests.• 3 = Disabled — Indicates that the element will not run commands and drops any new requests.• 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state.• 5 = Not Applicable — Indicates that the element does not support being enabled or disabled.• 6 = Enabled but Offline — Indicates that the element may be completing commands, and drops any new requests.• 7 = In Test — Indicates that the element is in a test state.• 8 = Deferred — Indicates that the element may be completing commands, but queues any new requests.• 9 = Quiesce — Indicates that the element is enabled but in a restricted mode.• 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued.• 11..32767 = DMTF Reserved• 32768..65535 = Vendor Reserved

Property	Description
Name	The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.
OtherEnabledState	A string that describes the enabled or disabled state of the element when the EnabledState property is set to 1 (Other) . This property must be set to null when EnabledState is any value other than 1.
PrimaryOwnerContact	A string that provides information on how the primary owner of the Service can be reached (for example, phone number, e-mail address and so on).
PrimaryOwnerName	The name of the primary owner for the service, if one is defined. The primary owner is the initial support contact for the Service.
PrimaryStatus	<p>Provides a high-level status value, intended to align with Red-Yellow-Green type representation of status. It should be used with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — Indicates that the implementation is in general capable of returning this property, but is unable to do so now. 1 = OK — Indicates the ManagedElement is functioning normally. 2 = Degraded — Indicates the ManagedElement is functioning below normal. 3 = Error — Indicates the ManagedElement is in an Error condition. .. = DMTF Reserved 0x8000.. = Vendor Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown — Indicates that the last requested state for the element is unknown. 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. 7 = Test 8 = Deferred 9 = Quiesce 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. 11 = Reset — Indicates that the element is first Disabled and then Enabled. 12 = Not Applicable .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p>

Property	Description
	<p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not run or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_BootService

Table 42. BootService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. By default, the element is Enabled (value = 2).</p> <p>Possible values are:</p>

Property	Description
EnabledState	<ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test— Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting - Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Name	<p>The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.</p>

SystemName	<p>The Name of the scoping System.</p>
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled

Property	Description
	<ul style="list-style-type: none"> • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_PowerUtilizationManagementService

Table 44. PowerUtilizationManagementService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. By default, the element is Enabled (value = 2).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests.

Property	Description
	<ul style="list-style-type: none"> 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. 10 = Starting 11..32767 = DMTF Reserved 32768..65535 = Vendor Reserved
Name	The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.
PendingPowerUtilizationAlgorithm	<p>This property describes the pending requested algorithm to be employed by the service for power utilization.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = None — Indicates that currently the service is not employing any power utilization algorithm. If the property value is 2 (None), then the PowerUtilizationMode is equal to 2 (None). 3 = Custom Settings Based — Indicates that the service is employing power utilization algorithm based on a specific settings. This settings may be represented by the DCIM_PowerUtilizationSettingData instance associated 4 = Maximum Performance — Indicates that the service is employing a power utilization that yields the maximum performance for the affected managed elements. If the property value is 4 (Maximum Performance), then the PowerUtilizationMode is equal to 4 (Static). 5 = Minimum Performance — Indicates that the service is employing a power utilization that yields the minimum power consumption for the affected managed elements. If the property value is 5 (Minimum Performance), then the PowerUtilizationMode is equal to 4 (Static). 6 = OS Specific — Indicates that the service is employing a power utilization defined by the operating system. If the property value is 6 (OS Specific), then the PowerUtilizationMode is equal to 3 (Dynamic). 7 = Active Power Utilization — Indicates that the service is employing a specific algorithm to yield the best power consumption and performance for the affected managed elements. If the property value is 7 (Active Power Utilization), then the PowerUtilizationMode is equal to 3 (Dynamic).
PowerUtilizationAlgorithm	<p>Describes the algorithm employed by the service for power utilization. Depending on the performance and power needs of the managed element, the selection could be made for the appropriate algorithm to be deployed for the power utilization.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown(Dynamic). 2 = None — Indicates that currently the service is not employing any power utilization algorithm. If the property value is 2 (None), then the PowerUtilizationMode is equal to 2 (None). 3 = Custom Settings Based — Indicates that the service is employing power utilization algorithm based on a specific settings. This settings may be represented by the DCIM_PowerUtilizationSettingData instance associated 4 = Maximum Performance — Indicates that the service is employing a power utilization that yields the maximum performance for the affected managed elements. If the property value is 4 (Maximum Performance), then the PowerUtilizationMode is equal to 4 (Static). 5 = Minimum Performance — Indicates that the service is employing a power utilization that yields the minimum power consumption for the affected managed elements. If the property value is 5 (Minimum Performance), then the PowerUtilizationMode is equal to 4 (Static). 6 = OS Specific — Indicates that the service is employing a power utilization defined by the operating system. If the property value is 6 (OS Specific), then the PowerUtilizationMode is equal to 3 (Dynamic).

Property	Description
PowerUtilizationMode	<ul style="list-style-type: none"> · 7 = Active Power Utilization — Indicates that the service is employing a specific algorithm to yield the best power consumption and performance for the affected managed elements. If the property value is 7 (Active Power Utilization), then the PowerUtilizationMode is equal to 3 <p>Indicates the current power utilization mode implemented by the service. The mode selection is a generally made infrequently as part of element configuration.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the last requested state for the element is unknown. · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change · 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. · 7 = Test · 8 = Deferred · 9 = Quiesce · 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. · 11 = Reset — Indicates that the element is first Disabled and then Enabled. · 12 = Not Applicable · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the last requested state for the element is unknown. · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change · 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. · 7 = Test · 8 = Deferred · 9 = Quiesce · 10 = Reboot - Refers to doing a Shut Down and then moving to an Enabled state. · 11 = Reset — Indicates that the element is first Disabled and then Enabled. · 12 = Not Applicable · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>NOTE: When EnabledState is set to 5 (Not Applicable), then this property has no meaning. See the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p>
	<p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state.</p>

Property	Description
	<p>The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_BIOSService

Table 45. BIOSService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element. By default, the element is Enabled (value = 2).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled

Property	Description
EnabledState	<ul style="list-style-type: none"> • 3 = Disabled • 5 = Not Applicable • 6 = Enabled but Offline • 7 = No Default • 9 = Quiesce • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be running commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not run commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
Name	<p>The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.</p>
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested. The actual state of the element is represented by EnabledState.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates that the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved

Property	Description
	<p>This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. See the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates that the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
SetBIOSAttributes (Method)	<p>This method is called to modify a group of BIOSAttribute instances associated with this BIOSService. The method may return the following errors:</p> <ul style="list-style-type: none"> • 0 (Success) — If the method is completed successfully. • 1 (Failure) — If <ul style="list-style-type: none"> • the possible value is out of range. For example, trying to set value other than 0 to 23 for the attribute Autoon Hour. • it is an unsupported BIOS operation. For example, trying to enable TPM when TPM is disabled. • 2 (Authentication failure) — If the BIOS password is incorrect. • 4294967295 (Invalid Possible Value) — If the possible value is invalid; or read-only.
	The method may return an instance of CIM_Error.
RemoteBIOSUpdate (Method)	This method is called to remotely update the BIOS image. It takes the hdr file of the BIOS image as the only parameter.

DCIM_SoftwareInstallationService

Table 46. SoftwareInstallationService

Property	Description
CreationClassName	Indicates the name of the class or the subclass that is used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 2 = Enabled• 3 = Disabled• 5 = Not Applicable• 6 = Enabled but Offline• 7 = No Default• 9 = Quiesce• .. = DMTF Reserved• 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Other• 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests.• 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests.• 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state.• 5 = Not Applicable — Indicates the element does not support being enabled or disabled.• 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests.• 7 = In Test — Indicates that the element is in a test state.• 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests.• 9 = Quiesce — Indicates that the element is enabled but in a restricted mode.• 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued.• 11..32767 = DMTF Reserved• 32768..65535 = Vendor Reserved
Name	The Name property uniquely identifies the Service and provides an indication of the functionality that is managed. This functionality is described in more detail in the Description property of the object.
PrimaryOwnerContact	A string that provides information on how the primary owner of the Service can be reached (for example, phone number, e-mail address, and so on).
PrimaryOwnerName	The name of the primary owner for the service, if one is defined. The primary owner is the initial support contact for the Service.

Property	Description
PrimaryStatus	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. · 1 = OK — Indicates the ManagedElement is functioning normally. · 2 = Degraded — Indicates the ManagedElement is functioning below normal. · 3 = Error — Indicates the ManagedElement is in an Error condition. · .. = DMTF Reserved · 0x8000.. = Vendor Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the last requested state for the element is unknown. · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change · 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. · 7 = Test · 8 = Deferred · 9 = Quiesce · 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. · 11 = Reset — Indicates that the element is first Disabled and then Enabled. · 12 = Not Applicable · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
	<p>The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p>
	<p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p>
	<p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p>
	<p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p>
	<p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>
SystemCreationClassName	The CreationClassName of the scoping System.
SystemName	The Name of the scoping System.

Property	Description
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change — Indicates that no transition is in progress. • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset • 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions. <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>

DCIM_ComputerSystem

Table 47. ComputerSystem

Property	Description
CreationClassName	<p>Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.</p>
Dedicated	<p>Enumeration indicating the purpose(s) for which the ComputerSystem is dedicated, if any, and the functionality provided. For example, one could specify that the System is dedicated to Print (value = 11) or acts as a Hub (value = 8).</p> <p>Also, a value = 0 indicates this is a general purpose system, Not Dedicated but that it also hosts Print (value = 11) or mobile phone Mobile User Device (value = 17) services.</p> <p>A clarification is needed with respect to the value 17 (Mobile User Device). An example of a dedicated user device is a mobile phone or a barcode scanner in a store that communicates via radio frequency. These systems are quite limited in functionality and programmability, and are not considered general purpose computing platforms. Alternately, an example of a mobile system that is general purpose (that is, is NOT dedicated) is a hand-held computer. Although limited in its programmability, new software can be downloaded and its functionality expanded by the user.</p> <p>The management scope of a Management Controller is typically a single managed system in which it is contained.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Not Dedicated • 1 = Unknown • 2 = Other • 3 = Storage • 4 = Router • 5 = Switch • 6 = Layer 3 Switch • 7 = Central Office Switch • 8 = Hub • 9 = Access Server

Property	Description
	<ul style="list-style-type: none"> • 10 = Firewall • 11 = Print • 12 = I/O • 13 = Web Caching • 14 = Management — Indicates this instance is dedicated to hosting system management software. • 15 = Block Server • 16 = File Server • 17 = Mobile User Device • 18 = Repeater • 19 = Bridge/Extender • 20 = Gateway • 21 = Storage Virtualizer • 22 = Media Library • 23 = ExtenderNode • 24 = NAS Head • 25 = Self-contained NAS • 26 = UPS • 27 = IP Phone • 28 = Management Controller — Indicates this instance represents specialized hardware dedicated to systems management (i.e., a Baseboard Management Controller (BMC) or service processor). • 29 = Chassis Manager — Indicates this instance represents a system dedicated to management of a blade chassis and its contained devices. This value would be used to represent a Shelf Controller. A Chassis Manager is an aggregation point for management and may rely on subordinate management controllers for the management of constituent parts. • 30 = Host-based RAID controller — Indicates this instance represents a RAID storage controller contained within a host computer. • 31 = Storage Device Enclosure — Indicates this instance represents an enclosure that contains storage devices. • 32 = Desktop • 33 = Laptop • 34 = Virtual Tape Library — Is the emulation of a tape library by a Virtual Library System. • 35 = Virtual Library System — Uses disk storage to emulate tape libraries. • 36..32567 = DMTF Reserved • 32568..65535 = Vendor Reserved

ElementName A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.

NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.

EnabledDefault An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.

Possible values are:

- 2 = Enabled
- 3 = Disabled
- 5 = Not Applicable
- 6 = Enabled but Offline

Property	Description
	<ul style="list-style-type: none"> · 7 = No Default · 9 = Quiesce · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. · 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. · 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. · 5 = Not Applicable — Indicates the element does not support being enabled or disabled. · 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. · 7 = In Test — Indicates that the element is in a test state. · 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. · 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. · 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. · 11..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — The implementation cannot report on HealthState at this time. · 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. · 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. · 15 = Minor failure — All functionality is available but some may be degraded. · 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. · 25 = Critical failure — The element is non-functional and recovery may not be possible. · 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. · .. = DMTF Reserved
IdentifyingDescriptions	<p>An array of free-form strings providing explanations and details behind the entries in the OtherIdentifyingInfo array. Note, each entry of this array is related to the entry in OtherIdentifyingInfo that is located at the same index.</p>
Name	<p>The inherited Name serves as the key of a system instance in an enterprise environment.</p>

Property	Description
OperationalStatus	<p data-bbox="560 232 1437 286">Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p data-bbox="560 304 756 331">Possible values are:</p> <ul data-bbox="560 349 1485 1397" style="list-style-type: none"> <li data-bbox="560 349 735 376">• 0 = Unknown <li data-bbox="560 383 692 409">• 1 = Other <li data-bbox="560 416 671 443">• 2 = OK <li data-bbox="560 450 735 477">• 3 = Degraded <li data-bbox="560 483 1474 537">• 4 = Stressed - Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. <li data-bbox="560 544 1390 598">• 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. <li data-bbox="560 604 692 631">• 6 = Error <li data-bbox="560 638 871 665">• 7 = Non-Recoverable Error <li data-bbox="560 672 719 698">• 8 = Starting <li data-bbox="560 705 730 732">• 9 = Stopping <li data-bbox="560 739 1091 766">• 10 = Stopped — Implies a clean and orderly stop. <li data-bbox="560 772 1417 826">• 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. <li data-bbox="560 833 1401 887">• 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. <li data-bbox="560 893 1461 947">• 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable. <li data-bbox="560 954 1406 1008">• 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. <li data-bbox="560 1014 1273 1041">• 15 = Dormant — Indicates that the element is inactive or quiesced. <li data-bbox="560 1048 1466 1133">• 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. <li data-bbox="560 1140 1485 1279">• 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). <li data-bbox="560 1285 1485 1339">• 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. <li data-bbox="560 1346 804 1373">• .. = DMTF Reserved <li data-bbox="560 1379 890 1406">• 0x8000.. = Vendor Reserved <p data-bbox="560 1424 1485 1671">OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. This change was not made earlier because it required the deprecated qualifier. Due to the widespread use of the existing Status property in management applications, it is strongly recommended that providers or instrumentation provide both the Status and OperationalStatus properties. Further, the first value of OperationalStatus should contain the primary status for the element. When instrumented, Status (because it is single-valued) should also provide the primary status of the element.</p>
OtherIdentifyingInfo	<p data-bbox="560 1704 1485 1792">Captures additional data, beyond System Name information, that could be used to identify a ComputerSystem. One example would be to hold the Fibre Channel World-Wide Name (WWN) of a node.</p> <p data-bbox="560 1809 1485 1899">NOTE: If only the Fibre Channel name is available and is unique (able to be used as the System key), then this property would be NULL and the WWN would become the System key, its data placed in the Name property.</p>
PrimaryStatus	<p data-bbox="560 1928 1485 2011">Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p>

Property	Description
RequestedState	<p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. • 1 = OK — Indicates the ManagedElement is functioning normally. • 2 = Degraded — Indicates the ManagedElement is functioning below normal. • 3 = Error — Indicates the ManagedElement is in an Error condition. • .. = DMTF Reserved • 0x8000.. = Vendor Reserved
RequestedState	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — Indicates the last requested state for the element is unknown. • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 5 = No Change • 6 = Offline • 7 = Test • 8 = Deferred • 9 = Quiesce • 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. • 11 = Reset — Indicates that the element is first Disabled and then Enabled. • 12 = Not Applicable • .. = DMTF Reserved • 32768..65535 = Vendor Reserved <p>The actual state of the element is represented by EnabledState. TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = Enabled • 3 = Disabled

Property	Description
	<ul style="list-style-type: none"> 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions <p>A value other than 5 or 12 identifies the state to which the element is in the process of transitioning.</p>
RequestStateChange (Method)	<p>Requests that the state of the element be changed to the value specified in the RequestedState parameter. When the requested state change takes place, the EnabledState and RequestedState of the element will be the same. Invoking the RequestStateChange method multiple times could result in earlier requests being overwritten or lost.</p> <p>A return code of 0 shall indicate the state change was successfully initiated.</p> <p>A return code of 3 shall indicate that the state transition cannot complete within the interval specified by the TimeoutPeriod parameter.</p> <p>A return code of 4096 (0x1000) shall indicate the state change was successfully initiated, a ConcreteJob has been created, and its reference returned in the output parameter Job. Any other return code indicates an error condition.</p>

DCIM_RecordLog

Table 48. RecordLog

Property	Description
ElementName	<p>ElementName A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled 5 = Not Applicable 6 = Enabled but Offline 7 = No Default 9 = Quiesce .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>

Property	Description
EnabledState	<p>An integer enumeration that indicates the enabled and disabled states of an element. It can also indicate the transitions between these requested states. For example, shutting down (value = 4) and starting (value = 10) are transient states between enabled and disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved
HealthState	<p>Indicates the current health of the element. This attribute expresses the health of this element but not necessarily that of its subcomponents.</p> <p>DMTF has reserved the unused portion of the continuum for additional HealthStates in the future.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown — The implementation cannot report on HealthState at this time. • 5 = OK — The element is fully functional and is operating within normal operational parameters and without error. • 10 = Degraded/Warning — The element is in working order and all functionality is provided. However, the element is not working to the best of its abilities. For example, the element may not be operating at optimal performance or it may be reporting recoverable errors. • 15 = Minor failure — All functionality is available but some may be degraded. • 20 = Major failure — The element is failing. It is possible that some or all of the functionality of this component is degraded or not working. • 25 = Critical failure — The element is non-functional and recovery may not be possible. • 30 = Non-recoverable error — The element has completely failed, and recovery is not possible. All functionality provided by this element has been lost. • .. = DMTF Reserved
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world)</p>

Property	Description
LogState	<p>elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p> <p>LogState is an integer enumeration that indicates the current state of a log represented by CIM_Log subclasses. LogState is to be used in conjunction with the EnabledState property to fully describe the current state of the log.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the state of the log is unknown. · 2 = Normal — Indicates that the log is or could be executing logging commands, will process any queued log entries, and will queue new logging requests. · 3 = Erasing — Indicates that the log is being erased. · 4 = Not Applicable — Indicates the log does not support representing a log state. · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
MaxNumberOfRecords	<p>Maximum number of records that can be captured in the Log. If undefined, a value of zero should be specified.</p>
OperationalStatus	<p>Indicates the current statuses of the element. Various operational statuses are defined. Many of the enumeration's values are self-explanatory.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = OK · 3 = Degraded · 4 = Stressed — Indicates that the element is functioning, but needs attention. Examples of Stressed states are overload, overheated, and so on. · 5 = Predictive Failure — Indicates that an element is functioning nominally but predicting a failure in the near future. · 6 = Error · 7 = Non-Recoverable Error · 8 = Starting · 9 = Stopping · 10 = Stopped — Implies a clean and orderly stop · 11 = In Service — Describes an element being configured, maintained, cleaned, or otherwise administered. · 12 = No Contact — Indicates that the monitoring system has knowledge of this element, but has never been able to establish communications with it. · 13 = Lost Communication — Indicates that the ManagedSystem Element is known to exist and has been contacted successfully in the past, but is currently unreachable. · 14 = Aborted — Implies an abrupt stop where the state and configuration of the element may need to be updated. · 15 = Dormant — Indicates that the element is inactive or quiesced. · 16 = Supporting Entity in Error — Indicates that this element may be OK but that another element, on which it is dependent, is in error. An example is a network service or endpoint that cannot function due to lower-layer networking problems. · 17 = Completed — Indicates that the element has completed its operation. This value should be combined with either OK, Error, or Degraded so that a client can tell if the complete operation Completed with OK (passed), Completed with Error (failed), or Completed with Degraded (the operation finished, but it did not complete OK or did not report an error). · 18 = Power Mode — Indicates that the element has additional power model information contained in the Associated PowerManagementService association. · .. = DMTF Reserved

Property	Description
	<ul style="list-style-type: none"> · 0x8000.. = Vendor Reserved <p>OperationalStatus replaces the Status property on ManagedSystemElement to provide a consistent approach to enumerations, to address implementation needs for an array property, and to provide a migration path from today's environment to the future. <p>PrimaryStatus</p>	<p>Provides a high level status value, intended to align with Red-Yellow-Green type representation of status. It should be used in conjunction with DetailedStatus to provide high level and detailed health status of the ManagedElement and its subcomponents.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the implementation is in general capable of returning this property, but is unable to do so at this time. · 1 = OK — Indicates the ManagedElement is functioning normally. · 2 = Degraded — Indicates the ManagedElement is functioning below normal. · 3 = Error — Indicates the ManagedElement is in an Error condition. · .. = DMTF Reserved · 0x8000.. = Vendor Reserved
<p>RequestedState</p>	<p>An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown — Indicates the last requested state for the element is unknown. · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 5 = No Change · 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState. · 7 = Test · 8 = Deferred · 9 = Quiesce · 10 = Reboot — Refers to doing a Shut Down and then moving to an Enabled state. · 11 = Reset — Indicates that the element is first Disabled and then Enabled. · 12 = Not Applicable · .. = DMTF Reserved · 32768..65535 = Vendor Reserved <p>The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the</p>

Property	Description
	<p>EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11). Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 Not Applicable.</p>

TransitioningToState

Indicates the target state to which the instance is transitioning.

