

# Dell Command Line Reference Guide for the S6100–ON System

9.14.2.5

## Notes, cautions, and warnings

 **NOTE:** A NOTE indicates important information that helps you make better use of your product.

 **CAUTION:** A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

 **WARNING:** A WARNING indicates a potential for property damage, personal injury, or death.

# About this Guide

This guide provides information about the Dell EMC Networking operating system (OS) command line interface (CLI). This book also includes information about the protocols and features supported in Dell EMC Networking OS.

## References

For more information about your system, go to the [Dell EMC Networking Support page](#) and refer to the following documents:

- *Dell EMC Networking OS Configuration Guide*
- *Dell EMC Networking OS Installation Guide*
- *Dell EMC Networking OS Quick Start Guide*
- *Dell EMC Networking OS Release Notes*

### Topics:

- [Objectives](#)
- [Audience](#)
- [Conventions](#)
- [Information Icons](#)

## Objectives

This information is intended as a reference guide for the Dell EMC Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

 **NOTE:** For more information about when to use the CLI commands, see the *Dell EMC Networking OS Configuration Guide* for your specific system.

## Audience

The *Dell EMC Networking OS CLI Guide* is intended for system administrators with an understanding of Layer 2 and Layer 3 networking technologies, who are responsible for configuring or maintaining networks.

## Conventions

This guide uses the following conventions to describe command syntax:

|                         |                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------|
| <b>Keyword</b>          | Keywords are in Courier font and must be entered in the CLI as listed.                           |
| <b><i>parameter</i></b> | Parameters are in italics and require a number or word to be entered in the CLI.                 |
| <b>{X}</b>              | Keywords and parameters within braces must be entered in the CLI.                                |
| <b>[X]</b>              | Keywords and parameters within brackets are optional.                                            |
| <b>x y</b>              | Keywords and parameters separated by a bar require you to choose one option.                     |
| <b>x  y</b>             | Keywords and parameters separated by a double bar allow you to choose any or all of the options. |

# Information Icons

This guide uses the following information symbols:

 **NOTE:** The Note icon signals important operational information.

 **CAUTION:** The Caution icon signals information about situations that could result in equipment damage or loss of data.

 **NOTE:** The Warning icon signals information about hardware handling that could result in injury.

## CLI Basics

This chapter describes the command line interface (CLI) structure and command modes. The Dell EMC Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

### Topics:

- [Accessing the Command Line](#)
- [Multiple Configuration Users](#)
- [Obtaining Help](#)
- [Navigating the CLI](#)
- [Using the no Command](#)
- [Filtering show Commands](#)
- [Enabling Software Features on Devices Using a Command Option](#)
- [Command Modes](#)

## Accessing the Command Line

Access the CLI through a serial console port or a Telnet session.

When the system successfully boots, enter the command line in EXEC mode.

 **NOTE:** You must have a password configured on a virtual terminal line before you can Telnet into the system. Therefore, you must use a console connection when connecting to the system for the first time.

### Example

```
telnet 172.31.1.53
Trying 172.31.1.53...
Connected to 172.31.1.53.
Escape character is '^]'.
Login: username
Password: DellEMC>
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

| Prompt                | CLI Command Mode |
|-----------------------|------------------|
| <b>DellEMC&gt;</b>    | EXEC             |
| <b>DellEMC#</b>       | EXEC Privilege   |
| <b>DellEMC (conf)</b> | CONFIGURATION    |
| <b>#</b>              |                  |

 **NOTE:** For a list of all the command mode prompts, refer to the [Command Modes](#) section.

## Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell EMC Networking operating software generates an alert warning message similar to the following:

```
DellEMC#conf

% Warning: The following users are currently configuring the system:

User "" on line console0
```

```
User "admin" on line vty0 ( 123.12.1.123 )
User "admin" on line vty1 ( 123.12.1.123 )
User "Irene" on line vty3 ( 123.12.1.321 )
DellEMC#conf
```

When another user enters CONFIGURATION mode, Dell EMC Networking OS sends a message similar to the following:

```
% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration
```

In this case, the user is “admin” on vty2.

## Obtaining Help

As soon as you are in a Command mode, there are several ways to access help:

**To obtain a list of keywords at any command mode:** Type a ? at the prompt or after a keyword. There must always be a space before the ?.

**To obtain a list of keywords with a brief functional description:** Type help at the prompt.

**To obtain a list of available options:** Type a keyword, and then enter a space and a ?.

**To obtain a list of partial keywords using a partial keyword:** Type a partial keyword, and then enter a ?.

**Example** The following is an example of entering ip ? at the prompt:

```
DellEMC(conf)#ip ?
access-list      Named access-list
as-path          BGP autonomous system path filter
community-list   Add a community list entry
control-plane     Control plane configuration
dhcp             DHCP configuration commands
domain-list       Domain name to complete unqualified host name
domain-lookup     Enable IP Domain Name System hostname translation
domain-name       Define the default domain name
ecmp              Weighted Ecmp Configuration
ecmp-group        ECMP Group Configuration
extcommunity-list Add a Extended community list entry
ftp              FTP configuration commands
helper-address    DHCP relay agent configuration
host             Add an entry to the ip hostname table
http             HTTP configuration commands
icmp             ICMP configuration commands
igmp             Internet Group Management Protocol
max-frag-count    Max. fragmented packets allowed in IP re-assembly
mroute           Multicast routes and counters
msdp             Multicast source discovery protocol
multicast-limit   Max entries in Multicast TIB
multicast-msdp    Enable IP multicast MSDP protocol
multicast-routing Enable IP multicast forwarding
name-server       Specify address of name server to use
pim              Protocol Independent Multicast
prefix-list       Build a prefix list
radius           Interface configuration for RADIUS
redirect-list     Named redirect-list
route            Establish static routes
route-export      Export routes
route-import      Import routes
scp              SCP configuration commands
source-route      Process packets with source routing header options
ssh              SSH configuration commands
tacacs           Interface configuration for TACACS+
tcp              global tcp settings
telnet           Specify telnet options
tftp             TFTP configuration commands
unicast-host-route Configuration for ip unicast address-family
unknown-unicast   Enable IPv4 unknown-unicast packets to CPU
vlan-flooding     Vlan flooding
vrf              Configure VRF instance
```

When entering commands, you can take advantage of the following timesaving features:

- Commands are not case-sensitive.
- Enter partial (truncated) command keywords. For example, you can enter `int teng 1/1/11/1` for the interface `tengigabitethernet 1/1/11/1` command.
- Use the TAB key to complete keywords in commands.
- Use the up Arrow key to display the last enabled command.
- Use either the Backspace key or Delete key to erase the previous character.
- Use the left and right Arrow keys to navigate left or right in the Dell EMC Networking OS command line.

The shortcut key combinations at the Dell EMC Networking OS command line are as follows:

| Key Combination | Action                                                                                                              |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| <b>CNTL-A</b>   | Moves the cursor to the beginning of the command line.                                                              |
| <b>CNTL-B</b>   | Moves the cursor back one character.                                                                                |
| <b>CNTL-D</b>   | Deletes the character at the cursor.                                                                                |
| <b>CNTL-E</b>   | Moves the cursor to the end of the line.                                                                            |
| <b>CNTL-F</b>   | Moves the cursor forward one character.                                                                             |
| <b>CNTL-I</b>   | Completes a keyword.                                                                                                |
| <b>CNTL-K</b>   | Deletes all the characters from the cursor to the end of the command line.                                          |
| <b>CNTL-L</b>   | Re-enters the previous command.                                                                                     |
| <b>CNTL-N</b>   | Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key. |
| <b>CNTL-P</b>   | Recalls commands, beginning with the last command.                                                                  |
| <b>CNTL-R</b>   | Re-enters the previous command.                                                                                     |
| <b>CNTL-U</b>   | Deletes the line.                                                                                                   |
| <b>CNTL-W</b>   | Deletes the previous word.                                                                                          |
| <b>CNTL-X</b>   | Deletes the line.                                                                                                   |
| <b>CNTL-Z</b>   | Ends continuous scrolling of the command outputs.                                                                   |
| <b>Esc B</b>    | Moves the cursor back one word.                                                                                     |
| <b>Esc F</b>    | Moves the cursor forward one word.                                                                                  |
| <b>Esc D</b>    | Deletes all the characters from the cursor to the end of the word.                                                  |

## Navigating the CLI

The Dell EMC Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is "Dell" by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell EMC Networking OS command modes, see the *command mode list* in [Accessing the Command Line](#).

The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, see [Command Modes](#).

# Using the no Command

To disable, delete or return to default values, use the `no` form of the commands.

For most commands, if you type the keyword `no` in front of the command, you disable that command or delete it from the running configuration. In this guide, the `no` form of the command is described in the Syntax portion of the command description.

## Filtering show Commands

You can filter commands using the `show` command to find specific information, display certain information only, or begin the command output at the first instance of a regular expression or phrase.

Execute a `show` command and a pipe ( `|` ), and one of the following parameters and a regular expression to show output that either excludes or includes the specified parameters.

**NOTE:** The Dell EMC Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: `command | grep gigabit |except regular-expression | find regular-expression`.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>except</b>  | Displays only the text that does not match the pattern (or regular expression).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>find</b>    | Searches for the first occurrence of a pattern.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>grep</b>    | Displays text that matches a pattern.<br><br>The <code>grep</code> command option has an ignore-case suboption that makes the search case-insensitive. For example, the commands:<br><br><div><div><b>show run  <br/>grep Ethernet</b></div><div>Returns a search result with instances containing a capitalized <i>Ethernet</i>, such as<br/>interface TenGigabitEthernet 1/1/1/1.</div></div> <div><div><b>show run  <br/>grep ethernet</b></div><div>Does not return the previous search result because it only searches for instances<br/>containing a noncapitalized <i>ethernet</i>.</div></div> <div><div><b>show run  <br/>grep Ethernet<br/>ignore-case</b></div><div>Returns instances containing both <i>Ethernet</i> and <i>ethernet</i>.</div></div> |
| <b>no-more</b> | Does not paginate the display output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>save</b>    | Copies the output to a file for future use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Displaying All Output

Use the `no-more` option after the pipe to display all output at once — not one screen at a time. This operation is similar to terminal `length screen-length` except that the `no-more` option affects the output of just the specified command. For example: `show running-config|no-more`.

## Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the `save` option as the last filter. For example: `command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save`.

# Enabling Software Features on Devices Using a Command Option

The capability to activate software applications or components on a device using a command is supported on this platform.

Starting with Release 9.4(0.0), you can enable or disable specific software features or applications that need to run on a device by using a command attribute in the CLI interface. This enables effective, streamlined management and administration of applications and utilities that run on a device. You can employ this capability to perform an on-demand activation, or turn-off a software component or protocol. A feature configuration file generated for each image contains feature names, and denotes if this enabling or disabling method is available. You can enable or disable the VRF application globally across the system by using this capability.

Activate the VRF application on a device by using the `feature vrf` command in CONFIGURATION mode.

 **NOTE:** The `no feature vrf` command is not supported on any of the platforms.

To enable the VRF feature and cause all VRF-related commands to be available or viewable in the CLI interface, use the following command. You must enable the VRF feature before you can configure its related attributes.

```
DellEMC(conf)# feature vrf
```

Based on if the VRF feature is identified as supported in the Feature Configuration file, configuration command `feature vrf` becomes available for usage. This command is stored in the running-configuration and precedes all other VRF-related configurations.

To display the state of Dell EMC Networking OS features:

```
DellEMC# show feature
```

**Example of show feature output**

For a particular target where VRF is enabled, the show output is similar to the following:

| Feature | State   |
|---------|---------|
| -----   | -----   |
| VRF     | Enabled |

## feature vrf

Enable the VRF application on a switch. Once enabled, you cannot deactivate the VRF application.

| <b>Syntax</b>            | <code>feature vrf</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |           |                             |          |                             |            |                             |            |                             |          |                          |          |                                                    |

| Usage Information | You can activate VRF application on a device by using the <code>feature vrf</code> command in CONFIGURATION mode. The <code>no feature vrf</code> command is not supported on any of the platforms.                                                                                                                                                |                                                                                           |
| Example           | <pre>6702#show feature Feature                               State -----                               - Acloptimized                         disabled Aclrange                             disabled IPV6acloptimized                     enabled UDF                                  enabled VRF                                  disabled</pre> |                                                                                           |

## Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

### BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the `address-family` command.
3. Enter the protocol type:
  - For IPv4, enter the `ipv4 multicast` command. The prompt changes to include `conf-router_bgp_af` for IPv4.

## CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, see [Policy-Based QoS Commands](#).

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `class-map` command, and then enter the class map name. The prompt changes to include `config-class-map`.

You can return to CONFIGURATION mode by using the `exit` command.

## CONFIGURATION Mode

In EXEC Privilege mode, use the `configure` command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the `configure` command. The prompt changes to include `conf`.

From this mode, you can enter INTERFACE mode by using the `interface` command.

## CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, see [Control Plane Policing \(CoPP\)](#).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `control-plane-cpuqos` command. The prompt changes to include `conf-control-cpuqos`.

You can return to CONFIGURATION mode by using the `exit` command.

## DHCP Mode

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip dhcp server` command. The prompt changes to include `config-dhcp`.

You can return to CONFIGURATION mode by using the `exit` command.

## DHCP POOL Mode

To create an address pool, use DHCP POOL mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include `config-dhcp-pool-name`.

You can return to DHCP mode by using the `exit` command.

## ECMP GROUP Mode

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, see [ecmp\\_overview](#).

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include `conf-ecmp-group-ecmp-group-id`.

You can return to CONFIGURATION mode by using the `exit` command.

## EIS Mode

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `management egress-interface-selection` command. The prompt changes to include `conf-mgmt-eis`.

You can return to CONFIGURATION mode by using the `exit` command.

## EXEC Mode

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.

When you are in EXEC mode, the `>` prompt is displayed following the host name prompt, which is “DellEMC” by default. You can change the host name prompt using the `hostname` command.

 **NOTE:** Each mode prompt is preceded by the host name.

## EXEC Privilege Mode

The `enable` command accesses EXEC Privilege mode. If an administrator has configured an “Enable” password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the `#` prompt is displayed.

## EXTENDED COMMUNITY LIST Mode

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip extcommunity-list` command then a community list name. The prompt changes to include `conf-ext-community-list`.

You can return to CONFIGURATION mode by using the `exit` command.

## FRRP Mode

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, see [Force10 Resilient Ring Protocol \(FRRP\)](#).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol frrp` command then the ring ID. The prompt changes to include `conf-frrp-ring-id`.

You can return to CONFIGURATION mode by using the `exit` command.

## INTERFACE Mode

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `interface` command and then enter an interface type and interface number that is available on the switch.

 **NOTE:** In Dell EMC Networking OS, the stack unit number and interfaces start from 0. But in Dell EMC Networking OS Open Networking platforms, the stack unit number and interfaces start from 1.

The prompt changes to include the designated interface and slot/port[/subport] number. For example:

| Prompt                                | Interface Type                                                                                                                         |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>DellEMC (conf-if) #</b>            | INTERFACE mode                                                                                                                         |
| <b>DellEMC (conf-if-te-1/1/1/1) #</b> | Ten-Gigabit Ethernet interface then stack/slot/port/subport information                                                                |
| <b>DellEMC (conf-if-tf-1/1/1/1) #</b> | Twenty-five Gigabit Ethernet interface then stack/slot/port/subport information                                                        |
| <b>DellEMC (conf-if-fo-1/1/1/1) #</b> | Forty-Gigabit Ethernet interface then stack/slot/port/subport information or stack/slot/port information, depending on the module used |
| <b>DellEMC (conf-if-fi-1/1/1/1) #</b> | Fifty-Gigabit Ethernet interface then stack/slot/port/subport information                                                              |
| <b>DellEMC (conf-if-hu-1/1/1) #</b>   | Hundred-Gigabit Ethernet interface then stack/slot/port information                                                                    |
| <b>DellEMC (conf-if-lo-0) #</b>       | Loopback interface number                                                                                                              |
| <b>DellEMC (conf-if-nu-0) #</b>       | Null Interface then zero                                                                                                               |
| <b>DellEMC (conf-if-po-1) #</b>       | Port-channel interface number The range is from 1 to 4096.                                                                             |
| <b>DellEMC (conf-if-vl-01) #</b>      | VLAN Interface then VLAN number (range 1–4094)                                                                                         |
| <b>DellEMC (conf-if-ma-1/1) #</b>     | Management Ethernet interface then slot/port information                                                                               |
| <b>DellEMC (conf-if-tu-0) #</b>       | Tunnel interface then tunnel ID.                                                                                                       |
| <b>DellEMC (conf-if-range) #</b>      | Designated interface range (used for bulk configuration).                                                                              |

## IP ACCESS LIST Mode

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` command or the `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter either the `ip access-list standard` command or the `ip access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-nacl` or `conf-ext-nacl`.

You can return to CONFIGURATION mode by using the `exit` command.

## ISIS ADDRESS-FAMILY Mode

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.
2. Enter the `address-family ipv6 unicast` command. The prompt changes to include `conf-router_isis-af_ipv6`.

## LLDP Mode

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, see [Link Layer Discovery Protocol \(LLDP\)](#).

To enter LLDP mode:

1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the `protocol lldp` command. The prompt changes to include `conf-lldp` or `conf-if-interface-lldp`.

## LLDP MANAGEMENT INTERFACE Mode

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:

1. Verify that you are logged in to LLDP mode.
2. Enter the `management-interface` command. The prompt changes to include `conf-lldp-mgmtIf`.

## LINE Mode

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `line` command. Include the keywords `console` or `vtty` and their line number available on the switch. The prompt changes to include `config-line-console` or `config-line-vty`.

You can exit this mode by using the `exit` command.

## MAC ACCESS LIST Mode

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `mac access-list standard` or `mac access-list extended` command.

To enter MAC ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `mac access-list standard` command or the `mac access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-macl` or `conf-ext-macl`.

You can return to CONFIGURATION mode by using the `exit` command.

## MONITOR SESSION Mode

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, see [Port Monitoring](#).

To enter MONITOR SESSION mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `monitor session` command, and then the session ID. The prompt changes to include `conf-mon-sess-sessionID`.

## MULTIPLE SPANNING TREE (MSTP) Mode

To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, see [Multiple Spanning Tree Protocol \(MSTP\)](#).

To enter MULTIPLE SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree mstp` command. The prompt changes to include `conf-mstp`. You can return to CONFIGURATION mode by using the `exit` command.

## OPENFLOW INSTANCE Mode

To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `openflow of-instance` command, and then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include `conf-of-instance of-id`.

You can return to the CONFIGURATION mode by entering the `exit` command.

## Per-VLAN SPANNING TREE (PVST+) Plus Mode

To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, see [Per-VLAN Spanning Tree Plus \(PVST+\)](#).

 **NOTE:** The protocol name is PVST+, but the plus sign is dropped at the CLI prompt.

To enter PVST+ mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree pvst` command. The prompt changes to include `conf-pvst`. You can return to CONFIGURATION mode by using the `exit` command.

## PORT-CHANNEL FAILOVER-GROUP Mode

To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, see [Port Channel Commands](#).

To enter PORT-CHANNEL FAILOVER-GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `port-channel failover-group` command. The prompt changes to include `conf-po-failover-grp`. You can return to CONFIGURATION mode by using the `exit` command.

## PREFIX-LIST Mode

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command and the name for the prefix list. The prompt changes to include `conf-nprefixl`. You can return to CONFIGURATION mode by using the `exit` command.

## PROTOCOL GVRP Mode

To enable and configure GARP VLAN Registration Protocol (GVRP), use PROTOCOL GVRP mode. For more information, see [GARP VLAN Registration \(GVRP\)](#).

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include `config-gvrp`.

You can return to CONFIGURATION mode by using the `exit` command.

## RAPID SPANNING TREE (RSTP) Mode

To enable and configure RSTP, use RSTP mode. For more information, see [Rapid Spanning Tree Protocol \(RSTP\)](#).

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include `conf-rstp`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTE-MAP Mode

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `route-map map-name [permit | deny] [sequence-number]` command. The prompt changes to include `config-route-map`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER BGP Mode

To enable and configure Border Gateway Protocol (BGP), use ROUTER BGP mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter ROUTER BGP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router bgp` command, and then enter the AS number. The prompt changes to include `conf-router_bgp`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER ISIS Mode

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ROUTER ISIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include `conf-router_isis`.

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER OSPF Mode

To configure OSPF, use ROUTER OSPF mode. For more information, see [Open Shortest Path First \(OSPFv2\)](#).

To enter ROUTER OSPF mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include `conf-router_ospf-id`.

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

## ROUTER OSPFV3 Mode

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include `conf-ipv6-router_ospf`. You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER RIP Mode

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, see [Routing Information Protocol \(RIP\)](#).

To enter ROUTER RIP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include `conf-router_rip`. You can return to CONFIGURATION mode by using the `exit` command.

## SPANNING TREE Mode

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, see [Spanning Tree Protocol \(STP\)](#).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include `conf-stp`. You can return to CONFIGURATION mode by using the `exit` command.

## SupportAssist Mode

To enable and configure the SupportAssist, use SupportAssist mode. For more information, see [SupportAssist](#).

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `support-assist` command. The prompt changes to include `conf-supportassist`. You can return to CONFIGURATION mode by using the `exit` command.

## TRACE-LIST Mode

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command, and the name of the Trace list. The prompt changes to include `conf-trace-acl`. You can exit this mode by using the `exit` command.

## VLT DOMAIN Mode

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, see [Virtual Link Trunking \(VLT\)](#).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `vlt domain` command, and then the VLT domain number. The prompt changes to include `conf-vlt-domain`. You can return to CONFIGURATION mode by entering the `exit` command.

## VRRP Mode

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, see [Virtual Router Redundancy Protocol \(VRRP\)](#).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command, and then enter the VRRP group ID. The prompt changes to include `conf-if-interface-type-slot/port-vrid-vrrp-group-id`.

# File Management

This section contains command line interface (CLI) commands needed to manage the configuration files, as well as other file management commands.

## Topics:

- [boot system](#)

## boot system

Specify the location where the Dell EMC Networking OS image used to boot the system is stored.

**Syntax** `boot system {gateway ip-address | stack-unit {stack-unit-number | all} {default | primary | secondary} {ftp: | nfsmount: | system: {A: | B: | bmp-boot} | tftp: | usbflash:}}`

To return to the default boot sequence, use the `no boot system` command.

| Parameters                      |  |                                                                                             |
|---------------------------------|--|---------------------------------------------------------------------------------------------|
| <b>gateway</b>                  |  | Enter the IP address of the default next-hop gateway for the management subnet.             |
| <b><i>ip-address</i></b>        |  | Enter an IP address in dotted decimal format.                                               |
| <b>stack-unit</b>               |  | Enter the keywords <code>stack-unit</code> to specify the stack unit number.                |
| <b>all</b>                      |  | Enter the keyword <code>all</code> for all the stack units.                                 |
| <b><i>stack-unit-number</i></b> |  | Enter the stack-unit number. The range is from 1 to 6.                                      |
| <b>default</b>                  |  | Enter the keyword <code>default</code> to specify the default Dell EMC Networking OS image. |
| <b>primary</b>                  |  | Enter the keyword <code>primary</code> to specify the primary Dell EMC Networking OS image. |

|                  |                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>secondary</b> | Enter the keyword <code>secondary</code> to specify the secondary Dell EMC Networking OS image.                                               |
| <b>ftp:</b>      | Enter the keyword <code>FTP:</code> to retrieve the image from an FTP server. <code>ftp://userid:password@hostip/filepath</code> .            |
| <b>nfsmount</b>  | Enter the keyword <code>nfsmount:</code> to retrieve the image from a mounted NFS file system. <code>nfsmount://filepath</code>               |
| <b>system:</b>   | Enter the keyword <code>system:</code> to retrieve the image from the system.                                                                 |
| <b>usbflash</b>  | Enter the keyword <code>usbflash:</code> to retrieve the image from the USB flash memory. <code>usbflash://filename</code> .                  |
| <b>tftp:</b>     | Enter the keyword <code>TFTP:</code> to retrieve the image from a TFTP server. <code>tftp://hostip/filepath</code> .                          |
| <b>A:   B:</b>   | Enter <code>A:</code> or <code>B:</code> to boot one of the system partitions.                                                                |
| <b>bmp-boot</b>  | Enter the keywords <code>bmp-boot</code> to boot the system from the image present in the DHCP offer.                                         |
|                  |  <b>NOTE:</b> In normal-reload, this keyword is not enabled. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                             |
|-------------------|-----------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                               |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                             |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                         |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                             |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                             |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                             |
| <b>9.7(0.0)</b>   | Introduced the support for <code>bmp-boot</code> on the S-Series and Z-Series switches. |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                               |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                |

**Usage Information** To display these changes in the `show bootvar` command output, save the running configuration to the startup configuration (using the `copy` command) and reload system.

Use the `bmp-boot` keyword only when the device boots up from bare metal provisioning (BMP). For an industrial standard upgraded device, the Dell EMC Networking OS stores the image partition upgraded from the DHCP offer in the `bmp-boot` option.

## cd

Change to a different working directory.

**Syntax** `cd [flash: | usbflash:] <directory name and path>`

**Parameters** **flash:** Use the keyword `flash:` to change the current directory to internal flash and its sub directories.

**usbflash:** Use the keyword `usbflash:` to change the current directory to the inserted USB.

**directory name and path** Enter the directory name and path as follows: `directory name ([flash://]directory_path)`

 **NOTE:** The `cd` command without any arguments will change the current directory to `flash:`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                          |
|-------------------|------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.            |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                             |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                          |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                      |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                          |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                          |
| <b>9.7(0.0)</b>   | Added NFS mount support. Introduced on the S6000-ON. |
| <b>9.0.2.0</b>    | Introduced on the S6000.                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                             |

| <b>7.6.1.0</b>    | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                          |
| <b>E-Series</b>   | Original command.                                    |

## copy

Copy one file to another location. Dell EMC Networking OS supports IPv4 and IPv6 addressing for FTP, HTTP, TFTP, and SCP (in the *hostip* field).

**Syntax** `copy source-file-url destination-file-url`

|                   |                          |                                                                                                                                                 |
|-------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>compressed-config</b> | Enter the keywords <code>compressed-config</code> to copy a file from the current system configuration.                                         |
|                   | <b>flash:</b>            | Enter the keyword <code>flash:</code> to copy from the local file system ( <code>[flash://]filepath</code> ).                                   |
|                   | <b>ftp:</b>              | Enter the keyword <code>ftp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>ftp://userid:password@hostip/filepath</code> ). |
|                   | <b>http:</b>             | Enter the keyword <code>http:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>http://hostip/filepath</code> ).               |
|                   | <b>nfsmount:</b>         | Enter the keyword <code>nfsmount:</code> to copy from the nfs mount file system ( <code>nfsmount://&lt;mount-point&gt;/filepath</code> ).       |
|                   | <b>running-config</b>    | Enter the keywords <code>running-config</code> to copy from the current system configuration.                                                   |
|                   |                          |                                                                                                                                                 |

|                       |                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>scp:</b>           | Enter the keyword <code>scp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>scp://userid:password@hostip/filepath</code> ). |
| <b>startup-config</b> | Enter the keywords <code>startup-config</code> to copy from the startup configuration.                                                          |
| <b>tftp:</b>          | Enter the keyword <code>tftp:</code> to copy from the remote file system, IPv4, or IPv6, ( <code>tftp://hostip/filepath</code> ).               |
| <b>usbflash:</b>      | Enter the keyword <code>usbflash:</code> to copy the file to or from the external USB flash.                                                    |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(1.0)</b>  | Introduced on the S5048F-ON.                                                                                                                 |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                                    |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                                     |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                              |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. Added the <code>nfsmount:&lt;mount-point&gt;</code> parameters that allow you to mount a remote NFS file system. |
| <b>9.4(0.0)</b>   | Added the <code>compressed-config</code> parameter.                                                                                          |
| <b>9.3(0.1)</b>   | Added the <code>http</code> parameter on the S6000, Z9000, S4810, and S4820T.                                                                |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                                     |
| <b>8.4.1.0</b>    | Added IPv6 addressing support for FTP, TFTP, and SCP.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                                    |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                                     |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                                     |
| <b>8.2.1.0</b>    | Added <code>usbflash</code> and <code>rpm0usbflash</code> commands on E-Series.                                                              |
| <b>7.6.1.0</b>    | Introduced on the S-Series and added the SSH port number to the SCP prompt sequence on all systems.                                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                                  |
| <b>E-Series</b>   | Original command.                                                                                                                            |

**Usage Information** Dell EMC Networking OS supports a maximum of 100 files at the root directory level on both the internal and external flash.

When copying a file to a remote location (for example, using Secure Copy [SCP]), enter only the keywords and Dell EMC Networking OS prompts you for the rest of the information. For example, when using SCP, you can enter `copy running-config scp:` where `running-config` is the source and the target is specified in the ensuing prompts. Dell EMC Networking OS prompts you to enter any required information for the named destination — remote destination, destination filename, user ID, password, and so forth.

When you use the `copy running-config startup-config` command to copy the running configuration to the startup configuration file, Dell EMC Networking OS creates a backup file on the internal flash of the startup configuration.

When you load the startup configuration or a configuration file from a network server such as TFTP to the running configuration, the configuration is added to the running configuration. This does not replace the existing running configuration. Commands in the configuration file has precedence over commands in the running configuration.

Dell EMC Networking OS supports copying the running-configuration to a TFTP server, an FTP server, or a remote NFS file system. For example:

- `copy running-config tftp:`
- `copy running-config ftp:`
- `copy running-config nfsmount://<mount-point>/filepath`

You can compress the running configuration by grouping all the VLANs and the physical interfaces with the same property. You can store the operating configuration to the startup config in Compressed mode and perform an image downgrade without any configuration loss.

#### Example

```
DellEMC#copy running-config scp:
Address or name of remote host []: 192.168.1.1
Port number of the server [22]: 22
Destination file name [startup-config]:
User name to login remote host: username
Password to login remote host:
!
4080 bytes successfully copied
DellEMC#
```

In this `copy scp: flash:` example, specifying SCP in the first position indicates that you need to specify the target in the ensuing prompts. Entering `flash:` in the second position indicates that the target is the internal flash. The source is on a secure server running secure shell (SSH), so you are prompted for the user datagram protocol (UDP) port of the SSH server on the remote host.

#### Example

```
DellEMC# copy running-config nfsmount://<mount-point>/filepath
Destination file name [test.txt]:
User name to login remote host: username
Password to login remote host:
DellEMC#
```

#### Example

```
DellEMC# copy scp: flash:
Address or name of remote host []: 10.11.199.134
Port number of the server [22]: 99
Source file name []: test.cfg
User name to login remote host: admin
Password to login remote host:
Destination file name [test.cfg]: test1.cfg
DellEMC#
```

#### Example

```
DellEMC# copy compressed-config compressed-cfg
!
6655 bytes successfully copied
DellEMC#
DellEMC#copy compressed-config ftp:
Address or name of remote host []: 10.11.8.12
Destination file name [startup-config]:
User name to login remote host: spbalaji
Password to login remote host:
!
6655 bytes successfully copied
DellEMC#
```

#### Example

```
DellEMC# copy http://admin:admin123@10.16.206.77/sample_file flash://
sample file
DellEMC#
```

## Related Commands

- [cd](#) – changes the working directory.

# delete

Delete a file from the flash. After deletion, files cannot be restored.

### Syntax

```
delete {flash: | nfsmount: | usbflash:} [no-confirm]
```

### Parameters

#### **flash:**

To delete a file or directory on the internal flash, enter `flash://` then the filename or directory name (`[flash://]filepath`).

#### **nfsmount:**

To delete a file or directory on the NFS-mounted file system, enter `nfsmount://` then the mount point and the file path (`nfsmount://filepath`).

**NOTE:** While deleting a file directory on a remote NFS file system, you must specify the mount-point that indicates the working directory on the NFS file system. You cannot delete the root directory of the remote NFS file system.

#### **usbflash:**

To delete a file or directory on the external USB flash, enter `usbflash://` then the filename or directory name (`[usbflash://]filepath`).

#### **no-confirm**

(OPTIONAL) Enter the keywords `no-confirm` to specify that the Dell EMC Networking OS does not require user input for each file prior to deletion.

**Command Modes** EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

#### **Version**

#### **Description**

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

**9.10(0.0)**

Introduced on the S6100-ON.

**9.8(2.0)**

Introduced on the S3100 series.

**9.8(1.0)**

Introduced on the Z9100-ON.

**9.8(0.0P5)**

Introduced on the S4048-ON.

**9.8(0.0P2)**

Introduced on the S3048-ON.

**9.7(0.0)**

Introduced on the S6000-ON. Added support for NFS mount.

**9.0.2.0**

Introduced on the S6000.

**8.3.19.0**

Introduced on the S4820T.

**8.3.11.1**

Introduced on the Z9000.

**8.3.7.0**

Introduced on the S4810.

**7.6.1.0**

Introduced on the S-Series.

**7.5.1.0**

Introduced on the C-Series.

**E-Series**

Original command.

# dir

Display the files in a file system. The default is the current directory.

### Syntax

```
dir [flash: | nfsmount: | usbflash:]
```

## Parameters

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>flash:</b>    | For a directory on the internal Flash, enter <code>flash://</code> directory name.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>nfsmount:</b> | For a file or directory on an NFS-mounted file system, enter <code>nfsmount://</code> then the mount point and file path.<br><div> <b>NOTE:</b> While displaying a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot display details corresponding to the root directory of the remote NFS file system.</div> |
| <b>usbflash:</b> | For a directory on the external USB flash, enter <code>usbflash://</code> directory name.                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.7(0.0)</b>   | Added support for NFS mount.              |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>E-Series</b>   | Original command.                         |

## Example

```
DellEMC# dir
Directory of flash:

 1 drwx  8192 Jan  1 1980 00:00:00 +00:00 .
 2 drwx  3072 Dec 15 2014 06:27:10 +00:00 ..
 3 drwx  4096 Jan  1 1980 00:02:44 +00:00 TRACE_LOG_DIR
 4 drwx  4096 Jan  1 1980 00:02:44 +00:00 CORE_DUMP_DIR
 5 d---  4096 Jan  1 1980 00:02:44 +00:00 ADMIN_DIR
 6 drwx  4096 Jan  1 1980 00:02:44 +00:00 RUNTIME_PATCH_DIR
 7 drwx  4096 Nov  6 2014 06:57:06 +00:00 CONFIG_TEMPLATE
 8 -rwx  4625 Nov  6 2014 06:55:28 +00:00 startup-config
 9 drwx  4096 May 31 2013 02:49:46 +00:00 CONFD_LOG_DIR
flash: 2056916992 bytes total (2052784128 bytes free)
DellEMC#
```

## Example (NFS Mount)

```
DellEMC# dir nfsmount:
Directory of nfsmount:

 1 drwx      512 Jun 15 2015 02:47:57 +00:00 .
 2 drwx      512 Jun 15 2015 02:47:57 +00:00 ..
```

```
nfsmount: 1463410688 bytes total (585719808 bytes free)
DellEMC#
```

#### Related Commands

- [cd](#) — changes the working directory.

## format

Erase all existing files and reformat the file system. After the file system is formatted, files cannot be restored.

**Syntax** `format {flash: | usbflash:}`

**Defaults** **None**

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the S-Series                |

**Usage Information** You must include the colon (:) when entering this command.

After reformatting is complete, three empty directories are automatically created on flash: CRASH\_LOG\_DIR, TRACE\_LOG\_DIR and NVTRACE\_LOG\_DIR.

 **CAUTION:** This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the `write memory` command or `copy running-config startup-config` command).

#### Related Commands

- [copy](#) – copy the current configuration to either the startup-configuration file or the terminal.
- [show file-systems](#) – display information about the file systems on the system.

## fsck flash

Checks the flash file system for errors.

**Syntax** `fsck {flash: | usbflash:}`

**Parameters** **flash:** For a directory on the internal Flash, enter `flash://` directory name.

**usbflash:** For a directory on the external USB flash, enter `usbflash://` directory name.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.1(0.0)   | Introduced on S4810 and Z9000.            |
| 8.3.19.0   | Introduced on S4820T.                     |

**Usage Information** Include the colon (:) when entering this command. This command checks the specified flash memory for errors. If errors are found, the command recommends that you format the flash.

 **CAUTION:** If you elect to format the flash, all files – including the startup configuration file – are lost. If you do decide to format the specified flash, consider saving the running configuration as the startup configuration after formatting the flash (use the `write memory` command or `copy running-config startup-config` command).

**Related Commands**

- [copy](#) — copy one file to another location.
- [show file-systems](#) — display information about the file systems on the system.

## mkdir

Creates a directory on the NFS mounted file system.

**Syntax** `mkdir nfsmount://mount-point/username`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S-Series. |

#### Example

