Introduction

This reference guide provides information about the Simple Network Management Protocol (SNMP) Management Information Base (MIB) which is applicable to Dell Command | Monitor.

Introduction to the SNMP Reference Guide

This reference guide provides a formatted version of the following MIB that are released with the current version of Dell Command | Monitor. Sections in this guide follow MIB groups and provide explanations and definitions for the terms used to define MIB objects. Content in this reference guide is organized as documented in the following subsections. The table below describes the sections that provide general information about the MIBs documented in this guide.

Dell Command | Monitor management instrumentation base

The Dell Command | Monitor MIB (10909.mib) provides instrumentation data that allows you to monitor the health of a client system with SNMP management applications. It provides:

- Information about the status at key points in the system.
- Rapid access to detailed fault and performance information gathered by industry-standard systems management agents.
- Version information for BIOS, firmware, and operating system.

In addition, traps are sent to report a change in status of the health of critical components.

The Dell Command | Monitor MIB structures the MIB objects into groups of scalar objects or MIB tables that provide related information. The following describes each Dell Command | Monitor MIB group and lists the MIB group number assigned to the MIB group. The Dell Command | Monitor MIB groups are identified by the SNMP OID **1.3.6.1.4.1.674.10909.1.<MIB group number>**, where *<MIB group number>* is the number assigned to the MIB group.

 **NOTE:** From Dell Command | Monitor version 9.0 onwards, the 10892 MIB is not supported. The 10909 MIB deprecates 10892 MIB and identifies only client systems.

 **NOTE:** You cannot perform write and set operations on MIB group variables.

SNMP basic terminology

It is important to have a good understanding of the key technical terms used in this guide. This guide provides definitions for all essential terms used in describing the Client Instrumentation MIBs.

 **NOTE:** Supported SNMP versions for Windows is SNMP v1 and v2c.

Tables

This reference guide contains two types of tables:

- Tables that are used to organize and define variable values
- Tables that define MIB objects

Supported SNMP versions

Windows — SNMP v1 and v2c

The **SystemStateGlobalSystemStatus** variable provides overall system health status and includes rolled-up (that is, critical) status for Instrumentation and Storage. This variable monitors the overall system health status. It reflects changes to **SystemStateChassisStatus** variable, which represents Instrumentation health status.

The **SystemStateChassisStatus** variable provides the rolled-up health status for the subsystems associated with the chassis that is represented by the row in the **SystemStateTable**. Changes to the variables in List 1, each of which indicates the rolled-up health status of all the components of the corresponding subsystem, are reflected in **SystemStateChassisStatus** variable.

For example, **SystemStatePowerSupplyStatusCombined** provides the rolled-up status of all power supplies for the chassis.

The variables in List 2 provide the health status of each component of the corresponding subsystem. Each octet of the value represents a component. If a power supply fails, the corresponding entry in **SystemStatePowerSupplyStatusDetails**, **SystemStatePowerSupplyStatusCombined**, **SystemStateChassisStatus**, and **SystemStateGlobalSystemStatus** transitions to critical.

SNMP traps

Dell Command | Monitor generates events that result in Simple Network Management Protocol (SNMP) traps or operating system event logs. This section describes the traps, also known as alerts, generated by Dell Command | Monitor.

Dell Command | Monitor generates events in response to changes in the status of sensors and other monitored parameters. When an event with predefined characteristics occurs on your system, the SNMP subagent sends information about the event, along with trap variables, to the management console.

Each status change event generates a unique identifier called the TrapID and a trap description that describes the event. The TrapID and message uniquely describe the severity and cause of the event. The TrapID and description also provide other relevant information such as the location of the event and the previous state of the monitored item.

Trap variables

This section describes the variables that are sent to the management console to provide additional information about a trap or alert generated by some event on your system. The trap variables listed here apply to all Instrumentation traps. Trap variables are sent in the order listed and are reserved for use only in traps. When a varbind is created for a trap variable, a zero is appended to the object ID (OID) to create the OID for the varbind.