- 0 = Unknown
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change — indicates that no transition is in progress.
- 6 = Offline
- 7 = Test
- 8 = Defer
- 9 = Quiesce
- 10 = Reboot
- 11 = Reset
- 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions.

A value other than **5** or **12** identifies the state to which the element is in the process of transitioning.

DCIM_OperatingSystem

Table 49. OperatingSystem

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
CSCreationClassName	The scoping ComputerSystem's CreationClassName.
CSName	The scoping ComputerSystem's Name.
EnabledDefault	<p>An enumerated value indicating an administrator's default or startup configuration for the Enabled State of an element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 1 = Other

Property	Description
	<ul style="list-style-type: none"> • 2 = Enabled — Indicates that the element is or could be executing commands, will process any queued commands, and queues new requests. • 3 = Disabled — Indicates that the element will not execute commands and will drop any new requests. • 4 = Shutting Down — Indicates that the element is in the process of going to a Disabled state. • 5 = Not Applicable — Indicates the element does not support being enabled or disabled. • 6 = Enabled but Offline — Indicates that the element may be completing commands, and will drop any new requests. • 7 = In Test — Indicates that the element is in a test state. • 8 = Deferred — Indicates that the element may be completing commands, but will queue any new requests. • 9 = Quiesce — Indicates that the element is enabled but in a restricted mode. • 10 = Starting — Indicates that the element is in the process of going to an Enabled state. New requests are queued. • 11..32767 = DMTF Reserved • 32768..65535 = Vendor Reserved <p>By default, the element is Enabled (value = 2).</p>
LastBootUpTime	Time when the operating system was last booted.
LocalDateTime	Operating system's notion of the local date and time of day.
Name	The inherited Name serves as key of an operating system instance within a computer system.
OSType	<p>A integer indicating the type of operating system.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = MACOS • 3 = ATTUNIX • 4 = DGUX • 5 = DECNT • 6 = Tru64 UNIX • 7 = OpenVMS • 8 = HPUX • 9 = AIX • 10 = MVS • 11 = OS400 • 12 = OS/2 • 13 = JavaVM • 14 = MSDOS • 15 = WIN3x • 16 = WIN95 • 17 = WIN98 • 18 = WINNT • 19 = WINCE • 20 = NCR3000 • 21 = NetWare • 22 = OSF • 23 = DC/OS • 24 = Reliant UNIX • 25 = SCO UnixWare • 26 = SCO OpenServer

RequestedState

An integer enumeration that indicates the last requested or desired state for the element, irrespective of the mechanism through which it was requested.

Possible values are:

- 0 = Unknown — Indicates the last requested state for the element is unknown.
- 2 = Enabled
- 3 = Disabled
- 4 = Shut Down
- 5 = No Change
- 6 = Offline — Indicates that the element has been requested to transition to the Enabled but Offline EnabledState.
- 7 = Test
- 8 = Deferred
- 9 = Quiesce
- 10 = Reboot — Refers to doing a **Shut Down** and then moving to an **Enabled** state.
- 11 = Reset - Indicates that the element is first **Disabled** and then **Enabled**.

Property	Description
	<ul style="list-style-type: none"> 12 = Not Applicable .. = DMTF Reserved 32768..65535 = Vendor Reserved <p>The actual state of the element is represented by EnabledState. This property is provided to compare the last requested and current enabled or disabled states. Note that when EnabledState is set to 5 (Not Applicable), then this property has no meaning. Refer to the EnabledState property description for explanations of the values in the RequestedState enumeration.</p> <p>NOTE: The value No Change (5) has been deprecated instead of indicating the last requested state is Unknown (0). If the last requested or desired state is unknown, RequestedState should have the value Unknown (0), but may have the value No Change (5).</p> <p>There are two new values in RequestedState that build on the statuses of EnabledState. These are Reboot (10) and Reset (11).</p> <p>Shut Down requests an orderly transition to the Disabled state, and may involve removing power, to completely erase any existing state. The Disabled state requests an immediate disabling of the element, such that it will not execute or accept any commands or processing requests.</p> <p>This property is set as the result of a method invocation (such as Start or StopService on CIM_Service), or can be overridden and defined as WRITEable in a subclass. The method approach is considered superior to a WRITEable property, because it allows an explicit invocation of the operation and the return of a result code.</p> <p>If knowledge of the last RequestedState is not supported for the EnabledLogicalElement, the property is NULL or has the value 12 (Not Applicable).</p>
TransitioningToState	<p>Indicates the target state to which the instance is transitioning.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Enabled 3 = Disabled 4 = Shut Down 5 = No Change — Indicates that no transition is in progress. 6 = Offline 7 = Test 8 = Defer 9 = Quiesce 10 = Reboot 11 = Reset 12 = Not Applicable — Indicates the implementation does not support representing ongoing transitions.
Version	<p>A string describing the Operating System's version number. The format of the version information is as follows: <Major Number>.<Minor Number>.<Revision> or <Major Number>.<Minor Number>.<Revision Letter>.</p>

DCIM_SoftwareIdentity

Table 50. OperatingSystem

Property	Description
ClassificationDescriptions	<p>An array of free-form strings providing more detailed explanations for any of the entries in the Classifications array. Note that each entry is related to one in the Classifications array located at the same index.</p>

Property	Description
Classifications	<p>An array of enumerated integers that classify this software. For example, the software MAY be instrumentation (value = 5) or firmware and diagnostic software (10 and 7). The use of value 6, Firmware/BIOS, is being deprecated. Instead, either the value 10 (Firmware) and/or 11 (BIOS/FCode) SHOULD be used. The value 13, Software Bundle, identifies a software package consisting of multiple discrete software instances that can be installed individually or together.</p> <p>Each contained software instance is represented by an instance of SoftwareIdentity that is associated to this instance of SoftwareIdentityinstance via a Component association.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Driver · 3 = Configuration Software · 4 = Application Software · 5 = Instrumentation · 6 = Firmware/BIOS · 7 = Diagnostic Software · 8 = Operating System · 9 = Middleware · 10 = Firmware · 11 = BIOS/FCode · 12 = Support/Service Pack · 13 = Software Bundle · .. = DMTF Reserved · 0x8000..0xFFFF = Vendor Reserved
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <pre data-bbox="552 1473 759 1500"><OrgID> : <LocalID></pre> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
IsEntity	<p>The IsEntity property is used to indicate whether the SoftwareIdentity corresponds to a discrete copy of the software component or is being used to convey descriptive and identifying information about software that is not present in the management domain. A value of TRUE indicates that the SoftwareIdentity instance corresponds to a discrete copy</p>

Property	Description
	of the software component. A value of FALSE indicates that the SoftwareIdentity instance does not correspond to a discrete copy of the Software.
Manufacturer	Manufacturer of this software.
ReleaseDate	The date the software was released.
RevisionNumber	The revision or maintenance release component of the software's version information. For example, 3 from version 12.1(3)T. This property is defined as a numeric value to allow the determination of newer versus older releases. A newer revision is indicated by a larger numeric value.
TargetTypes	An array of strings that describes the compatible installer(s). The purpose of the array elements is to establish compatibility between a SoftwareIdentity and a SoftwareInstallationService that can install the SoftwareIdentity by comparing the values of the array elements of this property to the values of SoftwareInstallationServiceCapabilities.SupportedTargetTypes[] property's array elements.
VersionString	A string representing the complete software version information. For example, 12.1(3)T . This string and the numeric major/minor/revision/build properties are complementary. Since vastly different representations and semantics exist for versions, it is not assumed that one representation is sufficient to permit a client to perform computations (i.e., the values are numeric) and a user to recognize the software's version (i.e., the values are understandable and readable). Hence, both numeric and string representations of version are provided.

DCIM_BIOSElement

Table 51. BIOSElement

Property	Description
Manufacturer	The name used to identify this SoftwareElement. Manufacturer of this SoftwareElement.
Name	The name used to identify this SoftwareElement.
ReleaseDate	Date that this BIOS was released.
SoftwareElementID	This is an identifier for the SoftwareElement and is designed to be used in conjunction with other keys to create a unique representation of the element.
SoftwareElementState	<p>The SoftwareElementState is defined in this model to identify various states of a SoftwareElement's life cycle.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Deployable — Describes the details necessary to successfully distribute it and the details (Checks and Actions) required to move it to the installable state (i.e., the next state). • 1 = Installable — Describes the details necessary to successfully install it and the details (Checks and Actions) required to create an element in the executable state (i.e., the next state). • 2 = Executable — Describes the details necessary to successfully start it and the details (Checks and Actions) required to move it to the running state (i.e., the next state). • 3 = Running — Describes the details necessary to manage the started element.
TargetOperatingSystem	The TargetOperatingSystem property specifies the element's operating system environment. The value of this property does not ensure that it is binary executable. Two other pieces of information are needed. First, the version of the OS needs to be specified using the class, CIM_OSVersion Check. The second piece of information is the architecture that the OS runs on. This information is verified using CIM_ArchitectureCheck. The combination of these constructs clearly identifies the level of OS required for a particular SoftwareElement.

Property	Description
	Possible values are:
	<ul style="list-style-type: none"> <li data-bbox="542 280 1503 302">· 0 = Unknown <li data-bbox="542 302 1503 324">· 1 = Other <li data-bbox="542 324 1503 347">· 2 = MACOS <li data-bbox="542 347 1503 369">· 3 = ATTUNIX <li data-bbox="542 369 1503 392">· 4 = DGUX <li data-bbox="542 392 1503 414">· 5 = DECNT <li data-bbox="542 414 1503 436">· 6 = Tru64 UNIX <li data-bbox="542 436 1503 459">· 7 = OpenVMS <li data-bbox="542 459 1503 481">· 8 = HPUX <li data-bbox="542 481 1503 504">· 9 = AIX <li data-bbox="542 504 1503 526">· 10 = MVS <li data-bbox="542 526 1503 548">· 11 = OS400 <li data-bbox="542 548 1503 571">· 12 = OS/2 <li data-bbox="542 571 1503 593">· 13 = JavaVM <li data-bbox="542 593 1503 616">· 14 = MSDOS <li data-bbox="542 616 1503 638">· 15 = WIN3x <li data-bbox="542 638 1503 660">· 16 = WIN95 <li data-bbox="542 660 1503 683">· 17 = WIN98 <li data-bbox="542 683 1503 705">· 18 = WINNT <li data-bbox="542 705 1503 728">· 19 = WINCE <li data-bbox="542 728 1503 750">· 20 = NCR3000 <li data-bbox="542 750 1503 772">· 21 = NetWare <li data-bbox="542 772 1503 795">· 22 = OSF <li data-bbox="542 795 1503 817">· 23 = DC/OS <li data-bbox="542 817 1503 840">· 24 = Reliant UNIX <li data-bbox="542 840 1503 862">· 25 = SCO UnixWare <li data-bbox="542 862 1503 884">· 26 = SCO OpenServer <li data-bbox="542 884 1503 907">· 27 = Sequent <li data-bbox="542 907 1503 929">· 28 = IRIX <li data-bbox="542 929 1503 952">· 29 = Solaris <li data-bbox="542 952 1503 974">· 30 = SunOS <li data-bbox="542 974 1503 996">· 31 = U6000 <li data-bbox="542 996 1503 1019">· 32 = ASERIES <li data-bbox="542 1019 1503 1041">· 33 = HP NonStop OS <li data-bbox="542 1041 1503 1064">· 34 = HP NonStop OSS <li data-bbox="542 1064 1503 1086">· 35 = BS2000 <li data-bbox="542 1086 1503 1108">· 36 = LINUX <li data-bbox="542 1108 1503 1131">· 37 = Lynx <li data-bbox="542 1131 1503 1153">· 38 = XENIX <li data-bbox="542 1153 1503 1176">· 39 = VM <li data-bbox="542 1176 1503 1198">· 40 = Interactive UNIX <li data-bbox="542 1198 1503 1220">· 41 = BSDUNIX <li data-bbox="542 1220 1503 1243">· 42 = FreeBSD <li data-bbox="542 1243 1503 1265">· 43 = NetBSD <li data-bbox="542 1265 1503 1288">· 44 = GNU Hurd <li data-bbox="542 1288 1503 1310">· 45 = OS9 <li data-bbox="542 1310 1503 1332">· 46 = MACH Kernel <li data-bbox="542 1332 1503 1355">· 47 = Inferno <li data-bbox="542 1355 1503 1377">· 48 = QNX <li data-bbox="542 1377 1503 1400">· 49 = EPOC <li data-bbox="542 1400 1503 1422">· 50 = IxWorks <li data-bbox="542 1422 1503 1444">· 51 = VxWorks <li data-bbox="542 1444 1503 1467">· 52 = MiNT

	<ul style="list-style-type: none"> • 53 = BeOS • 54 = HP MPE • 55 = NextStep • 56 = PalmPilot • 57 = Rhapsody • 58 = Windows 2000 • 59 = Dedicated • 60 = OS/390 • 61 = VSE • 62 = TPF • 63 = Windows (R) Me • 64 = Caldera Open UNIX • 65 = OpenBSD • 66 = Not Applicable • 67 = Windows XP • 68 = z/OS • 69 = Microsoft Windows Server 2003 • 70 = Microsoft Windows Server 2003 64-Bit • 71 = Windows XP 64-Bit • 72 = Windows XP Embedded • 73 = Windows Vista • 74 = Windows Vista 64-Bit • 75 = Windows Embedded for Point of Service • 76 = Microsoft Windows Server 2008 • 77 = Microsoft Windows Server 2008 64-Bit
Version	Displays the version of the BIOS.

DCIM_ConcreteJob

Table 52. ConcreteJob

Property	Description
Description	Provides a textual description of the object.
ErrorCode	A vendor-specific error code. The value must be set to zero if the Job completed without error. Note that this property is also present in the JobProcessingStatistics class. This class is necessary to capture the processing information for recurring Jobs, because only the 'last' run error can be stored in this single-valued property.
ErrorDescription	A free-form string that contains the vendor error description. Note that this property is also present in the JobProcessingStatistics class. This class is necessary to capture the processing information for recurring Jobs, because only the last run error can be stored in this single-valued property.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon</p>

Property	Description
	to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.
JobRunTimes	The number of times that the Job should be run. A value of 1 indicates that the Job is not recurring, while any non-zero value indicates a limit to the number of times that the Job will recur. Zero indicates that there is no limit to the number of times that the Job can be processed, but that it is terminated either after the UntilTime or by manual intervention. By default, a Job is processed once.
JobStatus	A free-form string that represents the status of the job. The primary status is reflected in the inherited OperationalStatus property. JobStatus provides additional, implementation-specific details.
Name	The user-friendly name for this instance of a Job. In addition, the user-friendly name can be used as a property for a search or query.  NOTE: Name does not have to be unique within a namespace.
Priority	Indicates the urgency or importance of execution of the Job. The lower the number, the higher the priority. Note that this property is also present in the JobProcessingStatistics class. This class is necessary to capture the setting information that would influence the results of a job.
TimeBeforeRemoval	The amount of time that the Job is retained after it has finished executing, either succeeding or failing in that execution. The job must remain in existence for some period of time regardless of the value of the DeleteOnCompletion property. The default is five minutes.

DCIM_BootSourceSetting

Table 53. ConcreteJob

Property	Description
BIOSBootString	A string identifying the boot source which corresponds to the string used by the BIOS to uniquely name the boot source. For example, in systems which implement the BIOS Boot Specification, the string could correspond to the descString string for entries in the IPL Table or BCV Table.
ElementName	The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.  NOTE: The name does not have to be unique within a namespace.
FailThroughSupported	An enumeration indicating the behavior when the attempt to boot using the boot source fails (no media, timeout). Possible values are: <ul style="list-style-type: none"> · 0 = Unknown · 1 = Is Supported — Indicates that next boot source the boot order is used. · 2 = Not Supported — Indicates that the boot order is terminated and no other boot sources associated to the same CIM_BootConfigSetting are used). The default value is 1 (is supported).
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value

Property	Description
	of InstanceID should be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.

StructuredBootString

A string identifying the boot source using the format **<OrgID>:<identifier>:<index>**, in which neither <OrgID>, <identifier> or <index> contains a colon (:). The value of <OrgID> is a copyrighted, trademarked or otherwise unique name that is owned by the entity defining the <identifier>, or is a registered ID that is assigned to the entity by a recognized global authority. For DMTF defined identifiers, the <OrgID> is set to **CIM**.

The <identifiers> are:

- **Floppy**
- **Hard-Disk**
- **CD/DVD**
- **Network**
- **PCMCIA**
- **USB**

The value of <index> is a non-zero integer.