```
DellEMC# mkdir nfsmount:/nfs-mountpoint/guest
DellEMC#
```

#### Related Commands

- [rmdir](#) — remove a directory.

## mount nfs

Mounts an NFS file system to a device.

**Syntax** `mount nfs rhost:path mount-point [username password]`

**Parameters** Enter the following location keywords and information:

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <b>rhost:path</b>  | Enter the remote hosts's path directory.             |
| <b>mount-point</b> | Enter the folder name in the local file system.      |
| <b>username</b>    | (OPTIONAL) Enter the user name to access the device. |
| <b>password</b>    | (OPTIONAL) Enter the password.                       |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S-Series.               |

#### Example

```
DellEMC# mount nfs nfstest nfs-mount-point username pwd
DellEMC#
```

#### Related Commands

- [cd](#) — change the working directory.

## rmdir

Removes a directory from the NFS mounted file system.

**Syntax** `rmdir nfsmount://mount-point/username`

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S-Series.               |

## Example

```
DellEMC# rmdir nfsmount:/nfs-mountpoint/guest
Proceed to remove the directory [confirm yes/no]: yes
```

## Related Commands

- [mkdir](#) – create a directory.

# upgrade system

Upgrade the Dell EMC Networking OS image. To upgrade the boot flash or boot selector image, use the `upgrade boot` command.

## Syntax

```
upgrade system {flash: | ftp: | nfsmount: | scp: | stack-unit {stack-unit-id | all} | tftp: | usbflash:} file-url {A: | B:}
```

## Parameters

|                                                |                                                                                                                                                                                                                       |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>system</b>                                  | Enter the keyword <code>system</code> to upgrade the operating system (OS) image.                                                                                                                                     |
| <b>flash: file-url</b>                         | Enter the keyword <code>flash:</code> and specify the location of the image file in the format <code>//directory-path</code> or press Enter to launch a prompt sequence.                                              |
| <b>ftp: file-url</b>                           | Enter the keyword <code>ftp:</code> and specify the location of the image file in the format <code>//userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.                              |
| <b>nfsmount://&lt;mount-point&gt;/filepath</b> | Enter the keyword <code>nfsmount:</code> and specify the location of the image file in the format <code>//&lt;mount-point&gt;/filepath</code> .                                                                       |
| <b>scp: file-url</b>                           | Enter the keyword <code>scp:</code> and specify the location of the image file in the format <code>userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.                                |
| <b>stack-unit all</b>                          | Enter the keyword <code>stack-unit</code> followed by the keyword <code>all</code> to sync the image on all stack-units.                                                                                              |
| <b>tftp: file-url</b>                          | Enter the keyword <code>tftp:</code> and specify the location of the image file in the format <code>//host-ip/filepath</code> or press Enter to launch a prompt sequence.                                             |
| <b>usbflash: file-path</b>                     | Enter the keyword <code>usbflash:</code> and specify the location of the source file in the format <code>//directory-path</code> to upgrade from an external flash device or press Enter to launch a prompt sequence. |
| <b>A:   B:</b>                                 | Specify the flash partition of the operating-system image to be upgraded.                                                                                                                                             |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0)  | Enhanced to specify the MD5, SHA1, or SHA256 hash of the OS image that the system uses to validate the image during reboot. |
| 9.12(1.0)  | Introduced on the S5048F-ON.                                                                                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                 |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                    |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                 |
| 9.7(0.0)   | Added support for NFS mount.                                                                                                |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                                    |
| 9.0(0.0)   | Added support for IPv6 for the <code>file-url</code> parameter.                                                             |
| 8.3.19.0   | Introduced on the S4820T.                                                                                                   |
| 8.3.11.1   | Introduced on the Z9000. Added support for the SSD on the Z9000 only.                                                       |
| 8.3.7.0    | Introduced on the S4810.                                                                                                    |
| 7.7.1.0    | Added support for TFTP and SCP.                                                                                             |
| 7.6.1.0    | Introduced on the S-Series.                                                                                                 |

## Usage Information

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:X:X:X::X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, using the `upgrade system` command, specify the default boot location using the `boot system` command. Save the configuration to the startup configuration file using the `write memory` command and reload the system using the `reload` command to use the new Dell EMC Networking OS software.

If you enable the verified boot feature using the `verified boot` command, the `upgrade system` command prompts you to enter the hash value of the Dell EMC Networking OS image. This is applicable only for the local partitions such as A: or B:. You can get the hash from the iSupport page.

**NOTE:** You can apply a set of configurations, available only in the new version to which you want to upgrade the system to, without having to re-boot the system twice. In order to accomplish this seamless upgrade, perform the following tasks:

1. Upgrade the system image to the new image and configure the primary partition to boot from the new image using the `boot system` command.
2. Update the startup configuration file with the new set of configurations and then reload the device using the `reload` command.

The new set of configurations are parsed from the startup configuration file and applied to the NVRAM. During the system boot up, the new set of configurations are applied to the system from the updated NVRAM configurations.

The following commands require NVRAM write to take effect in a single reload:

- Forwarding CLIs:
  - `hardware forwarding-table mode {scaled-l2-switch | scaled-l3-routes | scaled-l3-hosts}`
  - `cam-ipv6 extended-prefix {1024 | 2048 | 3072}`

- ip ecmp-group maximum-paths 2-64
- ACL CAM carving related CLIs:
  - cam-acl cli
  - cam-acl-vlan cli
  - cam-acl-egress cli
  - cam-sharing
- Feature keyword CLIs:
  - feature udf-acl
  - feature aclrange
  - feature ipv6acloptimized
  - feature acloptimized

### Example

```
DellEMC# upgrade system tftp://10.11.8.12/dv-rainier-13 a:
00:39:32 : Discarded 1 pkts. Expected block num : 51.
Received block num: 50
!00:39:36 : Discarded 1 pkts. Expected block num : 65.
Received block num: 64
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
.....!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
93924044 bytes successfully copied
System image upgrade completed successfully.
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Image upgraded to all
DellEMC#
```

The following example shows that the system prompts for the hash value of the OS image with the OS image verification feature enabled:

```
Dell# upgrade system tftp://10.16.127.35/FTOS-SE-9.11.0.1 A:
Hash Value: e42e2548783c2d5db239ea2fa9de4232
!!!!!!!!!!!!!!!!!!!!!!
```

## rename

Rename a file in the local file system.

**Syntax** `rename url url`

**Parameters** *url*

Enter the following keywords and a filename:

- For a file on the internal Flash, enter `flash://` followed by the filename.
- For a file on an NFS mounted file system, enter `nfsmount://` followed by the mount point and file path.
- For a file on an external USB drive, enter `usbflash://` followed by the filename.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |

| Version           | Description                                              |
|-------------------|----------------------------------------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                              |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                              |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. Added support for NFS mount. |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                 |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                 |
| <b>7.6.1.0</b>    | Introduced on S-Series                                   |
| <b>7.5.1.0</b>    | Introduced on C-Series                                   |
| <b>E-Series</b>   | Original command                                         |

## show boot system

Displays information about boot images currently configured on the system.

**Syntax** `show boot system stack-unit{stack-unit-id | all}`

**Parameters**

|                      |                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------|
| <b>all</b>           | Enter the keyword <code>all</code> to display the boot image information for all stack units. |
| <b>stack-unit-id</b> | Enter the <code>stack-unit-id</code> to display boot image information for a stack-unit.      |

**Defaults** `none`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000                   |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.7.1.0</b>    | Introduced on the C-Series and E-Series.  |

## Example

```
DellEMC#show boot system stack-unit 1

Current system image information in the system:
=====

Type                Boot Type      A                B
-----
stack-unit 1      FLASH BOOT  9.10(0.0)        9.10(0.0) [boot]
DellEMC#
```

# show bootvar

Display the variable settings for the boot parameters.

**Syntax**                `show bootvar`

**Command Modes**    EXEC Privilege

**Command History**    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                             |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                              |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                           |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                       |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                           |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                           |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                              |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                              |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                             |
| <b>8.3.11.4</b>   | Output expanded to display current reload mode (normal or Jumpstart). |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                              |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                           |
| <b>E-Series</b>   | Original command.                                                     |

## Example

```
DellEMC#show bootvar
PRIMARY IMAGE FILE = system://B
SECONDARY IMAGE FILE = variable does not exist
DEFAULT IMAGE FILE = system://A
LOCAL CONFIG FILE = variable does not exist
PRIMARY HOST CONFIG FILE = variable does not exist
SECONDARY HOST CONFIG FILE = variable does not exist
PRIMARY NETWORK CONFIG FILE = variable does not exist
SECONDARY NETWORK CONFIG FILE = variable does not exist
CURRENT IMAGE FILE = system://B
CURRENT CONFIG FILE 1 = variable does not exist
CURRENT CONFIG FILE 2 = variable does not exist
CONFIG LOAD PREFERENCE = local first
BOOT INTERFACE GATEWAY IP ADDRESS = variable does not exist
Reload Mode = normal-reload [Next boot : warmboot]DellEMC#
```

# show file-systems

Display information about the file systems on the system.

**Syntax** `show file-systems`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |

```

## Command Fields

| Field          | Description                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>size(b)</b> | Lists the size (in bytes) of the storage location. If the location is remote, no size is listed.                                                                                                                                  |
| <b>Free(b)</b> | Lists the available size (in bytes) of the storage location. If the location is remote, no size is listed.                                                                                                                        |
| <b>Feature</b> | Displays the formatted DOS version of the device.                                                                                                                                                                                 |
| <b>Type</b>    | Displays the type of storage. If the location is remote, the word <code>network</code> is listed.                                                                                                                                 |
| <b>Flags</b>   | Displays the access available to the storage location. The following letters indicate the level of access: <ul style="list-style-type: none"><li>• <code>r</code> = read access</li><li>• <code>w</code> = write access</li></ul> |

| Field           | Description                                |
|-----------------|--------------------------------------------|
| <b>Prefixes</b> | Displays the name of the storage location. |

## show os-version

Display the release and software image version information of the image file specified.

**Syntax** `show os-version [file-url]`

**Parameters** *file-url* (OPTIONAL) Enter the following location keywords and information:

- For a file on the internal flash, enter `flash://` followed by the filename.
- For a file on an FTP server, enter `ftp://user:password@hostip/filepath`.
- For a file on a TFTP server, enter `tftp://hostip/filepath`.
- For a file on the USB port, enter `usbflash://filepath`.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>E-Series</b>   | Original command.                         |

### Example

```
DellEMC#show os-version

RELEASE IMAGE INFORMATION :
-----
Platform          Version   Size      ReleaseTime
S-Series:S6100-ON  9.10(0.0) 54246311  Sep 12 2015 04:21:53

TARGET IMAGE INFORMATION :
-----
Type      Version   Target      checksum
```

```
runtime 9.10(0.0) Control Processor passed

BOOT IMAGE INFORMATION :
-----
Type      Version  Target      checksum
boot flash 3.25.2.2 Control Processor passed

BOOTSEL IMAGE INFORMATION :
-----
Type      Version  Target      checksum
boot selector 3.25.0.3 Control Processor passed

FPGA IMAGE INFORMATION :
-----
Card      FPGA Name      Version
stack-unit 1 S6100-ON SWITCHCARD CPLD 4
stack-unit 1 S6100-ON IOM CPLD1 18
stack-unit 1 S6100-ON IOM CPLD2 18
stack-unit 1 S6100-ON IOM CPLD3 18
stack-unit 1 S6100-ON IOM CPLD4 18
stack-unit 1 S6100-ON MSS FPGA 0.8
stack-unit 1 S6100-ON MSS IAP 1.22
stack-unit 1 S6100-ON OOB-FPGA 0.7
DellEMC#
```

## Usage Information

 **NOTE:** A filepath that contains a dot ( . ) is not supported.

# show running-config

Display the current configuration and display changes from the default values.

## Syntax

```
show running-config [entity] [configured] [status] [compressed]
```

## Parameters

**entity** (OPTIONAL) To display that entity's current (non-default) configuration, enter one of the following keywords:

 **NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <b>aaa</b>            | for the current AAA configuration                |
| <b>acl</b>            | for the current ACL configuration                |
| <b>arp</b>            | for the current static ARP configuration         |
| <b>as-path</b>        | for the current AS-path configuration            |
| <b>bfd</b>            | for the current BFD configuration                |
| <b>bgp</b>            | for the current BGP configuration                |
| <b>boot</b>           | for the current boot configuration               |
| <b>cam-profile</b>    | for the current CAM profile in the configuration |
| <b>class-map</b>      | for the current class-map configuration          |
| <b>community-list</b> | for the current community-list configuration     |
| <b>ecmp-group</b>     | for the current ECMP group configuration         |
| <b>eis</b>            | for the current EIS configuration                |
| <b>ethernet</b>       | for the current Ethernet CFM configuration       |
| <b>fe fd</b>          | for the current FEFD configuration               |
| <b>ftp</b>            | for the current FTP configuration                |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>frp</b>                    | for the current FRRP configuration                                                                    |
| <b>fvrp</b>                   | for the current FVRP configuration                                                                    |
| <b>gvrp</b>                   | for the current GVRP configuration                                                                    |
| <b>host</b>                   | for the current host configuration                                                                    |
| <b>hardware-monitor</b>       | for hardware-monitor action-on-error settings                                                         |
| <b>hypervisor</b>             | for the current hypervisor configuration                                                              |
| <b>igmp</b>                   | for the current IGMP configuration                                                                    |
| <b>interface</b>              | for the current interface configuration                                                               |
| <b>interface port-channel</b> | for the current port-channel interface configuration.                                                 |
| <b>interface tunnel</b>       | for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383. |
| <b>ip</b>                     | for the current IP configuration                                                                      |
| <b>isis</b>                   | for the current ISIS configuration                                                                    |
| <b>line</b>                   | for the current line configuration                                                                    |
| <b>lldp</b>                   | for the current LLDP configuration                                                                    |
| <b>load-balance</b>           | for the current port-channel load-balance configuration                                               |
| <b>logging</b>                | for the current logging configuration                                                                 |
| <b>mac</b>                    | for the current MAC ACL configuration                                                                 |
| <b>mac-address-table</b>      | for the current MAC configuration                                                                     |
| <b>management-eis</b>         | for the current management EIS configuration                                                          |
| <b>management-route</b>       | for the current Management port forwarding configuration                                              |
| <b>mld</b>                    | for the current MLD configuration                                                                     |
| <b>monitor</b>                | for the current Monitor configuration                                                                 |
| <b>mroute</b>                 | for the current Mroutes configuration                                                                 |
| <b>msdp</b>                   | for the current MSDP configuration                                                                    |
| <b>ntp</b>                    | for the current NTP configuration                                                                     |
| <b>ospf</b>                   | for the current OSPF configuration                                                                    |
| <b>pim</b>                    | for the current PIM configuration                                                                     |
| <b>policy-map-input</b>       | for the current input policy map configuration                                                        |
| <b>policy-map-output</b>      | for the current output policy map configuration                                                       |
| <b>po-failover-group</b>      | for the current port-channel failover-group configuration                                             |
| <b>prefix-list</b>            | for the current prefix-list configuration                                                             |
| <b>privilege</b>              | for the current privilege configuration                                                               |
| <b>qos-policy-input</b>       | for the current input QoS policy configuration                                                        |

|                           |                                                 |
|---------------------------|-------------------------------------------------|
| <b>qos-policy-output</b>  | for the current output QoS policy configuration |
| <b>radius</b>             | for the current RADIUS configuration            |
| <b>redirect-list</b>      | for the current redirect-list configuration     |
| <b>redundancy</b>         | for the current RPM redundancy configuration    |
| <b>resolve</b>            | for the current DNS configuration               |
| <b>rip</b>                | for the current RIP configuration               |
| <b>rmon</b>               | for the current RMON configuration              |
| <b>route-map</b>          | for the current route map configuration         |
| <b>sflow</b>              | for the current sFlow configuration             |
| <b>snmp</b>               | for the current SNMP configuration              |
| <b>spanning-tree</b>      | for the current spanning tree configuration     |
| <b>static</b>             | for the current static route configuration      |
| <b>status</b>             | for the file status information                 |
| <b>support-assist</b>     | for the current SupportAssist configuration     |
| <b>tacacs+</b>            | for the current TACACS+ configuration           |
| <b>tftp</b>               | for the current TFTP configuration              |
| <b>trace-group</b>        | for the current trace-group configuration       |
| <b>trace-list</b>         | for the current trace-list configuration        |
| <b>uplink-state-group</b> | for the uplink state group configuration        |
| <b>users</b>              | for the current users configuration             |
| <b>vlt</b>                | for the current VLT configuration               |
| <b>wred-profile</b>       | for the current wred-profile configuration      |

|                   |                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>configured</b> | (OPTIONAL) Enter the keyword <code>configuration</code> to display line card interfaces with non-default configurations only.                                                                                                                        |
| <b>status</b>     | (OPTIONAL) Enter the keyword <code>status</code> to display the checksum for the running configuration and the start-up configuration.                                                                                                               |
| <b>compressed</b> | (Optional) Enter the keyword <code>compressed</code> to display the compressed group configuration. Displays the compressed configuration by grouping all similar configurations. The compression is done only for interface related configurations. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                        |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                           |
| <b>9.2.(0.0)</b>  | Added support for the tunnel and EIS interface types.                                                              |
| <b>9.0.0.0</b>    | Added support for the VLT option.                                                                                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                           |
| <b>7.8.1.0</b>    | Added the hardware-monitor option.                                                                                 |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                        |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                        |
| <b>7.4.1.0</b>    | Expanded to include the last configuration change, start-up last updated (date and time), and who made the change. |
| <b>6.5.4.0</b>    | Added the status option.                                                                                           |

#### Example

```

DellEMC# show running-config
Current Configuration ...
! Version 9-8(1-53)
!
boot system stack-unit 1 primary system: A:
boot system stack-unit 1 default system: A:
boot system gateway 10.16.133.254
!
redundancy auto-synchronize full
!
service timestamps log datetime
!
hostname Dell
!

!
```

#### Example

```
DellEMC# show running-config status
running-config bytes 10257, checksum 0xFD33339F
startup-config bytes 10257, checksum 0xFD33339F
```

#### Usage Information

The status option allows you to display the size and checksum of the running configuration and the startup configuration.

## show startup-config

Display the startup configuration.

**Syntax** `show startup-config`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                        |

| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                        |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                           |
| <b>7.6.1.0</b>    | Introduced on S-Series                                                                                             |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                        |
| <b>7.4.1.0</b>    | Expanded to include the last configuration change, start-up last updated (date and time), and who made the change. |

#### Example

```
DellEMC#show startup-config
! Version 9.8(1.0)
! Last configuration change at Wed Sep 9 20:21:33 2015 by default
! Startup-config last updated at Wed Sep 9 20:21:35 2015 by default
!
boot system stack-unit 1 primary system: B:
```

```
boot system stack-unit 1 secondary system: B:
boot system stack-unit 1 default system: A:
!
redundancy auto-synchronize full
!
hardware watchdog stack-unit 1
!
service timestamps log datetime
!
```

#### Related Commands

- [show running-config](#) – displays the current (running) configuration.

## show version

Display the current Dell EMC Networking Operating System (OS) version information on the system.

**Syntax** `show version`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.12(1.0)</b>  | Introduced on the S5048F-ON.              |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |

| <b>8G Bytes ...</b>                        | Amount and type of memory on system                                                                  |
| <b>1 4 Modules...</b>                      | Hardware configuration of the system, including the number and type of physical interfaces available |

#### Example (S6100-ON)

```
DellEMC# show version
Dell EMC Real Time Operating System Software
Dell EMC Operating System Version: 2.0
Dell EMC Application Software Version: 9-13(0-0)
Copyright (c) 1999-2017 by Dell Inc. All Rights Reserved.
Build Time: Wed Dec 13 10:10:40 2017
Build Path: /build/build06/SW/SRC
Dell EMC Networking OS uptime is 23 hour(s), 26 minute(s)

System image file is "users/smahadevan/6100"

System Type: S6100-ON
Control Processor: Intel Rangeley with 3 Gbytes (3203289088 bytes) of
memory, core(s) 4.

8G bytes of boot flash memory.

1 4 Modules, 16x40G/8x100G ports TE/TF/FO/FI/HU G (S6100-ON)
14 Ten GigabitEthernet/IEEE 802.3 interface(s)
2 Fifty GigabitEthernet/IEEE 802.3 interface(s)
4 Hundred GigabitEthernet/IEEE 802.3 interface(s)
```

## upgrade boot

Upgrade the bootflash image or bootselector image.

|                   |                                                                                                                                                           |                                                                                          |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>upgrade boot {all   bootflash-image   bootselector-image}stack-unit {stack-unit-id   all}{booted   flash:   ftp:   scp:   tftp:   usbflash:}</code> |                                                                                          |
| <b>Parameters</b> | <b>all</b>                                                                                                                                                | Enter the keyword <code>all</code> to change both the bootflash and bootselector images. |
|                   | <b>bootflash-image</b>                                                                                                                                    | Enter the keyword <code>bootflash-image</code> to change the bootflash image..           |
|                   | <b>bootselector-image</b>                                                                                                                                 | Enter the keyword <code>bootselector-image</code> to upgrade the BIOS system image.      |
|                   | <b>stack-unit-id</b>                                                                                                                                      | Enter the <code>stack-unit-id</code> to upgrade only the mentioned stack-unit .          |
|                   | <b>all</b>                                                                                                                                                | Enter the keywords <code>all</code> to upgrade the member stack-units.                   |

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>booted</b>    | Enter the keyword <code>booted</code> to upgrade from the current image on the device.                                                                                                                 |
| <b>ftp:</b>      | Enter the keyword <code>ftp</code> to follow it with the location of the source file in this form: <code>//userid:password@hostip/filepath</code> , or press <b>Enter</b> to launch a prompt sequence. |
| <b>tftp:</b>     | Enter the keyword <code>tftp</code> to follow it with the location of the source file in this form: <code>//hostlocation/filepath</code> , or press <b>Enter</b> to launch a prompt sequence.          |
| <b>flash:</b>    | Enter the keyword <code>flash</code> to follow it with the location of the source file in this form: <code>//filepath</code> , or press <b>Enter</b> to launch a prompt sequence.                      |
| <b>usbflash:</b> | Enter the keyword <code>flash</code> to follow it with the location of the source file in this form: <code>//filepath</code> , or press <b>Enter</b> to launch a prompt sequence.                      |
| <b>A:</b>        | Enter the keyword <code>A</code> to upgrade the bootflash partition A:.                                                                                                                                |
| <b>B:</b>        | Enter the keyword <code>B</code> to upgrade the bootflash partition B:.                                                                                                                                |

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                                                           |
|------------------|-----------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                                           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.                                           |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                              |
| <b>9.0(0.0)</b>  | Added support for IPv6 for the <code>file-url</code> parameter.       |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                             |
| <b>8.3.11.1</b>  | Introduced on the Z9000. Added support for the SSD on the Z9000 only. |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                              |
| <b>7.7.1.0</b>   | Added support for TFTP and SCP.                                       |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                           |

**Usage Information** You must reload Dell EMC Networking OS after executing this command.

#### Example

```
DellEMC#upgrade boot ?
all                Upgrade both boot flash image and selector image
bootflash-image    Upgrade boot flash image
bootselector-image Upgrade boot selector image
DellEMC#
```

## verify

Validate the software image on the flash drive after the image has been transferred to the system, but before the image has been installed.

**Syntax** `verify { md5 | sha256 } [ flash:// ] img-file [ hash-value ]`

**Parameters**

|               |                                                                               |
|---------------|-------------------------------------------------------------------------------|
| <b>md5</b>    | Enter the <code>md5</code> keyword to use the MD5 message-digest algorithm.   |
| <b>sha256</b> | Enter the <code>sha256</code> keyword to use the SHA256 Secure Hash Algorithm |

|                   |                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>flash://</b>   | (Optional). Enter the <code>flash://</code> keyword. The default is to use the flash drive. You can just enter the image file name. |
| <b>img-file</b>   | Enter the name the Dell EMC Networking software image file to validate.                                                             |
| <b>hash-value</b> | (Optional). Enter the relevant hash published on i-Support.                                                                         |

|                        |                   |
|------------------------|-------------------|
| <b>Defaults</b>        | flash drive       |
| <b>Command Modes</b>   | EXEC mode         |
| <b>Command History</b> | Version 9.5.(0.0) |

| Version          | Description                                             |
|------------------|---------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                             |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.                             |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON.                |
| <b>9.5(0.0)</b>  | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

|                          |                                                   |
|--------------------------|---------------------------------------------------|
| <b>Usage Information</b> | You can enter this command in the following ways: |
|--------------------------|---------------------------------------------------|

- **verify md5 flash://img-file**
- **verify md5 flash://img-file <hash-value>**
- **verify sha256 flash://img-file**
- **verify sha256 flash://img-file <hash-value>**

|                |                                                                      |
|----------------|----------------------------------------------------------------------|
| <b>Example</b> | <b>Without Entering the Hash Value for Verification using SHA256</b> |
|----------------|----------------------------------------------------------------------|

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
SHA256 hash for FTOS-SE-9.5.0.0.bin:
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
```

#### Entering the Hash Value for Verification using SHA256

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
SHA256 hash VERIFIED for FTOS-SE-9.5.0.0.bin
```

# Control and Monitoring

This section contains command information to configure and monitor the system, including Telnet, file transfer protocol (FTP), and trivial file transfer protocol (TFTP).

## alias

Configure shorter alias names for single-line command input.

### Syntax

```
alias alias-name command
```

To undo the configuration, use the `no alias alias-name command` command.

### Parameters

**alias** *alias-name*

Enter the keyword `alias` then the alias-name.

**NOTE:** The *alias-name* length is limited to 32 characters starting with alphanumeric and are not case-sensitive. Special characters are not allowed except hyphen—`-`. You cannot use the reserved keywords such as `configure`, `show`, `reload`, `reboot`, `exit`, `end`, `quit`, `do`, `no`, `enable`, `alias`, `alias-definition`, and `malias` to create the alias name.

**command**

Enter the original command syntax for which you want to configure the alias-name.

**NOTE:** You can enter the arguments with white spaces and must be enclosed within double quotes—`" "`.

### Defaults

None.

### Command Modes

CONFIGURATION

ALIAS-DEFINITION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

#### Version

#### Description

##### 9.12(0.0)

Introduced on all the Dell EMC Networking OS platforms.

### Usage Information

- Users with privilege level 15 only can configure the alias-name. You can configure a maximum of 128 aliases.
- Single-line aliases accept a maximum of 128 bytes.
- User can configure up to nine arguments to the aliases—1 to 9. Repetition of arguments are allowed and the system does not allow discontinuous arguments.

## Example

The following example shows how to configure single-line alias-name:

```
DellEMC#configure terminal
DellEMC(conf)# alias-definition
DellEMC(conf-alias-definition)# alias showipbr10 show ip interface brief
```

The following example shows how to configure aliases with arguments in EXEC mode:

```
DellEMC#configure terminal
DellEMC(conf)# alias-definition
DellEMC(conf-alias-definition)# alias procpu show processes cpu
management-unit | grep $1
DellEMC(conf-alias-definition)# alias intbr show ip interface brief |
grep "$1"
DellEMC(conf)# end
DellEMC#
```

The following example shows how to configure aliases without arguments in EXEC mode:

```
DellEMC#configure terminal
DellEMC(conf)# alias-definition
DellEMC(conf-alias-definition)# alias ver show version
DellEMC(conf-alias-definition)# alias intst show interface status
DellEMC(conf)# end
DellEMC#
```

The following example shows how to configure aliases with arguments in CONFIGURATION mode:

```
DellEMC#configure terminal
DellEMC(conf)# alias-definition
DellEMC(conf-alias-definition)# alias ifvl interface vlan $1
DellEMC(conf)# end
DellEMC#
```

The following example shows how to configure aliases without arguments in CONFIGURATION mode:

```
DellEMC#configure terminal
DellEMC(conf)# alias-definition
DellEMC(conf-alias-definition)# alias facl feature aclrange
DellEMC(conf)# end
DellEMC#
```

## Related Commands

- [show alias](#)—display list of all the aliases with alias definition.

# banner exec

Configure a message that is displayed when you enter EXEC mode.

## Syntax

```
banner exec c line c
```

To delete a banner, use the `no banner exec` command.

## Parameters

***c***

Enter the keywords `banner exec`, then enter a character delineator, represented here by the letter *c*. Press **ENTER**.

***line***

Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (%); the banner message is "testing, testing".

## Defaults

No banner is displayed.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.1.1.0</b>    | Introduced on the E-Series.               |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>E-Series</b>   | Original Command                          |

#### Usage Information

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

#### Example

```
Dell EMC(conf)# banner exec ?
LINE c banner-text c, where 'c' is a delimiting character
Dell EMC(conf)# banner exec %
Enter TEXT message. End with the character '%'.
This is the banner%
Dell EMC(conf)# end
Dell EMC# exit
2d18h1m: %STKUNIT1-M:CP %SEC-5-LOGOUT: Exec session is terminated on
console

This is the banner

Dell con0 now available

Press RETURN to get started.
2d18h2m: %STKUNIT1-M:CP %SEC-5-LOGIN_SUCCESS: Login successful on console

This is the banner
Dell EMC>
```

#### Related Commands

- [line](#) — enables and configures the console and virtual terminal lines to the system.

## banner login

Set a message of the day banner to appear after logging on to the system.

**Syntax**      `banner login {acknowledgement | keyboard-interactive | c line c}`

Enter `no banner login` to delete the banner text. Enter `no banner login keyboard-interactive` to automatically go to the banner message prompt (does not require a carriage return).

## Parameters

|                             |                                                                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>keyboard-interactive</b> | Enter the <code>keyboard-interactive</code> keyword and then press Enter (carriage return) to retrieve the message banner prompt.            |
| <b>acknowledgement</b>      | Enter the <code>acknowledgement</code> keyword to require a positive acknowledgement from the user while logging in to the system.           |
| <b>c</b>                    | Enter a delineator character to specify the start and end of the text banner. You cannot use the delineator character in the banner message. |
| <b>line</b>                 | Enter text string for your text banner message, with a maximum of 50 lines and up to 255 characters per line.                                |

## Defaults

No banner is configured and a carriage return (CR) is required when creating a banner.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                      |
|-------------------|----------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                         |
| <b>9.10(0.0)</b>  | Introduced the <code>acknowledgement</code> keyword. Introduced on the S6100-ON. |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                      |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                         |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                         |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                        |
| <b>8.3.12.0</b>   | Introduced on the S4810.                                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                         |
| <b>8.2.1.0</b>    | Introduced the keyword <code>keyboard-interactive</code> .                       |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                      |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                      |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                      |
| <b>E-Series</b>   | Original command                                                                 |

## Usage Information

Enter the banner login command, type one or more spaces and a delineator character, type the banner text, and then type the second delineator character. The message of the day banner displays first when you are connected to the router; otherwise the login banner and prompt appear. After you have logged in, the banner EXEC (if configured) displays.

## Example

```
DellEMC(conf)#banner login ?
acknowledgement      Require positive acknowledgment after login
prompt
keyboard-interactive  Press enter key to get prompt
LINE                 c banner-text(max length 255) c, where 'c' is a
delimiting character
DellEMC(conf)#no banner login ?
acknowledgement      Disable positive acknowledgment required after
login prompt
keyboard-interactive  Prompt will be displayed by default
```

If you configure the `acknowledgement` keyword, the system requires a positive acknowledgement from the user while logging in to the system.

```
$ telnet 10.11.178.16
Trying 10.11.178.16...
Connected to 10.11.178.16.
Escape character is '^]'.
THIS IS A LOGIN BANNER. PRESS 'Y' TO ACKNOWLEDGE. ACKNOWLEDGE?

[y/n]: y
Login: admin
Password:
```

#### Related Commands

- [banner motd](#) — sets a Message of the Day banner.
- [banner exec](#) — enables the display of a text string when you enter EXEC mode.

## banner motd

Set a message of the day (MOTD) banner.

#### Syntax

```
banner motd c line c
```

To delete a Message of the Day banner, enter **no banner motd**.

#### Parameters

- |                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b><i>c</i></b>    | Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).     |
| <b><i>line</i></b> | Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%). |

#### Defaults

No banner is configured.

| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                           |
| <b>9.2(0.2)</b>   | Added support for the <code>fcoe</code> parameter on the S4810 and S4820T.                         |
| <b>9.1.(0.0)</b>  | Added support for OpenFlow on the Z9000.                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                          |
| <b>8.3.12.0</b>   | Added the keywords <code>fcoeacl</code> and <code>iscsiptacl</code> on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                           |
| <b>8.3.1.0</b>    | Added the keywords <code>ecfmac1</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> . |
| <b>8.2.1.0</b>    | Introduced on the S-Series.                                                                        |
| <b>7.8.1.0</b>    | Introduced on the C-Series.                                                                        |

**Usage Information**

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from .

When configuring space for IPv6 ACLs, the total number of Blocks must equal 9.

The `ipv6acl` allocation must be a factor of 3 (0,3,6,9).

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the `reload conditional nvram-cfg-change` command.

## clear average-power

Reset the average power and average power start time.

**Syntax** `clear average-power stack-unit {stack-unit-number}`

**Parameters**

|                          |                              |
|--------------------------|------------------------------|
| <b>stack-unit-number</b> | Enter the stack unit number. |
|--------------------------|------------------------------|

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                        |
|-------------|----------------------------------------------------|
| 9.11(2.1P1) | Introduced on all Dell EMC Networking OS platforms |

**Usage Information** This command resets the average power and average power start time to the current time. Average power and average power start time will be calculated from the reset time (i.e current time).

**Example**

```
DellEMC#clear average-power stack-unit 1
Proceed to clear Average power ? Confirm [yes/no]:yes
DellEMC#
```

## clear line

Reset a terminal line.

**Syntax** `clear line {line-number | console 0 | vty number}`

**Parameters**

|                    |                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------|
| <b>line-number</b> | Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.             |
| <b>console 0</b>   | Enter the keywords <code>console 0</code> to reset the console port.                                  |
| <b>vtty number</b> | Enter the keyword <code>vtty</code> then a number to clear a terminal line. The range is from 0 to 9. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON. |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>8.1.1.0</b>    | Introduced on the E-Series. |
| <b>7.6.1.0</b>    | Introduced on the S-Series. |
| <b>7.5.1.0</b>    | Introduced on the C-Series. |
| <b>E-Series</b>   | Original command.           |

## configure

Enter CONFIGURATION mode from EXEC Privilege mode.

### Syntax

```
configure [terminal]
```

### Parameters

**terminal** (OPTIONAL) Enter the keyword `terminal` to specify that you are configuring from the terminal.

### Command Modes

EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.12.0</b>   | Introduced on the S4810.    |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.1.1.0</b>    | Introduced on the E-Series. |
| <b>7.6.1.0</b>    | Introduced on the S-Series. |
| <b>7.5.1.0</b>    | Introduced on the C-Series. |
| <b>E-Series</b>   | Original command.           |

## Example

```
DellEMC# configure
DellEMC(conf)#
```

## disable

Return to EXEC mode.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>disable [<i>level</i>]</code>                                                                                                                           |
| <b>Parameters</b>      | <b><i>level</i></b> (OPTIONAL) Enter a number for a privilege level of the Dell EMC Networking OS. The range is from 0 to 15. The default is <b>1</b> .       |
| <b>Defaults</b>        | <b>1</b>                                                                                                                                                      |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |

| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.7.0  | Introduced on the S4810.    |
| 8.1.1.0  | Introduced on the E-Series. |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| E-Series | Original command.           |

## do

Allows the execution of most EXEC-level commands from all CONFIGURATION levels without returning to the EXEC level.