DCIM_BootConfigSetting

Table 54. BootConfigSetting

Property	Description
ElementName	The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.  NOTE: The name does not have to be unique within a namespace.
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.
ChangeBootOrder (Method)	This method is called to change the boot order within a boot configuration. An ordered array of BootSourceSetting instances is passed to this method. Each BootSourceSetting instance MUST already be associated with this BootConfigSetting instance via an instance

Property	Description
	of OrderedComponent. If not, the implementation MUST return a value of Invalid Parameter . Upon execution of this method, the value of the AssignedSequence property on each instance of OrderedComponent will be updated such that the values are monotonically increasing in correlation with the position of the referenced BootSourceSetting instance in the source input parameter. That is, the first position in the array will have the lowest value for AssignedSequence. The second position will have the second lowest value, and so on. For BootSourceSetting instances which are associated with the BootConfigSetting instance via OrderedComponent and not present in the input array, the AssignedSequence property on the OrderedComponent association will be assigned a value of 0 .

DCIM_IPAssignmentSettingData

Table 55. IPAssignmentSettingData

Property	Description
AddressOrigin	<p>AddressOrigin identifies the method by which the IP Address, Subnet Mask, and Gateway were assigned to the IPProtocolEndpoint.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Not Applicable — Indicates that the application of the IPAssignmentSettingData instance does not affect these properties. · 3 = Static — Indicates that values for the properties are contained in the IPAssignmentSettingData instance. · 4 = DHCP — Indicates that the values will be assigned via DHCP. · 5 = BOOTP — Indicates that the values will be assigned via BOOTP. · 6..32767 = DMTF Reserved · 32768.. = Vendor Reserved
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>

DCIM_PowerAllocationSettingData

Table 56. PowerAllocationSettingData

Property	Description
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
Limit	<p>This property specifies the upper bound, or maximum amount of resource that is granted for this allocation. For example, a system which supports memory paging may support setting the Limit of a Memory allocation below that of the VirtualQuantity, thus forcing paging to occur for this allocation.</p>
PowerAllocationSettingPurpose	<p>When power is consumed by or allocated to a ManagedSystemElement, there may be well-known or meaningful levels of allocation or consumption for the ManagedSystemElement. The PowerAllocationSettingPurpose property may be used to identify the well known level or provide context for the interpretation of the other values of the PowerAllocationSettingData instance. A value of MaxConAuxiliary indicates that the instance provides information about the maximum power allocated or consumed by the ManagedSystemElement as currently configured, while the ManagedSystemElement is turned off and drawing auxiliary power. Note that an alternate name for auxiliary power is trickle power.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 1 = Other• 2 = MaxConAuxiliary• 3 = MinWhenOn — Indicates the instance provides information about the minimum value for power consumption for which a configuration of the ManagedSystemElement exists such that when it is powered on and operating in that configuration, the power consumption of the ManagedSystemElement is guaranteed not to exceed the specified amount.• 4 = MaxAsConfigured — Indicates that the instance provides information about the maximum power that may be allocated to or consumed by the ManagedSystemElement as currently configured while powered on. The actual power consumed may be less.• 5 = MaxIfAllHotPlug — Indicates that the instance provides information about the maximum power allocated or consumed by the ManagedSystemElement if all components that could be added to the ManagedSystemElement without requiring a power cycle of the ManagedSystemElement were added to the ManagedSystemElement.• 6 = MaxIfAllColdPlug — Indicates that the instance provides information about the maximum power allocated or consumed by the ManagedSystemElement if all components that could be added to the ManagedSystemElement, including those that

Property	Description
	<p>require a power cycle of the ManagedSystemElement, were added to the ManagedSystemElement.</p> <ul style="list-style-type: none"> · 7 = Allocated — Indicates that the instance provides information about the current power allocated to the ManagedSystemElement. · 8 = MinWithoutDegradation — Indicates that the instance provides information about the minimum power allocated or consumed by the ManagedSystemElement without causing performance degradation. · .. = DMTF Reserved · 32768..65535 = Vendor Reserved
ResourceType	<p>The type of resource this allocation setting represents.</p>
	<p>Possible values are:</p> <ul style="list-style-type: none"> · 1 = Other · 2 = Computer System · 3 = Processor · 4 = Memory · 5 = IDE Controller · 6 = Parallel SCSI HBA · 7 = FC HBA · 8 = iSCSI HBA · 9 = IB HCA · 10 = Ethernet Adapter · 11 = Other Network Adapter · 12 = I/O Slot · 13 = I/O Device · 14 = Floppy Drive · 15 = CD Drive · 16 = DVD drive · 17 = Disk Drive · 18 = Tape Drive · 19 = Storage Extent · 20 = Other storage device · 21 = Serial port · 22 = Parallel port · 23 = USB Controller · 24 = Graphics controller · 25 = IEEE 1394 Controller · 26 = Partitionable Unit · 27 = Base Partitionable Unit · 28 = Power · 29 = Cooling Capacity · 30 = Ethernet Switch Port · 31 = Logical Disk · 32 = Storage Volume · 33 = Ethernet Connection · .. = DMTF reserved · 0x8000..0xFFFF = Vendor Reserved

DCIM_AssetAcquisition

Table 57. AssetAcquisition

Property	Description
CostCenter	Identifying information for the accounting unit within the purchasing company that authorized the purchase.
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p>NOTE: The name does not have to be unique within a namespace.</p>
InstallationDate	Date the system was put into service by the purchasing company.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> .<LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
PurchaseCost	<p>The Purchase Cost field accepts whole numbers only. Entering commas, decimal points, or dollar signs results in an error message. Value expressed in currency unit that was paid for the system, for example, 25000.</p> <p>Possible values are:</p> <ul style="list-style-type: none">0..32767 = DMTF Reserved32768..65535 = Vendor Reserved
PurchaseDate	Date the transaction for acquiring the system was completed.
ReferenceToDeliverySlip	<p>Identifying information for the waybill or delivery slip, such as a waybill number.</p> <p>Possible values are:</p> <ul style="list-style-type: none">0..32767 = DMTF Reserved32768..65535 = Vendor Reserved
ReferenceToPONumber	<p>Number of the purchase order that authorized buying the system.</p> <p>Possible values are:</p> <ul style="list-style-type: none">0..32767 = DMTF Reserved32768..65535 = Vendor Reserved

DCIM_AssetExtendedWarrantyInformation

Table 58. AssetExtendedWarrantyInformation

Property	Description
Cost	<p>Displays the total cost of the warranty service on a system.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
EndDate	<p>Displays the date that extended warranty service ends.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
ProviderName	<p>Displays the name of the business that is providing warranty service to the system owner.</p>
StartDate	<p>Displays the date that extended warranty service begins. This date usually follows the standard warranty service.</p>

DCIM_AssetOwnerInformation

Table 59. AssetOwnerInformation

Property	Description
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the</p>

Property	Description
	<Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.
InsuranceCompany	The company that insures the system against theft or other loss.
OwnerName	The individual or business entity that holds legal title to the system.
Type	The individual or business entity that holds legal title to the system. Type Whether the system is owned, rented, leased, managed by transfer, or off-lease. Possible values are: <ul style="list-style-type: none"> · 0 = Owned · 1 = Leased · 3 = Rented · 4 = Off Lease · 5..32767 = Transfer · 32768..65535 = DMTF Reserved
SetAssetOwnerInformation (Method)	This method allows the user to change the Insurance Company and Owner Name of the system.

DCIM_AssetSupportInformation

Table 60. AssetSupportInformation

Property	Description
AutomaticFix	Method used to fix the problem.
ElementName	The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.  NOTE: The name does not have to be unique within a namespace.
HelpDesk	Name of the help desk that provides technical support for your system;information provided by the help desk.
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm: <OrgID>:<LocalID> Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.

Property	Description
Outsourced	Indicates whether you have contracted with an outside business entity to provide technical support for your system.
Type	Indicates whether a support request is for a problem with your system's network connectivity or with a particular system component. Possible values are: <ul style="list-style-type: none"> · 0 = Network · 1 = Storage · 2..32767 = DMTF Reserved · 32768..65535 = Vendor Reserved

DCIM_AssetWarrantyInformation

Table 61. AssetWarrantyInformation

Property	Description
ElementName	The customer-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.  NOTE: The name does not have to be unique within a namespace.
Family	Family that the product belongs to. A family refers to a set of products that are similar but not identical from a hardware or software point of view. Typically, a family is composed of different products, which have different configurations and pricing points. Products in the same family often have similar branding and cosmetic features.
IdentifyingNumber	Service Tag of the chassis
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.
LastRefreshStatus	Indicates the last refresh status of Warranty information on device- Possible values are: <ul style="list-style-type: none"> · 0 = Success · 1 = Failure  NOTE: Failure can be due to Incorrect proxy settings, Internal Server Error, etc
LastRefreshed	Last timestamp when warranty information was attempted to refresh on the system.
Name	Service Level Description of the warranty entitlement.
WarrantyDuration	If this Product is under warranty, the duration of the warranty in days.

Property	Description
WarrantyEndDate	If this Product is under warranty, the end date of the warranty.
WarrantyStartDate	If this Product is under warranty, the start date of the warranty.

DCIM_AssetSystemInformation

Table 62. AssetSystemInformation

Property	Description
ChassisAssetTag	Chassis Asset Tag of the system.
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name>structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
PrimaryUserName	Text that provides the name for the person responsible for managing the system.
PrimaryUserPhone	Telephone number for the person responsible for managing the system.
SystemLocation	Alphanumeric text that specifies where the system is, such as building and room.
SystemName	Alphanumeric text that uniquely identifies the system.

DCIM_AMTSettings

Table 63. AMTSettings

Property	Description
AMTSupported	Defines if Intel AMT is supported.
Description	Provides a textual description of the object.
IDEREnabled	Defines if IDE redirection is enabled.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p>

Property	Description
	Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.
SOLEnabled	Defines if Serial Over LAN capability is enabled.

DCIM_ASFSettings

Table 64. ASFSettings

Property	Description
ASFEEnabled	Defines if Intel ASF is enabled.
Description	Provides a textual description of the object.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm: <OrgID>:<LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
StructureVersion	Defines the version of the Intel ASF structure.

DCIM_VProSettings

Table 65. VProSettings

Property	Description
BIOSSupportedMaximumVAVersion	Defines the maximum VA version supported by the BIOS. A value of 0 means the the highest version supported by BIOS is VA 2.6. A value of 1 means the the highest version supported by BIOS is VA 3.0.
Description	Provides a textual description of the object.
ElementName	The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.

Property	Description
	 NOTE: The name does not have to be unique within a namespace.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
LTTXTEnabledState	<p>Defines CPU LT/TXT enabled state for vPro brand.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SMXState	<p>Defines CPU SMX state for vPro brand.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SPIFlashhasPlatformDataRegionReserved	<p>Defines if SPI flash has a platform data region reserved.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
SupportedBIOSsetup	<p>SupportedBIOSsetup defines if BIOS setup properties are supported.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = SupportsMEinBIOSSetup — Defines if ME is supported in BIOS setup. • 3 = SupportsTPMinBIOSSetup — Defines if TPM is supported in BIOS setup. • 4 = SupportsTXTinBIOSSetup — Defines if TXT is supported in BIOS setup. • 5 = SupportsVAExtensions — Defines if VA extensions are supported by the BIOS. • 6 = SupportsVTdinBIOSSetup — Defines if VT-d is supported in BIOS setup. • 7 = SupportsVTxinBIOSSetup — Defines if VT-x is supported in BIOS setup • .. = DMTF Reserved • 32768..65535 = Vendor Reserved
TXTStateInMCHState	<p>Defines TXT state in MCH for vPro brand.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> 2 = Enabled 3 = Disabled .. = DMTF Reserved 32768..65535 = Vendor Reserved
VMXState	<p>Defines CPU VMX state for vPro brand.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled .. = DMTF Reserved 32768..65535 = Vendor Reserved
VProCharacteristics	<p>VProCharacteristics defines if VPro setup properties are supported.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = CPUSupportsVTx — CPUSupportsVTx:Defines if the CPU supports VT-x for vPro brand. 3 = MCHSupportForVTd — MCHSupportForVTd:Defines if the MCH supports TXT for vPro brand. 4 = LTTXTCapability — LTTXTCapability:Defines CPU LT/TXT capability for vPro brand. 5 = SupportsTPMOnBoard — SupportsTPMOnBoard:Defines if an on board TPM is supported for vPro brand. .. = DMTF Reserved 32768..65535 = Vendor Reserved
VTdState	<p>Defines VT-d state for vPro brand.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled .. = DMTF Reserved 32768..65535 = Vendor Reserved
VTxEnabledState	<p>Defines CPU VT-x state for vPro brand.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 2 = Enabled 3 = Disabled .. = DMTF Reserved 32768..65535 = Vendor Reserved

DCIM_AlertIndicationSettingData

Table 66. AlertIndicationSettingData

Property	Description
AlertCategory	<p>The identifying information of the entity (instance) for which this Indication is generated. The property contains the path of an instance, encoded as a string parameter — if the instance is modeled in the CIM Schema. If not a CIM instance, the property contains some identifying string that names the entity for which the Alert is generated. The path or identifying string is formatted per the AlertingElementFormat property.</p>
AlertType	<p>Primary classification of the Indication.</p> <p>Possible values are:</p>

Property	Description
	<ul style="list-style-type: none"> 1 = Other — The Indication's OtherAlertType property conveys its classification. Use of Other in an enumeration is a standard CIM convention. It means that the current Indication does not fit into the categories described by this enumeration. 2 = Communications Alert — An Indication of this type is principally associated with the procedures and/or processes required to convey information from one point to another. 3 = Quality of Service Alert — An Indication of this type is principally associated with a degradation or errors in the performance or function of an entity. 4 = Processing Error — An Indication of this type is principally associated with a software or processing fault. 5 = Device Alert — An Indication of this type is principally associated with an equipment or hardware fault. 6 = Environmental Alert — An Indication of this type is principally associated with a condition relating to an enclosure in which the hardware resides, or other environmental considerations. 7 = Model Change — The Indication addresses changes in the Information Model. For example, it may embed a Lifecycle Indication to convey the specific model change being alerted. 8 = Security Alert — An Indication of this type is associated with security violations, detection of viruses, and similar issues.
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
EventID	The identification number for events of this type.
IndicationIdentifier	An identifier for the Alert indication. This property is similar to a key value in that it can be used for identification, when correlating Alert indications (see the Correlated indications array). Its value should be unique as long as Alert correlations are reported, but may be reused or left NULL if no future Alert indications will reference it in their Correlated indications array.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.LocalOnly.</p>
LocalOnly	This property shows if the events from this the event source should be reported to the local indication consumer only or should be reported to CIMOM as an indication. TRUE for reporting to local consumer only, and FALSE for reporting as an indication.
MaxDisplayNotifications	The maximum number of indications of this type that will be sent to the local display.
MaxNTEventLogNotifications	The maximum number of indications of this type that will be sent to the local display.
Name	The label by which the Configuration object is known.

Property	Description
OtherAlertType	A string describing the Alert type - used when the Alert type property is set to 1, Other State Change .
PollEnabled	This property shows if status-polling of the event source is enabled or not. TRUE for enable, and FALSE for disabled.
PollingInterval	The polling interval for event source, in seconds.
ProbableCause	<p>An enumerated value that describes the probable cause of the situation which resulted in the AlertIndication.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = Unknown · 1 = Other · 2 = Adapter/Card Error · 3 = Application Subsystem Failure · 4 = Bandwidth Reduced · 5 = Connection Establishment Error · 6 = Communications Protocol Error · 7 = Communications Subsystem Failure · 8 = Configuration/Customization Error · 9 = Congestion · 10 = Corrupt Data · 11 = CPU Cycles Limit Exceeded · 12 = Dataset/Modem Error · 13 = Degraded Signal · 14 = DTE-DCE Interface Error · 15 = Enclosure Door Open · 16 = Equipment Malfunction · 17 = Excessive Vibration · 18 = File Format Error · 19 = Fire Detected · 20 = Flood Detected · 21 = Framing Error · 22 = HVAC Problem · 23 = Humidity Unacceptable · 24 = I/O Device Error · 25 = Input Device Error · 26 = LAN Error · 27 = Non-Toxic Leak Detected · 28 = Local Node Transmission Error · 29 = Loss of Frame · 30 = Loss of Signal · 31 = Material Supply Exhausted · 32 = Multiplexer Problem · 33 = Out of Memory · 34 = Output Device Error · 35 = Performance Degraded · 36 = Power Problem · 37 = Pressure Unacceptable · 38 = Processor Problem (Internal Machine Error) · 39 = Pump Failure · 40 = Queue Size Exceeded · 41 = Receive Failure · 42 = Receiver Failure · 43 = Remote Node Transmission Error

Property**Description**

-
- 44 = Resource at or Nearing Capacity
 - 45 = Response Time Excessive
 - 46 = Retransmission Rate Excessive
 - 47 = Software Error
 - 48 = Software Program Abnormally Terminated
 - 49 = Software Program Error (Incorrect Results)
 - 50 = Storage Capacity Problem
 - 51 = Temperature Unacceptable
 - 52 = Threshold Crossed
 - 53 = Timing Problem
 - 54 = Toxic Leak Detected
 - 55 = Transmit Failure
 - 56 = Transmitter Failure
 - 57 = Underlying Resource Unavailable
 - 58 = Version MisMatch
 - 59 = Previous Alert Cleared
 - 60 = Login Attempts Failed
 - 61 = Software Virus Detected
 - 62 = Hardware Security Breached
 - 63 = Denial of Service Detected
 - 64 = Security Credential MisMatch
 - 65 = Unauthorized Access
 - 66 = Alarm Received
 - 67 = Loss of Pointer
 - 68 = Payload Mismatch
 - 69 = Transmission Error
 - 70 = Excessive Error Rate
 - 71 = Trace Problem
 - 72 = Element Unavailable
 - 73 = Element Missing
 - 74 = Loss of Multi Frame
 - 75 = Broadcast Channel Failure
 - 76 = Invalid Message Received
 - 77 = Routing Failure
 - 78 = Backplane Failure
 - 79 = Identifier Duplication
 - 80 = Protection Path Failure
 - 81 = Sync Loss or Mismatch
 - 82 = Terminal Problem
 - 83 = Real Time Clock Failure
 - 84 = Antenna Failure
 - 85 = Battery Charging Failure
 - 86 = Disk Failure
 - 87 = Frequency Hopping Failure
 - 88 = Loss of Redundancy
 - 89 = Power Supply Failure
 - 90 = Signal Quality Problem
 - 91 = Battery Discharging
 - 92 = Battery Failure
 - 93 = Commercial Power Problem
 - 94 = Fan Failure
 - 95 = Engine Failure
 - 96 = Sensor Failure
 - 97 = Fuse Failure

Property	Description
	<ul style="list-style-type: none"> • 98 = Generator Failure • 99 = Low Battery • 100 = Low Fuel • 101 = Low Water • 102 = Explosive Gas • 103 = High Winds • 104 = Ice Buildup • 105 = Smoke • 106 = Memory Mismatch • 107 = Out of CPU Cycles • 108 = Software Environment Problem • 109 = Software Download Failure • 110 = Element Reinitialized • 111 = Timeout • 112 = Logging Problems • 113 = Leak Detected • 114 = Protection Mechanism Failure • 115 = Protecting Resource Failure • 116 = Database Inconsistency • 117 = Authentication Failure • 118 = Breach of Confidentiality • 119 = Cable Tamper • 120 = Delayed Information • 121 = Duplicate Information • 122 = Information Missing • 123 = Information Modification • 124 = Information Out of Sequence • 125 = Key Expired • 126 = Non-Repudiation Failure • 127 = Out of Hours Activity • 128 = Out of Service • 129 = Procedural Error • 130 = Unexpected Information
StartDelay	The start delay before polling the event source, in seconds.