**Syntax** `do command`

**Parameters** ***command*** Enter an EXEC-level command.

**Defaults** none

**Command Modes**

- CONFIGURATION
- INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

**Usage Information** The following commands are *not* supported by the do command:

- enable
- disable
- exit
- config

Example

```
DellEMC(conf-if-te-1/1/1/1)# do clear counters
Clear counters on all interfaces [confirm]
DellEMC(conf-if-te-1/1/1/1)#
DellEMC(conf-if-te-1/1/1/1)# do clear logging
Clear logging buffer [confirm]
DellEMC(conf-if-te-1/1/1/1)#
DellEMC(conf-if-te-1/1/1/1)# do reload
System configuration has been modified. Save? [yes/no]: n
Proceed with reload [confirm yes/no]: n
```

enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

|                 |                                                                                                                                                               |                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Syntax          | enable [level]                                                                                                                                                |                                                                                                       |

| 9.10(0.0)  | Introduced on the S3148.                                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                                          |
| 9.8(2.0)   | Introduced on the S3100 series.                                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                          |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                          |
| 9.7(0.0)   | Introduced on the S6000-ON.                                          |
| 9.5(0.0)   | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0)   | Introduced on the Z9500.                                             |
| 9.0.2.0    | Introduced on the S6000.                                             |
| 8.3.19.0   | Introduced on the S4820T.                                            |
| 8.3.12.0   | Introduced on the S4810.                                             |
| 8.3.11.1   | Introduced on the Z9000.                                             |
| 8.1.1.0    | Introduced on the E-Series.                                          |
| 7.6.1.0    | Introduced on the S-Series.                                          |
| 7.5.1.0    | Introduced on the C-Series.                                          |
| E-Series   | Original command.                                                    |

|                   |                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Information | Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the enable password command to configure a password for the enable command at a specific privilege level. If no privilege level is specified, the default is privilege level 15. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

 **NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an enable password.

**Related  
Commands**

- [enable password](#) — configures a password for the `enable` command and to access a privilege level.

## enable cpu-clock-monitor

Enables Intel CPU LPC (Low Pin Count) clock-failure monitoring.

|                          |                                                                                                                                                                  |                                                           |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>Syntax</b>            | <code>enable cpu-clock-monitor</code><br><br>To disable this feature, use the <code>no enable cpu-clock-monitor</code> command.                                  |                                                           |
| <b>Parameters</b>        | None                                                                                                                                                             |                                                           |
| <b>Defaults</b>          | Enabled                                                                                                                                                          |                                                           |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                    |                                                           |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .    |                                                           |
|                          | <b>Version</b>                                                                                                                                                   | <b>Description</b>                                        |
|                          | <b>9.11(2.0P1)</b>                                                                                                                                               | Introduced on the C9010, S3048-ON, S6100-ON and Z9100-ON. |
| <b>Usage Information</b> | Enables Intel CPU LPC (Low Pin Count) clock-failure monitoring and issues a warning syslog to the user to take appropriate action if signal degradation is seen. |                                                           |

## enable optic-info-update interval

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

|                        |                                                                                                                                                                                  |                                                                                                                                                                     |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>enable optic-info-update [interval seconds]</code><br><br>To disable optical power information updates, use the <code>no enable optic-info-update interval</code> command. |                                                                                                                                                                     |
| <b>Parameters</b>      | <b>interval seconds</b>                                                                                                                                                          | Enter the keyword <code>interval</code> then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is <b>300 seconds</b> (5 minutes). |
| <b>Defaults</b>        | Disabled                                                                                                                                                                         |                                                                                                                                                                     |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                    |                                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. | 7.5.1.0    | Introduced on the C-Series.               |
| E-Series   | Original command.                         |

## Usage Information

To remove the time interval, enter `exec-timeout 0 0`.

## Example

```
Dell con0 is now available
Press RETURN to get started.
DellEMC>
```

# exit

Return to the lower command mode.

**Syntax** `exit`

**Command Modes**

- EXEC Privilege
- CONFIGURATION
- LINE, INTERFACE
- TRACE-LIST
- PROTOCOL GVRP
- SPANNING TREE
- MULTIPLE SPANNING TREE
- MAC ACCESS LIST
- ACCESS-LIST
- AS-PATH ACL
- COMMUNITY-LIST
- PREFIX-LIST
- ROUTER OSPF
- ROUTER RIP
- ROUTER ISIS
- ROUTER BGP

## ftp-server topdir

Specify the top-level directory to be accessed when an incoming FTP connection request is made.

**Syntax** `ftp-server topdir directory`

**Parameters** ***directory*** Enter the directory path.

**Defaults** The internal flash is the default directory.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>E-Series</b>   | Original command.                         |

## Usage Information

After you enable FTP server functions with the `ftp-server enable` command, Dell EMC Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell EMC Networking OS directs users to the flash directory when logging in to the FTP server.

## Related Commands

- [ftp-server enable](#) — enables FTP server functions on the E-Series.
- [ftp-server username](#) — sets a username and password for incoming FTP connections to the E-Series.

# ftp-server username

Create a user name and associated password for incoming FTP server sessions.

## Syntax

```
ftp-server username username password [encryption-type] password
```

To delete a user name and its password, use the `no ftp-server username username` command.

## Parameters

- |                                    |                                                                                                                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>username</b>                    | Enter a text string up to 40 characters long as the user name.                                                                                                                                                                              |
| <b>password</b><br><b>password</b> | Enter the keyword <code>password</code> then a string up to 40 characters long as the password. Without specifying an encryption type, the password is unencrypted.                                                                         |
| <b>encryption-type</b>             | (OPTIONAL) After the keyword <code>password</code> , enter one of the following numbers: <ul style="list-style-type: none"><li>• 0 (zero) for an unencrypted (clear text) password</li><li>• 7 (seven) for a hidden text password</li></ul> |

| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| E-Series   | Original command.                         |

**Usage Information** The hostname is used in the prompt.

## ip ftp password

Specify a password for outgoing FTP connections.

**Syntax** `ip ftp password [encryption-type] password`

To remove a password and return to the default setting, use the `no ip ftp password [password]` command.

**Parameters** *encryption-type* (OPTIONAL) Enter one of the following numbers:

- 0 (zero) for an unencrypted (clear text) password
- 7 (seven) for a hidden text password

*password* Enter a string up to 40 characters as the password.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| E-Series   | Original command.                         |

**Usage Information** The password is listed in the configuration file; you can view the password by entering the `show running-config ftp` command.

Use the `ip ftp password` command when you use the `ftp: parameter` in the `copy` command.

**Related Commands**

## ip ftp source-interface

Specify an interface's IP address as the source IP address for FTP connections.

**Syntax** `ip ftp source-interface interface`

To delete an interface, use the `no ip ftp source-interface interface` command.

**Parameters**

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the stack/slot/port/subport information.</li><li>For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the stack/slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the stack/slot/port[/subport] information.</li><li>For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the stack/slot/port/subport information.</li><li>For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the stack/slot/port information.</li></ul> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version           | Description                                               |
|-------------------|-----------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                  |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.      |
| <b>8.2.1.0</b>    | Increased number of VLANs on ExaScale to 4094 (was 2094). |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                      |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                               |
| <b>E-Series</b>   | Original command.                                         |

## ip tftp vrf

Configures an TFTP client with a VRF that is used to connect to the TFTP server.

**Syntax** `ip tftp [vrf vrf-name]`

To undo the TFTP client configuration, use the `no ip tftp [vrf vrf-name]` command.

**Parameters** **vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to specify the VRF that is used by the TFTP client.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.0)   | Introduced on the Z9500.                  |
| 9.4.(0.0)  | Introduced on the S-Series and Z9000.     |

**Usage Information**

Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.

**Related Commands**

- [ftp-server topdir](#) — sets the directory to be used for incoming FTP connections.
- [ftp-server username](#) — sets a username and password for incoming FTP connections.

## ip ftp username

Assign a user name for outgoing FTP connection requests.

**Syntax**

```
ip ftp username username
```

To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

**Parameters**

***username*** Enter a text string as the user name up to 40 characters long.

**Defaults**

No user name is configured.

**Command Modes** CONFIGURATION**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.1.1.0</b>  | Introduced on the E-Series. |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>E-Series</b> | Original command.           |

**Usage Information** Configure a password with the `ip ftp password` command.

**Related Commands**

- [ip ftp password](#) — sets the password for FTP connections.

## ip ftp vrf

Configures an FTP client with a VRF that is used to connect to the FTP server.

**Syntax** `ip ftp [vrf {vrf-name | management}]`

To undo the FTP client configuration, use the `ip ftp [vrf vrf-name]` command.

**Parameters**

|                        |                                                                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------|
| <b><i>vrf-name</i></b> | Enter the <i>vrf-name</i> to specify the VRF that is used by the FTP client.                            |
| <b>management</b>      | Enter the keyword <i>management</i> to specify that the VRF used by the FTP client is a management VRF. |

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.0)</b>   | Introduced on the Z9500.                  |
| <b>9.4(0.0)</b>   | Introduced on the S-Series and Z9000.     |

**Usage Information** Use this command to make the FTP clients VRF-aware. The VRF name that you specify is used by the FTP client to reach the FTP server. If no VRF name is specified, then the default VRF is used.

## ip telnet server enable

Enable the Telnet server on the switch.

**Syntax** `ip telnet server enable`

To disable the Telnet server, use the `no ip telnet server enable` command.

**Defaults**

Enabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

**Related Commands**

- [ip ssh server](#) — enables the secure shell (SSH) server on the system.

## ip telnet server vrf

Configures the TELNET server on either a specific VRF or a management VRF.

**Syntax**

```
ip telnet server vrf {vrf-name | any | management}
```

To undo the TELNET server configuration, use the `no ip telnet server [vrf vrf-name]` command.

**Parameters**

|                   |                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------|
| <b>vrf-name</b>   | Enter the <i>vrf-name</i> to specify the VRF that is used by the TELNET server.                    |
| <b>any</b>        | Enter the keyword <i>any</i> to enable server from any VRF.                                        |
| <b>management</b> | Enter the keyword <i>management</i> to specify a management VRF that is used by the TELNET server. |

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.0)</b>   | Introduced on the Z9500.                  |
| <b>9.4.(0.0)</b>  | Introduced on the S-Series and Z9000.     |

#### Usage Information

You can enable the TELNET server on either a management VRF or a user-defined VRF but not both. If you do not specify a VRF name, then the TELNET server is enabled on the default VRF.

#### Example

```
DellEMC(conf)# ip telnet server vrf vrf1
DellEMC(conf)# no ip telnet server vrf
DellEMC(conf)# ip telnet server vrf management
DellEMC(conf)# no ip telnet server vrf
DellEMC(conf)#
```

## ip telnet source-interface

Set an interface's IP address as the source address in outgoing packets for Telnet sessions.

#### Syntax

```
ip telnet source-interface interface
```

To return to the default setting, use the `no ip telnet source-interface [interface]` command.

#### Parameters

##### *interface*

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the stack/slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the stack/slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the stack/slot/port[/subport] information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the stack/slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the stack/slot/port information.
- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

#### Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version    | Description                                               |
|------------|-----------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                 |
| 9.10(0.0)  | Introduced on the S3148.                                  |
| 9.10(0.0)  | Introduced on the S6100-ON.                               |
| 9.8(2.0)   | Introduced on the S3100 series.                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                               |
| 9.2(1.0)   | Introduced on the Z9500.                                  |
| 9.0.2.0    | Introduced on the S6000.                                  |
| 8.3.19.0   | Introduced on the S4820T.                                 |
| 8.3.11.1   | Introduced on the Z9000.                                  |
| 8.3.7.0    | Introduced on the S4810.                                  |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.      |
| 8.2.1.0    | Increased number of VLANs on ExaScale to 4094 (was 2094). |
| 8.1.1.0    | Introduced on the E-Series ExaScale.                      |
| 7.6.1.0    | Introduced on the S-Series.                               |
| 7.5.1.0    | Introduced on the C-Series.                               |

**Related Commands** [telnet](#) — telnet to another device.

## ip tftp vrf

Configures an TFTP client with a VRF that is used to connect to the TFTP server.

**Syntax** `ip tftp [vrf vrf-name]`  
To undo the TFTP client configuration, use the `no ip tftp [vrf vrf-name]` command.

**Parameters** **vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to specify the VRF that is used by the TFTP client.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| Version           | Description                           |
|-------------------|---------------------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.           |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.           |
| <b>9.5(0.0)</b>   | Introduced on the Z9500.              |
| <b>9.4.(0.0)</b>  | Introduced on the S-Series and Z9000. |

**Usage Information**

Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.

**Related Commands**

- [ftp-server topdir](#) — sets the directory to be used for incoming FTP connections.
- [ftp-server username](#) — sets a username and password for incoming FTP connections.

## line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

**Syntax**

```
line {console 0 | vty number [end-number]}
```

**Parameters**

|                    |                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>console 0</b>   | Enter the keyword <code>console 0</code> to configure the console port. The console option is <0-0>.                                                            |
| <b>vtty number</b> | Enter the keyword <code>vtty</code> then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions. |
| <b>end-number</b>  | (OPTIONAL) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.                             |

**Defaults**

Not configured

|----------|-----------------------------|
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| E-Series | Original command            |

#### Usage Information

You cannot delete a terminal connection.

#### Related Commands

- [access-class](#) — restricts the incoming connections to a particular IP address in an IP access control list (ACL).
- [password](#) — specifies a password for users on terminal lines.

## logging disable-syslog snmp auth-failure

Disable the generation of syslog messages for SNMP authentication failure events.

#### Syntax

```
logging disable-syslog snmp auth-failure
```

To enable syslog messages for SNMP authentication failure events, use the `no logging disable-syslog snmp auth-failure`.

#### Parameters

##### Defaults

The system generates syslog messages for SNMP authentication failure events.

##### Command Modes

CONFIGURATION

##### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S6000, S6000-ON, S6100-ON, and Z9100-ON. |

#### Usage Information

This command disables the generation of syslog messages for SNMP authentication failure events, preventing syslog files on the system from getting filled with too many messages.

This command does not disable SNMP traps for SNMP authentication failure events.

## login concurrent-session

Configures the limit of concurrent sessions for each user on console and virtual terminal lines.

#### Syntax

```
login concurrent-session {limit number-of-sessions | clear-line enable}
no login concurrent-session {limit number-of-sessions | clear-line enable}
```

#### Parameters

|                                        |                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>limit <i>number-of-sessions</i></b> | Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line). |
| <b>clear-line enable</b>               | Enables you to clear your existing sessions.                                                                                                                                  |

##### Defaults

Not configured. You can use all the available sessions.

##### Command Modes

CONFIGURATION

##### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                        |
|-------------------|--------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                        |
| <b>9.8(0.0)</b>   | Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500. |

## Usage Information

You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

## Example

The following example shows how to limit the number of concurrent sessions that any user can have to four:

```
DellEMC(conf)# login concurrent-session limit 4
DellEMC(conf)#
```

The following example shows how to use the `login concurrent-session clear-line enable` command.

```
DellEMC(conf)# login concurrent-session clear-line enable
DellEMC(conf)#
```

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Current sessions for user admin:
Line          Location
2 vty 0        10.14.1.97
3 vty 1        10.14.1.97
Clear existing session? [line number/Enter to cancel]:
```

When you try to create more than the permitted number of sessions, the following message appears, prompting you to close one of your existing sessions. Close any of your existing sessions to log in to the system.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Maximum concurrent sessions for the user reached.
Current sessions for user admin:
Line          Location
2 vty 0        10.14.1.97
```

```

3 vty 1 10.14.1.97
4 vty 2 10.14.1.97
5 vty 3 10.14.1.97
Clear existing session? [line number/Enter to cancel]:

```

## Related Commands

- [show login statistics](#) — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

# login statistics

Enable and configure user login statistics on console and virtual terminal lines.

## Syntax

```

login statistics {enable | time-period days}
no login statistics {enable | time-period days}

```

## Parameters

- |                                |                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------|
| <b>enable</b>                  | Enables login statistics for the last 30 days by default.                               |
| <b>time-period <i>days</i></b> | Sets the number of days the system stores user login statistics; range is from 1 to 30. |

## Defaults

Not configured

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                        |
|-------------------|--------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                        |
| <b>9.8(0.0)</b>   | Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500. |

## Usage Information

Only the system and security administrators can configure login activity tracking and view the login activity details of other users.

If you enable user login statistics, the system displays the last successful login details of the current user, the details of any failed login attempts by others, and if the current user's permissions have changed since the last login.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

**NOTE:** Login statistics are not applicable for login sessions that do not use authentication on user names. For example, the system does not report login activity for a telnet session that prompts only a password field.

## Example

When you log into the system, it displays a message similar to the following:

```

$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.

```

```
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 Line vty0 (
10.11.178.14 ).
There were 1 unsuccessful login attempt(s) since the last successful
login.
There were 1 unsuccessful login attempt(s) for user admin in the last 30
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.11.178.14. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 on console
There were 2 unsuccessful login attempt(s) since the last successful
login.
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

#### Related Commands

## ping

Test connectivity between the system and another device by sending echo requests and waiting for replies.

**Syntax**

```
ping [host | ip-address | ipv6-address] [count {number | continuous}]
[datagram-size] [timeout] [source (ip src-ipvt4-address) | interface] [tos]
[df-bit (y|n)] [validate-reply(y|n)] [outgoing-interface] [pattern pattern]
[sweep-min-size] [sweep-max-size] [sweep-interval] [ointerface (ip src-
ipv4-address) | interface] [ethernet | vrf vrf-name]
```

|                   |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>outgoing-interface</b> | (IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>pattern pattern</b>    | (IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: <b>0xABCD</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>sweep-min-size</b>     | Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sweep-max-size</b>     | Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sweep-interval</b>     | Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>interface</b>          | (IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the stack/slot/port/subport information.</li> <li>For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the stack/slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the stack/slot/port[/subport] information.</li> <li>For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the stack/slot/port/subport information.</li> <li>For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the stack/slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>ethernet</b>           | Enter the keyword <code>ethernet</code> to test layer2 connectivity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>vrf vrf-name</b>       | Enter the keyword <code>vrf</code> followed by the name of the VRF to test connectivity to the VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Defaults** None.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |

| Version           | Description                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                                 |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                             |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                                 |
| <b>9.8(0.0)P5</b> | Introduced on the S4048-ON.                                                                                                                 |
| <b>9.8(0.0)P2</b> | Introduced on the S3048-ON.                                                                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                                    |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.<br><br>Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4820T. |
| <b>8.3.12.0</b>   | Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4810.                                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                                    |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                                    |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards.                                                                                                    |
| <b>8.4.1.0</b>    | IPv6 ping available on management interface.                                                                                                |
| <b>8.3.1.0</b>    | Introduced extended ping options.                                                                                                           |
| <b>8.2.1.0</b>    | Introduced on the E-Series (IPv6).                                                                                                          |
| <b>8.1.1.0</b>    | Introduced on the E-Series (IPv4).                                                                                                          |
| <b>7.9.1.0</b>    | Introduced VRF.                                                                                                                             |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                                 |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                                 |
| <b>7.4.1.0</b>    | Added support for IPv6 address on the E-Series.                                                                                             |

#### Usage Information

When you enter the `ping` command without specifying an IP/IPv6 address (Extended Ping), you are prompted for a target IP/IPv6 address, a repeat count, a datagram size (up to 1500 bytes), a timeout (in seconds), and for Extended Commands.

The following table provides descriptions for the `ping` command status response symbols displayed in the output.

| Symbol       | Description                                                                   |
|--------------|-------------------------------------------------------------------------------|
| <b>!</b>     | Each exclamation point indicates receipt of a reply.                          |
| <b>.</b>     | Each period indicates the network server timed out while waiting for a reply. |
| <b>U</b>     | A destination unreachable error PDU was received.                             |
| <b>Q</b>     | Source quench (destination too busy).                                         |
| <b>M</b>     | Could not fragment.                                                           |
| <b>?</b>     | Unknown packet type.                                                          |
| <b>&amp;</b> | Packet lifetime exceeded.                                                     |

#### Example (IPv4)

```
DellEMC# ping 172.31.1.255
Type Ctrl-C to abort.
Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
```

```

DellEMC#

```

## reload

Reboot the system.

### Syntax

```
reload [conditional nvram-cfg-change | no-confirm [discard-running] | dell-
diag | onie [install | uninstall | rescue]]
```

### Parameters

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>conditional<br/>nvram-cfg-<br/>change</b> | (OPTIONAL) Reload into the Dell EMC Networking Operating System (OS) if the condition is true. A configuration change to the NVRAM requires a switch reload. To reload the switch, select <code>nvram-cfg-change</code> .                                                                                                                                                                                                                                             |
| <b>no-confirm<br/>[discard-running]</b>      | Reload the chassis without prompting for further confirmation.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dell-diag</b>                             | (OPTIONAL) Reload the system into the Dell diagnostics mode.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>onie</b>                                  | (OPTIONAL) Reload the system into the ONIE mode. You can also use one of the following options to reload the system and enter the respective modes directly: <ul style="list-style-type: none"> <li><code>install</code> — enter the Install mode and install the networking OS</li> <li><code>uninstall</code> — enter the Uninstall mode and uninstall the networking OS</li> <li><code>rescue</code> — enter the Rescue mode and access the file system</li> </ul> |

**Command Modes** EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                   |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                    |
| <b>9.10(0.0)</b>  | Added the optional <code>dell-diag</code> and <code>onie</code> parameters. |
|                   | Introduced on the S6100-ON.                                                 |
|                   | Introduced the <code>no-confirm</code> option.                              |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                             |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                 |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                 |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                 |

| Version         | Description                    |
|-----------------|--------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.       |
| <b>9.0.2.0</b>  | Introduced on the S6000.       |
| <b>9.0.0.0</b>  | Introduced on the Z9000.       |
| <b>9.1(0.0)</b> | Added 'conditional' parameter. |
| <b>8.3.19.0</b> | Introduced on the S4820T.      |
| <b>8.3.11.1</b> | Introduced on the Z9000.       |
| <b>7.6.1.0</b>  | Introduced on the S-Series.    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.    |
| <b>E-Series</b> | Original command.              |

#### Usage Information

If you use only the `reload` command, the system boots into the Dell EMC Networking OS.

If there is a change in the running configuration, the system prompts you to save the new configuration when you reload the system using the `reload` command. You can also save your running configuration manually using the `copy running-config` command.

You can use the `conditional` parameter if any configuration changes made to the NVRAM, such as, stack-group and fanout configurations, must be saved.

When you use the `reload` command after making configuration changes, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

#### Example

```
DellEMC# reload
Verified startup-configuration is enabled, Hash for startup-
configuration is invalid.
Please update Hash for the startup-configuration before reload.
```

#### Example

The following example shows how to reload the system:

```
DellEMC# reload
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into Dell diagnostics mode:

```
DellEMC#reload dell-diag
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE mode:

```
DellEMC#reload onie
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE prompt and enter the install mode directly:

```
DellEMC#reload onie install
Proceed with reload [confirm yes/no]: yes
```

## reload-type

Allows you to configure the boot-type for the next reload.

**Syntax** `reload-type`

**Parameters** N/A

| <b>Defaults</b>          | normal-reload                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                   |                                                |                  |                                                   |                      |                                                     |                 |                                 |

| <b>9.0.2.0</b>         | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |          |                                                                                 |                  |                                                               |                  |                                                                                        |                  |                                                                               |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                             |                 |                          |                |                          |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.0.0.0</b>  | Introduced on the Z9000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.1.1.0</b>  | Introduced on the E-Series. |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.5.1.0</b>  | Introduced on the E-Series. |

#### Usage Information

Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use <CR>. To send the message use CTR-Z; to abort a message, use CTR-C.

## service timestamps

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date with local time zone time difference included or excluded.

#### Syntax

```
service timestamps {debug | log} [datetime [localtime] [msec] [show-timezone] [utc] | uptime]
```

To disable timestamping, use the `no service timestamps [debug | log]` command.

#### Parameters

|                      |                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>datetime</b>      | (OPTIONAL) Enter the keyword <code>datetime</code> to have the current time and date as in local time zone added to the message. |
| <b>debug</b>         | (OPTIONAL) Enter the keyword <code>debug</code> to add timestamps to debug messages.                                             |
| <b>log</b>           | (OPTIONAL) Enter the keyword <code>log</code> to add timestamps to log messages with severity from 0 to 6.                       |
| <b>localtime</b>     | (OPTIONAL) Enter the keyword <code>localtime</code> to include the local time zone time in the timestamp.                        |
| <b>msec</b>          | (OPTIONAL) Enter the keyword <code>msec</code> to include milliseconds in the timestamp.                                         |
| <b>show-timezone</b> | (OPTIONAL) Enter the keyword <code>show-timezone</code> to include the time zone information in the timestamp.                   |
| <b>uptime</b>        | (OPTIONAL) Enter the keyword <code>uptime</code> to have the timestamp based on time elapsed since system reboot.                |
| <b>utc</b>           | (OPTIONAL) Enter the keyword <code>utc</code> to include the UTC time format (ignoring local time zone) in the timestamp.        |

#### Defaults

- `datetime [localtime]`
- `datetime`

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.14(1.5)</b> | Added support for UTC time format.        |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>9.0.0.0</b>    | Introduced on the Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.       |
| <b>8.3.12.0</b>   | Introduced on the S4810.        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.     |
| <b>7.6.1.0</b>    | Introduced on the S-Series.     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.     |
| <b>E-Series</b>   | Original command.               |

#### Usage Information

If you do not specify parameters and enter service timestamps, it appears as service timestamps debug datetime in the running-configuration.

To view the current options set for the `service timestamps` command, use the `show running-config` command.

From 9.14.1.5 release, the default timestamp display format for the logs is set to local time (`service timestamps log datetime localtime`) instead of `service timestamps log datetime`.

## show alias

Display list of all the aliases with alias definition.

**Syntax** `show alias [details [alias-name]]`

**Parameters**

|                   |                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------|
| <b>details</b>    | (OPTIONAL) Enter the keyword <code>details</code> to display the detailed alias configuration. |
| <b>alias-name</b> | (OPTIONAL) Enter the alias-name to display the details of a specific alias definition.         |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

| Version          | Description                                             |
|------------------|---------------------------------------------------------|
| <b>9.12(0.0)</b> | Introduced on all the Dell EMC Networking OS platforms. |

#### Usage Information

- Alias definitions display up to 40 characters, and detailed output can be seen using the `details` option.

#### Example

The following example shows the list of alias names configured and its corresponding definition:

```
DellEMC# show alias
-----
Alias Name           Definition
-----
```

```

showipbr10          show ip interface brief | ...
showipbr40          show ip interface brief | ...
shboot              show bootvar...
cr-vlan              interface vlan $1 ..
-----
Total Alias Configured : 4
-----

```

The following example shows the detailed list of alias names configured on the system:

```

DellEMC# show alias details
-----
Name: showipbr10
Definition:
  show ip interface brief | grep tengig ignore-case
-----
Name: showipbr40
Definition:
  show ip interface brief | grep fortygig ignore-case
-----
DellEMC#

```

The following example shows the details of a specific alias name configured on the system:

```

DellEMC# show alias details showipbr10
-----
Name: showipbr10
Definition:
  show ip interface brief | grep tengig ignore-case
-----
DellEMC#

```

#### Related Commands

- [alias](#)—configure shorter alias names for single-line command input.

## show alarms

View alarms currently active in the system.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show alarms [threshold]</code>                                                                                                                          |
| <b>Parameters</b>      | <p><b>threshold</b> (OPTIONAL) Enter the keyword <code>threshold</code> to display the temperature thresholds in Celsius for each level.</p>                  |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>9.0.0.0</b>  | Introduced on the Z9000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.1.1.0</b>  | Introduced on the E-Series. |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>E-Series</b> | Original command.           |

### Example

```
DellEMC#show alarms

-- Minor Alarms --
Alarm Type                                     Duration
-----
-- Major Alarms --
Alarm Type                                     Duration
-----
PEM 2 in unit 1 down                          13 min, 36 sec
Fan 1 in PSU 2 of Unit 1 is down or removed 13 min, 34 sec
DellEMC#
```

## show cpu-traffic-stats

View the CPU traffic statistics.

|                        |                                                                                                                                                               |                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show cpu-traffic-stats [port number   all   cp ]</code>                                                                                                 |                                                                                                                                                   |
| <b>Parameters</b>      | <b><i>port number</i></b>                                                                                                                                     | (OPTIONAL) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.                                    |
|                        | <b>all</b>                                                                                                                                                    | (OPTIONAL) Enter the keyword <code>all</code> to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic. |
|                        | <b>cp</b>                                                                                                                                                     | (OPTIONAL) Enter the keyword <code>cp</code> to display traffic statistics on the specified CPU.                                                  |
| <b>Defaults</b>        | <b>all</b>                                                                                                                                                    |                                                                                                                                                   |
| <b>Command Modes</b>   | EXEC                                                                                                                                                          |                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. | Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>9.0.0.0</b>    | Introduced on the Z9000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.12.0</b>   | Introduced on the S4810.    |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>7.6.1.0</b>    | Introduced on the S-Series. |
| <b>7.5.1.0</b>    | Introduced on the C-Series. |
| <b>6.2.1.1</b>    | Introduced on the E-Series. |

### Usage Information

Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the `debug cpu-traffic-stats` command is executed; not from the system bootup.

 **NOTE:** After debugging is complete, use the `no debug cpu-traffic-stats` command to shut off traffic statistics collection.

### Example

```
DellEMC# show cpu-traffic-stats
Processor : CP
-----
Received 100% traffic on TenGigabitEthernet 1/1/2/1 Total packets:100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----
Received 62% traffic on TenGigabitEthernet 1/1/2/1 Total packets:500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
Unicast:500, Multicast:0, Broadcast:0
Received 37% traffic on TenGigabitEthernet 1/1/2/1 Total packets:300
LLC:0, SNAP:0, IP:300, ARP:0, other:0
Unicast:300, Multicast:0, Broadcast:0
Processor : RP2
-----
No CPU traffic statistics.
DellEMC#
```

## show debugging

View a list of all enabled debugging processes.

**Syntax** `show debugging`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |

| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>9.0.0.0</b>    | Introduced on the Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.       |
| <b>8.3.12.0</b>   | Introduced on the S4810.        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.     |
| <b>7.6.1.0</b>    | Introduced on the S-Series.     |
| <b>7.5.1.0</b>    | Introduced on the C-Series      |
| <b>E-Series</b>   | Original command.               |

#### Example

```
DellEMC# show debug
Generic IP:
  IP packet debugging is on for
    ManagementEthernet 1/1
    Port-channel 1-2
    Port-channel 5
    TenGigabitEthernet
1/1/1/1-1/1/1/3,1/1/5/1-1/1/5/2,1/1/3/1-1/1/3/2,1/1/5/4
DellEMC#
```

## show environment

View system component status (for example, temperature or voltage).

|                      |                                                                                                                 |                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show environment [all   fan   pem   stack-unit <i>unit-id</i>   thermal-sensor   optional-module ]</code> |                                                                                                                       |
| <b>Parameters</b>    | <b>all</b>                                                                                                      | Enter the keyword <code>all</code> to view all components.                                                            |
|                      | <b>fan</b>                                                                                                      | Enter the keyword <code>fan</code> to view information on the fans. The output of this command is chassis-dependent.  |
|                      | <b>pem</b>                                                                                                      | Enter the keyword <code>pem</code> to view only information on power entry modules.                                   |
|                      | <b>stack-unit <i>unit-id</i></b>                                                                                | Enter the keywords <code>stack-unit</code> then the <i>unit-id</i> to display information on a specific stack member. |
|                      | <b>thermal-sensor</b>                                                                                           | Enter the keywords <code>thermal-sensor</code> to view information on thermal sensors.                                |
|                      | <b>optional-module</b>                                                                                          | Enter the keywords <code>optional-module</code> to view information on optional module.                               |
| <b>Command Modes</b> | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                  |                                                                                                                       |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.11(2.1P1) | The CLI has been enhanced to show the power, average power and average power start time.                                                                       |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                                                                                      |
| 9.10(0.0)   | Introduced on the S3148.                                                                                                                                       |
| 9.10(0.0)   | Introduced on the S6100-ON.                                                                                                                                    |
| 9.8(2.0)    | Introduced on the S3100 series.                                                                                                                                |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                                                                                                    |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                                                                                                    |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                                                                                                    |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                                                                    |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                                                                       |
| 9.0.2.0     | Introduced on the S6000.                                                                                                                                       |
| 9.0.0.0     | Introduced on the Z9000.                                                                                                                                       |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                                                      |
| 8.3.12.0    | Introduced on the S4810.                                                                                                                                       |
| 8.3.11.1    | Introduced on the Z9000.                                                                                                                                       |
| 7.8.1.0     | The output of the <code>show environment fan</code> command for the S Series is changed to display fan speeds instead of showing the fan status as up or down. |

## Usage Information

The following example shows the output of the `show environment` command.

### Example (all)

```
DellEMC#show environment

-- Fan Status --
Unit Bay   TrayStatus  Fan1      Speed
-----
1    1       up           up        7620
1    2       up           up        7680
1    3       up           up        7605
1    4       up           up        7635

Speed in RPM

```

## show inventory

Display the switch type, components (including media), and Dell EMC Networking Operating System (OS), including hardware identification numbers and configured protocols.

**Syntax** `show inventory [media slot]`

**Parameters** **media slot** (OPTIONAL) Enter the keyword `media` then the stack ID of the stack member for which you want to display pluggable media inventory.

**NOTE:** This parameter is available but not supported in Dell EMC Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays “Media not present or accessible” (refer to the *Usage Information* section).

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                                             |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                                              |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                                                                                           |

| Version           | Description                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------|
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                             |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                 |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                 |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                    |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                   |
| <b>8.3.12.0</b>   | Introduced on the S4810.                                                                    |
| <b>8.3.11.4</b>   | Output expanded to include Piece Part ID (PPID) and eSR4 optics.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                    |
| <b>7.6.1.0</b>    | Introduced this version of the command for S-Series. S-Series output differs from E-Series. |

## Usage Information

If there are no fiber ports in the unit, just the header under *show inventory media* displays. If there are fiber ports but no optics inserted, the output displays *Media not present or accessible*.

The explanation for the fields present in the **show inventory optional-module command** example, are below:

- CurrentConf – Module type configuration as present in the current running config.
- Inserted – Module type actually present in the slot.
- BootTimeConf - Module type configuration that existed in the startup config at the time of boot up.

## Example (S6100-ON)

```
DellEMC#show inventory
System Type       : S6100-ON
System Mode       : 1.0
Software Version   : 9-8(1-53)
```

# show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

**Syntax** `show login statistics [all | [[successful-attempts | unsuccessful-attempts] [user login-id] [time-period days]] | user login-id]`

|                   |                                |                                                                                                                                                                                                                                                                                                                         |
|-------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>all</b>                     | (Optional)Displays the login statistics of all users in the last 30 days or the custom defined time period.                                                                                                                                                                                                             |
|                   | <b>time-period <i>days</i></b> | (Optional)Displays the number of failed login attempts by the current user in the specified period.                                                                                                                                                                                                                     |
|                   | <b>successful-attempts</b>     | (Optional)Displays the number of successful login attempts by the current user in the last 30 days or the custom defined time period                                                                                                                                                                                    |
|                   | <b>unsuccessful-attempts</b>   | (Optional)Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.                                                                                                                                                                                       |
|                   | <b>user <i>login-id</i></b>    | (Optional)Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the <code>unsuccessful-attempts</code> keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period |

|                        |                                                                                                                                                               |

|-------------------|--------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                            |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                             |
| <b>9.10(0.0)</b>  | Introduced the <code>successful-attempts</code> keyword. Introduced on the S6100-ON. |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                      |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                          |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                          |
| <b>9.8(0.0)</b>   | Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.                   |

## Usage Information

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the `show login statistics` command.

To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

**NOTE:** By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

## Example

The following is sample output of the `show login statistics` command.

```
DellEMC#show login statistics

-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----
```

The following is sample output of the `show login statistics all` command.

```
DellEMC#show login statistics all

-----
User: admin
Last login time: 08:54:28 UTC Wed Mar 23 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 4
-----

-----
User: admin1
Last login time: 12:49:19 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
-----
-----
```

```

User: admin2
Last login time: 12:49:27 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
-----

User: admin3
Last login time: 13:18:42 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2

```

The following is sample output of the `show login statistics user user-id` command.

```

Dell EMC# show login statistics user admin

-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----

```

The following is sample output of the `show login statistics unsuccessful-attempts` command.

```

Dell EMC# show login statistics unsuccessful-attempts
There were 3 unsuccessful login attempt(s) for user admin in last 30
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts time-period days` command.

```

Dell EMC# show login statistics unsuccessful-attempts time-period 15
There were 0 unsuccessful login attempt(s) for user admin in last 15
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts user login-id` command.

```

Dell EMC# show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s) .