DCIM_HDDAlertIndicationSettingData

Table 67. HDDAlertIndicationSettingData

Property	Description
ElementName	<p>The user-friendly name for this instance of SettingData. In addition, the user-friendly name can be used as an index property for a search or query.</p> <p> NOTE: The name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the</p>

Property	Description
	<Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.

DCIM_BaseMetricValue

Table 68. BaseMetricValue

Property	Description
Duration	Property that represents the time duration over which this metric value is valid. This property should not exist for timestamps that apply only to a point in time but should be defined for values that are considered valid for a certain time period (ex. sampling). If the Duration property exists and is non null, the TimeStamp is to be considered the end of the interval.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
MetricDefinitionId	The key of the BaseMetricDefinition instance for this CIM_BaseMetricValue instance value.
MetricValue	The value of the metric represented as a string. Its original data type is specified in CIM_BaseMetricDefinition.
TimeStamp	Identifies the time when the value of a metric instance is computed. Note that this is different from the time when the instance is created. For a given CIM_BaseMetricValue instance, the TimeStamp changes whenever a new measurement snapshot is taken if Volatile is true. A managment application may establish a time series of metric data by retrieving the instances of CIM_BaseMetricValue and sorting them according to their TimeStamp.
Volatile	If true, Volatile indicates that the value for the next point in time may use the same object and just change its properties (such as the value or timestamp). If false, the existing objects remain unchanged and a new object is created for the new point in time.

DCIM_LogEntry

Table 69. LogEntry

Property	Description
CreationTimeStamp	A LogEntry may include a timestamp for the entry.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
RecordData	<p>A string containing LogRecord data. If the corresponding RecordFormat property is <empty>, or cannot be parsed according to the recommended format, RecordData should be interpreted as a free-form string. If the RecordFormat property contains parseable format information (as recommended in the RecordFormat Description qualifier), the RecordData string SHOULD be parsed in accordance with this format. In this case, RecordData SHOULD begin with the delimiter character and this character SHOULD be used to separate substrings in the manner described. The RecordData string can then be parsed by the data consumer and appropriately typed.</p>
RecordFormat	<p>A string describing the data structure of the information in the property, RecordData. If the RecordFormat string is <empty>, RecordData should be interpreted as a free-form string.</p> <p>To describe the data structure of RecordData, the RecordFormat string should be constructed as follows:</p>
RecordID	<p>RecordID may be used to provide a representation of log entry ordering or pointers/handles for log entries.</p>

DCIM_IndicatorLEDCapabilities

Table 70. IndicatorLEDCapabilities

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p>

Property	Description
	<p data-bbox="542 224 766 257"><OrgID> : <LocalID></p> <p data-bbox="542 268 1503 616">Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
<p data-bbox="97 627 414 660">SupportedActivationStates</p>	<p data-bbox="542 627 1503 705">SupportedActivationStates indicates the supported activation states for the associated IndicatorLED. See CIM_IndicatorLED.ActivationState for descriptions of the values.</p> <p data-bbox="542 716 766 750">Possible values are:</p> <ul data-bbox="542 761 798 952" style="list-style-type: none"> <li data-bbox="542 761 654 795">· 2 = Lit <li data-bbox="542 795 702 828">· 3 = Blinking <li data-bbox="542 828 654 862">· 4 = Off <li data-bbox="542 862 798 896">· 5 = Control Pattern <li data-bbox="542 896 798 929">· .. = DMTF Reserved <li data-bbox="542 929 941 952">· 32768..65535 = Vendor Reserved
<p data-bbox="97 952 319 985">SupportedColors</p>	<p data-bbox="542 952 1503 1030">This property indicates the colors supported by the associated instance of CIM_IndicatorLED.</p> <p data-bbox="542 1041 766 1075">Possible values are:</p> <ul data-bbox="542 1086 941 1422" style="list-style-type: none"> <li data-bbox="542 1086 686 1120">· 1 = Other <li data-bbox="542 1120 686 1153">· 3 = White <li data-bbox="542 1153 670 1187">· 4 = Red <li data-bbox="542 1187 686 1220">· 5 = Green <li data-bbox="542 1220 670 1254">· 6 = Blue <li data-bbox="542 1254 702 1288">· 7 = Orange <li data-bbox="542 1288 686 1321">· 8 = Yellow <li data-bbox="542 1321 686 1355">· 9 = Black <li data-bbox="542 1355 798 1388">· .. = DMTF Reserved <li data-bbox="542 1388 941 1422">· 32768..65535 = Vendor Reserved
<p data-bbox="97 1422 414 1456">SupportedControlModes</p>	<p data-bbox="542 1422 1503 1500">SupportedControlModes indicates the control modes supported for the LED. See CIM_IndicatorLED.CurrentControlMode for more information.</p> <p data-bbox="542 1512 766 1545">Possible values are:</p> <ul data-bbox="542 1556 798 1724" style="list-style-type: none"> <li data-bbox="542 1556 734 1590">· 2 = Automatic <li data-bbox="542 1590 702 1624">· 3 = Manual <li data-bbox="542 1624 670 1657">· 4 = Test <li data-bbox="542 1657 798 1691">· .. = DMTF Reserved <li data-bbox="542 1691 941 1724">· 32768..65535 = Vendor Reserved
<p data-bbox="97 1724 414 1758">SupportedControlPatterns</p>	<p data-bbox="542 1724 1503 2007">SupportedControlPatterns describes the control patterns supported by the associated LED. The values of SupportedControlPatterns may be an exact match for values allowed for CIM_IndicatorLED.ControlPatterns or may indicate general categories of behavior. The interpretation of value is specific to the business entity identified by <OrgID>. Each value of SupportedControlPatterns is constructed using the following preferred algorithm: <OrgID>::<<Pattern>Where <OrgID> and < Pattern> are separated by two colons (::), and where <OrgID> includes a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the ControlPattern or that is a registered ID assigned to the business entity by a recognized global authority. <Pattern> is</p>

Property	Description
	chosen by the business entity and is not reused to identify different underlying (real-world) behaviors. If the behavior specified for the LED adheres to a standard or proprietary specification, <Pattern> is a uniquely assigned value identifying the behavior. If the behavior for the LED is described using a standard or proprietary grammar, <Pattern> is prefixed with a uniquely assigned identifier for the grammar.
SupportedIndicatedConditions	<p>The conditions that may be indicated by the LED. See CIM_IndicatorLED.IndicatedCondition for a description of the values.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 1 = Other · 3 = Location · 4 = Attention · 5 = Activity · 6 = Powered On · 7 = Fault · .. = DMTF Reserved · 32768..65535 = Vendor Reserved

DCIM_ProcessorCapabilities

Table 71. ProcessorCapabilities

Property	Description
ElementNameEditSupported	Boolean indicating whether the ElementName can be modified.
ElementNameMask	This string expresses the restrictions on ElementName. The mask is expressed as a regular expression. See DMTF standard ABNF with the Profile Users Guide, appendix C for the regular expression syntax permitted. Since the ElementNameMask can describe the maximum length of the ElementName, then the requirements expressed in this property takes precedence of any length expressed in MaxElementNameLen.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>
NumberOfHardwareThreads	Number of hardware threads available for the processor. May be obtained from SMBIOS v2.5 4 offset 25h.
NumberOfProcessorCores	Number of processor cores available for processor. This number would not include cores disabled by hardware and may be obtained from SMBIOS 2.5 Type 4 offset 23h.

DCIM_AccountManagementCapabilities

Table 72. AccountManagementCapabilities

Property	Description
AccountManagementCapabilitiesElementNameEditSupported	Boolean indicating whether the ElementName can be modified.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm:</p> <p><OrgID>:<LocalID></p> <p>Where <OrgID> and <LocalID>are separated by a colon ':', and where MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema_Name>_<Class_Name>structure of Schema class names.) In addition, to ensure uniqueness MUST NOT contain a colon (':'). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the <OrgID>set to 'CIM'.</p>
OperationsSupported	<p>OperationsSupported describes the type of operations that are supported for an Account associated with the AccountManagementService.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = Create — Indicates the AccountManagementService may be used to create new accounts. · 3 = Modify — Indicates that the associated Accounts may be modified. · 4 = Delete — Indicates that associated Accounts may be deleted. · .. = DMTF Reserved · 0x8000..0xFFFF = Vendor Reserved

DCIM_BootServiceCapabilities

Table 73. BootServiceCapabilities

Property	Description
BootStringsSupported	<p>An enumeration indicating the boot string properties in the CIM_BootSourceSetting which are supported. If the array contains a value, then all the BootSourceSetting instances managed by the service are guaranteed to have a non-null value for the corresponding property. Since this is an array, multiple values may be specified.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = BootString · 3 = BIOSBootString · 4 = StructuredBootString
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p>NOTE: Name does not have to be unique within a namespace.</p>
ElementNameEditSupported	Boolean indicating whether the ElementName can be modified.

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID> and <LocalID> are separated by a colon ':', and where <OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (':'). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the <OrgID> set to 'CIM'.</p>

DCIM_PlatformWatchdogServiceCapabilities

Table 74. PlatformWatchdogServiceCapabilities

Property	Description
ActionOnExpirationSupported	<p>ActionOnExpirationSupported indicates the actions which can be performed when the watchdog timer expires. See CIM_PlatformWatchdogService.ActionOnExpiration for a description of the values.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = None - Status Only · 3 = System Reset · 4 = System Power Off · 5 = System Power Off, then On · 6 = Generate System NonMaskableInterrupt (NMI) · 7 = Generate System Management Interrupt (SMI) · 8 = Reset Monitored Entity
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p> NOTE: Name does not have to be unique within a namespace.</p>
ElementNameEditSupported	<p>Boolean indicating whether the ElementName can be modified.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID> set to CIM.</p>

Property	Description
LastExpirationDataSupported	LastExpirationDataSupported indicates the data which is provided on the last expiration of the watchdog timer. The values in the enumeration are: A value set to 2 (Time) indicates that the time of the last expiration is provided.
RequestedStatesSupported	RequestedStatesSupported indicates the possible states that can be requested when using the method RequestStateChange on the EnabledLogicalElement. Possible values are: <ul style="list-style-type: none"> · 2 = Enabled · 3 = Disabled · 4 = Shut Down · 6 = Offline · 7 = Test · 8 = Defer · 9 = Quiesce · 10 = Reboot · 11 = Reset
WatchdogTimerDataSupported	WatchdogTimerDataSupported indicates the data which is provided on the value of the watchdog timer. Possible values are: <ul style="list-style-type: none"> · 2 = Current Value — Indicates that the time of the current value of the timer is provided. · 3 = Timer Resolution — Indicates that the timer resolution for the last expiration is provided.

DCIM_DHCPCapabilities

Table 75. DHCPCapabilities

Property	Description
ElementName	The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as an index property for a search of query.  NOTE: Name does not have to be unique within a namespace.
ElementNameEditSupported	Boolean indicating whether the ElementName can be modified.
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.

DCIM_PowerUtilizationManagementCapabilities

Table 76. PowerUtilizationManagementCapabilities

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
RequiredCustomSettings	<p>Array of custom power utilization algorithm settings required by the RequestPowerUtilizationAlgorithm and RequestPowerUtilizationAlgorithmEl methods' CustomSettingNames parameter, if the RequestedAlgorithm parameter has value of 2 (Custom Settings Based).</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = CPUPowerMode • 3 = MemoryPowerMode • 4 = OtherMemoryPowerMode • 5 = FanPowerMode
SupportedMethods	<p>Each enumeration corresponds to support for the like-named method of the MetricService.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • .. = DMTF Reserved • 32768 = RequestPowerUtilizationLimit • 32769 = RequestPowerUtilizationAlgorithm • 32770 = RequestPowerUtilizationAlgorithmEl • 32771..65535 = Vendor Specific
SupportedRequestedAlgorithms	<p>Array of power utilization algorithms supported by the RequestPowerUtilizationAlgorithm and RequestPowerUtilizationAlgorithmEl methods RequestedAlgorithm parameter of the associated Service.</p>
SupportedUtilizationLimitUnits	<p>Array of programmatic units for power utilization limit supported by the RequestPowerUtilizationLimit method's UtilizationLimit parameter.</p>

DCIM_EnabledLogicalElementCapabilities

Table 77. EnabledLogicalElementCapabilities

Property	Description
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p>

Property	Description
	 NOTE: Name does not have to be unique within a namespace.
ElementNameEditSupported	Boolean indicating whether the ElementName can be modified.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
RequestedStatesSupported	<p>RequestedStatesSupported indicates the possible states that can be requested when using the method RequestStateChange on the EnabledLogicalElement.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset

DCIM_ButtonCapabilities

Table 78. ButtonCapabilities

Property	Description
ElementNameEditSupported	Boolean indicating whether the ElementName can be modified.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other</p>

Property	Description
	providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.
RequestedStatesSupported	<p>RequestedStatesSupported indicates the possible states that can be requested when using the method RequestStateChange on the EnabledLogicalElement.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = Enabled • 3 = Disabled • 4 = Shut Down • 6 = Offline • 7 = Test • 8 = Defer • 9 = Quiesce • 10 = Reboot • 11 = Reset

DCIM_LCDPanelCapabilities

Table 79. LCDPanelCapabilities

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
SupportedDisplayDataCategories	<p>Identifies the category of data to be displayed on the LCD Panel.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 2 = None • 3 = User Specified • 4 = Default • 5 = IPv4 Address • 6 = IDRAC MAC Address • 7 = Service Tag • 8 = System Name • 9 = IPv6 Address • 10 = Ambient • 11 = System Power

DCIM_PowerManagementCapabilities

Table 80. PowerManagementCapabilities

Property	Description
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p> NOTE: Name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
PowerChangeCapabilities	<p>An enumeration indicating the specific power-related capabilities of a managed element. Since this is an array, multiple values may be specified.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = Power Saving Modes Entered Automatically — Indicates that a managed element can change its power state based on usage or other criteria • 3 = Power State Settable — Indicates that the RequestPowerStateChange method is supported • 4 = Power Cycling Supported — Indicates that the RequestPowerStateChange method can be invoked with the PowerState input variable set to Power Cycle (Off Soft) • 5 = Timed Power On Supported — Indicates that the RequestPowerStateChange method can be invoked with the PowerState input variable set to 'Power On' and the Time parameter set to a specific date and time, or interval, for power on. • 6 = Off Hard Power Cycling Supported • 7 = HW Reset Supported • 8 = Graceful Shutdown Supported — Indicates that the managed element can be sent a hardware signal requesting an orderly shutdown prior to the requested power state change.
PowerStatesSupported	<p>An enumeration that indicates the power states supported by a managed element. Because this is an array, multiple values can be specified. The current values in the enumeration are:</p> <ul style="list-style-type: none"> • 2 = On — Corresponds to ACPI state G0 or S0 or D0. • 3 = Sleep - Light — C orresponds to ACPI state G1, S1/S2, or D1. • 4 = Sleep - Deep — Ccorresponds to ACPI state G1, S3, or D2. • 5 = Power Cycle (Off - Soft) — Corresponds to ACPI state G2, S5, or D3, but where the managed element is set to return to power state On at a pre-determined time. • 6 = Off — Hard, corresponding to ACPI state G3, S5, or D3. • 7 = Hibernate (Off - Soft) — Corresponds to ACPI state S4, where the state of the managed element is preserved and will be recovered upon powering on. • 8 = Off — Soft, corresponding to ACPI state G2, S5, or D3.

Property	Description
	<ul style="list-style-type: none"> 9 = Power Cycle (Off-Hard) — Corresponds to the managed element reaching the ACPI state G3 followed by ACPI state S0. 10 = Master Bus Reset, corresponds to the system reaching ACPI state S5 followed by ACPI state S0. This is used to represent system master bus reset. 11 = Diagnostic Interrupt (NMI) — Corresponds to the system reaching ACPI state S5 followed by ACPI state S0. This is used to represent system non-maskable interrupt. 12 = Off - Soft Graceful — Equivalent to Off Soft but preceded by a request to the managed element to perform an orderly shutdown. 13 = Off - Hard Graceful — Equivalent to Off Hard but preceded by a request to the managed element to perform an orderly shutdown. 14 = Master Bus Rest Graceful — Equivalent to Master Bus Reset but preceded by a request to the managed element to perform an orderly shutdown. 15 = Power Cycle (Off - Soft Graceful) — Equivalent to Power Cycle (Off - Soft) but preceded by a request to the managed element to perform an orderly shutdown. 16 = Power Cycle (Off - Hard Graceful) — Equivalent to Power Cycle (Off - Hard) but preceded by a request to the managed element to perform an orderly shutdown. .. = DMTF Reserved. 0x7FFF..0xFFFF = Vendor Specific.

DCIM_PhysicalAssetCapabilities

Table 81. PhysicalAssetCapabilities

Property	Description
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p> NOTE: Name does not have to be unique within a namespace.</p>
FRUInfoSupported	<p>Boolean indicating whether the PartNumber, Serial Number, Model, Manufacturer, and SKU properties of PhysicalElement are non-null, non-blank values, and the availability of the complete FRU information.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>

DCIM_RoleBasedManagementCapabilities

Table 82. RoleBasedManagementCapabilities

Property	Description
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p> NOTE: Name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
SharedPrivilegeSupported	<p>Set to TRUE if this PrivilegeManagementService supports association of multiple subjects or targets to a particular Privilege. If False, the AssignAccess method supports at most one entry each in the Subjects and Targets parameters.</p>

DCIM_AllocationCapabilities

Table 83. AllocationCapabilities

Property	Description
ElementName	<p>The user friendly name for this instance of Capabilities. In addition, the user friendly name can be used as a index property for a search of query.</p> <p> NOTE: Name does not have to be unique within a namespace.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (!:), and where <OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (!:). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the 'preferred' algorithm MUST be used with the <OrgID> set to 'CIM'.</p>
ResourceType	<p>The type of resource this allocation setting represents.</p>

Property**Description**

Possible values are:

- 1 = Other
- 2 = Computer System
- 3 = Processor
- 4 = Memory
- 5 = IDE Controller
- 6 = Parallel SCSI HBA
- 7 = FC HBA
- 8 = iSCSI HBA
- 9 = IB HCA
- 10 = Ethernet Adapter
- 11 = Other Network Adapter
- 12 = I/O Slot
- 13 = I/O Device
- 14 = Floppy Drive
- 15 = CD Drive
- 16 = DVD drive
- 17 = Disk Drive
- 18 = Tape Drive
- 19 = Storage Extent
- 20 = Other Storage Device
- 21 = Serial port
- 22 = Parallel port
- 23 = USB Controller
- 24 = Graphics controller
- 25 = IEEE 1394 Controller
- 26 = Partitionable Unit
- 27 = Base Partitionable Unit
- 28 = Power
- 29 = Cooling Capacity
- 30 = Ethernet Switch Port
- 31 = Logical Disk
- 32 = Storage Volume
- 33 = Ethernet Connection
- .. = DMTF reserved
- 0x8000..0xFFFF = Vendor Reserved

SharingMode

Indicates how access to underlying resource is granted.