```

The following is sample output of the `show login statistics successful-attempts` command.

```

Dell EMC# show login statistics successful-attempts
There were 4 successful login attempt(s) for user admin in last 30
day(s) .

```

## Related Commands

- [login statistics](#) — enable and configure user login statistics on console and virtual terminal lines.
- [login concurrent-session](#) — configures the limit of concurrent sessions for each user on console and virtual terminal lines.

# show memory

View current memory usage on the switch.

**Syntax** `show memory [stack-unit id]`

**Parameters** **stack-unit id** (OPTIONAL) Enter the keyword `stack-unit` then the stack unit ID to display memory information on the designated stack member.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                              |
|------------|----------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)  | Introduced on the S3148.                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                              |
| 9.8(2.0)   | Introduced on the S3100 series.                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                              |
| 9.0.2.0    | Introduced on the S6000.                                 |
| 9.0.0.0    | Introduced on the Z9000.                                 |
| 8.3.19.0   | Introduced on the S4820T.                                |
| 8.3.11.1   | Introduced on the Z9000.                                 |
| 8.3.7.0    | Introduced on the S4810.                                 |
| 7.6.1.0    | Introduced this version of the command for the S-Series. |

**Usage Information** The output for `show memory` displays the memory usage of LP part (sysdlp) of the system. The `sysdlp` is an aggregate task that handles all the tasks running on the S-Series' CPU.

**Example**

```
DellEMC#show memory stack-unit 1
Statistics On Unit 1 Processor
=====
Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
3177185280     2310248       3174875032    3174676264     3174875032
DellEMC#
```

# show processes cpu

Display CPU usage information based on processes running.

**Syntax** `show processes cpu [management-unit [1-99 | details] | stack-unit id [1-99] | summary ]`

**Parameters** **management-unit [1-99 | details]** (OPTIONAL) Display processes running in the control processor. The 1-99 variable sets the number of tasks to display in order of the highest CPU usage in the past five (5) seconds. Add the keyword `details` to display all running processes (except `sysdlp`). Refer to Example (management-unit).

|                             |                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit <i>id</i></b> | (OPTIONAL) Enter the keyword <code>stack-unit</code> then the stack member ID.<br><br>As an option of the <code>show processes cpu</code> command, this option displays CPU usage for the designated stack member. Or, as an option of the <code>command</code> , this option limits the output of memory statistics to the designated stack member.<br><br>Refer to Example (stack-unit). |
| <b>summary</b>              | (OPTIONAL) Enter the keyword <code>summary</code> to view CPU utilization of processes related to stack-unit processing.                                                                                                                                                                                                                                                                   |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Related Commands

- [show hardware layer2 acl](#) — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.
- [show hardware layer3](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- [show hardware stack-unit](#) — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- [show hardware system-flow](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- [show interfaces stack-unit](#) — displays information on all interfaces on a specific S-Series stack member.
- [show processes memory \(S-Series\)](#) — displays CPU usage information based on processes running in an S-Series.

# show processes ipc flow-control

Display the single window protocol queue (SWPQ) statistics.

**Syntax** `show processes ipc flow-control [cp]`

**Parameters** **cp** (OPTIONAL) Enter the keyword `cp` to view the control processor's SWPQ statistics.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.1.1.0</b>  | Introduced on the E-Series.              |
| <b>7.6.1.0</b>  | Introduced on the S-Series.              |
| <b>7.5.1.0</b>  | Introduced on the C-Series and E-Series. |

#### Usage Information

| Field                             | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <b>Source QID /Tx Process</b>     | Source Service Identifier                          |
| <b>Destination QID/Rx Process</b> | Destination Service Identifier                     |
| <b>Cur Len</b>                    | Current number of messages enqueued                |
| <b>High Mark</b>                  | Highest number of packets in the queue at any time |
| <b>#of to / Timeout</b>           | Timeout count                                      |
| <b>#of Retr /Retries</b>          | Number of retransmissions                          |
| <b>#msg Sent/Msg Sent/</b>        | Number of messages sent                            |
| <b>#msg Ackd/Ack Rcvd</b>         | Number of messages acknowledged                    |
| <b>Retr /Available Retra</b>      | Number of retries left                             |
| <b>Total/ Max Retra</b>           | Number of retries allowed                          |

#### Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue<sup>3</sup> for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the SWP-2-NOMORETIMEOUT timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

#### Example

```
DellEMC#show processes ipc flow-control cp

Q Statistics on CP Processor
TxProcess RxProcess Cur High Time Retr Msg Ack Aval Max
          Len Mark Out ies Sent Rcvd Retra Retra

```

# show processes memory

Display memory usage information based on processes running in the S-Series or Z-Series system.

|            |                                                                                |                                                                                                                                     |
|------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | show processes memory {management-unit   stack unit {unit-id   all   summary}} |                                                                                                                                     |
| Parameters | management-unit                                                                | Enter the keyword management-unit for CPU memory usage of the stack management unit.                                                |
|            | stack unit unit id                                                             | Enter the keyword stack unit then a stack unit ID of the member unit for which to display memory usage on the forwarding processor. |
|            | all                                                                            | Enter the keyword all for detailed memory usage on all stack members.                                                               |
|            | summary                                                                        | Enter the keyword summary for a brief summary of memory availability and usage on all stack members.                                |

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.  |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.0.2.0   | Introduced on the S6000.                  |
| 9.0.0.0   | Introduced on the Z9000.                  |
| 8.3.19.0  | Introduced on the S4820T.                 |
| 8.3.12.0  | Introduced on the S4810.                  |
| 8.3.11.1  | Introduced on the Z9000.                  |
| 7.7.1.0   | Added the management-unit option.         |
| 7.6.1.0   | Introduced on the S-Series.               |

|                   |                                    |                                                                    |
|-------------------|------------------------------------|--------------------------------------------------------------------|
| Usage Information | show processes memory output Field | Description                                                        |
|                   | Total:                             | Total system memory available                                      |
|                   | MaxUsed:                           | Total maximum memory used ever (history indicated with time stamp) |
|                   | CurrentUsed:                       | Total memory currently in use                                      |
|                   | CurrentFree:                       | Total system memory available                                      |

|                   | Process                            | Process Name                                                       |
|                   |                                    |                                                                    |

| <b>show<br/>processes<br/>memory<br/>output Field</b> | <b>Description</b>                            |
|-------------------------------------------------------|-----------------------------------------------|
| <b>ResSize</b>                                        | Actual resident size of the process in memory |
| <b>Size</b>                                           | Process test, stack, and data size            |
| <b>Allocs</b>                                         | Total dynamic memory allocated                |
| <b>Frees</b>                                          | Total dynamic memory freed                    |
| <b>Max</b>                                            | Maximum dynamic memory allocated              |
| <b>Current</b>                                        | Current dynamic memory in use                 |

The output for the `show process memory` command displays the memory usage statistics running on CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on S-Series' CP.

For the S-Series, the output of the `show memory` command and this command differ based on which Dell OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the output of this command, the memory size is equal to the size of the application processes plus the size of the system processes.

#### Example

```
DellEMC# show processes memory stack-unit 1

DellEMC#

```

## show reload-type

Shows the reload type which occurs on the next reboot.

**Syntax** `show reload-type`

**Parameters** N/A

**Defaults** normal-reload

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                         |
|------------------|-----------------------------------------------------|
| <b>9.12(0.0)</b> | Updated to include warmboot support.                |
| <b>8.3.11.4</b>  | Introduced on all Dell EMC Networking OS platforms. |

### Example

```

DellEMC#show reload-type
Reload-Type                               : warmboot [Next boot : warmboot]
Current ISSU Version 1.0
Next boot from System A
Next ISSU Version 1.0
DellEMC#

```

## show reset-reason

Display the reason for the last system reboot.

**Syntax** `show reset-reason [stack-unit {stack-unit-number | all}]`

**Parameters**

|                               |                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit unit-number</b> | (OPTIONAL) Enter the keyword <code>stack-unit</code> and the stack unit number to view the reason for the last system reboot for that stack unit.                    |
| <b>all</b>                    | (OPTIONAL) Enter the keyword <code>stack-unit</code> and the keyword <code>all</code> to view the reason for the last system reboot of all stack units in the stack. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b> | Introduced on the S5048F-ON.                                                                                                                        |
| <b>9.13(0.0)</b> | Introduced on the S3048-ON, S3100 series, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, C9010, MXL, M-IOA, and FN-IOM. |

**Usage Information** You can use the `show reset-reason` without the `stack-unit` option to view the reason for the last system reboot of the local system.

**Example — User-initiated reboot with the `reload` command**

```
DellEMC#show reset-reason
Cause      : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

**Example — System reboot due to the upgrade command**

```
DellEMC# show reset-reason
Cause: Reboot by Software upgrade Module.
Reset Time: 8/9/2017 1:39 PM.
```

**Example — System reboot for unknown reasons**

```
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A
```

**Example — System reboot due to power loss or pressing the power button off and on.** The example shows that the last system reboot was due to warm reset.

```
DellEMC#show reset-reason
Cause      : Warm Reset
Reset Time  : N/A.
```

**Example — System reboot due to watchdog timeout**

```
DellEMC#show reset-reason
Cause: Watchdog timeout.
Reset Time: N/A
```

**Example — System reboot due to thermal shutdown** The example shows that the last system reboot was due to thermal shutdown.

```
DellEMC#show reset-reason
Cause: Thermal Shutdown.
Reset Time: N/A.
```

**Example — System reboot due to BIOS boot fail** The example shows the reason for the last reboot was due to BIOS boot fail.

```
DellEMC#show reset-reason
Cause: Reset on Boot Ok Fail.
Reset Time: N/A.
```

**Example — Unknown reason** If the reason for the last system reboot is not available, the system displays the reason as N/A.

```
DellEMC# show reload-reason
Cause: N/A
Time: N/A
```

**Example — Reset reason of a single stack unit**

```
DellEMC# show reset-reason stack-unit 1
Cause      : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

**Example — Reset reason of all stack units**

```
DellEMC#show reset-reason stack-unit all
```

Last Reset Reason:

| Type         | Cause              | Time             |
|--------------|--------------------|------------------|
| stack-unit 1 | Reboot by Software | 11/05/2017-09:04 |
| stack-unit 2 | Reboot by Software | 11/05/2017-09:04 |
| stack-unit 3 | Cold Reset         | N/A              |
| stack-unit 4 | N/A                | N/A              |
| stack-unit 5 | N/A                | N/A              |
| stack-unit 6 | N/A                | N/A              |

# show software ifm

Display interface management (IFM) data.

|                 |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Version   | Description                                              |
|-----------|----------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0) | Introduced on the S3148.                                 |
| 9.10(0.0) | Introduced on the S6100-ON.                              |
| 9.8(1.0)  | Introduced on the Z9100-ON.                              |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.                 |
| 9.7(0.0)  | Introduced on the S6000-ON.                              |
| 9.2(1.0)  | Introduced on the Z9500.                                 |
| 9.0.2.0   | Introduced on the S6000.                                 |
| 9.0.0.0   | Introduced on the Z9000.                                 |
| 8.3.19.0  | Introduced on the S4820T.                                |
| 8.3.12.0  | Introduced on the S4810.                                 |
| 8.3.11.1  | Introduced on the Z9000.                                 |
| 8.5.1.0   | Added support for 4-port 40G line cards on the E-Series. |

| Version | Description                               |
|---------|-------------------------------------------|
| 7.6.1.0 | Introduced for the C-Series and S-Series. |

## show system

Display the status of all stack members or a specific member.

**Syntax** `show system [brief | stack-unit unit-id]`

**Parameters**

- brief** (OPTIONAL) Enter the keyword `brief` to view an abbreviated list of system information.
- stack-unit *unit-id*** (OPTIONAL) Enter the keywords `stack-unit` then the stack member ID for information on that member.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network Command Line Reference Guide*.

| Version    | Description                                                  |
|------------|--------------------------------------------------------------|
| 9.12(1.0)  | Introduced on the S5048F-ON.                                 |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                    |
| 9.10(0.0)  | Introduced on the S3148.                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                  |
| 9.7(0.0)   | Introduced on the S6000-ON.                                  |
| 9.4(0.0)   | Added support for the <code>disabled-ports</code> parameter. |
| 9.2(1.0)   | Introduced on the Z9500.                                     |
| 9.0.2.0    | Introduced on the S6000.                                     |
| 9.0.0.0    | Introduced on the Z9000.                                     |

| Version         | Description                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                                                                                                                              |
| <b>8.3.11.4</b> | The <code>brief</code> parameter no longer displays the current Reload mode. To display Reload mode, use the <code>reload-type</code> command. Modified the <code>show system stack-unit</code> command output to show Part ID (PPID). |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                                                                                                                               |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                                                                                                                               |
| <b>7.8.1.0</b>  | The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot code displays "Present".                                                                                                                |
| <b>7.7.1.0</b>  | Added Master Priority field.                                                                                                                                                                                                           |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                                                                                                                                                            |

## show tech-support

Display a collection of data from other `show` commands, necessary for Dell EMC Networking technical support to perform troubleshooting.

**Syntax** `show tech-support [stack-unit unit-id | page]`

**Parameters**

**stack-unit** (OPTIONAL) Enter the keywords `stack-unit` to view CPU memory usage for the stack member designated by `unit-id`.

**page** (OPTIONAL) Enter the keyword `page` to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text.

When using the pipe command ( `|` ), enter one of these keywords to filter command output. For details about filtering commands, refer to [CLI Basics](#).

**save** Enter the keyword `save` to save the command output.

`flash:` Save to local flash drive (`flash://filename`). A maximum of 20 characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b>  | Updated to display the <code>show revision</code> and <code>show os-version</code> command outputs. |
| <b>9.12(1.0)</b>  | Introduced on the S5048F-ON.                                                                        |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                         |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON                                                                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                         |

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.          |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>7.8.1.0</b>  | Introduced save to the file options. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |

## Usage Information

Without the `page` or `stack-unit` option, the command output is continuous. To interrupt the command output, use Ctrl-z.

The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `DellEMC#show tech-support |grep regular-expression |except regular-expression | find regular-expression | save flash://result`

This display output is an accumulation of the same information that is displayed when you execute one of the following `show` commands:

- `show version`
- `show os-version`
- `show revision`
- `show clock`
- `show running-config`
- `show system stack-ports`
- `show interfaces`
- `show process memory`
- `show process cpu`
- `show file system`
- `show system`
- `show environment`
- `show ip traffic`
- `show ip management route`
- `show ip route summary`
- `show Inventory`
- `show log summary`
- `show command-history (last 20 commands)`
- `show log`

## Example (options under show tech-support)

```
DellEMC# show tech-support ?
page          Page through output
stack-unit    Unit Number
|            Pipe through a command
<cr>
DellEMC#show tech-support stack-unit 1 ?
|            Pipe through a command
<cr>
DellEMC# show tech-support stack-unit 1 | ?
except        Show only text that does not match a pattern
find          Search for the first occurrence of a pattern
grep          Show only text that matches a pattern
no-more       Don't paginate output
save          Save output to a file

DellEMC# show tech-support stack-unit 1 | save ?
flash:        Save to local file system (flash://filename (max 20
chars) )
```

```

DellEMC# show tech-support stack-unit 1 | save flash://LauraSave
Start saving show command report .....
DellEMC#

DellEMC# dir

## ssh-peer-stack-unit

Open an SSH connection to the peer stack-unit.

**Syntax**                ssh-peer-stack-unit [-l username]

| <b>Parameters</b>      | <b>-l <i>username</i></b> (OPTIONAL) Enter the keyword -l then your user name. The default is the user name associated with the terminal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |           |                                           |           |                          |           |                             |          |                                 |          |                             |          |                             |         |                          |          |                           |          |                          |          |                          |          |                             |

# telnet

Connect through Telnet to a server. The Telnet client and server in Dell EMC Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

**Syntax** `telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name} [/source-interface]`

|                   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Parameters</b> | <b>host</b>             | Enter the name of a server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                   | <b>ip-address</b>       | Enter the IPv4 address in dotted decimal format of the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>ipv6-address</b>     | Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>prefix-length</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>vrf instance</b>     | (Optional) Enter the keyword <code>vrf</code> then the VRF instance name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                   | <b>source-interface</b> | (OPTIONAL) Enter the keywords <code>/source-interface</code> then the interface information to include the source interface. Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the stack/slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the stack/slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the stack/slot/port[/subport] information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the stack/slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the stack/slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For Tunnel interface types, enter the keyword <code>tunnel</code> then the slot/ port information. The range is from 1 to 16383.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

**Defaults** Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version         | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                           |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                          |
| <b>8.3.12.0</b> | Introduced on the S4810. Added support for <i>source-interface</i> for link-local IPv6 addressing. |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                           |
| <b>8.2.1.0</b>  | Introduced on the E-Series (IPv6). Increased the number of VLANs to 4094 (was 2094).               |
| <b>8.1.1.0</b>  | Introduced on the E-Series (IPv4).                                                                 |
| <b>7.9.1.0</b>  | Introduced VRF.                                                                                    |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                        |
| <b>7.5.1.0</b>  | Introduced on the C-Series and added support for IPv6 address on the E-Series only.                |

#### Usage Information

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

## telnet-peer-stack-unit

Open a Telnet connection to the peer stack unit.

**Syntax** `telnet-peer-stack-unit`

**Defaults** Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.11.1 | Introduced on the S-Series. |

## terminal length

Configure the number of lines displayed on the terminal screen.

|                        |                                                                                                                                                               |                                                                                                                    |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>terminal length screen-length</code>                                                                                                                    |                                                                                                                    |
| <b>Parameters</b>      | <b><i>screen-length</i></b>                                                                                                                                   | Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512. |
| <b>Defaults</b>        | 24 lines                                                                                                                                                      |                                                                                                                    |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                |                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                    |

| Version         | Description                               |
|-----------------|-------------------------------------------|
| 9.10(0.1)       | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)       | Introduced on the S3148.                  |
| 9.10(0.0)       | Introduced on the S6100-ON.               |
| 9.8(2.0)        | Introduced on the S3100 series.           |
| 9.8(1.0)        | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)      | Introduced on the S4048-ON.               |
| 9.8(0.0P2)      | Introduced on the S3048-ON.               |
| 9.7(0.0)        | Introduced on the S6000-ON.               |
| 9.2(1.0)        | Introduced on the Z9500.                  |

| 9.0.0.0         | Introduced on the Z9000.                  |
| 8.3.19.0        | Introduced on the S4820T.                 |
| 8.3.12.0        | Introduced on the S4810.                  |
| 8.3.11.1        | Introduced on the Z9000.                  |
| 8.1.1.0         | Introduced on the E-Series.               |
| 7.6.1.0         | Introduced on the S-Series.               |
| 7.5.1.0         | Introduced on the C-Series.               |
| <b>E-Series</b> | Original command.                         |

## traceroute

View a packet's path to a specific device.

|                   |                                                                           |                           |
|-------------------|---------------------------------------------------------------------------|---------------------------|
| <b>Syntax</b>     | <code>traceroute {host   vrf instance   ip-address   ipv6-address}</code> |                           |
| <b>Parameters</b> | <b><i>host</i></b>                                                        | Enter the name of device. |

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf instance</b> | (Optional) E-Series Only: Enter the keyword <code>vrf</code> then the VRF Instance name.                                                                         |
| <b>ip-address</b>   | Enter the IP address of the device in dotted decimal format.                                                                                                     |
| <b>ipv6-address</b> | Enter the IPv6 address, in the x:x:x::x format, to which you are testing connectivity.                                                                           |
|                     |  <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros. |

#### Defaults

- Timeout = **5 seconds**
- Probe count = **3**
- 30 hops max
- 40 byte packet size
- UDP port = **33434**

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.2.1.0</b>    | Introduced on the E-Series with IPv6.           |
| <b>8.1.1.0</b>    | Introduced on the E-Series (IPv4 only).         |
| <b>7.9.1.0</b>    | Introduced VRF.                                 |
| <b>7.6.1.0</b>    | Added support for the S-Series.                 |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                     |
| <b>7.4.1.0</b>    | Added support for IPv6 address on the E-Series. |
| <b>E-Series</b>   | Original command.                               |

#### Usage Information

When you enter the `traceroute` command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is **5**), a probe count (default is **3**), minimum TTL (default is **1**), maximum TTL (default is **30**), and port number (default is **33434**). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is **1**) and a maximum hop count (default is **64**).

Example (IPv4)

```
DellEMC# traceroute www.Dell EMC Networking.com

Translating "www.Dell EMC Networking.com"...domain server (10.11.0.1)
[OK]
Type Ctrl-C to abort.

-----
Tracing the route to www.Dell EMC Networking.com (10.11.84.18),
30 hops max, 40 byte packets
-----

TTL Hostname          Probel      Probe2      Probe3
1   10.11.199.190 001.000 ms 001.000 ms 002.000 ms
2   gwegress-sjc-02.Dell EMC Networking.com (10.11.30.126) 005.000 ms
    001.000 ms 001.000 ms
3   fw-sjc-01.Dell EMC Networking.com (10.11.127.254) 000.000 ms 000.000
    ms 000.000 ms
4   www.Dell EMC Networking.com (10.11.84.18) 000.000 ms 000.000 ms
    000.000 ms
DellEMC#
```

Example (IPv6)

```
DellEMC# traceroute 100::1

Type Ctrl-C to abort.

-----
Tracing the route to 100::1, 64 hops max, 60 byte packets
-----

Hops Hostname Probel      Probe2      Probe3
1   100::1 000.000 ms 000.000 ms 000.000 ms

DellEMC#traceroute 3ffe:501:ffff:100:201:e8ff:fe00:4c8b

Type Ctrl-C to abort.

## warmboot-failure-action

This CLI is used to define the system behavior in the event of a warmboot failure.

**Syntax** `warmboot-failure-action fastboot | normal-reload`

**Parameters**

|                      |                                        |
|----------------------|----------------------------------------|
| <b>fastboot</b>      | Do a fastboot on warmboot failure      |
| <b>normal-reload</b> | Do a normal reload on warmboot failure |

**Defaults** `normal-reload`

**Command Modes** `CONFIGURATION`

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                    |
|------------------|------------------------------------------------|
| <b>9.12(0.0)</b> | Introduced on the S6000, S6100-ON and Z9100-ON |

**Usage Information** Enter `warmboot-failure-action fastboot` to restart in fastboot mode in case there is a failure of warmboot. Enter `warmboot-failure-action normal-reload` to restart in normal mode in case there is a failure of warmboot.

## write

Copy the current configuration to either the startup-configuration file or the terminal.

**Syntax** `write [memory [compressed] | terminal]`

**Parameters**

|                   |                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>memory</b>     | Enter the keyword <code>memory</code> to copy the current running configuration to the startup configuration file. This command is similar to the <code>copy running-config startup-config</code> command. |
| <b>compressed</b> | Enter the keyword <code>compressed</code> to write the operating configuration to the startup-config file in the compressed mode.                                                                          |

**terminal** Enter the keyword `terminal` to copy the current running configuration to the terminal. This command is similar to the `show running-config` command.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.1.1.0</b>    | Introduced on the E-Series.               |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>E-Series</b>   | Original command.                         |

**Usage Information** The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named "startup-configuration" (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.

When you use the `write memory` command to copy the running configuration to the startup configuration file with the startup configuration verification feature enabled, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

## 802.1X

802.1X is a port-based Network Access Control (PNAC) that provides an authentication mechanism to devices wishing to attach to a LAN or WLAN. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell EMC Networking OS supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

### Important Points to Remember

Dell EMC Networking OS limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.4.1.0</b>    | Introduced on the C-Series and S-Series.  |

## dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

|               |                                                                               |
|---------------|-------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>dot1x auth-fail-vlan <i>vlan-id</i> [max-attempts <i>number</i>]</code> |
|---------------|-------------------------------------------------------------------------------|

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

|                        |                                                                                                                                                               |                                                                                                                                                                              |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>vlan-id</i></b>                                                                                                                                         | Enter the VLAN Identifier. The range is from 1 to 4094.                                                                                                                      |
|                        | <b>max-attempts <i>number</i></b>                                                                                                                             | (OPTIONAL) Enter the keywords <code>max-attempts</code> followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is <b>3</b> . |
| <b>Defaults</b>        | <b>3</b> attempts                                                                                                                                             |                                                                                                                                                                              |

| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.4.1.0</b>    | Introduced on the C-Series and S-Series.  |

|                          |                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN. |
|                          | After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval ( <code>dot1x reauthentication</code> ).                                                                                    |

|                         |                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------|

| 9.0.2.0    | Introduced on the S6000.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.4.2.1</b>  | Introduced on the C-Series and S-Series. |

#### Usage Information

The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1x authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.

#### Related Commands

- [dot1x mac-auth-bypass](#) — enable MAC authentication bypass.

## dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

#### Syntax

```
dot1x authentication
```

To disable dot1x on a globally, use the `no dot1x authentication` command.

#### Defaults

Disabled

Commands**

- [dot1x authentication \(Configuration\)](#) — enable dot1x globally.

## dot1x critical-vlan

Configure critical-VLAN for users or devices when authentication server is not reachable.

**Syntax**

`[no] dot1x critical-vlan vlan-id`

**Parameters**

***vlan-id***

Enter the VLAN identifier. The VLAN-ID range is from 1 to 4094.

**Defaults**

Not Configured.

**Command Modes**

INTERFACE

INTERFACE (BATCH MODE)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.0) | Introduced on the S3148.                                                                                                                                                  |
| 9.10(0.0) | Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500. |
| 9.9(0.0)  | Introduced on the C9000 Series.                                                                                                                                           |

## Usage Information

The `dot1x critical-vlan` command configures critical VLAN for the interface. If the authentication server is not reachable or not responding, the authenticator places the port or the supplicant in critical VLAN within the first attempt.

Use this command in Interface Batch mode to configure critical VLAN for users in a dual-homing setup.

## Example

```
DellEMC(conf)#show dot1x interface twentyFiveGigE 1/41
```

```
802.1x information on Tf 1/41:
-----
Dot1x Status:                Enable
Port Control:                AUTO
Port Auth Status:            AUTHORIZED (CRITICAL-VLAN)
Re-Authentication:           Enable
Untagged VLAN id:            400
Guest VLAN:                  Enable
Guest VLAN id:               400
Auth-Fail VLAN:              Enable
Auth-Fail VLAN id:           400
Auth-Fail Max-Attempts:      3
Critical VLAN:               Enable
Critical VLAN id:            400
Mac-Auth-Bypass:             Disable
Mac-Auth-Bypass Only:        Disable
Tx Period:                   30 seconds
Quiet Period:                60 seconds
ReAuth Max:                  2
Supplicant Timeout:          30 seconds
Server Timeout:              30 seconds
Re-Auth Interval:            60 seconds
Max-EAP-Req:                 2
Host Mode:                   SINGLE_HOST
Auth PAE State:              Authenticated
Backend State:               Idle
```

# dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

## Syntax

```
dot1x guest-vlan vlan-id
```

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

## Parameters

**vlan-id** Enter the VLAN Identifier. The range is from 1 to 4094.

## Defaults

Not configured.

**Command Modes** CONFIGURATION (*conf-if-interface-slot/port*)

## Command History

| Version           | Description                                         |
|-------------------|-----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                         |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                            |
| <b>9.0.2.0</b>    | Introduced on the S6000.                            |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                            |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                           |
| <b>8.3.12.0</b>   | Introduced on the S4810.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                            |
| <b>7.6.1.0</b>    | Introduced on the C-Series, E-Series, and S-Series. |

#### Usage Information

1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

**NOTE:** You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

#### Related Commands

- [dot1x auth-fail-vlan](#) — Configure an authentication failure VLAN.
- [dot1x reauthentication](#) — Enable periodic re-authentication of the client.
- [dot1x reauth-max](#) —

Configure the maximum number of times to re-authenticate a port before it becomes unauthorized

## dot1x host-mode

Enable single-host or multi-host authentication.

**Syntax** `dot1x host-mode {single-host | multi-host | multi-auth}`

**Parameters**

|                    |                                        |
|--------------------|----------------------------------------|
| <b>single-host</b> | Enable single-host authentication.     |
| <b>multi-host</b>  | Enable multi-host authentication.      |
| <b>multi-auth</b>  | Enable multi-suplicant authentication. |

**Defaults** `single-host`

**Command Modes** `INTERFACE`

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)  | Introduced on the S3148.                                                                                        |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                        |
| 9.0.2.0    | Introduced on the S6000.                                                                                        |
| 9.0.0.0    | Introduced on the Z9000.                                                                                        |
| 8.3.19.0   | Introduced on the S4820T.                                                                                       |
| 8.3.12.0   | Introduced on the S4810.                                                                                        |
| 8.3.11.1   | Introduced on the Z9000.                                                                                        |
| 8.4.1.0    | Added the <code>multi-auth</code> option on the C-Series and S-Series.                                          |
| 8.3.2.0    | Added the <code>single-host</code> and <code>multi-host</code> options on the C-Series, E-Series, and S-Series. |

## Usage Information

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-supPLICANT mode authenticates every device attempting to connect to the network on the authenticator port.

## Related Commands

- [show dot1x interface](#) — display the 802.1X configuration of an interface.

# mac

Configure a list of supplicant MAC addresses for dot1x profile represented with a profile-name.

## Syntax

```
[no] mac {mac-address1 mac-address2... mac-address6}
```

## Parameters

|                        |                                                                                       |
|------------------------|---------------------------------------------------------------------------------------|
| <b>mac-address1</b>    | Enter the keyword <code>mac</code> and type the 48- bit MAC addresses using the H.H.H |
| <b>mac-address2...</b> | format. A maximum of 6 MAC addresses are allowed.                                     |
| <b>mac-address6</b>    |                                                                                       |

## Defaults

None

## Command Modes

DOT1X PROFILE CONFIG (conf-dot1x-profile)  
CONFIGURATION TERMINAL BATCH

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description              |
|-----------|--------------------------|
| 9.10(0.0) | Introduced on the S3148. |

| Version          | Description                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                                                                                                  |

#### Usage Information

The `mac` command configures a list of supplicant MAC addresses for a dot1x profile represented with a profile-name. You can configure up to 6 MAC addresses in a single `mac` command. The maximum number of MAC addresses that you can configure in a single profile is limited to 100.

Use this command in Configuration Terminal Batch mode to configure a list of supplicant MAC addresses for dot1x profile in a dual-homing setup.

#### Example

```
DellEMC(conf)#dot1x profile mySupplicants
DellEMC(conf-dot1x-profile)#mac 00:50:56:AA:01:10 00:50:56:AA:01:11

DellEMC(conf-dot1x-profile)#show config
dot1x profile mySupplicants
  mac 00:50:56:aa:01:10
  mac 00:50:56:aa:01:11
DellEMC(conf-dot1x-profile)#
DellEMC(conf-dot1x-profile)#exit
```

## dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>dot1x mac-auth-bypass</code><br><br>To disable MAC authentication bypass on a port, use the <code>no dot1x mac-auth-bypass</code> command.              |
| <b>Defaults</b>        | Disabled                                                                                                                                                      |

| <b>8.3.12.0</b>   | Introduced on the S4810.                  |

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.4.1.0</b>  | Introduced on the C-Series and S-Series. |

#### Usage Information

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax** `dot1x max-eap-req number`

To return to the default, use the `no dot1x max-eap-req` command.

**Parameters** *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

**Defaults** **2**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## dot1x max-suplicants

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only takes effect in Multi-auth mode.

**Syntax** `dot1x max-suplicants number`

|                         |                                                                                                                                                               |                                                                                                                                                        |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>       | <b><i>number</i></b>                                                                                                                                          | Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is <b>128</b> . |
| <b>Defaults</b>         | 128 hosts can be authenticated on a single authenticator port.                                                                                                |                                                                                                                                                        |

|                        | <b>9.10(0.1)</b>                                                                                                                                              | Introduced on the S6010-ON and S4048T-ON.                                                     |
|                        | <b>9.10(0.0)</b>                                                                                                                                              | Introduced on the S3148.                                                                      |

| Version           | Description                              |
|-------------------|------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.              |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.          |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.              |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.              |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.              |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>    | Introduced on the S6000.                 |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                 |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                |
| <b>8.3.12.0</b>   | Introduced on the S4810.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                 |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series. |
| <b>7.4.1.0</b>    | Introduced on the E-Series.              |

#### Usage Information

The authenticator completes authentication only when you set `port-control` to `auto`.

## dot1x profile

Configure a dot1x profile to define a list of trusted supplicant MAC addresses.

|                        |                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>[no] dot1x profile <i>profile-name</i></code>                                                                                                                |
| <b>Parameters</b>      | <b><i>profile-name</i></b> Enter a dot1x <i>profile-name</i> . The profile name length is limited to 32 characters.                                                |
| <b>Defaults</b>        | None                                                                                                                                                               |
| <b>Command Modes</b>   | CONFIGURATION<br>CONFIGURATION TERMINAL BATCH                                                                                                                      |
| <b>Error Strings</b>   | NONE                                                                                                                                                               |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version          | Description                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                                                                                                  |
| <b>9.10(0.0)</b> | Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                                                                                                  |

#### Usage Information

The `dot1x profile` command configures a dot1x profile to define a list of trusted supplicant MAC addresses. Maximum number of dot1x profiles is limited to 10. This command launches dot1x profile mode for entering profile related commands such as the `mac` command. The `dot1x static-mab` command assigns the dot1x profile to an interface.

Use this command in Configuration Terminal Batch mode to configure the dot1x profile in a dual-homing setup.

## dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax** `dot1x quiet-period seconds`

To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters** ***seconds*** Enter the number of seconds. The range is from 1 to 65535. The default is **60**.

**Defaults** **60** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## dot1x reauthentication

Enable periodic reauthentication of the client.

**Syntax** `dot1x reauthentication [interval seconds]`

To disable periodic reauthentication, use the `no dot1x reauthentication` command.

**Parameters** ***interval seconds*** (Optional) Enter the keyword `interval` then the interval time, in seconds, after which reauthentication is initiated. The range is from 1 to 31536000 (one year). The default is **3600** (1 hour).

**Defaults** **3600** seconds (1 hour)

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |
| 7.4.1.0    | Introduced on the E-Series.               |

## dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

### Syntax

```
dot1x reauth-max number
```

To return to the default, use the `no dot1x reauth-max` command.

### Parameters

***number***

Enter the permitted number of re-authentications. The range is from 1 to 10. The default is **2**.

### Defaults

**2**

### Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>7.6.1.0</b>  | Introduced on the C-Series and S-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series.              |

## dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

**Syntax** `dot1x server-timeout seconds`

To return to the default, use the `no dot1x server-timeout` command.

**Parameters** **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

**Usage Information** When you configure the `dot1x server-timeout` value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured.

Ideally, the `dot1x server-timeout` value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula: `dot1x server-timeout seconds > (radius-server retransmit seconds + 1) * radius-server timeout seconds`.

Where the default values are as follows: `dot1x server-timeout` (30 seconds), `radius-server retransmit` (3 seconds), and `radius-server timeout` (5 seconds).

#### Example

```
DellEMC(conf)# radius-server host 10.11.197.105 timeout 6
DellEMC(conf)# radius-server host 10.11.197.105 retransmit 4
DellEMC(conf)# interface tengigabitethernet 1/1/1/1
DellEMC(conf-if-te-1/1/1/1)# dot1x server-timeout 40
```

## dot1x static-mab

Enable static MAC authorization bypass (MAB) and configure static MAB profile to an interface.

**Syntax** [no] `dot1x static-mab profile profile-name`

**Parameters** **profile profile-name** Enter the keyword `profile` and the `profile-name` to configure the static MAB profile name. The profile name length is limited to 32 characters.

**Defaults** Disabled.

**Command Modes** INTERFACE  
INTERFACE (BATCH MODE)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.0) | Introduced on the S3148.                                                                                                                                                  |
| 9.10(0.0) | Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500. |
| 9.9(0.0)  | Introduced on the C9010.                                                                                                                                                  |

**Usage Information** The `dot1x static-mab` command enables static MAB (mac auth bypass) and configures the associated profile on a `dot1x` interface. Static MAB bypasses the authentication server for the supplicant MAC addresses configured in the associated profile.

Before you enable static MAB, you must do the following:

- Enable MAC authentication bypass on the port by configuring the `dot1x mac-auth-bypass` command.
- Ensure that no configured profile exists at the time of configuring the `static-mab` command.
- Use this command in Interface Batch Mode to enable static MAB in a dual-homing setup.