Possible values are:

- 0 = Unknown
- 1 = Other
- 2 = Dedicated — Exclusive access to underlying resource
- 3 = Shared — Shared use of underlying resource.
- .. = DMTF reserved
- 0x8000..0xFFFF = Vendor Reserved

Actual quantity is controlled by min, max size, weights, and so on.

DCIM_BIOSServiceCapabilities

Table 84. BIOSServiceCapabilities

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <OrgID>and <LocalID> are separated by a colon ':', and where <OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (':'). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID>and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the <OrgID> set to 'CIM'.</p>
MethodsSupported	<p>This property advertises the methods that are supported by the service .</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 0 = SetBIOSAttribute · 1 = RestoreBIOSDefaults · 2 = SetBIOSAttributeEmbeddedInstance · 3 = ReadRawBIOSData · 4 = WriteRawBIOSData · 5 = SetBIOSAttributes · 6..65535 = DMTF Reserved · 65536..4294967295 = Vendor Specified

DCIM_SoftwareInstallationServiceCapabilities

Table 85. SoftwareInstallationServiceCapabilities

Property	Description
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>
SupportedAsynchronousActions	<p>Enumeration indicating what operations will be executed as asynchronous jobs. If an operation is included in both this and SupportedSynchronousActions then the underlying implementation is indicating that it may or may not create a job. If a Job is created, then the</p>

Property	Description
	<p>methods in SoftwareInstallationService return a reference to that Job as the Job parameter.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = Defer target/system reset · 3 = Force installation · 4 = Install · 5 = Update · 6 = Repair · 7 = Reboot · 8 = Password · 9 = Uninstall · 10 = Log · 11 = SilentMode · 12 = AdministrativeMode · .. = DMTF Reserved · 32768..65535 = Vendor Specific
SupportedInstallOptions	<p>An enumeration indicating the specific install related options supported by this service. Since this is an array, multiple values may be specified. See the InstallOptions parameter of the SoftwareInstallationService.InstallFromSoftwareIdentity method for the description of these values.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = Defer target/system reset · 3 = Force installation · 4 = Install · 5 = Update · 6 = Repair · 7 = Reboot · 8 = Password · 9 = Uninstall · 10 = Log · 11 = SilentMode · 12 = AdministrativeMode · .. = DMTF Reserved · 32768..65535 = Vendor Specific
SupportedTargetTypes	<p>An array containing a list of SoftwareIdentity.TargetType properties that this service 'knows' how to install. TargetType is an application specific string which is invariant across version or name changes of the SoftwareIdentity and so can be used by a client to select Software Identities compatible with this service. If the service is generic (for example an OS installer), this array will be empty.</p>
SupportedURISchemes	<p>This property lists the URI schemes supported by the SoftwareInstallationService.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = data · 3 = file · 4 = ftp · 5 = http · 6 = https · 7 = nfs · 8 = tftp · .. = DMTF Reserved · 0x8000..0xFFFF = Vendor Specific

DCIM_ConcreteCollection

Table 86. ConcreteCollection

Property	Description
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.</p>

DCIM_RedundancySet

Table 87. RedundancySet

Property	Description
ElementName	<p>ElementName A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon</p>

Property	Description
	to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.
MinNumberNeeded	MinNumberNeeded indicates the smallest number of elements that MUST be operational in order to function. For example, in an N+1 redundancy relationship, the MinNumberNeeded property is set equal to N. In a 'LimitedSparing' environment, this property is meaningless and SHOULD be set to zero.
RedundancyStatus	RedundancyStatus provides information on the state of the RedundancyGroup. Possible values are: <ul style="list-style-type: none"> 0 = Unknown 1 = DMTF Reserved 2 = Fully Redundant — Indicates that all of the configured redundancy is still available 3 = Degraded Redundancy — Indicates that some configured elements are degraded, missing or failed but that the number of elements in the set is still greater than the minimum required (MinNumberNeeded); 4 = Redundancy Lost — Indicates that sufficient configured elements are missing or failed that no redundancy is available and the next failure experienced will cause overall failure. 5 = Overall Failure — Indicates that there has been an overall failure of the RedundancySet.
TypeOfSet	TypeOfSet provides information on the type of redundancy. - N+1 (=2) indicates all members are active, are unaware and function independent of one another. However, there exist at least one extra member to achieve functionality. Sparing is implied (i.e. each member can be a spare for the other(s)). An example of N+1 is a system that has 2 power supplies, but needs only 1 power supply to functioning properly. Possible values are: <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = N+1 3 = Load Balanced — Indicates all members are active. However, their functionality is not independent of each other. Their functioning is determined by some sort of load balancing algorithm (implemented in hardware and/or software). Sparing is implied (i.e. each member can be a spare for the other(s)). 4 = Sparing — Indicates that all members are active and are aware of each others. However, their functionality is independent until failover. Each member can be a spare for the other(s). 5 = Limited Sparing — Indicates that all members are active, and they may or may not be aware of each and they are not spares for each other. Instead, their redundancy is indicated by the IsSpare relationship. .. = DMTF Reserved 0x8000.. = Vendor Reserved

DCIM_Role

Table 88. Role

Property	Description
CommonName	A Common Name is a (possibly ambiguous) name by which the role is commonly known in some limited scope (such as an organization) and conforms to the naming conventions of the country or culture with which it is associated.

Property	Description
CreationClassName	Indicates the name of the class or the subclass used in the creation of an instance. When used with the other key properties of this class, this property allows all instances of this class and its subclasses to be uniquely identified.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
Name	The Name property defines the label by which the object is known. In the case of an LDAP-derived instance, the Name property value may be set to the distinguished name of the LDAP-accessed object instance.
RoleCharacteristics	<p>RoleCharacteristics provides descriptive information about the intended usage of the Role.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> · 2 = Static · 3 = Opaque · .. = DMTF Reserved · 32000..65535 = Vendor Specific <p>When the value 2 Static is specified, no modification to the role is allowed. Any requests by client to change the privileges or the scope of the role by modifying the associated instances of CIM_Privilege or referencing associations fails.</p> <p>When the value 2 Static is not specified, the instance of CIM_Role may be modified by a client. The modification may include changing the scope of the role or rights granted. When the value 3 Opaque is specified, the rights granted by the CIM_Role instance is not explicitly modeled through aggregation of instances of CIM_Privilege.</p> <p>When the value 3 Opaque is not specified, the rights granted by the instance of CIM_Role is explicitly modeled through aggregation of instances of CIM_Privilege.</p>

DCIM_IndicationSettingCollection

Table 89. IndicationSettingCollection

Property	Description
ElementName	Human user oriented identifier for this instance.
InstanceID	<p>Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. To ensure uniqueness within the NameSpace, the value of InstanceID should be constructed using the following preferred algorithm:</p> <p><OrgID> : <LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon (:), and where <OrgID> must include a copyrighted, trademarked, or otherwise unique name that is owned by the business entity that is creating or defining the InstanceID or that is a registered ID assigned to the business entity by a recognized global authority. (This requirement is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness, <OrgID> must not contain a colon (:). When using this algorithm, the first colon to appear in InstanceID must appear between <OrgID> and <LocalID> . <LocalID> is chosen by the business entity and should not be reused to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity must assure that the resulting InstanceID is not reused across any InstanceIDs produced by this or other</p>

Property	Description
	providers for the NameSpace of this instance. For DMTF-defined instances, the preferred algorithm must be used with the <OrgID>set to CIM.
Name	The name of the product-defined event sources.
OccurrencesCount	Defines TXT state in MCH for vPro brand (on/off).

DCIM_ConfigurationCapacity

Table 90. ConfigurationCapacity

Property	Description
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
Increment	Increment in which Elements must be added or removed.
MaximumCapacity	Maximum number of Elements of type, ObjectType, that may be installed.
Name	The inherited Name serves as a part of the Configuration Capacity object key.
ObjectType	<p>The type of object (power supply, fan, disk drive, ...) whose capacities are indicated. This information is part of the class' key.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Other • 1 = Processors • 2 = Power Supplies • 3 = Fans • 4 = Batteries • 5 = I/O Slots • 6 = Memory Slots • 7 = MediaAccessDevices (Drives) • 8 = StorageMediaLocation Slots • 9 = StorageMediaLocation Magazines • 10 = StorageMediaLocation Panels • 11 = StorageMediaLocation InterLibrary Ports • 12 = StorageMediaLocation Limited Access Ports • 13 = Doors • 14 = MediaTransferDevice Pickers • 15 = MediaTransferDevice Changers • 16 = LabelReaders • 17 = Contained Chassis • 18 = Connected Chassis • 19 = Connected Frames • 20 = Front Side I/O Slots • 21 = Back Side I/O Slots • 22 = Cache Memory • 23 = NVS Memory

Property	Description
	<ul style="list-style-type: none"> 24 = Volatile Memory 25 = Multi-Purpose
UsedCapacity	This property defines the total capacity in use.
VendorCompatibilityStrings	<p>An array of strings that identifies the compatibility of the elements within the configuration capacity. This allows vendors to provide information to the system administrators by providing sufficient information to request the appropriate hardware that can populate the configuration. In order to ensure uniqueness within the NameSpace, each value defined by the vendor for use in the VendorCompatibilityStrings property SHOULD be constructed using the following preferred algorithm:</p> <p><OrgID>:<LocalID></p> <p>Where <OrgID> and <LocalID> are separated by a colon ':', and where <OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (':'). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID>and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements.</p>

DCIM_Location

Table 91. Location

Property	Description
Address	Address is a free-form string indicating a street, building, or other type of address for the location of the PhysicalElement.
Altitude	The altitude at which the managed resource is located.
Building	Free form string identifying the building in which the managed element resides.
Campus	Free form string identifying the campus in which the managed element resides.
ChangeableType	<p>Enumeration indicating intended usage of the DCIM_Location instance.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Not Changeable — Persistent — Indicates the instance of DCIM_Location reports read only location information and is not modifiable. 1 = Changeable — Transient — Indicates the DCIM_Location reports location information that may be modified by the client but is not persisted. 2 = Changeable — Persistent — Indicates the DCIM_Location reports location information that may be modified by the client that is persisted. 3 = Not Changeable — Transient — Indicates the instance of DCIM_Location reports read only location information and is not modifiable.
City	Free form string identifying the city in which the managed element resides.
Country	Free form string identifying the Countryin which the managed element resides.
ElementName	Human user oriented identifier for this instance.
Floor	Free form string identifying the floor in which the managed element resides.
GPSLatitude	The latitude at which the managed resource is located.

Property	Description
GPSLongitude	The longitude at which the managed resource is located.
MaxStringLength	If ChangeableType has the value 1 or 2 , MaxStringLength specifies the maximum length for any property that may be modified by a client.
Name	Name is a free-form string defining a label for the Location. It is a part of the key for the object.
PhysicalPosition	Position is a free-form string that indicates the placement of a PhysicalElement. It can specify slot information on a HostingBoard, mounting site in a Cabinet, or latitude and longitude information, for example, from a GPS. It is part of the key of the Location object.
PostalCode	Free form string specifying postal code in which the managed element resides.
Province	Free form string identifying the province in which the managed element resides.
Rack	Free form string identifying the rack in which the managed element resides.
RackCluster	Free form string identifying the rack cluster in which the managed element resides.
RackTheta	Free form string identifying the rack theta.
RackUnit	A rack unit is a standard measurement of height used to denote the amount of space a physical component occupies in a rack. Rack capacity may be expressed in terms rack units. When used to indicate location, rack units indicate an offset from the bottom of rack. Thus RackUnit identifies a particular offset from the bottom of the rack that is occupied by the managed resource. It is implementation-specific whether the rack unit reported is the highest, lowest, or intermediate rack unit occupied by the managed resource.
Row	Free form string identifying the row in which the managed element resides.
State	Free form string identifying the state in which the managed element resides.
StreetAddressOne	Free form string for the first line of a street address.
StreetAddressTwo	Free form string for the second line of a street address. Uses of this property include consistency with form based address entry, or if the number of characters in the street address exceed MaxStringLength.
SetLocation (Method)	This method allows you to change the physical location of the system.

DCIM_BIOSEnumeration

Table 92. BIOSEnumeration

Property	Description
AttributeName	A string identifying the structured element name for a BIOS attribute using the format <OrgID> : <identifier> in which <OrgID>, does contain a colon (:). The value of <OrgID> is a copyrighted, trademarked or otherwise unique name that is owned by the entity defining the <identifier>, or is a registered ID that is assigned to the entity by a recognized global authority. For DMTF defined identifiers, the <OrgID> is set to DMTF and the <identifier> is specified in the BIOS Attribute Registry. <identifier>
CurrentValue	An array of strings representing the current value or values of the BIOS Attribute.
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm: <OrgID> : <LocalID> Where <LocalID> and <OrgID> are separated by a colon :, and where

Property	Description
	<OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (:). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the <OrgID> set to CIM .
IsReadOnly	This property specifies if the underlying system BIOS or BIOSService will not allow the Attribute to be modified through calls to the methods CIM_BIOSService.SetBIOSAttribute or CIM_BIOSService.SetBIOSDefaults. This does not mean the Attribute can not be modified through other means. Only that the CIM interface is not capable of making a change.
PossibleValues	An array of strings containing possible value definitions for the Attribute. The first element SHOULD not be NULL and there SHOULD be no NULL or empty string elements intermixed with populated array element values. A Value of NULL indicates an element's value is unknown.
PossibleValuesDescription	An array of free-form strings providing explanations and details behind the entries in the CIM_BIOSEnumeration.PossibleValues array. Note that each entry of this array is related to the entry in PossibleValues array that is located at the same index.

DCIM_BIOSPassword

Table 93. BIOSPassword

Property	Description	Supported Operating System(s)
AttributeName	A string identifying the structured element name for a BIOS attribute using the format <OrgID> : <identifier> in which <OrgID> , does contain a colon (:). The value of <OrgID> is a copyrighted, trademarked or otherwise unique name that is owned by the entity defining the <identifier>, or is a registered ID that is assigned to the entity by a recognized global authority. For DMTF defined identifiers, the <OrgID> is set to DMTF and the <identifier> is specified in the BIOS Attribute Registry.	Microsoft Windows, Linux
CurrentValue	CurrentValue returns an empty array.	Microsoft Windows, Linux
ElementName	A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.  NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.	Microsoft Windows, Linux
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm: <OrgID> : <LocalID>Where <OrgID> and <LocalID> are separated by a colon ' : ', and where <OrgID> MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized	Microsoft Windows, Linux

Property	Description	Supported Operating System(s)
	global authority (This is similar to the <Schema Name>_<Class Name> structure of Schema class names.) In addition, to ensure uniqueness <OrgID> MUST NOT contain a colon (:). When using this algorithm, the first colon to appear in InstanceID MUST appear between <OrgID> and <LocalID>. <LocalID> is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the <OrgID> set to CIM .	
MaxLength	This property specifies the maximum string length allowed when modifying this BIOS attribute. A value of NULL defines the maximum length is unknown. A value of 0 defines the maximum length as 18446744073709551615, the limitation of the property definition as uint64.	Microsoft Windows, Linux
MinLength	This property specifies the minimum string length allowed when modifying this BIOS attribute. A value of NULL is defined as zero.	Microsoft Windows, Linux
PendingValue	PendingValue returns an empty array.	Microsoft Windows

DCIM_BIOSString

Table 94. BIOSString

Property	Description
AttributeName	A string identifying the structured element name for a BIOS attribute using the format (:) in which , does contain a colon (:). The value of is a copyrighted, trademarked or otherwise unique name that is owned by the entity defining the , or is a registered ID that is assigned to the entity by a recognized global authority. For DMTF defined identifiers, the is set to DMTF and the is specified in the BIOS Attribute Registry.
CurrentValue	An array of strings representing the current value or values of the BIOS Attribute.
InstanceID	Within the scope of the instantiating Namespace, InstanceID opaquely and uniquely identifies an instance of this class. In order to ensure uniqueness within the NameSpace, the value of InstanceID SHOULD be constructed using the following preferred algorithm: :Where and are separated by a colon (:), and where MUST include a copyrighted, trademarked or otherwise unique name that is owned by the business entity creating/ defining the InstanceID, or is a registered ID that is assigned to the business entity by a recognized global authority (This is similar to the _ structure of Schema class names.) In addition, to ensure uniqueness MUST NOT contain a colon (:). When using this algorithm, the first colon to appear in InstanceID MUST appear between and . is chosen by the business entity and SHOULD not be re-used to identify different underlying (real-world) elements. If the above preferred algorithm is not used, the defining entity MUST assure that the resultant InstanceID is not re-used across any InstanceIDs produced by this or other providers for this instance's NameSpace. For DMTF defined instances, the preferred algorithm MUST be used with the set to CIM .
MaxLength	This property specifies the maximum string length allowed when modifying this BIOS attribute. A value of NULL defines the maximum length is unknown. A value of 0 defines the maximum length as 18446744073709551615, the limitation of the property definition as uint64.
StringType	The StringType property provides management applications with information defining implementation's capabilities regarding string values. A value of ASCII indicates a plain text formatting with no tabs formatting or bolds, plain text. A value of hex indicates a simple encoding of the numerals 0 to 9 and the letters A to F and is not case sensitive. A value of unicode indicates fully multi-lingual text support. A string BIOS Attribute with value of regex

Property	Description
	<p>is a regular expression and the CIM_BIOSString.ValueExpression is applied to values represented and any value that is attempted to be set by invoking SetBIOSAttribute().</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 2 = ASCII • 3 = hex • 4 = unicode • 5 = regex .. = DMTF Reserved • 65536..4294967295 = Vendor Reserved

DCIM_MemoryError

Table 95. MemoryError

Property	Description
DeviceCreationClassName	The scoping StorageExtent's CreationClassName.
DeviceID	The scoping StorageExtent's DeviceID.
ElementName	<p>A user-friendly name for the object. This property allows each instance to define a user-friendly name in addition to its key properties, identity data, and description information.</p> <p>NOTE: The Name property of ManagedSystemElement is also defined as a user-friendly name. But, it is often subclassed to be a Key. It is not reasonable that the same property can convey both identity and a user-friendly name, without inconsistencies. Where Name exists and is not a Key (such as for instances of LogicalDevice), the same information can be present in both the Name and ElementName properties.</p>
ErrorInfo	<p>An integer enumeration describing the type of error that occurred most recently. For example, single (value = 6) or double bit errors (7) can be specified using this property. The values, 12 – 14, are undefined in the CIM Schema since in DMI, they mix the semantics of the type of error and whether it was correctable or not. The latter is indicated in the property, CorrectableError.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = OK • 3 = Bad Read • 4 = Parity Error • 5 = Single-Bit Error • 6 = Double-Bit Error • 7 = Multi-Bit Error • 8 = Nibble Error • 9 = Checksum Error • 10 = CRC Error • 32768 = DIMM Disabled via Spare Activation
StartingAddress	Specifies the address of the memory error. The type of error is described by the ErrorInfo property. If the ErrorInfo property is equal to 3, OK , then this property has no meaning.
SystemCreationClassName	The scoping System's CreationClassName.
SystemName	The scoping System's Name.

DCIM_IdentityContext

Table 96. IdentityContext

Property	Description
ElementInContext	An Identity whose context is defined.
ElementProvidingContext	The ManagedElement that provides context or scope for the Identity.