**Example** `DellEMC(conf)#do show dot1x interface twentyFiveGigE 1/41`

```
802.1x information on Tf 1/41:
-----
Dot1x Status:          Enable
Port Control:          AUTO
Port Auth Status:      AUTHORIZED (STATIC-MAB)
Re-Authentication:     Enable

```

## dot1x supplicant-timeout

Configure the amount of time after which exchanges with the supplicant time-out.

**Syntax** `dot1x supplicant-timeout seconds`

To return to the default, use the `no dot1x supplicant-timeout` command.

**Parameters** **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## dot1x tx-period

Configure the intervals at which EAPOL PDUs the Authenticator PAE transmits.

|                        |                                                                                                                                                               |                                                                                                                                |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>dot1x tx-period seconds</code><br>To return to the default, use the <code>no dot1x tx-period</code> command.                                            |                                                                                                                                |
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                | Enter the interval time, in seconds, that EAPOL PDUs are transmitted. The range is from 1 to 65535. The default is <b>30</b> . |
| <b>Defaults</b>        | <b>30</b> seconds                                                                                                                                             |                                                                                                                                |

| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## show dot1x cos-mapping interface

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

|                   |                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show dot1x cos-mapping interface <i>interface</i> [mac-address <i>mac-address</i>]</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b> | <b><i>interface</i></b>                                                                         | Enter one of the following keywords and the interface information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the stack/slot/port/subport information.</li><li>For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the stack/slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the stack/slot/port[/subport] information.</li><li>For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the stack/slot/port/subport information.</li></ul> |

- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the `stack/slot/port` information.

***mac-address*** (Optional) MAC address of an 802.1X-authenticated supplicant.

#### Defaults

None

#### Command Modes

- EXEC
- EXEC privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.4.2.1</b>    | Introduced on the C-Series and S-Series.  |

#### Usage Information

Enter a supplicant's MAC address using the `mac-address` option to display CoS mapping information only for the specified supplicant.

You can display the CoS mapping information applied to traffic from authenticated supplicants on 802.1X-enabled ports that are in Single-Hot, Multi-Host, and Multi-Supplicant authentication modes.

#### Example

```
DellEMC# show dot1x cos-mapping interface tengigabitethernet 1/1/1/1
802.1p CoS re-map table on Te 1/1/1/1:
-----
Dot1p      Remapped Dot1p
0           7
1           6
2           5
3           4
4           3
5           2
6           1
7           0
DellEMC#

DellEMC# show dot1x cos-mapping interface tengigabitethernet 1/1/1/1 mac-
address 00:00:00:00:00:10

7               0
DellEMC#
```

## show dot1x interface

Display the 802.1X configuration of an interface.

### Syntax

```
show dot1x interface interface [mac-address mac-address]
```

### Parameters

#### ***interface***

Enter one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the stack/slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the stack/slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the stack/slot/port[/subport] information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the stack/slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the stack/slot/port information.

#### ***mac-address***

(Optional) MAC address of a supplicant.

### Defaults

None

### Command Modes

- EXEC
- EXEC privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |

| Version         | Description                                                             |
|-----------------|-------------------------------------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                |
| <b>8.4.2.1</b>  | Added the <code>mac-address</code> option on the C-Series and S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series, E-Series, and S-Series.                     |

## Usage Information

If you enable 802.1X multi-supplicant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

## Example

```
DellEMC# show dot1x interface tengigabitethernet 1/1/1/1

802.1x information on Te 1/1/1/1:
-----
Dot1x Status:                Enable

## show dot1x profile

Display all the dot1x profiles or the details of a specific profile configured in the system.

**Syntax** `show dot1x profile profile-name`

**Parameters** ***profile-name*** Specify a static dot1x *profile-name*. The maximum character limit for a profile name is 32 characters.

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                                                         |
| <b>9.10(0.0)</b> | Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, C9010, Z9100-ON, and Z9500. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                                                         |

# Access Control Lists (ACL)

Access control lists (ACLs) are supported by the Dell EMC Networking OS.

Dell EMC Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

 **NOTE:** For ACL commands that use the Trace function, see *Trace List Commands* section in [Security](#).

 **NOTE:** For IPv6 ACL commands, see [IPv6 Access Control Lists \(IPv6 ACLs\)](#).

## Topics:

- [Commands Common to all ACL Types](#)
- [Common IP ACL Commands](#)
- [Standard IP ACL Commands](#)
- [Extended IP ACL Commands](#)
- [Extended IPv6 ACL Commands](#)
- [Common MAC Access List Commands](#)
- [Standard MAC ACL Commands](#)
- [Extended MAC ACL Commands](#)
- [IP Prefix List Commands](#)
- [Route Map Commands](#)
- [deny \(for Standard IP ACLs\)](#)
- [deny \(for Extended IP ACLs\)](#)
- [seq \(for Standard IPv4 ACLs\)](#)
- [deny tcp \(for Extended IP ACLs\)](#)
- [deny ether-type \(for Extended MAC ACLs\)](#)
- [deny \(for Standard MAC ACLs\)](#)
- [deny \(for Extended MAC ACLs\)](#)
- [permit \(for Standard IP ACLs\)](#)
- [permit arp \(for Extended MAC ACLs\)](#)
- [permit ether-type \(for Extended MAC ACLs\)](#)
- [permit icmp \(for Extended IP ACLs\)](#)
- [permit udp \(for Extended IP ACLs\)](#)
- [permit \(for Extended IP ACLs\)](#)
- [permit \(for Standard MAC ACLs\)](#)
- [seq \(for Standard MAC ACLs\)](#)
- [permit tcp \(for Extended IP ACLs\)](#)
- [seq arp \(for Extended MAC ACLs\)](#)
- [seq ether-type \(for Extended MAC ACLs\)](#)
- [seq \(for IP ACLs\)](#)
- [permit icmp \(for IPv6 ACLs\)](#)

- `permit tcp` (for IPv6 ACLs)
- `permit udp` (for IPv6 ACLs)
- `seq` (for IPv6 ACLs)
- `permit` (for IPv6 ACLs)
- `deny arp` (for Extended MAC ACLs)
- `deny icmp` (for Extended IPv6 ACLs)
- `deny tcp` (for IPv6 ACLs)
- `deny udp` (for Extended IP ACLs)
- `deny` (for IPv6 ACLs)

## Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the `deny` and `permit` commands).

### remark

Enter a description for an ACL entry.

|                        |                                                                                                                                                                                                                                                                                                                                                                               |  |

| Version           | Description                                                            |
|-------------------|------------------------------------------------------------------------|
| <b>9.14(1.0)</b>  | Introduced the remark number as an optional value on S4810 and S4820T. |
| <b>9.14.0.0</b>   | Made the remark number as an optional value.                           |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                               |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                                            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.                                            |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                               |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>8.1.1.0</b>  | Introduced on the E-Series. |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.4.1.0</b>  | Introduced on the E-Series. |

## Usage Information

The `remark` command is available in each ACL mode. You can configure up to 4294967291 remarks for a given IP ACL and 65536 remarks for a given MAC ACL.

You can include a remark with or without a remark number. If you do not enter a remark number, the remark inherits the sequence number of the last ACL rule. If there is no ACL rule when you enter a remark, the remark takes sequence number 5. If you configure two remarks with the same sequence number and different strings, the second one replaces the first string. You cannot configure two or more remarks with the same string and different sequence numbers.

To remove a remark, use the `no remark` command with or without the sequence number. If there is a matching string, the system deletes the remark.

## Example

The following example shows the use of the `remark` command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The remark precedes the rule in the running configuration because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

```
DellEMC(config-std-nacl)# remark 10 Deny rest of the traffic
DellEMC(config-std-nacl)# remark 5 Permit traffic from XYZ Inc.
DellEMC(config-std-nacl)# show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 deny any
DellEMC(config-std-nacl)#
```

The following example shows adding a remark without a sequence number:

```
DELLEMC(config-ext-nacl)#permit ip any any
DELLEMC(config-ext-nacl)#remark permit any ip
DELLEMC(config-ext-nacl)#show c
!
ip access-list extended testac
seq 5 permit ip any any
remark 5 permit any ip
```

The following example shows that the system displays an error message when the same remark string is used with different remark numbers.

```
DELLEMC(config-ext-nacl)#seq 100 permit ip any any
DELLEMC(config-ext-nacl)#remark 10 permit any ip
DELLEMC(config-ext-nacl)#remark permit any ip
DELLEMC(config-ext-nacl)%% Error : Remark string already exists
```

## Related Commands

- [show config](#) — display the current ACL configuration.

## show config

Display the current ACL configuration.

**Syntax** `show config`

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

### Example

```
DellEMC(config-std-nacl)# show conf
!
ip access-list standard test
 remark 5 Permit traffic from XYZ Inc.
 seq 5 permit 1.1.1.0/24 count
 remark 10 Deny traffic from ABC
 seq 10 deny 2.1.1.0/24 count
DellEMC(config-std-nacl)#
```

## Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) section.

## aclrange profile-name

Create ACL range profiles for L4 ports.

|                   |                                                                                                                                                                                      |                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>aclrange profile-name</code><br>After entering the configuration mode of the ACL range, enter the following: <code>type [inverse value] lower threshold upper-threshold</code> |                                                                                                              |
| <b>Parameters</b> | <b><i>profile-name</i></b>                                                                                                                                                           | Enter a valid name for the range profile.                                                                    |
|                   | <b>type</b>                                                                                                                                                                          | Specify the type of the L4 port as source or destination.                                                    |
|                   | <b>inverse</b>                                                                                                                                                                       | Enter the keyword <code>inverse</code> followed by a value. This is used as a negative (not equal to) match. |
|                   | <b><i>lower threshold</i></b>                                                                                                                                                        | Enter the minimum inclusive value of the range.                                                              |
|                   | <b><i>upper-threshold</i></b>                                                                                                                                                        | Enter the maximum inclusive value of the range.                                                              |

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                                     |
|------------------|-------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S6000-ON, S6100-ON, Z9100-ON. |

**Usage Information** Ensure that the ACL range feature is enabled before creating the profile names for the ranges using the `feature aclrange` command. Reboot the system for the range profiles to come up.

### Example

```
DellEMC(conf)#aclrange profile-name
DellEMC(conf-aclrange-profile-name)#
```

```
DellEMC(conf)#aclrange sportrange1
DellEMC(conf-aclrange-sportrange1)# 14srcport 1024 65535
```

```
DellEMC(conf)#aclrange destportrange1
DellEMC(conf-acl-destportrange1)# 14dstport 500 500
```

```
DellEMC(conf)#aclrange inverserange
DellEMC(conf-acl-inverserange)# 14dstport inverse 1000
```

**Related Commands** [feature aclrange](#) on page 187— Enable the ACL range.

## access-class

Apply a standard ACL to a terminal line.

**Syntax** `access-class access-list-name [ipv4 | ipv6]`  
To remove an ACL, use the `no access-class` command.

**Parameters**

|                                |                                                                        |
|--------------------------------|------------------------------------------------------------------------|
| <b><i>access-list-name</i></b> | Enter the name of a configured Standard ACL, up to 140 characters.     |
| <b>ipv4</b>                    | Enter the keyword <code>ipv4</code> to configure an IPv4 access class. |
| <b>ipv6</b>                    | Enter the keyword <code>ipv6</code> to configure an IPv6 access class. |

**Defaults** Not configured.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)  | Introduced on the S3148.                                                                                        |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                     |
| 9.8(0.0)   | Added the <code>ipv4</code> and <code>ipv6</code> parameters to the command.                                    |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                        |
| 9.0.2.0    | Introduced on the S6000.                                                                                        |
| 8.3.19.0   | Introduced on the S4820T.                                                                                       |
| 8.3.11.1   | Introduced on the Z9000.                                                                                        |
| 8.3.7.0    | Introduced on the S4810.                                                                                        |
| 8.1.1.0    | Introduced on the E-Series.                                                                                     |
| 7.8.1.0    | Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| 7.6.1.0    | Introduced on the S-Series.                                                                                     |
| 7.5.1.0    | Introduced on the C-Series.                                                                                     |
| 6.2.1.1    | Introduced on the E-Series.                                                                                     |

**Usage Information**

When you use the `access-class access-list-name` command without specifying the `ipv4` or `ipv6` attribute, both IPv4 as well as IPv6 rules that are defined in that ACL are applied to the terminal. This method is a generic way of configuring access restrictions.

To be able to filter access exclusively using either IPv4 or IPv6 rules, use either the `ipv4` or `ipv6` attribute along with the `access-class access-list-name` command. Depending on the attribute that you specify (`ipv4` or `ipv6`), the ACL processes either IPv4 or IPv6 rules, but not both. Using this configuration, you can set up two different types of access classes with each class processing either IPv4 or IPv6 rules separately.

However, if you already have configured generic IP ACL on a terminal line, then you cannot further apply IPv4 or IPv6 specific filtering on top of this configuration. Because, both IPv4 and IPv6 access classes are already configured on this terminal line. Before applying either IPv4 or IPv6 filtering, first undo the generic configuration using the `no access-class access-list-name` command.

Similarly, if you have configured either IPv4 or IPv6 specific filtering on a terminal line, you cannot apply generic IP ACLs on top of this configuration. Before applying the generic ACL configuration, first undo the existing configuration using the `no access-class access-list-name [ipv4 | ipv6]` command.

## clear counters ip access-group

Erase all counters maintained for access lists.

**Syntax** `clear counters ip access-group [access-list-name]`

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>access-list-name</i></b> (OPTIONAL) Enter the name of a configured access-list, up to 140 characters.                                                   |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                     |

| <b>9.14(0.0)</b>         | Introduced on the S5048F-ON.                                                                                                                                                                                                  |         |             |                  |                              |                  |                                          |
| <b>9.13(0.0)</b>         | Introduced on the S6100-ON and Z9100-ON.                                                                                                                                                                                      |         |             |                  |                              |                  |                                          |
| <b>Usage Information</b> | After enabling the acloptimized feature, reboot the system.                                                                                                                                                                   |         |             |                  |                              |                  |                                          |

## Example

```
DellEMC(conf)#feature acloptimized
Configuration change will be in effect after save and reload. ACL
config containing TTL, layer3 and VRF conflicts with ACL Cam optimization
feature and these keywords would be discarded while applying the ACL.
```

## feature aclrange

Enable the ACL range option.

### Syntax

`feature aclrange`

Use the `no feature aclrange` command to disable the option.

### Defaults

None

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

#### Version

#### Description

**9.11(0.0)**

Introduced on the S6000-ON, S6100-ON, Z9100-ON.

### Usage Information

After enabling the range option, create the range profiles using the `aclrange profile-name` command. Reboot the system for the range profiles to come up.

### Related Commands

[aclrange profile-name](#) on page 184 — Create range profiles.

## ip access-group

Assign an IP access list (IP ACL) to an interface.

### Syntax

```
[vrf vrf-name]ip access-group access-list-name {in | out} [implicit-permit
[vlan vlan-id | vrf vrf-name | optimized] | vlan vlan-id | vrf vrf-name |
optimized] [layer3]
```

To delete an IP access-group configuration, use the `no ip access-group access-list-name {in | out}` command.

### Parameters

- |                         |                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access-list-name</b> | Enter the name of a configured access list, up to 140 characters.                                                                                                                                                                                                                                                                                                                                            |
| <b>in</b>               | Enter the keyword <code>in</code> to apply the ACL to incoming traffic.                                                                                                                                                                                                                                                                                                                                      |
| <b>out</b>              | Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.                                                                                                                                                                                                                                                                                                                                     |
| <b>implicit-permit</b>  | (OPTIONAL) Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).                                                                                                                                                        |
| <b>vlan vlan-id</b>     | (OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).                                                                                                                                                                                                                                                               |
| <b>vrf vrf-name</b>     | (OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 511 (you can use IDs from 1 to 511).<br><div> <b>NOTE:</b> When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.</div> |
| <b>optimized</b>        | (OPTIONAL) Enter the keyword <code>optimized</code> to enable ACL optimization                                                                                                                                                                                                                                                                                                                               |

**layer3** (OPTIONAL) Enter the keyword `layer3` to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.

**Defaults** Not enabled.

**Command Modes** INTERFACE/VRF MODE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                        |
| 9.10(0.0)  | Introduced on the S3148.                                                                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                      |
| 9.4.(0.0)  | Added support for VRF.                                                                                           |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                         |
| 9.0.2.0    | Introduced on the S6000.                                                                                         |
| 8.3.19.0   | Introduced on the S4820T.                                                                                        |
| 8.3.11.1   | Introduced on the Z9000.                                                                                         |
| 8.3.7.0    | Introduced on the S4810.                                                                                         |
| 8.1.1.0    | Introduced on the E-Series.                                                                                      |
| 7.8.1.0    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| 7.6.1.0    | Introduced on the S-Series.                                                                                      |
| 7.5.1.0    | Introduced on the C-Series.                                                                                      |
| 6.2.1.1    | Introduced on the E-Series.                                                                                      |

**Usage Information** You can assign one ingress ACL and one egress ACL to an interface.

 **NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the `vrf` attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

In the Dell EMC Networking OS versions prior to 9.13(0.0), the system does not install any of your ACL rules if the available CAM space is lesser than what is required for your set of ACL rules. Effective with the Dell EMC Networking OS version 9.13(0.0), the system installs your ACL rules until all the allocated CAM memory is used. If there is no implicit permit in your rule, the Dell EMC Networking OS ensures that an implicit deny is installed at the end of your rule. This behavior is applicable for IPv4 and IPv6 ingress and egress ACLs.

One of the usage scenarios for using the **layer3** keyword at the VLAN level, is to avoid ACL being applied on the L2 traffic which comes in via ICL.

 **NOTE:** The usage scenario listed above is one of many other usage scenarios.

**Related Commands**

- [ip access-list standard](#) — configure a standard ACL.
- [ip access-list extended](#) — configure an extended ACL.

# ip control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv4 CPU traffic.

| <b>Examples</b> | To display the list of ACL ranges: |
|-----------------|------------------------------------|

|          |               |      |         |                 |                 |      |
|----------|---------------|------|---------|-----------------|-----------------|------|
| DellEMC# | show aclrange |      |         |                 |                 |      |
| INDEX    | PROFILE_NAME  | TYPE | INVERSE | LOWER THRESHOLD | UPPER THRESHOLD | REF_ |
| -----    |               |      |         |                 |                 |      |

|   |             |           |     |      |       |   |
|---|-------------|-----------|-----|------|-------|---|
| 1 | dport1      | l4dstport | No  | 80   | 89    | 0 |
| 2 | dport2      | l4dstport | No  | 3000 | 3500  | 2 |
| 3 | dportgt5000 | l4dstport | No  | 5001 | 65535 | 1 |
| 4 | ip-mtu-782  | mtu       | No  | 782  | 782   | 1 |
| 5 | sport1      | l4srcport | No  | 1024 | 65535 | 1 |
| 6 | sportinv1   | l4srcport | Yes | 2500 | 2500  | 1 |

To display the list of ACLs using the configured range profiles:

```
DellEMC# show aclrange access-list
Profile-name      type      Acl-name      seqno
abc               v4        abc            5
                  V4        zyx            10
                  V6        def            8
bgp               V6        ghi            8
```

## show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

### Syntax

```
show ip accounting access-list [access-list-name [cam-count | interface
interface [cam_count] | vrf {management | vrf-name} [cam_count] {in | out}]
```

### Parameters

- access-list-name*** Enter the name of the ACL to be displayed.
- cam\_count*** List the count of the CAM rules for this ACL.
- interface*** Enter the keyword *interface* then the one of the following keywords and the interface information:
- interface***
- For a 10-Gigabit Ethernet interface, enter the keyword *TenGigabitEthernet* then the stack/slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword *twentyFiveGigE* then the stack/slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword *fortyGigE* then the stack/slot/port[/subport] information.
  - For a 50-Gigabit Ethernet interface, enter the keyword *fiftyGigE* then the stack/slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword *hundredGigE* then the stack/slot/port information.
  - For a port channel interface, enter the keywords *port-channel* then a number.
  - For a VLAN interface, enter the keyword *vlan* then a number from 1 to 4094.
- in | out*** Identify whether ACL is applied on the ingress or egress side.
- vrf vrf-name*** (Optional) Enter the keyword *vrf* and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.11(0.0) | Updated the show command output to include monitor option. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                  |
| 9.10(0.0) | Introduced on the S3148.                                   |
| 9.10(0.0) | Introduced on the S6100-ON.                                |
| 9.8(2.0)  | Introduced on the S3100 series.                            |

| Version    | Description                                  |
|------------|----------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100–ON.                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                  |
| 9.7(0.0)   | Introduced on the S6000–ON.                  |
| 9.4.(0.0)  | Added support for VRF.                       |
| 9.2(1.0)   | Introduced on the Z9500.                     |
| 9.0.2.0    | Introduced on the S6000.                     |
| 8.3.19.0   | Introduced on the S4820T.                    |
| 8.3.11.1   | Introduced on the Z9000.                     |
| 8.5.1.0    | Added support for the 4-port 40G line cards. |
| 8.3.7.0    | Introduced on the S4810.                     |
| 7.6.1.0    | Introduced on the S-Series.                  |
| 7.5.1.0    | Introduced on the C-Series.                  |
| 6.2.1.1    | Introduced.                                  |

#### Usage Information

 **NOTE:** The vrf option is available only when VRF feature is enabled.

| <code>show ip accounting access-lists</code> Field | Description                                                                                                                                                                                          |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| “Extended IP...”                                   | Displays the name of the IP ACL.                                                                                                                                                                     |
| “seq 5...”                                         | Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line. |
| “order 4”                                          | Displays the QoS order of priority for the ACL entry.                                                                                                                                                |

#### Example

## Standard IP ACL Commands

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit. The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

### deny

To drop packets with a certain IP address, configure a filter.

#### Syntax

```
deny {source | any | host {ip-address}} [count [bytes] | log] [dscp value]
[ecn value] [fragments] [monitor] [no-drop] [order]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

|                   |                               |                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>source</b>                 | Enter the IP address in dotted decimal format of the network from which the packet was sent.                                                                                                                                                                                                                                  |
|                   | <b>any</b>                    | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                      |
|                   | <b>host <i>ip-address</i></b> | Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address only.                                                                                                                                                                                                                          |
|                   | <b>count</b>                  | (OPTIONAL) Enter the keyword <code>count</code> to count the packets.                                                                                                                                                                                                                                                         |
|                   | <b>bytes</b>                  | (OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.                                                                                                                                                                                                                                                           |
|                   | <b>log</b>                    | (OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.                                                                                                                                                                                                                                                |
|                   | <b>dscp</b>                   | (OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.                                                                                                                                                                                                                        |
|                   | <b>ecn</b>                    | (OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.                                                                                                                                                                                                                                |
|                   | <b>order</b>                  | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255). |
|                   | <b>monitor</b>                | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                      |
|                   |                               |  <b>NOTE:</b> For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .                                                                                    |
|                   | <b>fragments</b>              | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                             |
|                   | <b>no-drop</b>                | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                  |

**Defaults** Not configured.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                                  |
|-------------------|-------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| <b>9.11(0.0)</b>  | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.    |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                         |
| <b>9.8(0.0)</b>   | Added the <code>no-drop</code> parameter.                                           |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                         |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                            |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                            |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                           |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                            |

| Version | Description                                                                          |
|---------|--------------------------------------------------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                                                             |
| 8.3.1.0 | Add the DSCP value for ACL matching.                                                 |
| 8.2.1.0 | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                      |
| 8.1.1.0 | Introduced on the E-Series.                                                          |
| 7.6.1.0 | Introduced on the S-Series.                                                          |
| 7.5.1.0 | Introduced on the C-Series.                                                          |
| 7.4.1.0 | Added support for the non-contiguous mask and added the <code>monitor</code> option. |
| 6.5.1.0 | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.  |

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section in the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the `count` `byte` options, only bytes increment.

#### Related Commands

- [ip access-list standard](#) — configure a standard ACL.
- [permit](#) — configure a permit filter.

## ip access-list standard

Create a standard IP access list (IP ACL) to filter based on IP address.

#### Syntax

```
ip access-list standard access-list-name
```

To delete an access list, use the `no ip access-list standard access-list-name` command.

#### Parameters

***access-list-name*** Enter a string up to 140 characters long as the ACL name.

#### Defaults

All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.10.0   | Introduced on the S4810.                  |

| Version | Description                                                                          |
|---------|--------------------------------------------------------------------------------------|
| 8.1.1.0 | Introduced on the E-Series.                                                          |
| 7.8.1.0 | Increased the name string to accept up to 140 characters.                            |
| 7.6.1.0 | Introduced on the S-Series.                                                          |
| 7.5.1.0 | Introduced on the C-Series.                                                          |
| 7.4.1.0 | Added support for the non-contiguous mask and added the <code>monitor</code> option. |
| 6.5.1.0 | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.  |

#### Usage Information

Dell EMC Networking OS supports one ingress and one egress IP ACL per interface.

Prior to Dell EMC Networking OS version 7.8.1.0, names are up to 16 characters long.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

#### Example

```
DellEMC(conf)# ip access-list standard TestList
DellEMC(config-std-nacl)#
```

#### Related Commands

- [ip access-list extended](#) — create an extended access list.
- [show config](#) — display the current configuration.

## permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

#### Syntax

```
permit {source [mask] | any | host ip-address} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor ] [no-drop] [order]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address in dotted decimal format of the network from which the packet was sent.                                                                                                                                                                                                                                    |
| <b>mask</b>            | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                      |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                        |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.                                                                                                                                                                                                                               |
| <b>count</b>           | (OPTIONAL) Enter the keyword <code>count</code> to count the packets.                                                                                                                                                                                                                                                           |
| <b>bytes</b>           | (OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.                                                                                                                                                                                                                                                             |
| <b>log</b>             | (OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.                                                                                                                                                                                                                                                  |
| <b>dscp</b>            | (OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.                                                                                                                                                                                                                          |
| <b>ecn</b>             | (OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.                                                                                                                                                                                                                                  |
| <b>order</b>           | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255). |

|                          | <p><b>monitor</b> (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.</p> <p> <b>NOTE:</b> For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                  |                                                                                     |                  |                                                                                  |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                           |                 |                             |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                                                                 |                |                             |                |                             |                |                             |                |                                                                                      |               |                                                                                     |

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

**Syntax** `resequence access-list {ipv4 | ipv6 | mac} {access-list-name StartingSeqNum Step-to-Increment}`

**Parameters**

|                          |                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------|
| <b>ipv4   ipv6   mac</b> | Enter the keyword <code>ipv4</code> or <code>mac</code> to identify the access list type to resequence. |
| <b>access-list-name</b>  | Enter the name of a configured IP access list.                                                          |
| <b>StartingSeqNum</b>    | Enter the starting sequence number to resequence. The range is from 0 to 4294967290.                    |
| <b>Step-to-Increment</b> | Enter the step to increment the sequence number. The range is from 1 to 4294967290.                     |

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                        |
| 9.10(0.0)  | Introduced on the S3148.                                                                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                      |
| 9.0.2.0    | Introduced on the S6000.                                                                                         |
| 8.3.19.0   | Introduced on the S4820T.                                                                                        |
| 8.3.11.1   | Introduced on the Z9000.                                                                                         |
| 8.3.7.0    | Introduced on the S4810.                                                                                         |
| 8.2.1.0    | Introduced on the E-Series (IPv6).                                                                               |
| 8.1.1.0    | Introduced on the E-Series (IPv4).                                                                               |
| 7.8.1.0    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| 7.6.1.0    | Introduced on the S-Series.                                                                                      |
| 7.5.1.0    | Introduced on the C-Series.                                                                                      |
| 7.4.1.0    | Introduced on the E-Series.                                                                                      |

**Usage Information** When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing access-list.

## seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

**Syntax** `seq sequence-number {deny | permit} {source [mask] | any | host ip-address}} [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]`

To delete a filter, use the `no seq sequence-number` command.

|                   |                        |                                                                                                                                                                                                                                                                                                                                 |
|-------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>sequence-number</b> | Enter a number from 0 to 4294967290.                                                                                                                                                                                                                                                                                            |
|                   | <b>deny</b>            | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.                                                                                                                                                                                                                               |
|                   | <b>permit</b>          | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.                                                                                                                                                                                                                           |
|                   | <b>source</b>          | Enter an IP address in dotted decimal format of the network from which the packet was received.                                                                                                                                                                                                                                 |
|                   | <b>mask</b>            | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                      |
|                   | <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                        |
|                   | <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.                                                                                                                                                                                                                               |
|                   | <b>count</b>           | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                          |
|                   | <b>bytes</b>           | (OPTIONAL) Enter the keyword <code>bytes</code> to count bytes the filter processes.                                                                                                                                                                                                                                            |
|                   | <b>log</b>             | (OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.                                                                                                                                                                                                                                                  |
|                   | <b>dscp</b>            | (OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values. The range is from 0 to 63.                                                                                                                                                                                                                       |
|                   | <b>ecn</b>             | (OPTIONAL) Enter the keyword <code>ecn</code> to match to the ECN values. The range is from 0 to 3.                                                                                                                                                                                                                             |
|                   | <b>order</b>           | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255). |
|                   | <b>monitor</b>         | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                        |

 **NOTE:** For more information, see “Flow-based Monitoring” in the Port Monitoring section of the *Dell EMC Networking OS Configuration Guide*.

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <b>fragments</b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments. |
| <b>no-drop</b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.      |

**Defaults** Not configured

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| 9.12(0.0) | Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| 9.11(0.0) | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.    |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                           |

| Version           | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                             |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                          |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                      |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                          |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                          |
| <b>9.8(0.0)</b>   | Added the no-drop parameter.                                                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                             |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                             |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                             |
| <b>8.3.1.0</b>    | Add the DSCP value for ACL matching.                                                 |
| <b>8.2.1.0</b>    | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                      |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                          |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                          |
| <b>7.4.1.0</b>    | Added support for the non-contiguous mask and added the <code>monitor</code> option. |
| <b>6.5.10</b>     | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.  |

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

#### Related Commands

- [deny](#) — configure a filter to drop packets.
- [permit](#) — configure a filter to forward packets.

## Extended IP ACL Commands

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet's protocol type.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

## deny

Configure a filter that drops IP packets meeting the filter criteria.

### Syntax

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address}  
{destination mask | any | host ip-address} [ttl operator] [count [byte] |  
log] [dscp value] [order] [monitor] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                 | Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list denies all IP protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ip-protocol-number</b> | Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>source</b>             | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>mask</b>               | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>any</b>                | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>host ip-address</b>    | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>destination</b>        | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ttl</b>                | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>operator</b>           | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul> |
| <b>count</b>              | (OPTIONAL) Enter the keyword <code>count</code> to count packets that the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>byte</b>               | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes that the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>log</b>                | (OPTIONAL, E-Series only) Enter the keyword <code>log</code> to enter ACL matches in the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dscp</b>               | (OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>order</b>              | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>monitor</b>            | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>fragments</b>          | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>no-drop</b>            | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Version    | Description                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0)  | Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| 9.11(0.0)  | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                               |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                                      |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                       |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                    |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                                |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                    |
| 9.8(0.0)   | Added the <code>no-drop</code> parameter.                                                                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                                    |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                                       |
| 9.0.2.0    | Introduced on the S6000.                                                                                                       |
| 8.3.19.0   | Introduced on the S4820T.                                                                                                      |
| 8.3.11.1   | Introduced on the Z9000.                                                                                                       |
| 8.3.7.0    | Introduced on the S4810.                                                                                                       |
| 8.3.1.0    | Add the DSCP value for ACL matching.                                                                                           |
| 8.2.1.0    | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                |
| 8.1.1.0    | Introduced on the E-Series.                                                                                                    |
| 7.6.1.0    | Introduced on the S-Series.                                                                                                    |
| 7.5.1.0    | Introduced on the C-Series.                                                                                                    |
| 7.4.1.0    | Added support for the noncontiguous mask and added the <code>monitor</code> option.                                            |
| 6.5.1.0    | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.                                            |

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the *Dell EMC Networking OS Configuration Guide*.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- [deny tcp](#) — assign a filter to deny TCP packets.
- [deny udp](#) — assign a filter to deny UDP packets.
- [ip access-list extended](#) — create an extended ACL.

## deny icmp

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```
deny icmp {source mask | any | host ip-address} {destination mask | any  
| host ip-address} [type] [ttl operator] [dscp] [count [byte] [order]  
[fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                        |                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets were sent.                                                                   |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous. |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                        |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                           |
| <b>destination</b>     | Enter the IP address of the network or host to which the packets are sent.                                                                      |
| <b>type</b>            | Enter the ICMP packet type. The following types are available:                                                                                  |

For IPv4:

```
echo count  
echo-reply count  
host-unreachable count  
host-unknown count  
network-unknown count  
net-unreachable count  
packet-too-big count  
parameter-problem count  
port-unreachable count  
source-quench count  
time-exceeded count
```

For IPv6:

```
echo count  
echo-reply count  
nd-ns count  
nd-na count  
packet-too-big count  
parameter-problem count  
time-exceeded count  
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>      | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                |
| <b>operator</b> | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li></ul> |

- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

|                  |                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dscp</b>      | Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                                 |
| <b>count</b>     | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                 |
| <b>byte</b>      | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                    |
| <b>order</b>     | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).        |
| <b>fragments</b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                         |
| <b>monitor</b>   | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> . |
| <b>no-drop</b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                              |

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.          |
| <b>9.11(2.0P0)</b> | Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.11(0.0)</b>   | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                                        |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                               |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                                                |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                                                                                                             |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                         |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                             |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                             |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                             |
| <b>9.8(0.0)</b>    | Added the <code>no-drop</code> parameter.                                                                                               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                             |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                                                |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                                                |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                                               |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                                                |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                                                |
| <b>8.3.1.0</b>     | Added the keyword <code>dscp</code> .                                                                                                   |
| <b>8.2.1.0</b>     | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                         |

| Version | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| 8.1.1.0 | Introduced on the E-Series.                                                         |
| 7.4.1.0 | Added support for non-contiguous mask and added the <code>monitor</code> option.    |
| 6.5.1.0 | Expanded to include the optional QoS <code>order</code> priority for the ACL entry. |

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

## deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

#### Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [bit]
[operator port [port]] [count [bytes] [order] [fragments] [monitor] [no-
drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ttl</b>             | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>operator</b>        | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b>dscp</b>            | Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>bit</b>             | Enter a flag or combination of bits: <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> <li>• <code>established</code>: datagram of established TCP session</li> </ul>                                                                                                                                                                                                                                                                                                |

Use the `established` flag to match only ACK and RST flags of established TCP session.

You cannot use `established` along with the other control flags

While using the `established` flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, `established` is masked and other control flags are available.

|                    |                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>operator</b>    | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li> </ul> |
| <b>port port</b>   | Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>                                                  |
| <b>destination</b> | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                |
| <b>mask</b>        | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                           |
| <b>count</b>       | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                    |
| <b>byte</b>        | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                       |
| <b>order</b>       | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                        |
| <b>fragments</b>   | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                         |
| <b>monitor</b>     | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .                                                 |
| <b>no-drop</b>     | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                              |

| Version            | Description                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| <b>9.11(2.0P0)</b> | Added the <code>established</code> parameter on the on the S6000, S6000-ON, S6100-ON, Z9100-ON.                                |
| <b>9.11(0.0)</b>   | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                               |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                      |

| Version           | Description                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                        |
| <b>9.8(0.0)</b>   | Added the no-drop parameter.                                                                                                       |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                        |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                           |
| <b>8.3.1.0</b>    | Added the keyword <code>dscp</code> .                                                                                              |
| <b>8.2.1.0</b>    | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                    |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                                        |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                        |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                        |
| <b>7.4.1.0</b>    | Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> . |
| <b>6.5.1.0</b>    | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.                                                |

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

| Rule#             | Data             | Mask             | From | To   | #Covered |
|-------------------|------------------|------------------|------|------|----------|
| 1                 | 0000111110100000 | 1111111111100000 | 4000 | 4031 | 32       |
| 2                 | 0000111111000000 | 1111111111000000 | 4032 | 4095 | 64       |
| 3                 | 0001000000000000 | 1111100000000000 | 4096 | 6143 | 2048     |
| 4                 | 0001100000000000 | 1111110000000000 | 6144 | 7167 | 1024     |
| 5                 | 0001110000000000 | 1111111000000000 | 7168 | 7679 | 512      |
| 6                 | 0001111000000000 | 1111111100000000 | 7680 | 7935 | 256      |
| 7                 | 0001111100000000 | 1111111110000000 | 7936 | 7999 | 64       |
| 8                 | 0001111101000000 | 1111111111111111 | 8000 | 8000 | 1        |
| Total Ports: 4001 |                  |                  |      |      |          |

## Example

An ACL rule with a TCP port 1023 uses only one entry in the CAM.

| Rule#             | Data             | Mask             | From | To   | #Covered |
|-------------------|------------------|------------------|------|------|----------|
| 1                 | 0000000000000000 | 1111110000000000 | 0    | 1023 | 1024     |
| Total Ports: 1024 |                  |                  |      |      |          |

## Related Commands

- [deny](#) — assign a filter to deny IP traffic.
- [deny udp](#) — assign a filter to deny UDP traffic.