DCIM_OrderedComponent

Table 97. OrderedComponent

Property	Description
AssignedSequence	<p>AssignedSequence is an unsigned integer n that indicates the relative order of ManagedElement instances. When n is a positive integer, it indicates a place in the sequence of members, with smaller integers indicating earlier positions in the sequence. The special value 0 indicates don't care. If two or more members have the same non-zero sequence number, then the ordering between those members is irrelevant, but they must all be ordered at the appropriate place in the overall sequence. A series of examples will make ordering of members clearer: If all members have the same sequence number, regardless of whether it is 0 or non-zero, any order is acceptable. o The values: 1:MEMBER A 2:MEMBER B 1:MEMBER C 3:MEMBER D indicate two acceptable orders: A,C,B,D or C,A,B,D, since A and C can be ordered in either sequence, but only at the 1 position.</p> <p>NOTE: The non-zero sequence numbers need not start with 1, and they need not be consecutive. All that matters is their relative magnitude.</p>
GroupComponent	The parent element in the association.
PartComponent	The child element in the association.

DCIM_Container

Table 98. Container

Property	Description
GroupComponent	The PhysicalPackage that contains other PhysicalElements, including other Packages.
LocationWithinContainer	A free-form string representing the positioning of the PhysicalElement within the PhysicalPackage. Information relative to stationary elements in the Container (for example, second drive bay from the top), angles, altitudes and other data may be recorded in this property. This string could supplement or be used in place of instantiating the CIM_Location object.
PartComponent	The PhysicalElement which is contained in the Package.

DCIM_ConcreteComponent

Table 99. ConcreteComponent

Property	Description
GroupComponent	The parent element in the association.
PartComponent	The child element in the association.

DCIM_SystemDevice

Table 100. SystemDevice

Property	Description
GroupComponent	The aggregating system also provides name scoping for the Account.
PartComponent	The subordinate Account.

DCIM_AccountOnSystem

Table 101. AccountOnSystem

Property	Description
GroupComponent	The aggregating system also provides name scoping for the Account.
PartComponent	The subordinate Account.

DCIM_InstalledOS

Table 102. InstalledOS

Property	Description
GroupComponent	The ComputerSystem.
PartComponent	The OperatingSystem installed on the ComputerSystem.
PrimaryOS	Boolean indicating that the OperatingSystem is the default OS for the ComputerSystem.

DCIM_SystemBIOS

Table 103. SystemBIOS

Property	Description
GroupComponent	The ComputerSystem that boots from the BIOS.
PartComponent	The System's BIOS.

DCIM_SystemComponent

Table 104. SystemComponent

Property	Description
GroupComponent	The parent System in the Association.
PartComponent	The child element that is a component of a System.

DCIM_SettingsDefineCapabilities

Table 105. SettingsDefineCapabilities

Property	Description
GroupComponent	The Capabilities instance.
PartComponent	A Setting used to define the associated Capabilities instance.
PropertyPolicy	<p>PropertyPolicy defines whether or not the non-null, non-key properties of the associated SettingData instance are treated independently or as a correlated set. For instance, an independent set of maximum properties may be defined, when there is no relationship between each property. On the other hand, several correlated sets of maximum properties may need to be defined when the maximum values of each are dependent on some of the others.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Independent• 1 = Correlated• 2.. = DMTF Reserved
ValueRange	<p>The ValueRange property indicates further semantics on the interpretation of all non-null, non-key properties of the Component SettingData. Minimums, Maximums, and Increments, are only evaluated against non-null, non-key, non-enumerated, non-boolean, numeric properties of the SettingData instance. Each property of that set is mathematically comparable to other instances of that property.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Point — Indicates that this SettingData instance provides a single set of values.• 1 = Minimums — Indicates that this SettingData instance provides minimum values for evaluated properties. When used with PropertyPolicy = Independent, only one such setting per particular SettingData instance is specified for any Capabilities. Unless restricted by a Maximums on the same set of properties, all values that compare higher than the specified values are also considered to be supported by the associated capabilities instance.• 2 = Maximums — Indicates that this SettingData instance provides maximum values for evaluated properties. When used with PropertyPolicy = Independent, only one such setting per particular SettingData instance is specified for any Capabilities. Unless restricted by a Minimums on the same set of properties, all values that compare lower than the specified values are also considered to be supported by the associated capabilities instance.• 3 = Increments — Indicates that this SettingData instance provides increment values for evaluated properties. For the associated Capabilities, if an evaluated property currently has no corresponding minimums or maximums, then the property has no affect. Otherwise, for each evaluated property: its value x is between the minimum and maximum, inclusively, and has the property that both the result of maximum minus x and the result of x minus minimum are each an integer multiple of the increment. If either minimum or maximum is not specified and the other is, then the missing value is respectively assumed to be the lowest or highest supported value for the property's data-type. Additionally, if both a minimum and a maximum are specified for an evaluated property, then the result of maximum minus minimum is an integer multiple of the increment.• 4.. = DMTF Reserved
ValueRole	<p>The ValueRole property indicates further semantics on the interpretation of the non-null, non-key properties of the Component SettingData.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Default — Indicates that property values of the component SettingData instance will be used as default values, when a new SettingData instance is created for elements whose capabilities are defined by the associated Capabilities instance. Across instances

Property	Description
	<p>of settingdata, for particular properties having the same semantic purpose, at most one such settingdata instance is specified as a default.</p> <ul style="list-style-type: none"> • 1 = Optimal — Indicates that the SettingData instance represents optimal setting values for elements associated with the associated capabilities instance. Multiple component SettingData instances may be declared as optimal. • 2 = Mean — Indicates that the non-null, non-key, non-enumerated, non-boolean, numeric properties of the associated SettingData instance represents an average point along some dimension. For different combinations of SettingData properties, multiple component SettingData instances may be declared as Mean. • 3 = Supported — Indicates that the non-null, non-key properties of the Component SettingData instance represents a set of supported property values that are not otherwise qualified. • 4.. = DMTF Reserved

DCIM_DeviceSAPImplementation

Table 106. DeviceSAPImplementation

Property	Description
Antecedent	The LogicalDevice.
Dependent	The ServiceAccessPoint implemented using the LogicalDevice.

DCIM_HostedAccessPoint

Table 107. HostedAccessPoint

Property	Description
Antecedent	The hosting System.
Dependent	The SAPs that are hosted on this System.

DCIM_HostedCollection

Table 108. HostedCollection

Property	Description
Antecedent	The scoping system.
Dependent	The collection defined in the context of a system.

DCIM_HostedService

Table 109. HostedService

Property	Description
Antecedent	The hosting System.
Dependent	The Service hosted on the System.

DCIM_VideoHeadOnController

Table 110. VideoHeadOnController

Property	Description
Antecedent	The video device that includes the head.
Dependent	The head on the video device.

DCIM_SAPSAPDependency

Table 111. SAPSAPDependency

Property	Description
Antecedent	The required ServiceAccessPoint.
Dependent	The ServiceAccessPoint that is dependent on an underlying SAP.

DCIM_ReferencedProfile

Table 112. ReferencedProfile

Property	Description
Antecedent	The RegisteredProfile that is referenced by the Dependent Profile.
Dependent	A RegisteredProfile that references other profiles.

DCIM_MetricDefForME

Table 113. MetricDefForME

Property	Description
Antecedent	The CIM_ManagedElement that can have metrics of this type associated with it.
Dependent	A CIM_BaseMetricDefinition for a CIM_ManagedElement.
MetricCollectionEnabled	<p>MetricCollectionEnabled indicates whether the metric defined by the referenced CIM_BaseMetricDefinition is being collected for the referenced CIM_ManagedElement.</p> <p>Possible values are:</p> <ul style="list-style-type: none">· 2 = Enabled — Indicates the metric is being collected.· 3 = Disabled — Indicates the metric is not being collected.· 4 = Reserved .. = DMTF Reserved· 32768..65535 = Vendor Reserved <p>When collection of a metric is reenabled, the metric is re-initialized such that any values for a current access metric reflect data collected after the time at which collection was reenabled.</p>
RecordedSince	<p>If a metric is being collected for an instance of CIM_ManagedElement, the RecordedSince indicates when the capturing of the metric began. If MetricCollectionEnabled is 3 (Disabled), the RecordedSince property has a value of 99990101000000.000000+000. A value of NULL indicates the beginning of the metric capture period is unknown.</p>

DCIM_MetricForME

Table 114. MetricForME

Property	Description
Antecedent	ManagedElement to which the metric values belong.
Dependent	A metric value for the ManagedElement.

DCIM_MetricInstance

Table 115. MetricInstance

Property	Description
Antecedent	The CIM_BaseMetricDefinition for this particular CIM_BaseMetricValue.
Dependent	A CIM_BaseMetricValue instance holding the Value.

DCIM_ElementInConnector

Table 116. ElementInConnector

Property	Description
Antecedent	The Connector into which the Element is inserted.
Dependent	The Element in the Connector.

DCIM_Docked

Table 117. Docked

Property	Description	Supported Operating System(s)
Antecedent	The Docking Station Chassis.	Microsoft Windows, Linux
Dependent	The System Chassis.	Microsoft Windows, Linux

DCIM_ConcreteDependency

Table 118. ConcreteDependency

Property	Description
Antecedent	Antecedent represents the independent object in this association.
Dependent	Dependent represents the object that is dependent on the Antecedent.

DCIM_Realizes

Table 119. Realizes

Property	Description
Antecedent	The physical component that implements the Device.

Property	Description
Dependent	The LogicalDevice.

DCIM_ComputerSystemPackage

Table 120. ComputerSystemPackage

Property	Description
Antecedent	Antecedent The PhysicalPackage(s) that realize a Unitary ComputerSystem.
Dependent	The UnitaryComputerSystem.
PlatformGUID	A Globally Unique Identifier for the System's Package.

DCIM_RunningOS

Table 121. RunningOS

Property	Description
Antecedent	The OperatingSystem currently running on the ComputerSystem.
Dependent	The ComputerSystem.

DCIM_UseOfLog

Table 122. UseOfLog

Property	Description
Antecedent	The Log.
Dependent	The ManagedSystemElement whose information is recorded in the Log.
RecordedData	A free-form string describing the use of the Log by the ManagedSystemElement.

DCIM_AssociatedIndicatorLED

Table 123. AssociatedIndicatorLED

Property	Description
Antecedent	The ManagedSystemElement that has an associated LED.
Dependent	The LED.

DCIM_AssociatedCacheMemory

Table 124. AssociatedCacheMemory

Property	Description
Antecedent	Memory installed on or associated with a Device.

Property	Description
Associativity	<p>An integer enumeration defining the system cache associativity. For example, 5 indicates a fully associative cache.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Direct Mapped 3 = 2-way Set-Associative 4 = 4-way Set-Associative 5 = Fully Associative 6 = 8-way Set-Associative 7 = 16-way Set-Associative
CacheType	<p>Defines whether this is for instruction caching (value = 2), data caching (value = 3) or both (value = 4, Unified). Also, Other (1) and Unknown (0) can be defined.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Instruction 3 = Data 4 = Unified
Dependent	The LogicalElement.
ReadPolicy	<p>Policy that is employed by the Cache for handling read requests. For example, Read, Read-Ahead or both can be specified using the values, 2, 3 or 4, respectively. If the read policy is determined individually (ie, for each request), then the value 5 (Determination per I/O) should be specified. Other (1) and Unknown (0) are also valid values.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Read 3 = Read-Ahead 4 = Read and Read-Ahead 5 = Determination Per I/O
WritePolicy	<p>Defines whether this is write-back (value = 2) or write-through (value = 3) Cache, or whether this information Varies with Address (4) or is defined individually for each I/O (5). Also, Other and Unknown (0) can be specified.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 1 = Other 2 = Read 3 = Read-Ahead 4 = Read and Read-Ahead 5 = Determination Per I/O

DCIM_AssociatedSensor

Table 125. AssociatedSensor

Property	Description
Antecedent	The Sensor.

Property	Description
Dependent	The ManagedSystemElement for which information is measured by the Sensor.

DCIM_RemoteAccessAvailableToElement

Table 126. RemoteAccessAvailableToElement

Property	Description
Antecedent	The remote server or system.
Dependent	The EnabledLogicalElement which has knowledge of the remote server or system.
IsDefault	Indicates that this access information is defined as a default configuration for the system.
OrderOfAccess	When an element is accessing remote services and systems, it MAY be necessary to order those accesses. This property defines that ordering — where lower numbers indicate a higher priority for access. A value of 0 (default) indicates that ordering does not apply. If multiple RemoteAccessPoint instances have the same value for OrderOfAccess, then these AccessPoints MAY be used in any sequence defined by the implementation.

DCIM_ServiceServiceDependency

Table 127. ServiceServiceDependency

Property	Description
Antecedent	The required Service
Dependent	The Service that is dependent on an underlying Service.

DCIM_DeviceConnection

Table 128. DeviceConnection

Property	Description
Antecedent	A LogicalElement's Software Asset.
Dependent	The ManagedElement that requires or uses the software.

DCIM_ElementSoftwareIdentity

Table 129. ElementSoftwareIdentity

Property	Description
Antecedent	A LogicalElement's Software Asset.
Dependent	The ManagedElement that requires or uses the software.

DCIM_ElementCapabilities

Table 130. ElementCapabilities

Property	Description
Capabilities	The Capabilities object associated with the element.
ManagedElement	The managed element.

DCIM_ElementSettingData

Table 131. ElementSettingData

Property	Description
IsCurrent	<p>An enumerated integer that indicates that the referenced SettingData represents the last requested values for attributes of the Managed Element or that this information is unknown. Attributes of the SettingData itself indicate whether it represents the last configuration applied to the ManagedElement or is a transient snapshot of the requested settings. Current operational characteristics of a ManagedElement should be represented with properties of the ManagedElement. element or that this information is unknown. For a given ManagedElement and all instances of a SettingData subclass, there is at most one instance of ElementSettingData which references the ManagedElement and an instance of the SettingData sub-class where there is a specified non-null, non-key property of the SettingData sub-class, and the IsMaximum property on the referencing ElementSettingData instance has a value of Is Maximum or the IsMinimum property on the referencing ElementSettingData instance has a value of Is Minimum and the IsCurrent property on the referencing ElementSettingData instance has a value of Is Current. There is at most one instance of ElementSettingData which references a ManagedElement and an instance of a SettingData sub-class where the IsCurrent property has a value of Is Current and the IsMinimum property does not have a value of Is Minimum and the IsMaximum property does not have a value of Is Maximum.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Is Current• 2 = Is Not Current
IsDefault	<p>An enumerated integer that indicates that the referenced setting is a default setting for the element or that this information is unknown.</p> <p>Possible values are:</p> <ul style="list-style-type: none">• 0 = Unknown• 1 = Is Default• 2 = Is Not Default
IsMaximum	<p>This property affects the interpretation of all non-null, non-enumerated, non-binary, numeric, non-key properties of the associated SettingData instance. All other properties of the associated SettingData instance are not affected by this property.</p> <p>NOTE: It is assumed that the semantics of each property of this set are designed to be compared mathematically. When IsMaximum = Is Maximum, this property indicates that the affected property values specified in the associated SettingData instance defines desired maximum setting values. The operational maximum values should be modeled as a properties of the CIM_ManagedElement instance. When IsMaximum = Is Not Maximum, this property indicates that the affected property values specified in the associated SettingData instance does not define desired maximum setting values. When IsMaximum = Unknown, this property indicates that the affected property values specified in the associated SettingData instance may</p>

Property	Description
	<p>correspond to maximum desired setting values. When IsMaximum = Not Applicable, this property indicates that the affected property values specified in the associated SettingData instance is not interpreted with respect to whether each defines a desired maximum.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Not Applicable • 2 = Is Maximum • 3 = Is Not Maximum
IsMinimum	<p>This property affects the interpretation of all non-null, non-enumerated, non-binary, numeric, non-key properties of the associated SettingData instance. All other properties of the associated SettingData instance are not affected by this property.</p> <p>NOTE: It is assumed that the semantics of each property of this set are designed to be compared mathematically. When IsMinimum = Is Minimum, this property indicates that the affected property values specified in the associated SettingData instance defines desired minimum setting values. The operational minimum values should be modeled as a properties of the CIM_ManagedElement instance. When IsMinimum = Is Not Minimum, this property indicates that the affected property values specified in the associated SettingData instance does not define desired minimum setting values. When IsMinimum = Unknown, this property indicates that the affected property values specified in the associated SettingData instance may correspond to minimum desired setting values. When IsMinimum = Not Applicable, this property indicates that the affected property values specified in the associated SettingData instance is not interpreted with respect to whether each defines a desired minimum.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Not Applicable • 2 = Is Minimum • 3 = Is Not Minimum
IsNext	<p>An enumerated integer indicating whether or not the referenced setting is the next setting to be applied. For example, the application could take place on a re-initialization, reset, reconfiguration request. This could be a permanent setting, or a setting used only one time, as indicated by the flag. If it is a permanent setting then the setting is applied every time the managed element reinitializes, until this flag is manually reset. However, if it is single use, then the flag is automatically cleared after the settings are applied. Also note that if this flag is specified (i.e. set to value other than Unknown), then this takes precedence over any SettingData that may have been specified as Default. For example: If the managed element is a computer system, and the value of this flag is Is Next, then the setting will be effective next time the system resets. And, unless this flag is changed, it will persist for subsequent system resets. However, if this flag is set to Is Next For Single Use, then this setting will only be used once and the flag would be reset after that to Is Not Next. So, in the above example, if the system reboots in a quick succession, the setting will not be used at the second reboot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Is Next • 2 = Is Not Next • 3 = Is Next For Single Use
IsPending	<p>An enumerated integer that indicates whether or not the referenced CIM_SettingData instance represents outstanding changes to the configuration of the referenced</p>

Property	Description
	<p>CIM_ManagedElement that are known to be pending and are in the process of being applied. A value of 0 Unknown indicates that the referenced instance of CIM_SettingData may represent the last configuration applied to the referenced CIM_ManagedElement. A value of 2 (Is Pending) indicates that the referenced instance of CIM_SettingData represents outstanding changes to the configuration of the referenced CIM_ManagedElement that are known to be pending. A value of 3 (Is Not Pending) indicates that the referenced instance of CIM_SettingData does not represent outstanding changes to the configuration of the referenced CIM_ManagedElement.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 = Unknown 2 = Is Pending 3 = Is Not Pending .. = DMTF Reserved 32768.. = Vendor Reserved
ManagedElement	The managed element.
SettingData	The SettingData object that is associated with the element.

DCIM_OrderedMemberOfCollection

Table 132. OrderedMemberOfCollection

Property	Description
AssignedSequence	<p>AssignedSequence is an unsigned integer n that indicates the relative position of members within a Collection. When n is a positive integer, it indicates a place in the sequence of members, with smaller integers indicating earlier positions in the sequence. The special value 0 indicates don't care. If two or more members have the same non-zero sequence number, then the ordering between those members is irrelevant, but they must all be ordered at the appropriate place in the overall sequence. A series of examples will make ordering of members clearer: If all members have the same sequence number, regardless of whether it is 0 or non-zero, any order is acceptable. The values are: 1:MEMBER A 2:MEMBER B 1:MEMBER C 3:MEMBER D indicate two acceptable orders: A,C,B,D or C,A,B,D, because A and C can be ordered in either sequence, but only at the 1 position.</p> <p>NOTE: The non-zero sequence numbers do not need to start with 1, and they do not need to be consecutive. However, the sequence numbers must reflect their relative magnitude.</p>
Collection	The Collection that aggregates members.
Member	The aggregated member of the Collection.

DCIM_MemberOfCollection

Table 133. MemberOfCollection

Property	Description
Collection	The Collection that aggregates members.
Member	The aggregated member of the Collection.

DCIM_OwningCollectionElement

Table 134. OwningCollectionElement

Property	Description
OwningElement	The ManagedElement acting as the 'owner' or object that is responsible for the control of the Collection.
OwnedElement	The Collection owned or controlled by the ManagedElement.

DCIM_ElementConformsToProfile

Table 135. ElementConformsToProfile

Property	Description
ManagedElement	The ManagedElement that conforms to the RegisteredProfile.
ConformantStandard	The RegisteredProfile to which the ManagedElement conforms.

DCIM_RoleLimitedToTarget

Table 136. RoleLimitedToTarget

Property	Description
TargetElement	Reference to the target set that can be accessed from the Role.
DefiningRole	The Role whose target set is explicitly defined.

DCIM_ElementCapacity

Table 137. ElementCapacity

Property	Description
Element	The PhysicalElement being described.
Capacity	PhysicalCapacity describes the minimum and maximum requirements, and ability to support different types of hardware for a PhysicalElement.

DCIM_ServiceAffectsElement

Table 138. ServiceAffectsElement

Property	Description
AffectedElement	The Managed Element that is affected by the Service.
AffectingElement	The Service that is affecting the ManagedElement.
AssignedSequence	AssignedSequence is an unsigned integer 'n' that indicates the relative sequence in which order the ManagedElement instances are affected by the Service, which is associated to the ManagedElement instances through this class. The implementation of the Service uses the relative sequence to order all the managed elements represented by ManagedElements associated through this class for servicing or prioritizing. When n is a positive integer, it indicates a place in the sequence of affected elements, with smaller integers indicating

Property

Description

earlier positions in the sequence. NULL or the special value **0** indicates **don't care**. If two or more affected elements have the same non-zero sequence number, then the ordering between those elements is irrelevant, but they must all be serviced in the appropriate order in the overall sequence. A series of examples will make order of elements clearer: If all elements affected have the same sequence number, regardless of whether it is **0** or non-zero, any order is acceptable. The values, 1:ELEMENT A 2:ELEMENT B 1:ELEMENT C 3:ELEMENT D, indicate two acceptable orders: A,C,B,D or C,A,B,D, since A and C can be ordered in either sequence, but only at the **1** position.

NOTE: The non-zero sequence numbers need not start with 1, and they need not be consecutive. All that matters is their relative magnitude.

ElementEffects

An enumeration that describes the effect on the ManagedElement. This array corresponds to the OtherElementEffectsDescriptions array, where the latter provides details that are related to the high-level effects enumerated by this property. Additional detail is required if the ElementEffects array contains the value 1 (Other).

Possible values are:

- 0 = Unknown
- 1 = Other
- 2 = Exclusive Use — Indicates that no other Service may have this association to the element.
- 3 = Performance Impact — Deprecated in favor of **Consumes, Enhances Performance, or Degrades Performance**. Execution of the Service may enhance or degrade the performance of the element. This may be as a side-effect of execution or as an intended consequence of methods provided by the Service.
- 4 = Element Integrity — Deprecated in favor of **Consumes, Enhances Integrity, or Degrades Integrity**. Execution of the Service may enhance or degrade the integrity of the element. This may be as a side-effect of execution or as an intended consequence of methods provided by the Service.
- 5 = Manages — The Service manages the element.
- 6 = Consumes — Execution of the Service consumes some or all of the associated element as a consequence of running the Service. For example, the Service may consume CPU cycles, which may affect performance, or Storage which may affect both performance and integrity. (For instance, the lack of free storage can degrade integrity by reducing the ability to save state.) **Consumes** may be used alone or in conjunction with other values, in particular, **Degrades Performance** and **Degrades Integrity**. **Manages** and not **Consumes** should be used to reflect allocation services that may be provided by a Service.
- 7 = Enhances Integrity — The Service may enhance integrity of the associated element.
- 8 = Degrades Integrity — The Service may degrade integrity of the associated element.
- 9 = Enhances Performance — The Service may enhance performance of the associated element.
- 10 = Degrades Performance — The Service may degrade performance of the associated element.
- .. = DMTF Reserved
- 0x8000..0xFFFF = Vendor Reserved

OtherElementEffectsDescriptions

Provides details for the effect at the corresponding array position in ElementEffects. This information is required if ElementEffects contains the value 1 (Other).

DCIM_AssociatedPowerManagementService

Table 139. AssociatedPowerManagementService

Property	Description
OtherPowerState	A string describing the additional power management state of the element, used when the PowerState is set to the value 1, Other .
OtherRequestedPowerState	A string describing the additional power management state of the element, used when the RequestedPowerState is set to the value 1, Other .
PowerOnTime	The time when the element will be powered on again, used when the RequestedPowerState has the value 2, On, 5, Power Cycle (Off - Soft) or 6, Power Cycle (Off - Hard) .
PowerState	<p>The current power state of the associated Managed System Element.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = Other • 2 = On • 3 = Sleep - Light • 4 = Sleep -Deep • 5 = Power Cycle (Off - Soft) • 6 = Off - Hard • 7 = Hibernate (Off - Soft) • 8 = Off - Soft • 9 = Power Cycle (Off-Hard) • 10 = Master Bus Reset • 11 = Diagnostic Interrupt (NMI) • 12 = Off - Soft Graceful • 13 = Off - Hard Graceful • 14 = Master Bus Reset Graceful • 15 = Power Cycle (Off - Soft Graceful) • 16 = Power Cycle (Off - Hard Graceful) • .. = DMTF Reserved • 0x7FFF..0xFFFF = Vendor Specific
RequestedPowerState	<p>The desired or the last requested power state of the associated Managed System Element, irrespective of the mechanism through which the request was made. If the requested power state is unknown, then the property has the value of 0 Unknown. If the property has no meaning or is not supported, then the property has the value 12 Not Applicable.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 = Unknown • 1 = Other • 2 = On • 3 = Sleep - Light • 4 = Sleep -_Deep • 5 = Power Cycle (Off - Soft) • 6 = Off - Hard • 7 = Hibernate (Off - Soft) • 8 = Off - Soft • 9 = Power Cycle (Off-Hard) • 10 = Master Bus Reset • 11 = Diagnostic Interrupt (NMI) • 12 = Not Applicable • 13 = Off - Soft Graceful • 14 = Off - Hard Graceful • 15 = Master Bus Reset Graceful

Property	Description
	<ul style="list-style-type: none"> · 16 = Power Cycle (Off - Soft Graceful) · 17 = Power Cycle (Off - Hard Graceful) · .. = DMTF Reserved · 0x7FFF..0xFFFF = Vendor Specific
ServiceProvided	The Service that is available.
UserOfService	The ManagedElement that can use the Service.

DCIM_ServiceAvailableToElement

Table 140. ServiceAvailableToElement

Property	Description
ServiceProvided	The Service that is available.
UserOfService	The ManagedElement that can use the Service.

DCIM_LogManagesRecord

Table 141. LogManagesRecord

Property	Description
Log	The Log.
Record	The record managed by the Log.

DCIM_InstalledSoftwareIdentity

Table 142. InstalledSoftwareIdentity

Property	Description
InstalledSoftware	The SoftwareIdentity that is installed.
System	The system on which the software is installed.

DCIM_ConcretelIdentity

Table 143. ConcretelIdentity

Property	Description
SameElement	SameElement Another aspect of the ManagedElement.
SystemElement	One aspect of the ManagedElement. The use of 'System' in the name does not limit the scope of the association. This name is an artifact of the original definition of the association.

DCIM_SMARTAttributeInfo

Table 144. SMARTAttributeInfo

Property	Description
AttributeID	AttributeID represents the relative reliability of individual performance or calibration attributes. The valid range of attribute values begins from 1–253 decimal.
AttributeName	Name defined for the corresponding AttributeID.
CurrentValue	Current value of an attribute which represents the relative reliability of individual performance or calibration attributes.
CustomThresholdValue	Each attribute has a corresponding Custom Threshold Value which is used for direct comparison to the Current Value to indicate the existence of a degrading or faulty condition. The numerical value of the Custom Threshold Value is determined by the IT administrator and set the value lesser than the Threshold Value set by the Manufacturer. The valid range for Attribute Thresholds is from 1–253 decimal.
DiskID	Disk ID of the HDD/SSD.
FirmwareVersion	Firmware Version of the HDD/SSD.
Manufacturer	HDD/SSD Manufacturer.
ModelNumber	HDD/SSD Model Number.
RawDataContent	Raw data content in hexadecimal for the corresponding AttributeID (6 bytes).
SerialNumber	HDD/SSD Serial Number.
StatusFlag	A 2-byte number which represents the status of the corresponding AttributeID: <ul style="list-style-type: none">• Bit 0: Prefail/Advisory bit• Bit 1: Online data collection bit• Bit 2–5: Vendor-specific• Bit 6–15: Reserved
ThresholdValue	The (failure) limit of the attribute.
WorstValue	The worst (smallest) value ever found in the previous lifetime of the storage device.
SetCustomThreshold (Method)	This property represents the success or failure of the SMART operation. The method may return the following errors: <ul style="list-style-type: none">• 0 (Success) - If the method is completed successfully.• 1 (Failure) - If the Input parameter is out of range or IO operation fails.

DCIM_SettingsDefineState

Table 145. SettingsDefineState

Property	Description
ManagedElement	The managed element.
SettingData	The SettingData object that provides additional information about the current state and configuration of the ManagedElement.

DCIM_ElementLocation

Table 146. ElementLocation

Property	Description
Element	The ManagedElement whose location is specified.
PhysicalLocation	The location of the element.

DCIM_CredentialContext

Table 147. CredentialContext

Property	Description
ElementInContext	A Credential whose context is defined.
ElementProvidingContext	The ManagedElement that provides context or scope for the Credential.

DCIM_OwningJobElement

Table 148. OwningJobElement

Property	Description
OwnedElement	The Job created by the ManagedElement.
OwningElement	The ManagedElement responsible for the creation of the Job.

BIOS settings supported in Dell Command | Monitor 10.2.1

Following is the list of BIOS settings supported in Dell Command | Monitor.

Table 149. BIOS settings supported in Dell Command | Monitor 10.2.1

BIOS Settings Name	Description	Supported Operating System(s)
Absolute	<p>Sets the value to the Absolute interface and controls the Absolute service.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • Enable - If enabled, then the Absolute service is activated or deactivated. • Disable - If disabled, then the Absolute service does not run. • Permanently Disabled - If the Absolute interface is permanently disabled, then the Absolute feature can be enabled by using the factory reset feature. 	Microsoft Windows, Linux
Active State Power Management	<p>Set the ASPM (Active State Power Management) level.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Auto — There is handshaking between the device and PCI Express hub to determine the best ASPM mode supported by the device. • Disabled — ASPM power management is turned off always. • L1 Only — ASPM power management is set to use L1. 	Microsoft Windows, Linux
Activity LED	<p>Sets the Network Activity Light Emitting Diode (LED) to any of the following:</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 = EnableACPIOSControl — Sets the Activity LED controlled by an Advanced Configuration and Power Interface (ACPI) operating system and driver. • 2 = WirelessLANIndicator — Sets the Activity LED as a wireless Local Area Network (LAN) radio on/off indicator. • 3 = Off — Sets the Activity LED to off. 	Microsoft Windows, Linux
AGP Slot	<p>Enables or disables the on-board AGP slot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable 	Microsoft Windows
AC Power Recovery Mode	<p>Sets AC Power Recovery Mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Off • Last • On 	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
Adjacent Cache Line Prefetch	<p>If sets to Disable then the CPU will only fetch the cache line that contains the data currently required by the CPU.</p> <p>If sets to Enable then it enables the CPU to fetch the adjacent cache line in the other half of the sector.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable 	Microsoft Windows, Linux
Admin Setup Lockout	<p>If the value of Admin Setup Lockout is Enabled and the Admin Password is set, users will not be allowed to see any part of the Setup screens unless they enter the correct Admin Password. If the Admin password is NOT set and Admin Setup Lockout is Enabled, users will be able to access Setup normally.</p> <p>If the value of Admin Setup Lockout is Disabled and the Admin Password is or is not set, users will be allowed to enter Setup normally. However, many fields may still be inaccessible, depending on how other Setup security settings are configured.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable 	Microsoft Windows, Linux
Adv Battery Charge Cfg	<p>Configures the days settings based on BeginningOfDay and workperiod. Advanced Battery charge mode uses standard charging algorithm and other methods during working hours to maximize battery health. During working hours, express charge is used to charge the batteries faster. You can configure the days and the work period during which the battery has to be charged. To enable advanced battery charging, provide the day, and set the following:</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • BeginningOfDay — To configure the AdvanceBatteryCharge start time in 24 hours format. The value of hour must be in the range 0–23 and minute must be 0, 15, 30, or 45. • Workperiod — To configure the duration of charging. 	Microsoft Windows, Linux
Advanced Battery Charging Mode	<p>Configures all the batteries in the systems with Advance Battery Charging Mode to maximize the battery health.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 1 — Disable • 2 — Enable <p>NOTE: If Advanced Battery Charging Mode is disabled, Dell Command Monitor shows the instances for Adv Battery Charge Cfg with all '0' values. User cannot set the values in Adv Battery Charge Cfg. When the Advanced Battery Charging Mode is enabled, instances for Adv Battery Charge Cfg reports the data retrieved from BIOS.</p>	Microsoft Windows, Linux
Adv Battery Charge Cfg Sun	<p>Configures the Advanced Battery charging configuration for Sunday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — 23 — Beginning of day Hour 	Microsoft Windows

BIOS Settings Name	Description	Supported Operating System(s)
Adv Battery Charge Cfg Mon	<ul style="list-style-type: none"> • 0 — 59 — Beginning of day Minute • 0 — 23 — Work Period Hour • 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> • Adv Battery Charge Cfg Sun BodHour • Adv Battery Charge Cfg Sun BodMin • Adv Battery Charge Cfg Sun WpHour • Adv Battery Charge Cfg Sun WpMin <p>NOTE: The values defined for Minute field are 0, 15, 30 and 45. In case you set any other value, the value is round to the lower defined value.</p>	Microsoft Windows
Adv Battery Charge Cfg Tue	<p>Configures the Advanced Battery charging configuration for Monday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — 23 — Beginning of day Hour • 0 — 59 — Beginning of day Minute • 0 — 23 — Work Period Hour • 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> • Adv Battery Charge Cfg Mon BodHour • Adv Battery Charge Cfg Mon BodMin • Adv Battery Charge Cfg Mon WpHour • Adv Battery Charge Cfg Mon WpMin 	Microsoft Windows
Adv Battery Charge Cfg Wed	<p>Configures the Advanced Battery charging configuration for Tuesday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — 23 — Beginning of day Hour • 0 — 59 — Beginning of day Minute • 0 — 23 — Work Period Hour • 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> • Adv Battery Charge Cfg Tue BodHour • Adv Battery Charge Cfg Tue BodMin • Adv Battery Charge Cfg Tue WpHour • Adv Battery Charge Cfg Tue WpMin 	Microsoft Windows
Adv Battery Charge Cfg Wed	<p>Configures the Advanced Battery charging configuration for Wednesday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — 23 — Beginning of day Hour • 0 — 59 — Beginning of day Minute • 0 — 23 — Work Period Hour • 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> • Adv Battery Charge Cfg Wed BodHour • Adv Battery Charge Cfg Wed BodMin • Adv Battery Charge Cfg Wed WpHour 	Microsoft Windows

BIOS Settings Name	Description	Supported Operating System(s)
Adv Battery Charge Cfg Thu	<ul style="list-style-type: none"> Adv Battery Charge Cfg Wed WpMin <p>Configures the Advanced Battery charging configuration for Thursday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — 23 — Beginning of day Hour 0 — 59 — Beginning of day Minute 0 — 23 — Work Period Hour 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> Adv Battery Charge Cfg Thu BodHour Adv Battery Charge Cfg Thu BodMin Adv Battery Charge Cfg Thu WpHour Adv Battery Charge Cfg Thu WpMin 	Microsoft Windows
Adv Battery Charge Cfg Fri	<p>Configures the Advanced Battery charging configuration for Friday.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — 23 — Beginning of day Hour 0 — 59 — Beginning of day Minute 0 — 23 — Work Period Hour 0 — 59 — Work Period Minute <p>BIOS setting name for Set operation:</p> <ul style="list-style-type: none"> Adv Battery Charge Cfg Fri BodHour Adv Battery Charge Cfg Fri BodMin Adv Battery Charge Cfg Fri WpHour Adv Battery Charge Cfg Fri WpMin 	Microsoft Windows

Always Allow Dell Docks	<p>Allows or restricts Dell Type-C Thunderbolt docks to function when the Thunderbolt is disabled.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable — Restricts the Dell Type-C Thunderbolt docks to function when the Thunderbolt is disabled. Enable — Allows the Dell Type-C Thunderbolt docks to function even when the Thunderbolt is disabled. 	Microsoft Windows, Linux
Ambient Light Sensor	<p>Enables or Disables the Ambient Light Sensor.</p> <p>Possible values are:</p>	Microsoft Windows