# deny udp

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

## Syntax

```
deny udp {source mask | any | host ip-address} [operator port [port]]  
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator  
port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ttl</b>             | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>operator</b>        | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul> |
| <b>dscp</b>            | Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>operator</b>        | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li></ul>                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>port port</b>       | Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>destination</b>     | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                  |                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mask</b>      | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                           |
| <b>count</b>     | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                 |
| <b>byte</b>      | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                    |
| <b>order</b>     | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).        |
| <b>fragments</b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                         |
| <b>monitor</b>   | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> . |
| <b>no-drop</b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                              |

**Defaults** Not configured.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>t1l</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.     |
| <b>9.11(0.0)</b>  | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                                   |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                        |
| <b>9.8(0.0)</b>   | Added the <code>no-drop</code> parameter.                                                                                          |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                        |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                           |
| <b>8.3.1.0</b>    | Added the keyword <code>dscp</code> .                                                                                              |
| <b>8.2.1.0</b>    | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                    |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                                        |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                        |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                        |
| <b>7.4.1.0</b>    | Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> . |

## Version Description

**6.5.1.0** Expanded to include the optional QoS `order` priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt` or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

| Rule# | Data             | Mask             | From | To   | #Covered |
|-------|------------------|------------------|------|------|----------|
| 1     | 0000111110100000 | 1111111111100000 | 4000 | 4031 | 32       |
| 2     | 0000111111000000 | 1111111111100000 | 4032 | 4095 | 64       |
| 3     | 0001000000000000 | 1111100000000000 | 4096 | 6143 | 2048     |
| 4     | 0001100000000000 | 1111110000000000 | 6144 | 7167 | 1024     |
| 5     | 0001110000000000 | 1111111000000000 | 7168 | 7679 | 512      |
| 6     | 0001111000000000 | 1111111100000000 | 7680 | 7935 | 256      |
| 7     | 0001111100000000 | 1111111110000000 | 7936 | 7999 | 64       |
| 8     | 0001111101000000 | 1111111111111111 | 8000 | 8000 | 1        |

Total Ports: 4001

### Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

| Rule# | Data             | Mask             | From | To   | #Covered |
|-------|------------------|------------------|------|------|----------|
| 1     | 0000000000000000 | 1111110000000000 | 0    | 1023 | 1024     |

Total Ports: 1024

### Related Commands

- [deny](#) — assign a filter to deny IP traffic.
- [deny tcp](#) — assign a filter to deny TCP traffic.

## ip access-list extended

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

### Syntax

```
ip access-list extended access-list-name
```

To delete an access list, use the `no ip access-list extended access-list-name` command.

### Parameters

***access-list-name*** Enter a string up to 140 characters long as the access list name.

### Defaults

All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                         |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                  |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                      |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                         |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                         |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                         |
| <b>8.3.10.0</b>   | Introduced on the S4810.                                                                                         |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                      |
| <b>7.8.1.0</b>    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                      |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                      |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                                                                      |

### Example

```
DellEMC(conf)# ip access-list extended TESTListEXTEND
DellEMC(config-ext-nacl)#
```

### Related Commands

- [ip access-list standard](#) — configure a standard IP access list.
- [show config](#) — display the current configuration.

## permit

To pass IP packets meeting the filter criteria, configure a filter.

### Syntax

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [count [bytes]] [dscp value] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                        |                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address in dotted decimal format of the network from which the packet was sent.                                                               |
| <b>mask</b>            | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous. |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                   |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.                                                          |
| <b>destination</b>     | Enter the IP address of the network or host to which the packets are sent.                                                                                 |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>       | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>operator</b>  | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b>count</b>     | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>bytes</b>     | (OPTIONAL) Enter the keyword <code>bytes</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>dscp</b>      | (OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>order</b>     | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>fragments</b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>monitor</b>   | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>no-drop</b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Version           | Description                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| <b>9.11(0.0)</b>  | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                               |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                      |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                       |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                    |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                    |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                    |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                    |
| <b>9.8(0.0)</b>   | Added the <code>no-drop</code> parameter.                                                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                       |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                       |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                      |

| Version         | Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                             |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                             |
| <b>8.3.1.0</b>  | Add the DSCP value for ACL matching.                                                 |
| <b>8.2.1.0</b>  | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                      |
| <b>8.1.1.0</b>  | Introduced on the E-Series.                                                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                          |
| <b>7.4.1.0</b>  | Added support for the non-contiguous mask and added the <code>monitor</code> option. |
| <b>6.5.10</b>   | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.  |

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

#### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit tcp](#) — assign a permit filter for TCP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## permit icmp

Configure a filter to allow all or specific ICMP messages.

#### Syntax

```
permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [type] [dscp] [message-type] [count [byte] | log] [order] [monitor] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

|                        |                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets were sent.                                                                  |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous. |
| <b>any</b>             | Enter the keyword <code>any</code> to match and drop specific Ethernet traffic on the interface.                                               |
| <b>host ip-address</b> | Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.                                                |
| <b>destination</b>     | Enter the IP address of the network or host to which the packets are sent.                                                                     |
| <b>type</b>            | Enter the ICMP packet type. The following types are available:<br>For IPv4:                                                                    |

```
echo count
echo-reply count
host-unreachable count
host-unknown count
network-unknown count
net-unreachable count
packet-too-big count
```

```
parameter-problem count
port-unreachable count
source-quench count
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dscp</b>         | Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is 0 to 63.                                                                                                                                                                                                                                                                                                                                                   |
| <b>message-type</b> | (OPTIONAL) Enter an ICMP message type, either with the type (and code, if necessary) numbers or with the name of the message type. The range is 0 to 255 for ICMP type and 0 to 255 for ICMP code.                                                                                                                                                                                                                                                    |
| <b>count</b>        | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                                                                                |
| <b>byte</b>         | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>log</b>          | (OPTIONAL, E-Series only) Enter the keyword <code>log</code> to have the information kept in an ACL log file.                                                                                                                                                                                                                                                                                                                                         |
| <b>order</b>        | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                                                                                         |
| <b>monitor</b>      | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.<br> <b>NOTE:</b> For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the <i>FTOS Configuration Guide</i> . |
| <b>fragments</b>    | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>no-drop</b>      | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                                                                                          |

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

| Command History | Version          | Description                                                                                                                             |
|-----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>9.11(2.0)</b> | Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
|                 | <b>9.8(1.0)</b>  | Introduced on the Z9100-ON..                                                                                                            |
|                 | <b>9.8(0.0)</b>  | Added the no-drop parameter.                                                                                                            |
|                 | <b>9.2(1.0)</b>  | Introduced on the Z9500.                                                                                                                |
|                 | <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                                                               |
|                 | <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                                                                |
|                 | <b>8.3.7.0</b>   | Introduced on the S4810.                                                                                                                |
|                 | <b>8.3.1.0</b>   | Added the keyword <code>dscp</code> .                                                                                                   |
|                 | <b>8.2.1.0</b>   | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                         |

| Version | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| 8.1.1.0 | Introduced on the E-Series ExaScale.                                                |
| 7.4.1.0 | Added support for noncontiguous mask and added the <code>monitor</code> option.     |
| 6.5.10  | Expanded to include the optional QoS <code>order</code> priority for the ACL entry. |

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *FTOS Configuration Guide*.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

 **NOTE:** When ACL logging and byte counters are configured simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## permit tcp

To pass TCP packets meeting the filter criteria, configure a filter.

#### Syntax

```
permit tcp {source mask | any | host ip-address} [bit] [operator port
[port]] {destination mask | any | host ip-address} [bit] [ttl operator]
[dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor]
[no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>host ip-address</b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>bit</b>             | <p>Enter a flag or combination of bits:</p> <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> <li>• <code>established</code>: datagram of established TCP session</li> </ul> <p>Use the <code>established</code> flag to match only ACK and RST flags of established TCP session.</p> <p>You cannot use <code>established</code> along with the other control flags</p> <p>While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.</p> |
| <b>ttl</b>             | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>operator</i></b>        | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b><code>dscp</code></b>      | Enter the keyword <code>dscp</code> to permit a packet based on the DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>operator</i></b>        | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>port port</i></b>       | Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>destination</i></b>     | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>mask</i></b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><code>count</code></b>     | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><code>byte</code></b>      | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><code>order</code></b>     | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><code>fragments</code></b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><code>monitor</code></b>   | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><code>no-drop</code></b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Defaults** Not configured.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                                                             |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b> | Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |

| Version            | Description                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.11(2.0P0)</b> | Added the <code>established</code> parameter on the S6000, S6000-ON, S6100-ON, Z9100-ON.                                           |
| <b>9.11(0.0)</b>   | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                                   |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                          |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                                           |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                                                                                                        |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                    |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                        |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                        |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                        |
| <b>9.8(0.0)</b>    | Added the no-drop parameter.                                                                                                       |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                        |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                                           |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                                           |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                                          |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                                           |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                                           |
| <b>8.3.1.0</b>     | Added the keyword <code>dscp</code> .                                                                                              |
| <b>8.2.1.0</b>     | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                    |
| <b>8.1.1.0</b>     | Introduced on the E-Series.                                                                                                        |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                                        |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                                                        |
| <b>7.4.1.0</b>     | Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> . |
| <b>6.5.10</b>      | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.                                                |

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

| DellEMC# | Data             | Mask             | From | To   | #Covered |
|----------|------------------|------------------|------|------|----------|
| 1        | 0000111110100000 | 1111111111100000 | 4000 | 4031 | 32       |
| 2        | 0000111111000000 | 1111111111100000 | 4032 | 4095 | 64       |
| 3        | 0001000000000000 | 1111100000000000 | 4096 | 6143 | 2048     |
| 4        | 0001100000000000 | 1111110000000000 | 6144 | 7167 | 1024     |

```

5 00011110000000000 11111110000000000 7168 7679 512
6 00011110000000000 11111111000000000 7680 7935 256
7 00011111000000000 11111111100000000 7936 7999 64
8 00011111010000000 11111111111111111 8000 8000 1

Total Ports: 4001

```

### Example

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

```

DellEMC# Data          Mask          From To    #Covered
1 00000000000000000 11111100000000000 0      1023 1024

Total Ports: 1024

```

### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## permit udp

To pass UDP packets meeting the filter criteria, configure a filter.

### Syntax

```

permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]

```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>          | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>mask</b>            | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>host ip-address</b> | Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ttl</b>             | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>operator</b>        | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b>dscp</b>            | Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>operator</b>        | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- `gt` = greater than
- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the `port` parameter)

|                           |                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>port port</i></b>   | Enter the application layer port number. Enter two port numbers if you are using the <code>range</code> logical operand. The range is 0 to 65535.                                                                                                                                                                                    |
| <b><i>destination</i></b> | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                           |
| <b><i>count</i></b>       | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                            |
| <b><i>byte</i></b>        | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                               |
| <b><i>order</i></b>       | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).   |
| <b><i>fragments</i></b>   | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                    |
| <b><i>monitor</i></b>     | (OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> . |
| <b><i>no-drop</i></b>     | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                         |

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                                                                             |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>tcl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter. |
| <b>9.11(0.0)</b>  | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                               |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                      |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                       |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                    |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                    |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                    |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                    |
| <b>9.8(0.0)</b>   | Added the <code>no-drop</code> parameter.                                                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                       |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                      |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                       |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                       |
| <b>8.3.1.0</b>    | Added the keyword <code>dscp</code> .                                                                                          |
| <b>8.2.1.0</b>    | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                                    |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                    |

| Version | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| 7.5.1.0 | Introduced on the C-Series.                                                         |
| 7.4.1.0 | Added support for non-contiguous mask and added the <code>monitor</code> option. .  |
| 6.5.10  | Expanded to include the optional QoS <code>order</code> priority for the ACL entry. |

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```
DellEMC# Data          Mask          From To    #Covered
1 0000111110100000 1111111111100000 4000 4031 32
2 0000111111000000 1111111111100000 4032 4095 64
3 0001000000000000 1111100000000000 4096 6143 2048
4 0001100000000000 1111110000000000 6144 7167 1024
5 0001110000000000 1111111000000000 7168 7679 512
6 0001111000000000 1111111100000000 7680 7935 256
7 0001111100000000 1111111110000000 7936 7999 64
8 0001111101000000 1111111111111111 8000 8000 1

Total Ports: 4001
```

## Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

```
DellEMC# Data          Mask          From To    #Covered
1 0000000000000000 1111110000000000 0     1023 1024

Total Ports: 1024
```

## Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit tcp](#) — assign a permit filter for TCP packets.

# resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

## Syntax

```
resequence access-list {ipv4 | mac} {access-list-name StartingSeqNum Step-to-Increment}
```

## Parameters

- ipv4 | mac** Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.
- access-list-name** Enter the name of a configured IP access list, up to 140 characters.
- StartingSeqNum** Enter the starting sequence number to resequence. The range is from 0 to 4294967290.

|                          |                                                                                                                                                               |                                                                                                                  |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
|                          | <b>Step-to-Increment</b>                                                                                                                                      | Enter the step to increment the sequence number. The range is from 1 to 4294967290.                              |
| <b>Defaults</b>          | None                                                                                                                                                          |                                                                                                                  |

| <b>Usage Information</b> | When all sequence numbers are exhausted, this feature permits re-assigning a new sequence number to entries of an existing access-list.                       |                                                                                                                  |

## seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

|                   |                                                                                                                                                                                                                                                                                                                                   |                                                                                                       |

|                   | <b>permit</b>                                                                                                                                                                                                                                                                                                                     | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria. |
|                   | <b>ip-protocol-number</b>                                                                                                                                                                                                                                                                                                         | Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.    |

|                        |                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp</b>            | Enter the keyword <code>icmp</code> to configure an ICMP access list filter.                                                                                                                                                                                                                                                                                                     |
| <b>ip</b>              | Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.                                                                                                                                                                                                                    |
| <b>tcp</b>             | Enter the keyword <code>tcp</code> to configure a TCP access list filter.                                                                                                                                                                                                                                                                                                        |
| <b>udp</b>             | Enter the keyword <code>udp</code> to configure a UDP access list filter.                                                                                                                                                                                                                                                                                                        |
| <b>source</b>          | Enter an IP address in dotted decimal format of the network from which the packet was received.                                                                                                                                                                                                                                                                                  |
| <b>mask</b>            | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.                                                                                                                                                                                                                       |
| <b>any</b>             | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                         |
| <b>host ip-address</b> | Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address or hostname.                                                                                                                                                                                                                                                                      |
| <b>operator</b>        | (OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter.)</li> </ul> |
| <b>portnumber</b>      | (OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP-DATA and FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>         |
| <b>portname</b>        | (OPTIONAL) Enter the logical name of the protocol.<br><br>The following logical names are supported in TCP:                                                                                                                                                                                                                                                                      |

|                             |                                       |
|-----------------------------|---------------------------------------|
| <code>bgp</code>            | Border Gateway Protocol (179)         |
| <code>chargen</code>        | Character generator (19)              |
| <code>cmd</code>            | Remote commands (rcmd, 514)           |
| <code>daytime</code>        | Daytime (13)                          |

| xdmcp         | X Display Manager Control Protocol (177)                         |

***destination***

Enter the IP address of the network or host to which the packets are sent.

***ttl***

Enter the keyword `ttl` to permit or deny a packet based on the time to live value. The range is from 1 to 255.

***operator***

Enter one of the following logical operand:

- `eq`(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- `range`(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

***count***

(OPTIONAL) Enter the keyword `count` to count the packets.

***bytes***

(OPTIONAL) Enter the keyword `bytes` to count the bytes.

***log***

(OPTIONAL) Enter the keyword `log` to enter ACL matches in the log.

***dscp***

(OPTIONAL) Enter the keyword `dscp` to match to the IP DSCP values. The range is from 0 to 63.

***ecn***

(OPTIONAL) Enter the keyword `ecn` to match to the ECN values. The range is from 0 to 3.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>order</b>     | (OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).                                                                                                                                                                     |
| <b>monitor</b>   | (OPTIONAL) Enter the keyword <code>monitor</code> then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.<br> <b>NOTE:</b> For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> . |
| <b>fragments</b> | Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>no-drop</b>   | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Introduced the <code>ttl</code> parameter.                                                                                                            |
| <b>9.11(2.0P0)</b> | Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.11(0.0)</b>   | Added support for <code>session-ID</code> to the <code>monitor</code> parameter.                                                                      |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                                             |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                                                              |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                                                                                                                           |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                                       |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                                           |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                                           |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                                           |
| <b>9.8(0.0)</b>    | Added the <code>no-drop</code> parameter.                                                                                                             |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                                           |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                                                              |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                                                              |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                                                             |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                                                              |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                                                              |
| <b>8.3.1.0</b>     | Add the DSCP value for ACL matching.                                                                                                                  |
| <b>8.2.1.0</b>     | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.                                                                                       |
| <b>8.1.1.0</b>     | Introduced on the E-Series.                                                                                                                           |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                                                           |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                                                                           |
| <b>7.4.1.0</b>     | Added support for the non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .                |
| <b>6.5.10</b>      | Expanded to include the optional QoS <code>order</code> priority for the ACL entry.                                                                   |

## Usage Information

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

If you configure the `sequence-number`, the `sequence-number` is used as a tie breaker for rules with the same order.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

# Extended IPv6 ACL Commands

The following commands configure extended IPv6 ACLs.

## deny

Configure a filter that drops IPv6 packets that match the filter criteria.

### Syntax

```
deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

### Parameters

|                                  |                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------|
| <b><i>ip-protocol-number</i></b> | Enter an IPv6 protocol number. The range is 0 to 255.                                    |
| <b>icmp</b>                      | Enter the keyword <code>icmp</code> to deny Internet Control Message Protocol version 6. |
| <b>ipv6</b>                      | Enter the keyword <code>ipv6</code> to deny any Internet Protocol version 6.             |
| <b>tcp</b>                       | Enter the keyword <code>tcp</code> to deny the Transmission Control protocol.            |
| <b>udp</b>                       | Enter the keyword <code>udp</code> to deny the User Datagram Protocol.                   |

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                 |
|------------------|-----------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100-ON. |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON. |

|                |                                                                             |
|----------------|-----------------------------------------------------------------------------|
| <b>9.0.2.0</b> | Introduced on the S6000.                                                    |
| <b>8.4.2.1</b> | Introduced on the S-Series.                                                 |
| <b>8.2.1.0</b> | Introduced on the E-Series TeraScale.                                       |
| <b>7.8.1.0</b> | Introduced on the C-Series.                                                 |
| <b>7.4.1.0</b> | Introduced on the E-Series TeraScale Added the <code>monitor</code> option. |

## deny icmp

Configure a filter to drop all or specific ICMP messages.

### Syntax

```
deny icmp {source address mask | any | host ipv6-address} {destination
address | any | host ipv6-address} [message-type] [count [byte]] | [log]
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

|                            |                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address</b>      | Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero. |
| <b>mask</b>                | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                     |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                         |
| <b>host ipv6-address</b>   | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the x:x:x:x:x format. The :: notation specifies successive hexadecimal fields of zero.                                                                           |
| <b>destination address</b> | Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.    |
| <b>count</b>               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                        |
| <b>byte</b>                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                           |

| <b>9.10(0.0)</b> | Introduced on the S6100–ON.                                                 |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                 |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                    |
| <b>8.4.2.1</b>   | Introduced on the S-Series.                                                 |
| <b>8.2.1.0</b>   | Introduced on the E-Series TeraScale.                                       |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                 |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale Added the <code>monitor</code> option. |

## deny tcp

Configure a filter that drops TCP packets that match the filter criteria.

### Syntax

```
deny tcp {source address mask | any | host ipv6-address} [operator port  
[port]] {destination address | any | host ipv6-address} [bit] [operator  
port [port]] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address</b>      | Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                              |
| <b>mask</b>                | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                    |
| <b>host ipv6-address</b>   | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the x:x:x:x format. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                                        |
| <b>operator</b>            | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port command parameter).</li></ul>           |
| <b>port port</b>           | Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"><li>• 23 = Telnet</li><li>• 20 and 21 = FTP</li><li>• 25 = SMTP</li><li>• 169 = SNMP</li></ul>                                                              |
| <b>destination address</b> | Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                 |
| <b>bit</b>                 | Enter a flag or combination of bits: <ul style="list-style-type: none"><li>• <code>ack</code>: acknowledgement field</li><li>• <code>fin</code>: finish (no more data from the user)</li><li>• <code>psh</code>: push function</li><li>• <code>rst</code>: reset the connection</li><li>• <code>syn</code>: synchronize sequence numbers</li><li>• <code>urg</code>: urgent field</li></ul> |
| <b>count</b>               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                                   |
| <b>byte</b>                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                                      |

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                 |
|------------------|-----------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON.                                                 |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                 |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                    |
| <b>8.4.2.1</b>   | Introduced on the S-Series.                                                 |
| <b>8.2.1.0</b>   | Introduced on the E-Series TeraScale.                                       |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                 |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale Added the <code>monitor</code> option. |

### Usage Information

The C-Series cannot count both packets and bytes, so when you enter the `count` `byte` options, only bytes are incremented.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (`gt`, `lt`, `range`) may require more than one entry. The range of ports is configured in the CAM based on bitmask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000 - 8000 uses eight entries in the CAM:

| Rule#             | Data              | Mask              | From | To   | #Covered |
|-------------------|-------------------|-------------------|------|------|----------|
| 1                 | 00001111110100000 | 11111111111100000 | 4000 | 4031 | 32       |
| 2                 | 00001111111000000 | 11111111111100000 | 4032 | 4095 | 64       |
| 3                 | 00010000000000000 | 11111000000000000 | 4096 | 6143 | 2048     |
| 4                 | 00011000000000000 | 11111100000000000 | 6144 | 7167 | 1024     |
| 5                 | 00011100000000000 | 11111110000000000 | 7168 | 7679 | 512      |
| 6                 | 00011110000000000 | 11111111000000000 | 7680 | 7935 | 256      |
| 7                 | 00011111000000000 | 11111111110000000 | 7936 | 7999 | 64       |
| 8                 | 00011111101000000 | 11111111111111111 | 8000 | 8000 | 1        |
| Total Ports: 4001 |                   |                   |      |      |          |

### Example

An ACL rule with TCP port `lt 1023` takes only one entry in the CAM:

| Rule#             | Data              | Mask              | From | To   | #Covered |
|-------------------|-------------------|-------------------|------|------|----------|
| 1                 | 00000000000000000 | 11111100000000000 | 0    | 1023 | 1024     |
| Total Ports: 1024 |                   |                   |      |      |          |

### Related Commands

[deny](#) – assigns a filter to deny IP traffic.

[deny udp](#) – assigns a filter to deny UDP traffic.

## deny udp

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

### Syntax

```
deny udp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [operator port
[port]] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

## Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address</b>      | Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x::x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                   |
| <b>mask</b>                | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                      |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                          |
| <b>host ipv6-address</b>   | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the x:x:x::x format. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                             |
| <b>operator</b>            | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port command parameter).</li></ul> |
| <b>port port</b>           | Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is 0 to 65535.                                                                                                                                                                                                                                                      |
| <b>destination address</b> | Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x::x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                      |
| <b>count</b>               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                         |
| <b>byte</b>                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                            |

**Defaults** Not configured.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON.                                                  |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                  |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                     |
| <b>8.4.2.1</b>   | Introduced on the S-Series.                                                  |
| <b>8.2.1.0</b>   | Introduced on the E-Series TeraScale.                                        |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                  |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale. Added the <code>monitor</code> option. |

## Usage Information

The C-Series cannot count both packets and bytes, so when you enter the `count byte` options, only bytes are incremented.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (`gt`, `lt`, `range`) may require more than one entry. The range of ports is configured in the CAM based on bitmask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000 - 8000 uses eight entries in the CAM:

| Rule# | Data              | Mask              | From | To   | #Covered |
|-------|-------------------|-------------------|------|------|----------|
| 1     | 00001111110100000 | 11111111111100000 | 4000 | 4031 | 32       |
| 2     | 00001111111000000 | 11111111111100000 | 4032 | 4095 | 64       |
| 3     | 00010000000000000 | 11111000000000000 | 4096 | 6143 | 2048     |
| 4     | 00011000000000000 | 11111000000000000 | 6144 | 7167 | 1024     |
| 5     | 00011100000000000 | 11111110000000000 | 7168 | 7679 | 512      |
| 6     | 00011110000000000 | 11111111000000000 | 7680 | 7935 | 256      |

```

7  00011111100000000 1111111111000000 7936 7999 64
8  00011111101000000 1111111111111111 8000 8000 1

Total Ports: 4001

```

### Example

An ACL rule with TCP port lt 1023 takes only one entry in the CAM:

```

Rule#      Data          Mask          From  To      #Covered
1  00000000000000000 11111100000000000 0      1023    1024

Total Ports: 1024

```

### Related Commands

[deny](#) – assigns a filter to deny IP traffic.  
[deny tcp](#) – assigns a deny filter for TCP traffic.

## ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

### Syntax

```
ipv6 access-list access-list-name cpu-qos
```

To delete an access list, use the `no ipv6 access-list access-list-name` command.

### Parameters

|                                |                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------|
| <b><i>access-list-name</i></b> | Enter the access list name as a string, up to 140 characters.                                          |
| <b><i>cpu-qos</i></b>          | Enter the keyword <code>cpu-qos</code> to assign this ACL to control plane traffic only (CoPP).        |
| <b><i>permit</i></b>           | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition. |
| <b><i>deny</i></b>             | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.      |
| <b><i>ospfv3</i></b>           | Specify that this ACL is for OSPFv3 control plane traffic                                              |

### Defaults

All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                         |
| <b>9.4(0.0)</b>   | Added support for CoPP for OSPFv3 on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                            |
| <b>9.0.2.0</b>    | Introduced on the S6000                                                             |

| Version         | Description                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                                            |
| <b>8.4.2.1</b>  | Introduced on the S-Series.                                                                                                                         |
| <b>8.2.1.0</b>  | Introduced on the E-Series.                                                                                                                         |
| <b>7.8.1.0</b>  | Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long. |
| <b>7.4.1.0</b>  | Introduced on the E-Series.                                                                                                                         |

#### Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specification on entries allowed per ACL, refer to your line card documentation. You can create an IPv6 ACL for control-plane traffic policing for OSPFv3, in addition to the CoPP support for VRRP, BGP, and ICMP.

## permit

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

#### Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

#### Parameters

|                                  |                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------|
| <b><i>ip-protocol-number</i></b> | Enter an IPv6 protocol number. The range is from 0 to 255.                                 |
| <b>icmp</b>                      | Enter the keyword <code>icmp</code> to filter internet Control Message Protocol version 6. |
| <b>ipv6</b>                      | Enter the keyword <code>ipv6</code> to filter any internet Protocol version 6.             |
| <b>tcp</b>                       | Enter the keyword <code>tcp</code> to filter the Transmission Control protocol.            |
| <b>udp</b>                       | Enter the keyword <code>udp</code> to filter the User Datagram Protocol.                   |

#### Defaults

Not configured.

#### Command Modes

ACCESS-LIST

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.0 | Introduced on the S4810. |

## permit tcp

Configure a filter to pass TCP packets that match the filter criteria.

### Syntax

```
permit tcp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [bit] [operator
port [port]] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address</b>      | Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                   |
| <b>mask</b>                | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                       |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                                           |
| <b>host ipv6-address</b>   | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the x:x:x:x:x format. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                                             |
| <b>operator</b>            | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two port for the port parameter.)</li> </ul>                     |
| <b>port port</b>           | Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>                                                                |
| <b>destination address</b> | Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                      |
| <b>bit</b>                 | Enter a flag or combination of bits: <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> </ul> |
| <b>count</b>               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                                          |
| <b>byte</b>                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                                             |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not configured.                                                                                                                                               |
| <b>Command Modes</b>   | ACCESS-LIST                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version          | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON.                                                  |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                  |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                     |
| <b>8.4.2.1</b>   | Introduced on the S-Series.                                                  |
| <b>8.2.1.0</b>   | Introduced on the E-Series ExaScale.                                         |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                  |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale. Added the <code>monitor</code> option. |

|                          |                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators ( <code>gt</code> , <code>lt</code> , <code>range</code> ) may require more than one entry. The range of ports is configured in the CAM based on bitmask boundaries; the space required depends on exactly what ports are included in the range. |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| <b>Example</b> | An ACL rule with a TCP port range 4000 - 8000 uses eight entries in the CAM: |
|----------------|------------------------------------------------------------------------------|

| Rule#             | Data             | Mask             | From | To   | #Covered |
|-------------------|------------------|------------------|------|------|----------|
| 1                 | 0000111110100000 | 1111111111100000 | 4000 | 4031 | 32       |
| 2                 | 0000111111000000 | 1111111111100000 | 4032 | 4095 | 64       |
| 3                 | 0001000000000000 | 1111100000000000 | 4096 | 6143 | 2048     |
| 4                 | 0001100000000000 | 1111100000000000 | 6144 | 7167 | 1024     |
| 5                 | 0001110000000000 | 1111110000000000 | 7168 | 7679 | 512      |
| 6                 | 0001111000000000 | 1111111000000000 | 7680 | 7935 | 256      |
| 7                 | 0001111100000000 | 1111111110000000 | 7936 | 7999 | 64       |
| 8                 | 0001111101000000 | 1111111111111111 | 8000 | 8000 | 1        |
| Total Ports: 4001 |                  |                  |      |      |          |

|                |                                                                                   |
|----------------|-----------------------------------------------------------------------------------|
| <b>Example</b> | An ACL rule with a TCP port <code>lt 1023</code> takes only one entry in the CAM: |
|----------------|-----------------------------------------------------------------------------------|

| Rule#             | Data             | Mask             | From | To   | #Covered |
|-------------------|------------------|------------------|------|------|----------|
| 1                 | 0000000000000000 | 1111110000000000 | 0    | 1023 | 1024     |
| Total Ports: 1024 |                  |                  |      |      |          |

|                         |                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">permit</a> – assigns a permit filter for IP packets.<br><a href="#">permit udp</a> – assigns a permit filter for UDP packets. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

## permit udp

Configure a filter to pass UDP packets meeting the filter criteria.

|               |                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>permit udp {source address mask   any   host ipv6-address} [operator port [port]] {destination address   any   host ipv6-address} [operator port [port]] [count [byte]]   [log] [monitor]</code> |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.

- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

## Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address</b>      | Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                 |
| <b>mask</b>                | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                   |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                       |
| <b>host ipv6-address</b>   | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the x:x:x:x format. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                           |
| <b>operator</b>            | (OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two port for the port parameter.)</li> </ul> |
| <b>port port</b>           | (OPTIONAL) Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is 0 to 65535.                                                                                                                                                                                                                                        |
| <b>destination address</b> | Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128. The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                    |
| <b>count</b>               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                      |
| <b>byte</b>                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                         |

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON.                                                  |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                  |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                     |
| <b>8.4.2.1</b>   | Introduced on the S-Series.                                                  |
| <b>8.2.1.0</b>   | Introduced on the E-Series ExaScale.                                         |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                  |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale. Added the <code>monitor</code> option. |

**Usage Information** Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (`gt`, `lt`, `range`) may require more than one entry. The range of ports is configured in the CAM based on bitmask boundaries; the space required depends on exactly what ports are included in the range.

**Example** An ACL rule with a TCP port range 4000 - 8000 uses eight entries in the CAM:

| Rule# | Data             | Mask             | From | To   | #Covered |
|-------|------------------|------------------|------|------|----------|
| 1     | 0000111110100000 | 1111111111100000 | 4000 | 4031 | 32       |
| 2     | 0000111111000000 | 1111111111100000 | 4032 | 4095 | 64       |
| 3     | 0001000000000000 | 1111100000000000 | 4096 | 6143 | 2048     |
| 4     | 0001100000000000 | 1111110000000000 | 6144 | 7167 | 1024     |
| 5     | 0001110000000000 | 1111111000000000 | 7168 | 7679 | 512      |
| 6     | 0001111000000000 | 1111111100000000 | 7680 | 7935 | 256      |

```

7 00011111100000000 1111111111000000 7936 7999 64
8 0001111101000000 111111111111111 8000 8000 1

Total Ports: 4001

```

### Example

An ACL rule with a TCP port 1 to 1023 takes only one entry in the CAM:

```

Rule#  Data          Mask          From  To #Covered
1  0000000000000000 1111110000000000 0    1023 1024

Total Ports: 1024

```

### Related Commands

[permit](#) – assigns a permit filter for IP packets.  
[permit tcp](#) – assigns a permit filter for TCP packets.

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

### S-Series

#### Syntax

```
resequence access-list {ipv4 | ipv6 | mac} {access-list-name StartingSeqNum Step-to-Increment}
```

#### Parameters

- ipv4 | ipv6 | mac** Enter the keyword `ipv4`, `ipv6` or `mac` to identify the access list type to resequence.
- access-list-name** Enter the name of a configured IP access list, up to 140 characters. Increased name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long.
- StartingSeqNum** Enter the starting sequence number to resequence. The range is 0 to 4294967290.
- Step-to-Increment** Enter the step to increment the sequence number. The range is 1 to 4294967290.

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.           |
| <b>9.0.2.0</b>   | Introduced on the S6000.              |
| <b>8.4.2.0</b>   | Introduced on the S-Series.           |
| <b>8.2.1.0</b>   | Introduced on the E-Series ExaScale.  |
| <b>7.8.1.0</b>   | Introduced on the C-Series.           |
| <b>7.4.1.0</b>   | Introduced on the E-Series TeraScale. |

#### Usage Information

When all sequence numbers have been exhausted, this feature permits re-assigning new sequence number to entries of an existing access-list.

## seq

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp  
| udp} {source address mask | any | host ipv6-address} {destination address  
| any | host ipv6-address} [operator port [port]] [count [byte]] | [log]  
[monitor]
```

To delete a filter, use the `no seq sequence-number` command.

### Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sequence-number</i></b>      | Enter a number from 0 to 4294967290.                                                                                                                                                                                                                                                                                                                                       |
| <b>deny</b>                        | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.                                                                                                                                                                                                                                                                          |
| <b>permit</b>                      | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.                                                                                                                                                                                                                                                                      |
| <b><i>ipv6-protocol-number</i></b> | Enter an IPv6 protocol number. The range is 0 to 255.                                                                                                                                                                                                                                                                                                                      |
| <b>icmp</b>                        | Enter the keyword <code>icmp</code> to configure an Internet Control Message Protocol version 6 filter.                                                                                                                                                                                                                                                                    |
| <b>ipv6</b>                        | Enter the keyword <code>ipv6</code> to configure any Internet Protocol version 6 filter.                                                                                                                                                                                                                                                                                   |
| <b>tcp</b>                         | Enter the keyword <code>tcp</code> to configure a Transmission Control protocol filter.                                                                                                                                                                                                                                                                                    |
| <b>udp</b>                         | Enter the keyword <code>udp</code> to configure a User Datagram Protocol filter.                                                                                                                                                                                                                                                                                           |
| <b><i>source address</i></b>       | Enter the IPv6 address of the network or host from which the packets were sent in the <code>x:x:x:x::x</code> format followed by the prefix length in the <code>/x</code> format. The range is <code>/0</code> to <code>/128</code> . The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                        |
| <b><i>mask</i></b>                 | Enter a network mask in <code>/prefix</code> format ( <code>/x</code> ).                                                                                                                                                                                                                                                                                                   |
| <b>any</b>                         | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                   |
| <b>host <i>ipv6-address</i></b>    | Enter the keyword <code>host</code> followed by the IPv6 address of the host in the <code>x:x:x:x::x</code> format. The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                                                          |
| <b>operator</b>                    | (OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter.)</li></ul> |
| <b><i>port port</i></b>            | (OPTIONAL) Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"><li>• 23 = Telnet</li><li>• 20 and 21 = FTP</li><li>• 25 = SMTP</li><li>• 169 = SNMP</li></ul>                                  |
| <b><i>destination address</i></b>  | Enter the IPv6 address of the network or host to which the packets are sent in the <code>x:x:x:x::x</code> format followed by the prefix length in the <code>/x</code> format. The range is <code>/0</code> to <code>/128</code> . The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                           |

|                         |                                                                                                                                                               |                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <b><i>message-type</i></b>                                                                                                                                    | (OPTIONAL) Enter an ICMP message type, either with the type (and code, if necessary) numbers or with the name of the message type . The range is 0 to 255 for ICMP type and 0 to 255 for ICMP code. |
|                         | <b>count</b>                                                                                                                                                  | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                           |
|                         | <b>byte</b>                                                                                                                                                   | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                              |

## Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

### clear counters mac access-group

Clear counters for all or a specific MAC ACL.

|                        |                                                                                                                                                               |                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear counters mac access-group [mac-list-name]</code>                                                                                                  |                                                            |
| <b>Parameters</b>      | <b><i>mac-list-name</i></b>                                                                                                                                   | (OPTIONAL) Enter the name of a configured MAC access list. |

| 8.1.1.0    | Introduced on the E-Series. |
| 7.6.1.0    | Introduced on the S-Series. |
| 7.5.1.0    | Introduced on the C-Series. |
| 6.1.1.0    | Introduced on the E-Series. |

## mac access-group

Apply a MAC ACL to traffic entering or exiting an interface. You can apply a MAC ACL on a physical, port-channel, or VLAN interface.

**Syntax** `mac access-group access-list-name {in [vlan vlan-range] | optimized | out}`  
 To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

**Parameters**

**access-list-name** Enter the name of a configured MAC access list, up to 140 characters.  
***NOTE:*** This option is available only with the keyword `in` option.

**vlan vlan-range** (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).  
***NOTE:*** This option is available only with the keyword `in` option.

**optimized** Enter the keyword `optimized` to enable ACL optimization.

**in** Enter the keyword `in` to configure the ACL to filter incoming traffic.

**out** Enter the keyword `out` to configure the ACL to filter outgoing traffic.

- NOTE:**
1. If the MAC ACL is applied on VLAN, none of the VLAN members should have an access list applied for that VLAN.
  2. If the MAC ACL is applied on a Physical or Port Channel interface, the VLAN in which this port is associated should not have an access list applied.
  3. If the MAC ACL is applied on a VLAN, then that VLAN should not belong to VLAN ACL group.
  4. If the MAC ACL is applied on a VLAN ACL group, then none of the VLANs in that group should have an access list applied on it.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                 |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                     |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                     |

#### Usage Information

You can assign one ingress ACL and one egress ACL (standard or extended) to an interface.

#### Related Commands

- [mac access-list standard](#) — configure a standard MAC ACL.
- [mac access-list extended](#) — configure an extended MAC ACL.

## show mac access-lists

Display all of the Layer 2 ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

#### Syntax

```
show mac access-list {in | out | interface interface {in | out} | access-list-name {in | out | interface interface {in | out}}}
```

#### Parameters

- access-list-name*** Enter the name of a configured MAC ACL, up to 140 characters.
- interface***  
***interface*** Enter the keyword *interface* then the one of the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword *TenGigabitEthernet* then the stack/slot/port/subport information.
  - For a 25-Gigabit Ethernet interface, enter the keyword *twentyFiveGigE* then the stack/slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword *fortyGigE* then the stack/slot/port[/subport] information.
  - For a 50-Gigabit Ethernet interface, enter the keyword *fiftyGigE* then the stack/slot/port/subport information.
  - For a 100-Gigabit Ethernet interface, enter the keyword *hundredGigE* then the stack/slot/port information.
  - For a VLAN interface, enter the keyword *vlan* then a number from 1 to 4094.

- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

**in | out** Identify whether ACL is applied on ingress or egress side.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## show mac accounting access-list

Display MAC access list configurations and counters (if configured).

**Syntax** `show mac accounting access-list [access-list-name [cam_count | interface interface {in | out}]`

**Parameters**

**access-list-name** Enter the name of a configured MAC ACL, up to 140 characters.

**interface interface** Enter the keyword `interface` then the one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the stack/slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the stack/slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the stack/slot/port[/subport] information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the stack/slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the stack/slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**in | out** Identify whether ACL is applied on ingress or egress side.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                        |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on the E-Series.                                                        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>    | Introduced on the C-Series                                                                                      |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                     |

**Usage Information**

The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

**Example**

```
DellEMC#show mac accounting access-list
Ingress Extended mac access-list acl1 on hundredGigE 1/1
Total cam count 1
  seq 5 permit host 00:00:00:00:00:aa host 00:00:00:00:00:bb
Egress Extended mac access-list acl1 on hundredGigE 1/32
Total cam count 1
  seq 5 permit host 00:00:00:00:00:aa host 00:00:00:00:00:bb
DellEMC#
```

## Standard MAC ACL Commands

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

## deny

To drop packets with a the MAC address specified, configure a filter.

**Syntax** `deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

**Parameters**

|                                       |                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                            | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                 |
| <b><i>mac-source-address</i></b>      | Enter a MAC address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                                                                                                         |
| <b><i>mac-source-address-mask</i></b> | (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).                                                                                                                                                          |
| <b>count</b>                          | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                |
| <b>byte</b>                           | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                   |
| <b>log</b>                            | (OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.                                                                                                                                                                                                                                                                         |
| <b>monitor</b>                        | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see the "Flow-based Monitoring" in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> . |

**Defaults** Not enabled.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Added the <code>monitor</code> option.    |

## Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

- `permit` — configures a MAC address filter to pass packets.
- `seq` — configures a MAC address filter with a specified sequence number.

# mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

## Syntax

```
mac access-list standard mac-list-name
```

To delete a MAC access list, use the `no mac access-list standard mac-list-name` command.

## Parameters

***mac-list-name*** Enter a text string as the name of the standard MAC access list (140 character maximum).

## Defaults

Not configured.

## Command Modes

CONFIGURATION

## Command History

| 9.8(2.0)   | Introduced on the S3100 series.                                                                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                        |
| 9.0.2.0    | Introduced on the S6000.                                                                                        |
| 8.3.19.0   | Introduced on the S4820T.                                                                                       |
| 8.3.11.1   | Introduced on the Z9000.                                                                                        |
| 8.3.7.0    | Introduced on the S4810.                                                                                        |
| 8.1.1.0    | Introduced on the E-Series.                                                                                     |
| 7.8.1.0    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| 7.6.1.0    | Introduced on the S-Series.                                                                                     |
| 7.5.1.0    | Introduced on the C-Series.                                                                                     |
| 6.1.1.0    | Introduced on the E-Series.                                                                                     |

## Usage Information

Dell EMC Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, see your line card documentation.

 **NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

### Example

```
DellEMC(conf)# mac-access-list access-list standard TestMAC
DellEMC(config-std-macl)# permit 00:00:00:00:00:00 00:00:00:00:ff:ff
count
DellEMC(config-std-macl)# deny any count
DellEMC(config-std-macl)#
```

## permit

To forward packets from a specific source MAC address, configure a filter.

**Syntax** `permit {any | mac-source-address [mac-source-address-mask]} [count [byte]]  
| [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

### Parameters

|                                              |                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                                   | Enter the keyword <code>any</code> to forward all packets received with a MAC address.                                                                                                                                                                                                                                                               |
| <b><i>mac-source-address</i></b>             | Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                                        |
| <b><i>mac-source-address-mask</i></b>        | (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).                                                                                                                                         |
| <b>count</b>                                 | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                            |
| <b>byte</b>                                  | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                               |
| <b>log</b>                                   | (OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.                                                                                                                                                                                                                                                                    |
| <b><i>threshold-in-msgs</i> <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                    |
| <b><i>interval minutes</i></b>               | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                                          |
| <b>monitor</b>                               | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> . |

### Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging inst"ad.

### Related Commands

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

## seq

To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

### Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]]
[log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                     | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                                                                                                                                                                                                          |
| <b>mac-source-address</b>      | Enter a MAC address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                                                                                  |
| <b>mac-source-address-mask</b> | (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).                                                                                                                                   |
| <b>count</b>                   | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                         |
| <b>byte</b>                    | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                            |
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.                                                                                                                                                                                                                                                 |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                       |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>monitor</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> . |
| <b>Defaults</b>          | Not configured                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                      |

|                          | <b>6.1.1.0</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                          |
| <b>Usage Information</b> | <p>When you use the <code>log</code> option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.</p> <p> <b>NOTE:</b> When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.</p> |                                                                                                                                                                                                                                                                                                                                                      |

## Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

## deny

To drop packets that match the filter criteria, configure a filter.

### Syntax

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype-operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

### Parameters

|                                            |                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                                 | Enter the keyword <code>any</code> to drop all packets.                                                                                                                                                                                                                                                                                              |
| <b>host <i>mac-address</i></b>             | Enter the keyword <code>host</code> and then enter a MAC address to drop packets with that host address.                                                                                                                                                                                                                                             |
| <b><i>mac-source-address</i></b>           | Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                                        |
| <b><i>mac-source-address-mask</i></b>      | Specify which bits in the MAC address must match.<br><br>The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.                                                                             |
| <b><i>mac-destination-address</i></b>      | Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                 |
| <b><i>mac-destination-address-mask</i></b> | Specify which bits in the MAC address must match.<br><br>The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.                                                                             |
| <b><i>ethertype-operator</i></b>           | (OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"><li>• <code>ev2</code> - is the Ethernet II frame format</li><li>• <code>llc</code> - is the IEEE 802.3 frame format</li><li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format</li></ul>                               |
| <b>count</b>                               | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                            |
| <b>byte</b>                                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                               |
| <b>log</b>                                 | (OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.                                                                                                                                                                                                                                                                    |
| <b>threshold-in-msgs <i>count</i></b>      | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                    |
| <b>interval <i>minutes</i></b>             | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                                          |
| <b>monitor</b>                             | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> . |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Added the <code>monitor</code> option.    |
| 6.1.1.0    | Introduced on the E-Series.               |

## Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

- [permit](#) — configure a MAC address filter to pass packets.
- [seq](#) — configure a MAC address filter with a specified sequence number.

# mac access-list extended

Name a new or existing extended MAC access control list (extended MAC ACL).

## Syntax

```
mac access-list extended access-list-name [cpu-qos]
```

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.

## Parameters

- |                                |                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>access-list-name</i></b> | Enter a text string as the MAC access list name, up to 140 characters.                           |
| <b><i>cpu-qos</i></b>          | Enter the keywords <code>cpu-qos</code> to assign this ACL to control plane traffic only (CoPP). |

## Defaults

None

| Version           | Description                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                         |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                  |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                      |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                         |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                         |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                         |
| <b>8.3.10.0</b>   | Introduced on the S4810.                                                                                         |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                      |
| <b>7.8.1.0</b>    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                      |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                      |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                      |

#### Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

#### Example

```
DelleMC(conf)# mac-access-list access-list extended TestMATExt
DelleMC(config-ext-macl)# remark 5 IPv4
DelleMC(config-ext-macl)# seq 10 permit any any ev2 eq 800 count bytes
DelleMC(config-ext-macl)# remark 15 ARP
DelleMC(config-ext-macl)# seq 20 permit any any ev2 eq 806 count bytes
DelleMC(config-ext-macl)# remark 25 IPv6
DelleMC(config-ext-macl)# seq 30 permit any any ev2 eq 86dd count bytes
DelleMC(config-ext-macl)# seq 40 permit any any count bytes
DelleMC(config-ext-macl)# exit
DelleMC(conf)# do show mac accounting access-list snickers interface
tengig 1/1/1/1 in
Extended mac access-list snickers on TenGigabitEthernet 1/1/1/1
seq 10 permit any any ev2 eq 800 count bytes (559851886 packets
191402152148
bytes)
seq 20 permit any any ev2 eq 806 count bytes (74481486 packets 5031686754
bytes)
seq 30 permit any any ev2 eq 86dd count bytes (7751519 packets 797843521
bytes)
```

#### Related Commands

- [mac access-list standard](#) — configure a standard MAC access list.
- [show mac accounting access-list](#) — display MAC access list configurations and counters (if configured).

# permit

To pass packets matching the criteria specified, configure a filter.

## Syntax

```
permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype operator] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | mac-destination-address mac-destination-address-mask}` command.

## Parameters

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                                 | Enter the keyword <code>any</code> to forward all packets.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>host</b>                                | Enter the keyword <code>host</code> then a MAC address to forward packets with that host address.                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>mac-source-address</i></b>           | Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>mac-source-address-mask</i></b>      | (OPTIONAL) Specify which bits in the MAC address must match.<br><br>The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.                                                                                                                                                                          |
| <b><i>mac-destination-address</i></b>      | Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>mac-destination-address-mask</i></b> | Specify which bits in the MAC address must be matched.<br><br>The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.                                                                                                                                                                                |
| <b><i>ethertype operator</i></b>           | (OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"><li>• <code>ev2</code> - is the Ethernet II frame format</li><li>• <code>11c</code> - is the IEEE 802.3 frame format</li><li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format</li></ul>                                                                                                                                       |
| <b>count</b>                               | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>byte</b>                                | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>log</b>                                 | (OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>monitor</b>                             | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.<br><br> <b>NOTE:</b> For more information, see Flow-based Monitoring in the “Port Monitoring” section of the <i>Dell EMC Networking OS Configuration Guide</i> . |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### Version

### Description

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

| Version           | Description                            |
|-------------------|----------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.            |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.               |
| <b>8.3.19.0</b>   | Introduced on the S4820T.              |
| <b>8.3.11.1</b>   | Introduced on the Z9000.               |
| <b>8.3.7.0</b>    | Introduced on the S4810.               |
| <b>8.1.1.0</b>    | Introduced on the E-Series.            |
| <b>7.6.1.0</b>    | Introduced on the S-Series.            |
| <b>7.5.1.0</b>    | Introduced on the C-Series.            |
| <b>7.4.1.0</b>    | Added the <code>monitor</code> option. |
| <b>6.1.1.0</b>    | Introduced on the E-Series.            |

#### Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

#### Related Commands

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

## IP Prefix List Commands

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. To configure or enable IP prefix lists, use these commands.

### clear ip prefix-list

Reset the number of times traffic meets the conditions ("hit" counters) of the configured prefix lists.

**Syntax** `clear ip prefix-list [prefix-name]`

**Parameters** *prefix-name* (OPTIONAL) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.

**Defaults** Clears "hit" counters for all prefix lists unless a prefix list is specified.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                     |

| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                 |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>    | Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                     |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                                                                     |

#### Related Commands

- [ip prefix-list](#) — configure a prefix list.

## deny

To drop packets meeting the criteria specified, configure a filter.

**Syntax** `deny ip-prefix [ge min-prefix-length] [le max-prefix-length]`  
 To delete a drop filter, use the `no deny ip-prefix` command.

**Parameters**

|                                    |                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-prefix</i></b>            | Specify an IP prefix in the network/length format. For example, 35.0.0.0/ 8 means match the first 8 bits of address 35.0.0.0. |
| <b><i>ge min-prefix-length</i></b> | (OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32. |
| <b><i>le max-prefix-length</i></b> | (OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32. |

**Defaults** Not configured.

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.3.7.0</b>    | Introduced on the S4810.        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.     |
| <b>7.6.1.0</b>    | Introduced on the S-Series.     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.     |
| <b>6.1.1.0</b>    | Introduced on the E-Series.     |

#### Usage Information

Sequence numbers for this filter are automatically assigned starting at sequence number 5.  
If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

## ip prefix-list

Enter the PREFIX-LIST mode and configure a prefix list.

#### Syntax

```
ip prefix-list prefix-name
```

To delete a prefix list, use the `no ip prefix-list prefix-name` command.

#### Parameters

***prefix-name*** Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

**Command Modes** CONFIGURATION

| Version  | Description                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                                                                                        |
| 8.3.7.0  | Introduced on the S4810.                                                                                        |
| 8.1.1.0  | Introduced on the E-Series.                                                                                     |
| 7.8.1.0  | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| 7.6.1.0  | Introduced on the S-Series.                                                                                     |
| 7.5.1.0  | Introduced on the C-Series.                                                                                     |
| 6.2.1.1  | Introduced on the E-Series.                                                                                     |

#### Usage Information

Prefix lists redistribute OSPF and RIP routes meeting specific criteria.

#### Related Commands

- [show ip route list](#) — display IP routes in an IP prefix list.
- [show ip prefix-list summary](#) — display a summary of the configured prefix lists.

## seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

#### Syntax

```
seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]
```

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`.

#### Parameters

|                             |                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>sequence-number</b>      | Enter a number. The range is from 1 to 4294967294.                                                                                      |
| <b>deny</b>                 | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition..                                      |
| <b>permit</b>               | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition.                                  |
| <b>any</b>                  | (OPTIONAL) Enter the keyword <code>any</code> to match any packets.                                                                     |
| <b>ip-prefix /nn</b>        | (OPTIONAL) Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0. |
| <b>ge min-prefix-length</b> | (OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.           |
| <b>le max-prefix-length</b> | (OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.           |
| <b>bitmask number</b>       | Enter the keyword <code>bitmask</code> then enter a bit mask number in dotted decimal format.                                           |

#### Defaults

Not configured.

#### Command Modes

PREFIX-LIST

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version           | Description                             |
|-------------------|-----------------------------------------|
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.         |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.             |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.             |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.             |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.             |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                |
| <b>9.0.2.0</b>    | Introduced on the S6000.                |
| <b>8.3.19.0</b>   | Introduced on the S4820T.               |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                |
| <b>8.3.7.0</b>    | Introduced on the S4810.                |
| <b>8.1.1.0</b>    | Introduced on the E-Series.             |
| <b>7.6.1.0</b>    | Introduced on the S-Series.             |
| <b>7.5.1.0</b>    | Introduced on the C-Series.             |
| <b>6.3.1.0</b>    | Added the <code>bit mask</code> option. |

#### Usage Information

If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

## show config

Display the current PREFIX-LIST configurations.

**Syntax** `show config`

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.1.1.0</b>    | Introduced on the E-Series.               |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.0 | Introduced on the E-Series. |

#### Example

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list snickers
DellEMC(conf-nprefix1)#
```

## show ip prefix-list detail

Display details of the configured prefix lists.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show ip prefix-list detail [ <i>prefix-name</i> ]                                                                                                             |
| <b>Parameters</b>      | <b><i>prefix-name</i></b> (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.                                                |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version    | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)  | Introduced on the S3148.                                                                                        |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                        |
| 9.0.2.0    | Introduced on the S6000.                                                                                        |
| 8.3.19.0   | Introduced on the S4820T.                                                                                       |
| 8.3.11.1   | Introduced on the Z9000.                                                                                        |
| 8.3.7.0    | Introduced on the S4810.                                                                                        |
| 8.1.1.0    | Introduced on the E-Series.                                                                                     |
| 7.8.1.0    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| 7.6.1.0    | Introduced on the S-Series.                                                                                     |
| 7.5.1.0    | Introduced on the C-Series.                                                                                     |
| 6.1.1.0    | Introduced on the E-Series.                                                                                     |

#### Example

```
DellEMC# show ip prefix-list detail
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
seq 5 permit 1.1.1.0/24 (hit count: 0)
```

```
seq 10 deny 2.1.0.0/16 ge 23 (hit count: 0)
seq 25 permit 192.0.0.0 bitmask 192.0.0.0 (hit count: 800)
DellEMC#
```

## show ip prefix-list summary

Display a summary of the configured prefix lists.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show ip prefix-list summary [prefix-name]</code>                                                                                                        |
| <b>Parameters</b>      | <b>prefix-name</b> (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.                                                       |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                 |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                        |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>    | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                     |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                     |

### Example

```
DellEMC# show ip prefix-list summary
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
DellEMC#
```

## Route Map Commands

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit.

To configure route maps and their redistribution criteria, use the following commands.

# continue

To a route-map entry with a higher sequence number, configure a route-map.

|                        |                                                                                                                                                               |                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>continue [sequence-number]</code>                                                                                                                       |                                                                               |
| <b>Parameters</b>      | <b><i>sequence-number</i></b>                                                                                                                                 | (OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535. |
| <b>Defaults</b>        | Not configured.                                                                                                                                               |                                                                               |

| Version    | Description                 |
|------------|-----------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON. |
| 9.8(1.0)   | Introduced on the Z9100-ON. |
| 9.8(0.0P5) | Introduced on the S4048-ON. |
| 9.8(0.0P2) | Introduced on the S3048-ON. |
| 9.7(0.0)   | Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.    |
| 9.0.2.0    | Introduced on the S6000.    |
| 8.3.19.0   | Introduced on the S4820T.   |
| 8.3.11.1   | Introduced on the Z9000.    |
| 8.3.7.0    | Introduced on the S4810.    |
| 8.1.1.0    | Introduced on the E-Series. |
| 7.6.1.0    | Introduced on the S-Series. |
| 7.5.1.0    | Introduced on the C-Series. |
| 7.4.1.0    | Introduced on the E-Series. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The <code>continue</code> feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the <code>continue</code> feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the <code>continue</code> feature executes only after a successful match occurs. If there are no successful matches, the <code>continue</code> feature is ignored. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The continue clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the continue clause.
- If the next route map entry contains a continue clause, the route map executes the continue clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

### Set Clause with Continue Clause

If the route-map entry contains sets with the continue clause, set actions are performed first then the continue clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same `set` command.
- If `set community additive` and `set as-path prepend` are configured, the communities and AS numbers are prepended.

#### Related Commands

- [set community](#) — specify a COMMUNITY attribute.
- [set as-path](#) — configure a filter to modify the AS path.

## description

Add a description to this route map.

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

**Parameters** ***description*** Enter a description to identify the route map (80 characters maximum).

**Defaults** None

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                 |

| <b>8.3.7.0</b>     | Introduced on the S4810.    |
| <b>8.1.1.0</b>     | Introduced on the E-Series. |
| <b>pre-7.7.1.0</b> | Introduced.                 |

#### Related Commands

- [route-map](#) — enable a route map.

## match as-path

To match routes that have a certain AS number in their BGP path, configure a filter.

**Syntax** `match as-path as-path-name`

To delete a match AS path filter, use the `no match as-path as-path-name` command.

**Parameters** ***as-path-name*** Enter the name of an established AS-PATH ACL, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                                                                                     |

| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)   | Introduced on the S3148.                                                                                        |
| 9.10(0.0)   | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)    | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                        |
| 9.0.2.0     | Introduced on the S6000.                                                                                        |
| 8.3.19.0    | Introduced on the S4820T.                                                                                       |
| 8.3.11.1    | Introduced on the Z9000.                                                                                        |
| 8.3.7.0     | Introduced on the S4810.                                                                                        |
| 8.1.1.0     | Introduced on the E-Series.                                                                                     |
| 7.8.1.0     | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                     |
| 7.5.1.0     | Introduced on the C-Series.                                                                                     |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                                     |

**Related Commands**

- [set as-path](#) — add information to the BGP AS\_PATH attribute.

## match community

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

**Syntax** `match community community-list-name [exact]`

To delete a community match filter, use the `no match community` command.

**Parameters**

|                            |                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>community-list-name</b> | Enter the name of a configured community list.                                                               |
| <b>exact</b>               | (OPTIONAL) Enter the keywords <code>exact</code> to process only those routes with this community list name. |

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| pre-6.1.1.0 | Introduced on the E-Series.     |

#### Related Commands

- [set community](#) — specify a COMMUNITY attribute.

## match interface

To match routes whose next hop is on the interface specified, configure a filter.

#### Syntax

```
match interface interface
```

To remove a match, use the `no match interface interface` command.

#### Parameters

##### ***interface***

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the stack/slot/port/subport information.
- For a 25-Gigabit Ethernet interface, enter the keyword `twentyFiveGigE` then the stack/slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the stack/slot/port[/subport] information.
- For a 50-Gigabit Ethernet interface, enter the keyword `fiftyGigE` then the stack/slot/port/subport information.
- For a 100-Gigabit Ethernet interface, enter the keyword `hundredGigE` then the stack/slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

#### Defaults

Not configured.

#### Command Modes

ROUTE-MAP

## match ip address

To match routes based on IP addresses specified in an access list, configure a filter.

**Syntax** `match ip address prefix-list-name`  
 To delete a match, use the `no match ip address prefix-list-name` command.

**Parameters** ***prefix-list-name*** Enter the name of configured prefix list, up to 140 characters.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |

| Version            | Description                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>9.8(1.0)</b>    | Introduced on the Z9100–ON.                                                                                     |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                     |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>    | Introduced on the S6000–ON.                                                                                     |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                        |
| <b>8.1.1.0</b>     | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>     | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                                     |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                                                     |

#### Related Commands

- [match interface](#) — redistribute routes that match the next-hop interface.

## match ip next-hop

To match based on the next-hop IP addresses specified in an IP access list or IP prefix list, configure a filter.

#### Syntax

```
match ip next-hop {prefix-list prefix-list-name}
```

To delete a match, use the `no match ip next-hop {prefix-list prefix-list-name}` command.

#### Parameters

**prefix-list *prefix-list-name*** Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

#### Defaults

Not configured.

#### Command Modes

## match ip route-source

To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

#### Syntax

```
match ip route-source {prefix-list prefix-list-name}
```

To delete a match, use the `no match ip route-source {prefix-list prefix-list-name}` command.

#### Parameters

**prefix-list *prefix-list-name*** Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

#### Defaults

Not configured.

## match metric

To match on a specified value, configure a filter.

#### Syntax

```
match metric metric-value
```

To delete a value, use the `no match metric [metric-value]` command.

#### Parameters

***metric-value*** Enter a value to match. The range is from zero (0) to 4294967295.

#### Defaults

Not configured.

## match origin

To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

#### Syntax

```
match origin {egp | igp | incomplete}
```

To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

#### Parameters

|                   |                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------|
| <b>egp</b>        | Enter the keyword <code>egp</code> to match routes originating outside the AS.                 |
| <b>igp</b>        | Enter the keyword <code>igp</code> to match routes originating within the same AS.             |
| <b>incomplete</b> | Enter the keyword <code>incomplete</code> to match routes with incomplete routing information. |

#### Defaults

Not configured.

|-------------|-----------------------------|
| 8.1.1.0     | Introduced on the E-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

## match route-type

To match routes based on the how the route is defined, configure a filter.

**Syntax** `match route-type {external [type-1 | type-2] | internal | level-1 | level-2 | local}`

To delete a match, use the `no match route-type {local | internal | external [type-1 | type-2] | level-1 | level-2}` command.

|                   |                                  |                                                                                                                                                           |
|-------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>external [type-1  type-2]</b> | Enter the keyword <code>external</code> then either <code>type-1</code> or <code>type-2</code> to match only on OSPF Type 1 routes or OSPF Type 2 routes. |
|                   | <b>internal</b>                  | Enter the keyword <code>internal</code> to match only on routes generated within OSPF areas.                                                              |
|                   | <b>level-1</b>                   | Enter the keyword <code>level-1</code> to match IS-IS Level 1 routes.                                                                                     |
|                   | <b>level-2</b>                   | Enter the keyword <code>level-2</code> to match IS-IS Level 2 routes.                                                                                     |
|                   | <b>local</b>                     | Enter the keyword <code>local</code> to match only on routes generated within the switch.                                                                 |

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 8.1.1.0     | Introduced on the E-Series.               |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

**Related  
Commands**

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
- [match metric](#) — redistribute routes that match a specific metric.
- [match tag](#) — redistribute routes that match a specific tag.

## match tag

To redistribute only routes that match a specified tag value, configure a filter.

**Syntax**

```
match tag tag-value
```

To remove a match, use the `no match tag` command.

**Parameters****tag-value**

Enter a value as the tag on which to match. The range is from zero (0) to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command  
History**

- [match metric](#) — redistribute routes that match a specific metric.
- [match route-type](#) — redistribute routes that match a route type.

## route-map

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

|                          |                                                                                                                                                                                                                     |                                                                                                                                                                                                                              |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>route-map map-name [permit   deny] [sequence-number]</code><br>To delete a route map, use the <code>no route-map map-name [permit   deny] [sequence-number]</code> command.                                   |                                                                                                                                                                                                                              |
| <b>Parameters</b>        | <b>map-name</b>                                                                                                                                                                                                     | Enter a text string of up to 140 characters to name the route map for easy identification.                                                                                                                                   |
|                          | <b>permit</b>                                                                                                                                                                                                       | (OPTIONAL) Enter the keyword <code>permit</code> to set the route map default as permit. If you do not specify a keyword, the default is <code>permit</code> .                                                               |
|                          | <b>deny</b>                                                                                                                                                                                                         | (OPTIONAL) Enter the keyword <code>deny</code> to set the route map default as deny.                                                                                                                                         |
|                          | <b>sequence-number</b>                                                                                                                                                                                              | (OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535. |
| <b>Defaults</b>          | Not configured.<br>If you do not define a keyword ( <code>permit</code> or <code>deny</code> ) for the route map, the <code>permit</code> action is the default.                                                    |                                                                                                                                                                                                                              |

|                          | 7.5.1.0                                                                                                                                                                                                             | Introduced on the C-Series.                                                                                                                                                                                                  |
|                          | pre-6.1.1.0                                                                                                                                                                                                         | Introduced on the E-Series.                                                                                                                                                                                                  |
| <b>Usage Information</b> | Use caution when you delete route maps because if you do not specify a sequence number, all route maps with the same <code>map-name</code> are deleted when you use the <code>no route-map map-name</code> command. |                                                                                                                                                                                                                              |

Example

```
DellEMC(conf)# route-map dempsey
DellEMC(config-route-map)#
```

## set as-path

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

Syntax

```
set as-path prepend as-number [... as-number]
```

To remove an AS-Path setting, use the `no set as-path {prepend as-number | tag}` command.

Parameters

**prepend as-number** Enter the keyword `prepend` and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.

Defaults

Not configured.

Command Modes

ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 8.1.1.0     | Introduced on the E-Series.               |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

Usage Information

You can prepend up to eight AS numbers to a BGP route.

This command influences best path selection in BGP by inserting a tag or AS number into the AS\_PATH attribute.

Related Commands

- [match as-path](#) — redistribute routes that match an AS-PATH attribute.

## set automatic-tag

To automatically compute the tag value of the route, configure a filter.

**Syntax** `set automatic-tag`

To return to the default, enter `no set automatic-tag`.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

**Related Commands**

- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the metric type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set comm-list delete

To remove the specified community list from the BGP route's COMMUNITY attribute, configure a filter.

**Syntax** `set comm-list community-list-name delete`

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

**Parameters**

|                                   |                                                                        |
|-----------------------------------|------------------------------------------------------------------------|
| <b><i>community-list-name</i></b> | Enter the name of an established Community list, up to 140 characters. |
|-----------------------------------|------------------------------------------------------------------------|

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)   | Introduced on the S3148.                                                                                        |
| 9.10(0.0)   | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)    | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                     |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                        |
| 9.0.2.0     | Introduced on the S6000.                                                                                        |
| 8.3.19.0    | Introduced on the S4820T.                                                                                       |
| 8.3.11.1    | Introduced on the Z9000.                                                                                        |
| 8.3.7.0     | Introduced on the S4810.                                                                                        |
| 8.1.1.0     | Introduced on the E-Series.                                                                                     |
| 7.8.1.0     | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                     |
| 7.5.1.0     | Introduced on the C-Series.                                                                                     |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                                     |

## Usage Information

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

## Related Commands

- [match community](#) — redistribute routes that match the COMMUNITY attribute.
- [set community](#) — specify a COMMUNITY attribute.

# set community

Allows you to assign a BGP COMMUNITY attribute.

## Syntax

```
set community {community-number | local-as | no-advertise | no-export | none} [additive]
```

To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none}` command.

## Parameters

|                         |                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>community-number</b> | Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.                                                                                                                                     |
| <b>local-AS</b>         | Enter the keywords <code>local-as</code> to drop all routes with the COMMUNITY attribute of <code>NO_EXPORT_SUBCONFED</code> .<br><br>All routes with the <code>NO_EXPORT_SUBCONFED (0xFFFFF03)</code> community attribute must not be advertised to external BGP peers. |

|                     |                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>no-advertise</b> | Enter the keywords <code>no-advertise</code> to drop all routes containing the well-known community attribute of NO_ADVERTISE.<br><br>All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.          |
| <b>no-export</b>    | Enter the keywords <code>no-export</code> to drop all routes containing the well-known community attribute of NO_EXPORT.<br><br>All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary. |
| <b>none</b>         | Enter the keyword <code>none</code> to remove the community attribute from routes meeting the route map criteria.                                                                                                                                             |
| <b>additive</b>     | (OPTIONAL) Enter the keyword <code>additive</code> to add the communities to already existing communities.                                                                                                                                                    |

**Defaults** Not configured.

**Related Commands**

- [match community](#) — redistribute routes that match the COMMUNITY attribute.
- [show ip bgp community](#) — display BGP community groups.

## set level

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

**Syntax**

```
set level {backbone | level-1 | level-1-2 | level-2 | stub-area}
```

To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area}` command.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                  |

| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 8.1.1.0     | Introduced on the E-Series.               |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

**Usage Information** The `set local-preference` command changes the LOCAL\_PREF attribute for routes meeting the route map criteria. To change the LOCAL\_PREF for all routes, use the `bgp default local-preference` command.

**Related Commands**

- [bgp default local-preference](#) — change the default LOCAL\_PREF attribute for all routes.

## set metric

To assign a new metric to redistributed routes, configure a filter.

**Syntax** `set metric [+ | -] metric-value`  
To delete a setting, enter `no set metric`.

**Parameters**

|                            |                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------|
| <b>+</b>                   | (OPTIONAL) Enter + to add a metric-value to the redistributed routes.             |
| <b>-</b>                   | (OPTIONAL) Enter - to subtract a metric-value from the redistributed routes.      |
| <b><i>metric-value</i></b> | Enter a number as the new metric value. The range is from zero (0) to 4294967295. |

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                               |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |

| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>8.1.1.0</b>     | Introduced on the E-Series.               |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.               |

#### Related Commands

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric-type](#) — specify the route type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

**Syntax** `set metric-type {internal | external | type-1 | type-2}`  
 To delete a setting, use the `no set metric-type` command.

|                   |                 |                                                                                                                                                       |
|-------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>internal</b> | Enter the keyword <code>internal</code> to assign the Interior Gateway Protocol metric of the next hop as the route's BGP MULTI_EXIT_DES (MED) value. |
|                   | <b>external</b> | Enter the keyword <code>external</code> to assign the IS-IS external metric.                                                                          |
|                   | <b>type-1</b>   | Enter the keyword <code>type-1</code> to assign the OSPF Type 1 metric.                                                                               |
|                   | <b>type-2</b>   | Enter the keyword <code>type-2</code> to assign the OSPF Type 2 metric.                                                                               |

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                     |

#### Related Commands

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

## set next-hop

To specify an IP address as the next hop, configure a filter.

**Syntax** `set next-hop ip-address`  
 To delete the setting, use the `no set next-hop ip-address` command.

**Parameters** ***ip-address*** Specify an IP address in dotted decimal format.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |

| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

#### Usage Information

If you configure the `set next-hop` command, its configuration takes precedence over the `neighbor next-hop-self` command in the ROUTER BGP mode.

If you configure the `set next-hop` command with the interface's IP address (either Loopback or physical), the software declares the route unreachable.

#### Related Commands

- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.

## set origin

To manipulate the BGP ORIGIN attribute, configure a filter.

#### Syntax

```
set origin {igp | egp | incomplete}
```

To delete an ORIGIN attribute setting, use the `no set origin` command.

#### Parameters

|                   |                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------|
| <b>egp</b>        | Enter the keyword <code>egp</code> to set routes originating from outside the local AS.      |
| <b>igp</b>        | Enter the keyword <code>igp</code> to set routes originating within the same AS.             |
| <b>incomplete</b> | Enter the keyword <code>incomplete</code> to set routes with incomplete routing information. |

#### Defaults

Not configured.

#### Command Modes

ROUTE-MAP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

## set tag

To specify a tag for redistributed routes, configure a filter.

**Syntax** `set tag tag-value`

To delete a setting, use the `no set tag` command.

**Parameters** **tag-value** Enter a number as the tag. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.               |

**Related Commands**

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the route type assigned to redistributed routes.

# set weight

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

|                   |                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                   |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax            | <code>set weight weight</code><br>To delete a weight specification, use the <code>no set weight weight</code> command.                                               |                                                                                                                                                                                                                                                                                                                   |
| Parameters        | <b>weight</b>                                                                                                                                                        | Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is router-originated = <b>32768</b> and all other routes = <b>0</b> .<br><br>When there are multiple routes to the same destination, the routes with a higher weight are preferred. |
| Defaults          | router-originated = <b>32768</b> ; all other routes = <b>0</b>                                                                                                       |                                                                                                                                                                                                                                                                                                                   |

|                   | <b>pre-6.1.1.0</b>                                                                                                                                                   | Introduced on the E-Series.                                                                                                                                                                                                                                                                                       |
| Usage Information | If you do not use the <code>set weight</code> command, router-originated paths have a weight attribute of 32768 and all other paths have a weight attribute of zero. |                                                                                                                                                                                                                                                                                                                   |

# show config

Display the current route map configuration.

|               |                          |
|---------------|--------------------------|
| Syntax        | <code>show config</code> |
| Command Modes | ROUTE-MAP                |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 8.1.1.0     | Introduced on the E-Series.               |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

## Example

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list PL_OSPF_to_RIP
 seq 5 permit 1.1.1.0/24
 seq 10 deny 2.1.0.0/16 ge 23
 seq 25 permit 192.0.0.0 bitmask 192.0.0.0
DellEMC(conf-nprefix1)#
```

# show route-map

Display the current route map configurations.