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> Disable Enable 	
Intel AMT Capability	<p>Set the Intel Active Management Technology (AMT) capability.</p> <p>Possible values:</p> <ul style="list-style-type: none"> Enabled - If Intel Active Management Technology is enabled, MEBx is available through the F12 menu and you can provision AMT. MEBx may not be accessible if OROM Keyboard Access is disabled. Disabled - If Intel Active Management Technology is disabled, MEBx is not available in pre-boot. Once disabled, Intel Active Management Technology can only be enabled through the BIOS interface. If the Intel AMT is already provisioned, AMT cannot be disabled. Un-provisioning AMT is required to disable AMT. Restrict MEBx Access - If Intel Active Management Technology is enabled, MEBx is not available in pre-boot but you can provision AMT from the operating system. 	Microsoft Windows, Linux
Enable AMD SmartShift	<p>Sets the AMD SmartShift.</p> <p>Possible values:</p> <ul style="list-style-type: none"> Enable - On a discrete GPU system, AMD SmartShift allows the system's CPU and discrete GPU to share the power limits. AMD SmartShift allows the potential performance that increases within the systems power or thermal limitation. Disable - AMD SmartShift feature is disabled. 	Microsoft Windows, Linux
AMD TSME	<p>Sets the AMD Transparent Secure Memory Encryption (TSME).</p> <p>Possible values:</p> <ul style="list-style-type: none"> Enabled - AMD Transparent Secure Memory Encryption (TSME) allows encryption of contents during residing on the memory DIMMS. NOTE: For best results while diagnosing potential memory DIMM issues, turn off this feature prior to running diagnostic functions or tools. Disabled - AMD Transparent Secure Memory Encryption (TSME) does not allow encryption on the memory DIMMS. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 1	<p>Sets the defined Analog/Digital Interface mode for channel 1.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — Unused — Channel is unused. 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 2	<p>Sets the defined Analog/Digital Interface mode for channel 2.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — Unused — Channel is unused. 	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> • 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. • 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. • 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. • 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	
Analog Digital Interface Mode Channel 3	<p>Sets the defined Analog/Digital Interface mode for channel 3.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — Unused — Channel is unused. • 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. • 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. • 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. • 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 4	<p>Sets the defined Analog/Digital Interface mode for channel 4.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — Unused — Channel is unused. • 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. • 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. • 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. • 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 5	<p>Sets the defined Analog/Digital Interface mode for channel 5.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — Unused — Channel is unused. • 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. • 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. • 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. • 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 6	<p>Sets the defined Analog/Digital Interface mode for channel 6.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • 0 — Unused — Channel is unused. • 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. • 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. • 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. 	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	
Analog Digital Interface Mode Channel 7	<p>Sets the defined Analog/Digital Interface mode for channel 7.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — Unused — Channel is unused. 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Analog Digital Interface Mode Channel 8	<p>Sets the defined Analog/Digital Interface mode for channel 8.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — Unused — Channel is unused. 1 — ADC Input — Sets the channel mode as Analog-to-Digital Converter (ADC) input. 2 — DAC Output — Sets the channel mode as Digital-to-Analog Converter (DAC) output. 3 — DAC and ADC — Sets the channel mode as DAC output, but can be monitored through ADC input. 8 — GPIO — Sets the channel mode as General Purpose Input or Output. 	Microsoft Windows, Linux
Attempt Legacy Boot	<p>Determines if BIOS should attempt to boot from the legacy boot list when the UEFI boot list fails.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Enabled — If the UEFI boot list fails, then BIOS attempts to boot from the Legacy boot list. Disabled — BIOS discontinues the booting process if the UEFI boot list fails. 	Microsoft Windows, Linux
AudioMode	<p>Onboard audio mode. Disabled mode completely un-assigns the onboard hardware resources. Half duplex mode allows only record or playback. Full duplex mode can record and play back sounds simultaneously.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Half Duplex Full Duplex 	Microsoft Windows
Auto Fan Speed Intensity	<p>Configures the fan speed control if the fan speed is set to Auto using fanspeed BIOS setting.</p> <p>Possible values are: 0 to 100</p> <ul style="list-style-type: none"> 0 — sets the fanspeed to the optimal speed level, and higher percentage provides enhanced cooling. 	Microsoft Windows, Linux
Auto On	<p>This property defines the auto-on configuration: disabled, everyday or weekdays (Monday — Friday).</p> <p>Possible values are:</p>	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> • Disable • Everyday • Weekdays • Select days 	
Auto On Hour	Defines the hour when to turn on the system (0–23).	Microsoft Windows, Linux
Auto On Minute	Defines the minutes when to turn on the system (0–59).	Microsoft Windows, Linux
Auto on Sunday	Defines that the system must be automatically turned on Sundays.	Microsoft Windows, Linux
Auto on Monday	Defines that the system must be automatically turned on Mondays.	Microsoft Windows, Linux
Auto on Tuesday	Defines that the system must be automatically turned on Tuesdays.	Microsoft Windows, Linux
Auto on Wednesday	Defines that the system must be automatically turned on Wednesdays.	Microsoft Windows, Linux
Auto on Thursday	Defines that the system must be automatically turned on Thursdays.	Microsoft Windows, Linux
Auto on Friday	Defines that the system must be automatically turned on Fridays.	Microsoft Windows, Linux
Auto on Saturday	Defines that the system must be automatically turned on Saturdays.	Microsoft Windows, Linux
Auto OS Recovery Threshold	<p>Sets the threshold value for auto OS recovery. Controls the automatic boot flow for SupportAssist System Resolution console and for Dell OS Recovery Tool. The system boots to the SupportAssist System Resolution console and for Dell OS Recovery Tool if,</p> <ul style="list-style-type: none"> • the primary operating system fails to boot consecutively • the count of boot failure is greater than or equal to the value of the Auto OS Recovery threshold setup option • the SupportAssist OS Recovery option is enabled <p>Possible values are: 0 to 3</p> <p>NOTE: If the Auto OS Recovery threshold is set to 0, then all automatic boot flow for SupportAssist System Resolution console and for Dell OS Recovery Tool is disabled.</p>	Microsoft Windows, Linux
Auto Switch	<p>Enable, Disable</p> <p>Possible values are: 1,2</p>	Microsoft Windows, Linux
Auto Wake Period	<p>Defines the time in minutes after which the system should automatically wake up from Standby, Hibernate, or Switched off mode.</p> <p>Possible values are: 0, integers ranging from 1 to 254</p> <p>NOTE: The system wakes up from Sleep, Hibernate, or Switched off mode only if the Auto On option is enabled for everyday of the week.</p>	Microsoft Windows, Linux
BIOS Auto Recovery	<p>Enables or disables the BIOS auto recovery feature.</p> <p>Possible values are:</p>	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> Enabled — If BIOS corruption is detected, the system automatically recovers BIOS without any user interaction. Disabled — Disables BIOS auto recovery feature. 	
Back Camera	<p>Enables or disables the rearward facing camera.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable — Disables the rearward facing camera. Enable — Enables the rearward facing camera. 	Microsoft Windows, Linux
Battery Slice Charge Configuration	<p>Configures the battery slice charging</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 1 - Adaptive 2 - Standard 3- Express 4- PrimAcUse 5- Custom 	Microsoft Windows, Linux
BIOS Connect	<p>Enables or disables the BIOS Connect feature.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Enable Disable 	Microsoft Windows, Linux
BIOS Connect Activation	<p>Configures the state of the available BiosConnect boot paths.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> 0 — Deactivate — BIOS setup options are not available and all BiosConnect boot paths are disabled. 1 — Full Activation — BIOS Setup options are enabled and all BiosConnect boot paths are enabled. 2 — Launchpad Activation Only — BIOS setup options are enabled and only launchpad code path is enabled. 	Microsoft Windows, Linux
BIOS Enumeration Mode	<p>BIOS Assist Enumeration, Native Enumeration</p> <p>Possible values are: 0,1</p>	Microsoft Windows, Linux
Bios Integrity Check	<p>Enables or disables the BIOS integrity check during the booting process.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> enable — BIOS checks the BIOS image integrity during every booting process. disable — BIOS checks the BIOS image integrity only if the previous booting process did not complete. <p>NOTE: BIOS checks the BIOS image integrity only if the biosautorecovery option is enabled.</p>	Microsoft Windows, Linux
BIOS Recovery	<p>Enables or disables the system BIOS Recovery option. This feature saves a recovery image to a primary hard disk drive storage, or to an external USB, and uses this recovery image to recover BIOS image when system BIOS fails.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Enable — BIOS stores the recovery image on primary hard disk drive storage. So BIOS recovery image is available both 	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<p>from primary hard disk drive permanent storage and via an external USB.</p> <ul style="list-style-type: none"> Disable — BIOS does not store the recovery image on primary hard disk drive storage. So BIOS recovery image is available only via an external USB. 	
Bitsmart	<p>Enables or disable the Bitsmart.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows
Bluetooth Devices	<p>Enable or disable Bluetooth Devices</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
BlinkPSULED1	<p>Provides the alert for the PSU 1. The Power Supply Unit(PSU) 1 LED starts to blink when it is enabled.</p> <p>Possible value:</p> <ul style="list-style-type: none"> Enable 	Microsoft Windows
BlinkPSULED2	<p>Provides the alert for the PSU 2. The Power Supply Unit(PSU) 2 LED starts to blink when it is enabled.</p> <p>Possible value:</p> <ul style="list-style-type: none"> Enable 	Microsoft Windows
BlockS3	<p>Enables or disables the Block S3 sleep state. If this option is Disabled, the system BIOS supports OSPM/ACPI S3 (suspend to RAM) operation. This moves the system authentication into the operating system and bypasses any Preboot Authentication on resume.</p> <p>If this option is Enabled, the system BIOS blocks all OSPM/ACPI S3 (suspend to RAM) requests and enforces Preboot Authentication on all non-S3 resumes.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
Boot Mode	<p>Determines the system's boot mode. Enables booting to Unified Extensible Firmware Interface (UEFI) capable operating systems. This ensures compatibility with operating systems that do not support UEFI.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> UEFI — Enables booting to Unified Extensible Firmware Interface (UEFI) capable operating systems. BIOS — Ensures compatibility with operating systems that do not support UEFI. <p> NOTE: Legacy boot mode is not allowed when secure boot is enabled or legacy option ROM is disabled.</p>	Microsoft Windows, Linux
Boot-time Video	<p>Sets the Primary Video source.</p> <p>Possible values are:</p>	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)
	<ul style="list-style-type: none"> On board Add-in 	
Boot Speed	<p>Sets CPU speed to default or compatible (low speed). This feature is implementation-dependent. There is no set speed for Compatible, only that it is slower than default. Some platforms implement this by turning off cache and others by STPCLK throttling.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Default Compatible 	Microsoft Windows
Broadcom ASF	<p>Sets the ASF (Alert Standard Format) mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable Alert only Dash and ASF 	Microsoft Windows
Broadcom TruManage	<p>Sets the Broadcom TruManage.</p> <p>Possible values are: 1,2</p> <ul style="list-style-type: none"> Enable Disable 	Microsoft Windows
Bus Ratio	<p>Sets Bus Ratio.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Max 6.0 7.0 7.5 8.0 8.5 9.0 9.5 	Microsoft Windows
Camera	<p>Enables or disables the camera.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
CAN Bus	<p>Enables or disables the Controller Area Network (CAN) Bus.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
Cellular Radio	<p>Enables or Disables the cellular radio, that is, the WWAN module.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
Charger	<p>Defines the charger details.</p>	Microsoft Windows

BIOS Settings Name	Description	Supported Operating System(s)
	<p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable 	
Chassis Intrusion	<p>Enables the system to detect and report the Chassis Intrusion events to the system display on boot-up.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable • Silent 	Microsoft Windows, Linux
Chassis Intrusion Status	<p>This property shows the status of the system with regards to Chassis Intrusion (Detected or Not Detected). A value of Unknown indicates one of two things: either Chassis Intrusion is not supported by this system, or Chassis Intrusion event reporting has been disabled by the user. If the value is Detected, the user may set it to Not Detected to enable the system to receive the next event and to stop generating events for now.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Tripped • Door open • Door closed • Trip reset 	Microsoft Windows, Linux
Clear BIOS Log	<p>Prevents or allows the BIOS event log to be cleared on the next boot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable — Does not clear the BIOS event log on the next boot. • Enable — Clears the BIOS event log on the next boot. 	Microsoft Windows, Linux
Clear Power Log	<p>Prevents or allows the Power log to be cleared on the next boot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable — Does not clear the Power log on the next boot. • Enable — Clears the Power log on the next boot. 	Microsoft Windows, Linux
Clear System Event Log	<p>Prevents or causes the system event log to be cleared on the next boot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable • Enable 	Microsoft Windows, Linux
Clear Thermal Log	<p>Prevents or allows the Thermal log to be cleared on the next boot.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable — Does not clear the Thermal log on the next boot. • Enable — Clears the Thermal log on the next boot. 	Microsoft Windows
Cool and Quiet	<p>Enables or disables the AMD Cool and Quiet processor feature.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • Disable 	Microsoft Windows

BIOS Settings Name	Description	Supported Operating System(s)
Adjacent Cache Line Prefetch	<ul style="list-style-type: none"> Enable <p>Enables or disables the AdjacentCacheLinePrefetch feature.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Enabled — CPU fetches the adjacent cache line in the other half of the sector. Disabled — CPU only fetches the cache line that contains the data currently required by the CPU. 	Microsoft Windows, Linux
CPU RSA	<p>Enables or disables the Reliability Availability Serviceability (RSA) support on CPUs.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows, Linux
CPU Snoop Mode	<p>Configures the CPU snoop mode.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Early snoop — Enables early snoop mode. Use this mode for latency-sensitive applications that do not require high remote bandwidth. Home snoop — Enables home snoop mode. Use this mode for applications that require high memory bandwidth. Cluster on Die — Enables cluster on die mode. Dell recommends this mode for NUMA-optimized applications to achieve lowest local memory latency, and highest local memory bandwidth. Opportunistic Snoop — Enables opportunistic snoop mode. Directory with Opportunistic Snoop Broadcast (OSB) offers a good balance of latency and bandwidth. No snoop — Enables no snoop mode. 	Microsoft Windows, Linux
CPU Virtualization Technology	<p>Enables or disables CPU Virtualization.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable Enable 	Microsoft Windows
Deep Sleep Control	<p>Configures the system power mode when the system is in S4 and S5 state. If set to S5only, the system moves to the lowest-Power Off mode only in S5 state. If set to S4 and S5 state, the system moves to the lowest-Power Off mode in both S4 and S5 states. When the system is in low-power mode, it turns off most of the power-consuming circuitry, to meet the 1 W power limit. It disables PME, USB power, etc.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> S5 only S4 and S5 Disable 	Microsoft Windows, Linux
Dell Reliable Memory Technology	<p>Configures the system to detect and correct the software errors in a block of RAM. When enabled, the system detects and corrects the software errors.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Disable 	Microsoft Windows, Linux

BIOS Settings Name	Description	Supported Operating System(s)

Alerts in Dell Command | Monitor 10.2.1

Local alerting involves displaying user messages and writing to the Windows event log. Remote alerting is accomplished through WMI indications. When Dell Command | Monitor detects an event, it generates an alert, which can be transmitted through the WMI service to a remote management application that is subscribed to that alert type.

When an alert is generated, Dell Command | Monitor supports following types of notification:

For Windows,

- Windows event log—available at Windows Logs > System
- CIM Indication— available through DCIM_AlerIndication class
- SNMP traps — available through 10909.mib file
- History — available through DCIM_LogEntry class instances

For Linux,

- Syslog — available at /var/log
- CIM Indication— available through DCIM_AlerIndication class
- Application log—available through DCIM_LogEntry class
- History — available through DCIM_LogEntry class instances

In Dell Command | Monitor, each type of event (for example, CurrentProbe, TemperatureProbe, Smart, and so on) that gets logged is provided with a unique event ID number. The events have unique IDs to enable log scraping; this way you can programmatically look at the event log and determine what Dell Command | Monitor events have occurred.

In Dell Command | Monitor for Windows, you are also provided with an option to receive either a single alert or a limited number of alerts of the occurrence of an event, of a given type. You can mask out specific events and can generate single alert messages for only those events.

NOTE: Configuring the selected events is not supported for Dell Command | Monitor for Linux.

Dell Command | Monitor recognizes the following eight CIM severity levels using perceived severity (represented by integers 0 through 7):

- UNKNOWN = 0
- OTHER = 1
- INFORMATION = 2
- WARNING_DEGRADED = 3
- MINOR = 4
- MAJOR = 5
- CRITICAL = 6
- FATAL_NONRECOVERABLE = 7

NOTE: Events with CRITICAL severity cause Dell Command | Monitor to shut down the local system.

The lowest WMI severity level that Dell Command | Monitor sends is WARNING_DEGRADED and the highest is CRITICAL. The severities of Dell Command | Monitor events are listed in Table 2 to 1. Dell Command | Monitor sends local alerting and remote alerting for all the listed events.

Table 150. Events Polled by Dell Command | Monitor

Dell Command Monitor Event (Windows event log Number)	Description
AlertTemperatureProbeWarning (1053)	Temperature probe has detected a warning value.
AlertTemperatureProbeFailure (1054)	Temperature probe has detected a failure value.
AlertTemperatureProbeNonRecoverable (1055)	Temperature probe has detected a nonrecoverable value.

Dell Command Monitor Event (Windows event log Number)	Description
FanProbe (1103)	A cooling device has exceeded a minor threshold.
AlertCoolingDeviceFailure (1104)	Cooling device sensor has detected a failure value.
AlertCoolingDeviceNonRecoverable (1105)	Cooling device sensor has detected a nonrecoverable value.
AlertVoltageProbeWarning (1153)	Voltage probe has detected a warning value.
AlertVoltageProbeFailure (1154)	Voltage probe has detected a failure value.
AlertVoltageProbeNonRecoverable (1155)	Voltage probe has detected a nonrecoverable value.
CurrentProbe (1203)	An electrical current probe has exceeded a minor threshold. One of the hard-disk drive is running out of free space.
AlertAmperageProbeFailure (1204)	Amperage probe has detected a failure value.
AlertAmperageProbeNonRecoverable (1205)	Amperage probe has detected a nonrecoverable value.
ChassisIntrusionNormal (1252)	Chassis intrusion has returned to normal.
ChassisIntrusion (1254)	System chassis intrusion alert.
EccMemory (1403)	A memory checksum failure has occurred.  NOTE: This event is not supported on the system running RHEL.
RAIDControllerFailure (1801)	A RAID controller has failed.
RAIDControllerOffline (1802)	A RAID controller is offline.
RAIDControllerPowerOff (1803)	A RAID controller is turned off.
AlertRaidControllerDegraded (1804)	A RAID controller has degraded.
PhysicalDiskDegraded (1811)	A physical hard-disk drive is degraded.
AlertPhysicalDiskRebuilding (1812)	A physical hard-disk drive is rebuilding.
PhysicalDiskFailed (1813)	A physical hard-disk drive has failed.
PhysicalDiskOffline (1814)	A physical hard-disk drive is offline.
VirtualDiskDegraded (1821)	A virtual hard-disk drive is degraded.
VirtualDiskRebuilding (1822)	A virtual hard-disk drive is rebuilding.
VirtualDiskFailed (1823)	A virtual hard-disk drive has failed.
VirtualDiskOffline (1824)	A virtual hard-disk drive is offline.
NumberOfDisksIncreased (2030)	A hard-disk drive has been added.
NumberOfDisksDecreased (2031)	A hard-disk drive has been removed.
MemorySizeIncreased (2032)	The memory size has been increased.
MemorySizeDecreased (2033)	The memory size has been decreased.

Dell Command Monitor Event (Windows event log Number)	Description
DiskCapacity (2034)	In the current version, two user-defined thresholds are used. An event is generated only when the conditions of both thresholds are met. The first threshold, expressed as an absolute value in megabytes, specifies the size of the hard-disk drive to be monitored. Hard-disk drives with a capacity smaller than the specified size are ignored. The second threshold is expressed as a percentage of the hard-disk drive size. An event is generated when the available free space on one of the monitored hard-disk drives falls below this percentage.
NumberOfProcessorsIncreased (2035)	Number of processors on the system has increased.
NumberOfProcessorsDecreased (2036)	A processor has been removed.
HDD Smart Failure(2037)	<ul style="list-style-type: none"> · A hard-disk drive condition has occurred that may eventually lead to a hard-disk drive failure. · Error message is displayed when the current value exceeds the threshold value. · Warning message is displayed when the current value exceeds the custom threshold value.
	<p> NOTE: Extended Error and Warning messages are supported only on Embedded box personal computer 3000/5000.</p>
DiskSizeIncreased (2038)	The size of at least one hard-disk drive has increased.
DiskSizeDecreased (2039)	The size of at least one hard-disk drive has decreased.

Sample scripts for Dell Command | Monitor

10.2.1

To run various functionalities in Dell Command | Monitor, see the sample PowerShell and VB scripts available at [Dell Knowledge Library, Dell Command | Monitor page](#).