**Syntax** `show route-map [map-name]`

**Parameters** **map-name** (OPTIONAL) Enter the name of a configured route map, up to 140 characters.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                     |
| <b>9.7(0.0)</b>    | Introduced on the S6000–ON.                                                                                     |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                        |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                        |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                       |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                        |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                        |
| <b>8.1.1.0</b>     | Introduced on the E-Series.                                                                                     |
| <b>7.8.1.0</b>     | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long. |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                     |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                                     |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                                                     |

#### Example

```
DellEMC# show route-map
route-map firpo, permit, sequence 10
  Match clauses:
  Set clauses:
    tag 34
DellEMC#
```

#### Related Commands

- [route-map](#) — configure a route map.

## deny (for Standard IP ACLs)

To drop packets with a certain IP address, configure a filter.

#### Syntax

```
deny {source | any | host {ip-address}}[count [byte]] [dscp value] [order]
[fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                    |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                               |
|------------|-------------------------------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S6100.                                                                  |
| 9.10(0.0)  | Introduced on the S3148.                                                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                                                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |
| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- [ip access-list standard](#) — configure a standard ACL.
- [permit](#) — configure a permit filter.

## deny (for Extended IP ACLs)

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax**

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address}
{destination mask | any | host ip-address} [ttl operator] [count
[byte]] [dscp value] [order] [monitor] [fragments] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ttl</b>                     | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
|                   | <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>ttl</code> parameter.                                                |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

- [deny tcp](#) — assign a filter to deny TCP packets.
- [deny udp](#) — assign a filter to deny UDP packets.
- [ip access-list extended](#) — create an extended ACL.

## seq (for Standard IPv4 ACLs)

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

#### Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address} [count [bytes]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

## deny tcp (for Extended IP ACLs)

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

#### Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [bit]
[operator port [port]] [count [byte]] [order] [fragments] [log [interval
minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>      | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>operator</b> | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |

|                                    |                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                         |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| Version           | Description                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>ttl</code> parameter.                                                    |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                     |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                      |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                               |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                   |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                   |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                   |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                   |
| <b>9.4(0.0)</b>   | Added the support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added the support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- `deny` — assign a filter to deny IP traffic.
- `deny udp` — assign a filter to deny UDP traffic.

# deny ether-type (for Extended MAC ACLs)

Configure an egress filter that drops specified types of Ethernet packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

## Syntax

```
deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any}` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                   |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny (for Standard MAC ACLs)

To drop packets with a the MAC address specified, configure a filter.

Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]]
[log [interval minutes] [threshold-in-msgs [count]]][monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

Parameters

|                            |                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log                        | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| threshold-in<br>msgs count | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| interval minutes           | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                        |
| monitor                    | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| 9.10(0.0)  | Introduced on the S6100.                                                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                                                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- `permit` — configure a MAC address filter to pass packets.
- `seq` — configure a MAC address filter with a specified sequence number.

# deny (for Extended MAC ACLs)

To drop packets that match the filter criteria, configure a filter.

## Syntax

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype-operator] [count [byte]][log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                    |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- `permit` — configure a MAC address filter to pass packets.
- `seq` — configure a MAC address filter with a specified sequence number.

## permit (for Standard IP ACLs)

To permit packets from a specific source IP address to leave the switch, configure a filter.

### Syntax

```
permit {source [mask] | any | host ip-address} [count [byte]] [dscp value]
[order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                       |

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- [deny](#) — assign a IP ACL filter to deny IP packets.
- [ip access-list standard](#) — create a standard ACL.

## permit arp (for Extended MAC ACLs)

Configure a filter that forwards ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics; refer to your line card documentation for specifications.

**Syntax**

```
permit arp {destination-mac-address mac-address-mask | any} vlan vlan-id  
{ip-address | any | opcode code-number} [count [byte]] [order] [fragments]  
[log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `{destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

|                   |                                    |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
|                   | <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
|                   | <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

|                 |                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b> | By default, 10 ACL logs are generated if you do not specify the threshold explicitly.                                    |
|                 | The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled. |

|                          | If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                          | You can activate flow-based monitoring for a monitoring session by entering the <code>flow-based enable</code> command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG). |

# permit ether-type (for Extended MAC ACLs)

Configure a filter that allows traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**Syntax**

```
permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any}` command.

**Parameters**

|                                |                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                         |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                               |
|------------|-------------------------------------------------------------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by

monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit icmp (for Extended IP ACLs)

Configure a filter to allow all or specific ICMP messages.

**Syntax** `permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ttl</b>                     | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
|                   | <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                   | <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                |
|------------------|--------------------------------------------|
| <b>9.12(0.0)</b> | Introduced the <code>ttl</code> parameter. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.  |

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048–ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048–ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit udp (for Extended IP ACLs)

To pass UDP packets meeting the filter criteria, configure a filter.

### Syntax

```
permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte]] [order] [fragments] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>      | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>operator</b> | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> </ul> |

- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

|                                |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>tul</code> parameter.                                                |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3.0.0</b>    | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing

packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit tcp](#) — assign a permit filter for TCP packets.

## permit (for Extended IP ACLs)

To pass IP packets meeting the filter criteria, configure a filter.

#### Syntax

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [ttl operator] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>                     | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul> |
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| Version          | Description                                |
|------------------|--------------------------------------------|
| <b>9.12(0.0)</b> | Introduced the <code>ttl</code> parameter. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.  |

| Version           | Description                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                      |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                               |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                                                                   |
| <b>9.8(0.0P5)</b> | Introduced on the S4048–ON.                                                                   |
| <b>9.8(0.0P2)</b> | Introduced on the S3048–ON.                                                                   |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.                                                                   |
| <b>9.4(0.0)</b>   | Added the support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added the support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit tcp](#) — assign a permit filter for TCP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## permit (for Standard MAC ACLs)

To forward packets from a specific source MAC address, configure a filter.

### Syntax

```
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]]
| [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

### Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |

|                                |                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interval <i>minutes</i></b> | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                               |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100.                                                                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [deny](#) — configure a MAC ACL filter to drop packets.
- [seq](#) —configure a MAC ACL filter with a specified sequence number.

# seq (for Standard MAC ACLs)

To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

**Syntax** `seq sequence-number {deny | permit} {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, use the `no seq sequence-number` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
|                   | <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
|                   | <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can

be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [deny](#) — configure a filter to drop packets.
- [permit](#) — configure a filter to forward packets.

# permit tcp (for Extended IP ACLs)

To pass TCP packets meeting the filter criteria, configure a filter.

## Syntax

```
permit tcp {source mask | any | host ip-address} [bit] [operator port
[port]] {destination mask | any | host ip-address} [bit] [ttl operator]
[dscp] [operator port [port]] [count [byte]] [order] [fragments] [log
[interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>                     | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>threshold-in msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>ttl</code> parameter.                                                |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

## seq arp (for Extended MAC ACLs)

Configure an egress filter with a sequence number that filters ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

### Syntax

```
seq sequence-number {deny | permit} arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To remove this filter, use the `no seq sequence-number` command.

### Parameters

**log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

|                                    |                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.                                                                                                                                                        |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                      |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                              |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms. |
| <b>9.3.0.0</b>    | Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.              |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is reenabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is reenabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## seq ether-type (for Extended MAC ACLs)

Configure an egress filter with a specific sequence number that filters traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

## Syntax

```
seq sequence-number {deny | permit} ether-type protocol-type-number  
{destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-  
address mac-address-mask | any} [count [byte]] [order] [log [interval  
minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, use the `no seq sequence-number` command.

## Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                   |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.                                                                                                                                                        |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                      |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                              |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                              |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms. |
| <b>9.3.0.0</b>    | Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is reenabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is reenabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# seq (for IP ACLs)

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

**Syntax** `seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [ttl operator] [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]`

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ttl</b>                     | Enter the keyword <code>ttl</code> to permit or deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul> |
|                   | <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100..                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                |
|------------|--------------------------------------------|
| 9.12(0.0)  | Introduced the <code>ttl</code> parameter. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0)  | Introduced on the S3148.                   |
| 9.10(0.0)  | Introduced on the S6100-ON.                |
| 9.8(2.0)   | Introduced on the S3100 series.            |
| 9.8(1.0)   | Introduced on the Z9100-ON.                |
| 9.8(0.0P5) | Introduced on the S4048-ON.                |
| 9.8(0.0P2) | Introduced on the S3048-ON.                |
| 9.7(0.0)   | Introduced on the S6000-ON.                |

| Version         | Description                                                                               |
|-----------------|-------------------------------------------------------------------------------------------|
| <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

# permit icmp (for IPv6 ACLs)

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

## Syntax

```
permit icmp {source address mask | any | host ipv6-address} {destination
address | any | host ipv6-address} [type] [message-type] [ttl operator]
[count [byte]] [log [interval minutes] [threshold-in-msgs [count]]
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

## Parameters

|                            |                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address mask</b> | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous. |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                        |
| <b>host ip-v6address</b>   | Enter the keyword <code>host</code> then the IPv6 address to specify a host IP address.                                                         |
| <b>destination</b>         | Enter the IP address of the network or host to which the packets are sent.                                                                      |
| <b>type</b>                | Enter the ICMP packet type. The following types are available:<br>For IPv4:                                                                     |

```
echo count
echo-reply count
host-unreachable count
host-unknown count
network-unknown count
net-unreachable count
```

```
packet-too-big count
parameter-problem count
port-unreachable count
source-quench count
time-exceeded count
```

For IPv6:

```
echo count
echo-reply count
nd-ns count
nd-na count
packet-too-big count
parameter-problem count
time-exceeded count
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>                         | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>operator</b>                    | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b>count</b>                       | (OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>byte</b>                        | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                |
|-----------|--------------------------------------------|
| 9.12(0.0) | Introduced the <code>ttl</code> parameter. |

| Version            | Description                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>9.11(2.0P1)</b> | Added the <i>type</i> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                         |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                                          |
| <b>9.10(0.0)</b>   | Introduced on the S6100.                                                                                                          |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                   |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                       |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                       |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                       |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                       |
| <b>9.5(0.1)</b>    | Introduced on the Z9500.                                                                                                          |
| <b>9.4(0.0)</b>    | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.                                         |
| <b>9.3(0.0)</b>    | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.                                                      |

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit tcp (for IPv6 ACLs)

Configure a filter to pass TCP packets that match the filter criteria.

#### Syntax

```
permit tcp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [bit] [operator
port [port]] [ttl operator] [count [byte]] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

#### Parameters

|                                   |                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------|
| <b><i>source address mask</i></b> | Enter a network mask in /prefix format (/x).                                |
| <b><i>any</i></b>                 | Enter the keyword any to specify that all routes are subject to the filter. |

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>host <i>ipv6-address</i></b>       | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>destination address</i></b>     | Enter the IPv6 address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>bit</i></b>                     | <p>Enter a flag or combination of bits:</p> <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> <li>• <code>established</code>: datagram of established TCP session</li> </ul> <p>Use the <code>established</code> flag to match only ACK and RST flags of established TCP session.</p> <p>You cannot use <code>established</code> along with the other control flags</p> <p>While using the <code>established</code> flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule. When you use any TCP control flag in an ACL rule, <code>established</code> is masked and other control flags are available.</p> |
| <b><i>operator</i></b>                | <p>(OPTIONAL) Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>port port</i></b>               | <p>Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.</p> <p>The following list includes some common TCP port numbers:</p> <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>ttl</i></b>                     | Enter the keyword <code>t1l</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>operator</i></b>                | <p>Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul>                                                                                                                                                                                                               |
| <b><i>count</i></b>                   | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>byte</i></b>                    | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>log</i></b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>threshold-in-msgs count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

which the generation of ACL logs is terminated. with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- interval *minutes*** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

## Command Modes ACCESS-LIST

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| 9.12(0.0)   | Introduced the <code>ttl</code> parameter.                                                |
| 9.11(2.0P0) | Added the <code>established</code> parameter on the S6000, S6000-ON, S6100-ON, Z9100-ON.  |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                 |
| 9.10(0.0)   | Introduced on the S3148.                                                                  |
| 9.10(0.0)   | Introduced on the S6100.                                                                  |
| 9.8(2.0)    | Introduced on the S3100 series.                                                           |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                               |
| 9.5(0.1)    | Introduced on the Z9500.                                                                  |
| 9.4(0.0)    | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)    | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [permit](#) – assign a permit filter for IP packets.

# permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

**Syntax** `permit udp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ttl</b>                     | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>operator</b>                | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li><li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li><li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li><li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li><li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li></ul> |
|                   | <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                |
|-----------|--------------------------------------------|
| 9.12(0.0) | Introduced the <code>ttl</code> parameter. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0) | Introduced on the S3148.                   |
| 9.10(0.0) | Introduced on the S6100.                   |
| 9.8(2.0)  | Introduced on the S3100 series.            |
| 9.8(1.0)  | Introduced on the Z9100-ON.                |

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                  |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3.0.0</b>    | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

**Syntax**

```
seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [operator port [portnumber | portname]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]
```

To delete a filter, use the `no seq sequence-number` command.

|                   |                             |                                                                                                                                                               |
|-------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>sequence-number</b>      | Enter a number from 0 to 4294967290.                                                                                                                          |
|                   | <b>deny</b>                 | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.                                                             |
|                   | <b>permit</b>               | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.                                                         |
|                   | <b>ipv6-protocol-number</b> | Enter a number to filter based on the protocol identified in the IPv6 protocol header.                                                                        |
|                   | <b>icmp</b>                 | Enter the keyword <code>icmp</code> to configure an ICMP access list filter.                                                                                  |
|                   | <b>ip</b>                   | Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols. |
|                   | <b>tcp</b>                  | Enter the keyword <code>tcp</code> to configure a TCP access list filter.                                                                                     |
|                   | <b>udp</b>                  | Enter the keyword <code>udp</code> to configure a UDP access list filter.                                                                                     |

|                          |                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source</b>            | Enter an IP address in dotted decimal format of the network from which the packet was received.                                                                                                                                                                                                                                                                          |
| <b>mask</b>              | (OPTIONAL) Enter a network mask in /prefix format (/x) .                                                                                                                                                                                                                                                                                                                 |
| <b>any</b>               | Enter the keyword any to specify that all routes are subject to the filter.                                                                                                                                                                                                                                                                                              |
| <b>host ipv6-address</b> | Enter the keyword host and then enter the IPv6 address to specify a host IP address or hostname.                                                                                                                                                                                                                                                                         |
| <b>operator</b>          | (OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> <li>• eq = equal to</li> <li>• neq = not equal to</li> <li>• gt = greater than</li> <li>• lt = less than</li> <li>• range = inclusive range of ports (you must specify two ports for the port parameter.)</li> </ul>                                                          |
| <b>portnumber</b>        | (OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.<br><br>The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP-DATA and FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul> |
| <b>portname</b>          | (OPTIONAL) Enter the logical name of the protocol.<br><br>The following logical names are supported in TCP:                                                                                                                                                                                                                                                              |

|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination</b>                 | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                       |
| <b>count</b>                       | (OPTIONAL) Enter the keyword <code>count</code> to count the packets.                                                                                                                                                                                                                                                            |
| <b>bytes</b>                       | (OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.                                                                                                                                                                                                                                                              |
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                      |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminate with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                       |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                         |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.11(2.0P0)</b> | Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                                             |

| Version          | Description                                                                               |
|------------------|-------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b> | Introduced on the S6100.                                                                  |
| <b>9.8(1.0)</b>  | Introduced on the Z9100–ON.                                                               |
| <b>9.7(0.0)</b>  | Introduced on the S6000–ON.                                                               |
| <b>9.5(0.1)</b>  | Introduced on the Z9500.                                                                  |
| <b>9.4(0.0)</b>  | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>  | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- [permit](#) – configure a filter to forward packets.

# permit (for IPv6 ACLs)

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

## Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]]
[dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs
[count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

## Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

|------------|-------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| 9.10(0.0)  | Introduced on the S3148.                                                                  |
| 9.10(0.0)  | Introduced on the S6100.                                                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                                                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.8(0.0)   | Added the no-drop parameter.                                                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.5(0.1)   | Introduced on the Z9500.                                                                  |
| 9.4(0.0)   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.3(0.0)   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

#### Syntax

```
deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

|                   |                                    |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
|                   | <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                   |
|                   | <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

|                 |                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b> | By default, 10 ACL logs are generated if you do not specify the threshold explicitly.                                    |
|                 | The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled. |

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | CONFIGURATION-EXTENDED-ACCESS-LIST |
|----------------------|------------------------------------|

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                  |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval. |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

## Syntax

```
deny icmp {source address mask | any | host ipv6-address} {destination  
address | any | host ipv6-address} [type] [message-type] [ttl operator]  
[count [byte]] | [log [interval minutes] [threshold-in-msgs [count]]  
[monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

## Parameters

|                            |                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source address mask</b> | Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous. |
| <b>any</b>                 | Enter the keyword <code>any</code> to specify that all routes are subject to the filter.                                                        |
| <b>host ip-v6address</b>   | Enter the keyword <code>host</code> then the IPv6 address to specify a host IP address.                                                         |
| <b>destination</b>         | Enter the IP address of the network or host to which the packets are sent.                                                                      |
| <b>type</b>                | Enter the ICMP packet type. The following types are available:                                                                                  |

For IPv4:

```
echo count  
echo-reply count  
host-unreachable count  
host-unknown count  
network-unknown count  
net-unreachable count  
packet-too-big count  
parameter-problem count  
port-unreachable count  
source-quench count  
time-exceeded count
```

For IPv6:

```
echo count  
echo-reply count  
nd-ns count  
nd-na count  
packet-too-big count  
parameter-problem count  
time-exceeded count  
port-unreachable count
```

The ICMP packets cannot be filtered using mirroring ACL.

|                 |                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>      | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                             |
| <b>operator</b> | Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li></ul> |

- `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- `range`(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

|                                       |                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                            | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                   |
| <b>threshold-in-msgs <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100. |
| <b>interval <i>minutes</i></b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.                                                                                                                                                        |
| <b>monitor</b>                        | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                      |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>     | <b>Description</b>                                                                                                                      |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Introduced the <code>ttl</code> parameter.                                                                                              |
| <b>9.11(2.0P0)</b> | Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                                               |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                                                |
| <b>9.10(0.0)</b>   | Introduced on the S6100.                                                                                                                |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                         |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                             |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                             |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                             |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                             |
| <b>9.4(0.0)</b>    | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.                                               |
| <b>9.5(0.1)</b>    | Introduced on the Z9500.                                                                                                                |
| <b>9.3.0.0</b>     | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.                                                            |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and

MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

### Syntax

```
deny tcp {source address mask | any | host ipv6-address} [operator port  
[port]] {destination address | any | host ipv6-address} [bit] [operator  
port [port]] [ttl operator] [count [byte]] [log [interval minutes]  
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

**source address  
mask**

Enter a network mask in /prefix format (/x).

**any**

Enter the keyword `any` to specify that all routes are subject to the filter.

**host ipv6-  
address**

Enter the keyword `host` then the IP address to specify a host IP address.

**destination  
address**

Enter the IPv6 address of the network or host to which the packets are sent.

**bit**

Enter a flag or combination of bits:

- `ack`: acknowledgement field
- `fin`: finish (no more data from the user)
- `psh`: push function
- `rst`: reset the connection
- `syn`: synchronize sequence numbers
- `urg`: urgent field
- `established`: datagram of established TCP session

Use the `established` flag to match only ACK and RST flags of established TCP session.

You cannot use `established` along with the other control flags

While using the `established` flag in an ACL rule, all the other TCP control flags are masked, to avoid redundant TCP control flags configuration in a single rule.

When you use any TCP control flag in an ACL rule, `established` is masked and other control flags are available.

**operator**

(OPTIONAL) Enter one of the following logical operand:

- `eq` = equal to
- `neq` = not equal to
- `gt` = greater than
- `lt` = less than

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | <ul style="list-style-type: none"> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>port port</i></b>                   | <p>Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.</p> <p>The following list includes some common TCP port numbers:</p> <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>ttl</i></b>                         | Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>operator</i></b>                    | <p>Enter one of the following logical operand:</p> <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.</li> </ul> |
| <b><i>count</i></b>                       | (OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>byte</i></b>                        | (OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>log</i></b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>threshold-in<br/>msgs count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>interval minutes</i></b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>monitor</i></b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

## Command Modes ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Introduced the <code>ttl</code> parameter.                                                      |
| <b>9.11(2.0P0)</b> | Added the <code>established</code> parameter on the on the S6000, S6000-ON, S6100-ON, Z9100-ON. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                       |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                        |
| <b>9.10(0.0)</b>   | Introduced on the S6100.                                                                        |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                 |

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.                                                               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                  |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny udp (for Extended IP ACLs)

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

### Syntax

```
deny udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte]] [order] [fragments] [log [interval minutes]
[threshold-in-msgs [count]]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ttl</b>      | Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>operator</b> | Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.</li> <li>• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.</li> <li>• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.</li> <li>• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.</li> </ul> |

|                                |                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                | <ul style="list-style-type: none"> <li>• <code>range</code>(inclusive range of values) — matches packets that contain a <code>ttl</code> value that falls between the specified range of <code>ttl</code> values.</li> </ul>                                                                                                       |
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                    |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.  
The default frequency at which ACL logs are generated is five minutes.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                  |
|-------------------|------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>t1</code> parameter.                                    |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms. |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

**Related Commands**

- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.

## deny (for IPv6 ACLs)

Configure a filter that drops IPv6 packets that match the filter criteria.

**Syntax** `deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

**Parameters**

|                                |                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |

|                                |                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interval <i>minutes</i></b> | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                          |
| <b>monitor</b>                 | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. |
| <b>no-drop</b>                 | Enter the keywords <code>no-drop</code> to match only the forwarded packets.                                                                                                                             |

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

## Command Modes ACCESS-LIST

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                               |
|-------------------|-------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                               |
| <b>9.8(0.0)</b>   | Added the <code>no-drop</code> parameter.                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                  |
| <b>9.4(0.0)</b>   | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b>   | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection.

The Dell EMC Networking OS implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03, and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels

## Topics:

- [bfd all-neighbors](#)

- [ipv6 route bfd](#)
- [neighbor bfd](#)
- [neighbor bfd disable](#)
- [show bfd neighbors](#)
- [vrrp bfd](#)

## bfd all-neighbors

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

|                      |                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>bfd all-neighbors [interval <i>interval</i> min_rx <i>min_rx</i> multiplier <i>value</i> role {active   passive}]</code> |                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>    | <b>interval</b><br><i>milliseconds</i>                                                                                         | (OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.                                                                                                                                                  |
|                      | <b>min_rx</b><br><i>milliseconds</i>                                                                                           | Enter the keyword <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.                                                                                                                                   |
|                      | <b>multiplier</b> <i>value</i>                                                                                                 | Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                                     |
|                      | <b>role</b> [active   passive]                                                                                                 | Enter the role that the local system assumes: <ul style="list-style-type: none"> <li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> The default is <b>active</b> . |
| <b>Defaults</b>      | See <i>Parameters</i> .                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Command Modes</b> | ROUTER OSPF                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                             |

| 9.13(0.0)   | Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.     |
| 9.11(2.1P1) | Introduced support for enabling BFD on non-default VRFs for OSPFv2 on all the remaining Dell EMC Networking OS platforms.<br><br>Introduced support for enabling BFD on non-default VRFs for OSPFv3 on all the Dell EMC Networking OS platforms. |
| 9.10(0.2)   | Introduced support for enabling BFD on non-default VRFs for OSPFv2 on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON.                                                                                                       |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                        |
| 9.10(0.0)   | Introduced on the S3148.                                                                                                                                                                                                                         |
| 9.10(0.0)   | Introduced on the S6100-ON.                                                                                                                                                                                                                      |
| 9.8(2.0)    | Introduced on the S3100 series.                                                                                                                                                                                                                  |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                                                                                                                                                                                      |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                                                                                                                                                                                      |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                                                                                                                                                                                      |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                                                                                                                                                      |
| 9.0.2.0     | Introduced on the S6000.                                                                                                                                                                                                                         |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                                                                                                                                                         |
| 9.2.(0.0)   | Introduced BFD for VRRP and OSPFv3 on Z9000, S4810, and S4820T.                                                                                                                                                                                  |
| 9.0.0.0     | Introduced BFD for BGP on the Z9000.                                                                                                                                                                                                             |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                                                                                                                                        |
| 8.3.8.0     | Introduced BFD for BGP on the S4810.                                                                                                                                                                                                             |
| 8.4.1.3     | Introduced BFD for BGP on the E-Series.                                                                                                                                                                                                          |
| 8.2.1.0     | Introduced BFD for OSPF and ISIS on the E-Series.                                                                                                                                                                                                |
| 7.6.1.0     | Introduced BFD for OSPF on the C-Series.                                                                                                                                                                                                         |
| 7.5.1.0     | Introduced BFD for ISIS on the E-Series.                                                                                                                                                                                                         |
| 7.4.1.0     | Introduced BFD for OSPF on the E-Series.                                                                                                                                                                                                         |

## Usage Information

All neighbors inherit the timer values configured with the `bfd neighbor` command except in the following cases:

- Timer values configured with the `isis bfd all-neighbors` or `ip ospf bfd all-neighbors` commands in INTERFACE mode override timer values configured with the `bfd neighbor` command. Likewise, using the `no bfd neighbor` command does not disable BFD on an interface if you explicitly enable BFD using the `isis bfd all-neighbors` command.
- Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/disable values configured with the `bfd neighbor` command or configured for the peer group to which a neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

You can enable BFD on both default and nondefault VRFs for OSPF and BGP protocols for both IPv4 and IPv6 neighbors.

 **NOTE:** The `bfd all-neighbors` command is applicable for both IPv4 and IPv6 BGP sessions.

## bfd disable

Disable BFD on an interface.

**Syntax** `bfd disable`

Re-enable BFD using the `no bfd disable` command.

**Defaults** BFD is disabled by default.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.2(0.2)   | Introduced on S4810.                      |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.2.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the C-Series.               |
| 7.5.1.0    | Introduced on the E-Series.               |

## bfd enable (Configuration)

Enable BFD on all interfaces.

**Syntax** `bfd enable`

Disable BFD using the `no bfd enable` command.

**Defaults** BFD is disabled by default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| <b>7.4.1.0</b>    | Introduced on the E-Series.     |

## bfd enable (Interface)

Enable BFD on an interface.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bfd enable</code>                                                                                                                                       |
| <b>Defaults</b>        | BFD is enabled on all interfaces when you enable BFD from CONFIGURATION mode.                                                                                 |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.10.0</b>   | Introduced on the S4810.                  |
| <b>8.2.1.0</b>    | Introduced on the E-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## bfd interval

Specify non-default BFD session parameters beginning with the transmission interval.

|               |                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>bfd interval <i>interval</i> min_rx <i>min_rx</i> multiplier <i>value</i> role {active   passive}</code> |
|---------------|----------------------------------------------------------------------------------------------------------------|

## Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interval<br/>milliseconds</b> | Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.                                                                                                                                                                      |
| <b>min_rx<br/>milliseconds</b>   | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> . Dell EMC recommends using more than 100 milliseconds.                                                                                                                                            |
| <b>multiplier value</b>          | Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                                              |
| <b>role [active   passive]</b>   | <p>Enter the role that the local system assumes:</p> <ul style="list-style-type: none"><li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li><li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li></ul> <p>The default is <b>Active</b>.</p> |

**Defaults** Refer to *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.2.1.0</b>    | Introduced on the E-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## Example

```
DellEMC(conf-if-te-1/3/1)# bfd interval 250 min_rx 300 multiplier 4 role  
passive  
DellEMC(conf-if-te-1/3/1)#
```

# bfd protocol-liveness

Enable the BFD protocol liveness feature.

**Syntax** `bfd protocol-liveness`

**Defaults** Disabled

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.10.0   | Introduced on the S4810.                  |
| 7.4.1.0    | Introduced on the E-Series.               |

## Usage Information

Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.

# ip route bfd

Enable BFD for all neighbors configured through static routes.

## Syntax

```
ip route bfd [prefix-list prefix-list-name] [interval interval min_rx  
min_rx multiplier value role {active | passive}]
```

To disable BFD for all neighbors configured through static routes, use the `no ip route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

## Parameters

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>prefix-list <i>prefix-list-name</i></b> | (Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific neighbors.                                                                                                                                                                                                                                                    |
| <b>interval <i>milliseconds</i></b>        | (OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .                                                                                                                                                                                            |
| <b>min_rx <i>milliseconds</i></b>          | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .                                                                                                                                                                                          |
| <b>multiplier <i>value</i></b>             | Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                         |
| <b>role [active   passive]</b>             | Enter the role that the local system assumes: <ul style="list-style-type: none"><li>• <b>Active</b> — active system initiates the BFD session. Both systems can be active for the same session.</li><li>• <b>Passive</b> — passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li></ul> The default is <b>Active</b> . |

## Defaults

See *Parameters*.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0)  | Introduced the <code>vrf</code> keyword on S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON. |
| 9.12(1.0)  | Introduced on the S5048F-ON.                                                                                                                                    |
| 9.11(2.5)  | Introduced the <code>vrf</code> keyword on the Z9100-ON.                                                                                                        |
| 9.11(0.0)  | Introduced the <code>prefix-list</code> keyword.                                                                                                                |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                                                                       |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                                                        |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                                                     |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                                                     |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                                                                     |
| 9.3.(0.0)  | Introduced on S6000.                                                                                                                                            |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                                                                        |
| 9.2.(0.0)  | Introduced on Z9000, S4810, and S4820T.                                                                                                                         |
| 8.2.1.0    | Introduced on the E-Series.                                                                                                                                     |
| 7.6.1.0    | Introduced on the C-Series.                                                                                                                                     |
| 7.4.1.0    | Introduced on the E-Series.                                                                                                                                     |

## ip ospf bfd all-neighbors

Establish BFD sessions with all OSPF neighbors on a single interface or use non-default BFD session parameters.

### Syntax

```
ip ospf bfd all-neighbors [disable | [interval interval min_rx min_rx  
multiplier value role {active | passive}]]
```

To disable all BFD sessions on an OSPF interface implicitly, use the `no ip ospf bfd all-neighbors disable` command in interface mode..

### Parameters

|                                    |                                                                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>                     | (OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.                                                                                                                             |
| <b>interval<br/>milliseconds</b>   | (OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .            |
| <b>min_rx<br/>milliseconds</b>     | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .         |
| <b>multiplier value</b>            | Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                         |
| <b>role [active  <br/>passive]</b> | Enter the role that the local system assumes: <ul style="list-style-type: none"><li>• <code>Active</code> — active system initiates the BFD session. Both systems can be active for the same session.</li></ul> |

- **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

**Defaults** See *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                         |
|-------------------|---------------------------------------------------------------------|
| <b>9.10(0.2)</b>  | Introduced support for enabling BFD on non-default VRFs for OSPFv2. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                         |
| <b>9.2.0.0</b>    | Introduced on the Z9000, S4820T, and S4810.                         |

**Usage Information** This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

## ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

**Syntax** `ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode..

**Parameters**

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>                   | (OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.                                                                                                                                                                                                                                                                                                                 |
| <b>interval<br/>milliseconds</b> | (OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .                                                                                                                                                                                                |
| <b>min_rx<br/>milliseconds</b>   | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> .                                                                                                                                                                                             |
| <b>multiplier value</b>          | Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                             |
| <b>role [active   passive]</b>   | Enter the role that the local system assumes: <ul style="list-style-type: none"> <li>• <b>Active</b> — active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <b>Passive</b> — passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> The default is <b>Active</b> . |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | See <i>Parameters</i> .                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |

| Version           | Description                                 |
|-------------------|---------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.   |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                    |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.             |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                 |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                 |
| <b>9.2.0.0</b>    | Introduced on the Z9000, S4820T, and S4810. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure <code>ipv6 ospf bfd</code> in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the <code>bfd all-neighbors</code> command. Using the <code>no</code> form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.</p> <p>To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword <code>disable</code>.</p> |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ipv6 route bfd

Enable BFD for all IPv6 neighbors configured through static routes.

|               |                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active   passive}]</pre> <p>To disable BFD for all IPv6 neighbors configured through static routes, use the <code>no ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active   passive}]</code> command.</p> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b>vrf vrf-name</b> (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to enable or disable BFD on the next-hop IPv6 neighbor corresponding to that VRF.</p> <p><b>prefix-list prefix-list-name</b> (Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific IPv6 neighbors.</p> <p><b>interval milliseconds</b> (OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b>.</p> <p><b>min_rx milliseconds</b> Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b>.</p> <p><b>multiplier value</b> Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b>.</p> <p><b>role [active   passive]</b> Enter the role that the local system assumes:</p> <ul style="list-style-type: none"> <li>• <b>Active</b> — active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <b>Passive</b> — passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> <p>The default is <b>Active</b>.</p> |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                         |
|-----------------|-------------------------|
| <b>Defaults</b> | See <i>Parameters</i> . |
|-----------------|-------------------------|

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6100-ON, C9010, and the Z9500. |
| 9.12(1.0) | Introduced on the S5048F-ON.                                                                                           |
| 9.11(2.5) | Introduced the <code>ipv6 route bfd</code> command on the Z9100-ON.                                                    |

**Example**

```
DellEMC(conf)#ipv6 route bfd
DellEMC(conf)#ipv6 route bfd vrf vrf1 prefix-list p6_le
```

## neighbor bfd

Explicitly enable or disable a BFD session with a BGP neighbor or a BGP peer group.

**Syntax** `neighbor {ip-address | ipv6-address | peer-group-name} bfd`

**Parameters**

|                               |                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the BGP neighbor that you want to explicitly enable for BFD sessions in dotted decimal format (A.B.C.D). |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group that you want to explicitly enable for BFD sessions.                                            |

**Defaults** None

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0)  | Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                                                                                                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                                                                                                                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                                                                                                                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                                                                                                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                                                                                                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                                                                                                                                  |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                                                                                                                                                  |
| 9.0.2.0    | Introduced on the S6000.                                                                                                                                                                                                                     |
| 9.0.0.0    | Introduced on the Z9000.                                                                                                                                                                                                                     |
| 8.3.19.0   | Introduced on the S4820T.                                                                                                                                                                                                                    |
| 8.3.8.0    | Introduced on the S4810.                                                                                                                                                                                                                     |
| 8.4.1.3    | Introduced on the E-Series.                                                                                                                                                                                                                  |

## Usage Information

When you enable a BFD session with a specified BGP neighbor or peer group using the `bfd neighbor` command, the default BFD session parameters are used (interval: **200** milliseconds, min\_rx: **200** milliseconds, multiplier: **3** packets, and role: **active**) if you have not specified parameters with the `bfd neighbor` command.

When you explicitly enable a BGP neighbor for a BFD session with the `bfd neighbor` command:

- The neighbor does not inherit the global BFD enable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, min\_rx, and multiplier.

## Related Commands

- [neighbor bfd disable](#) — disable a BFD session explicitly with a BGP neighbor or a BGP peer group.

# neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

## Syntax

```
neighbor {ip-address | ipv6-address | peer-group-name} bfd disable
```

## Parameters

### ***ip-address***

Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).

### ***peer-group-name***

Enter the name of the peer group that you want to explicitly disable for BFD sessions.

## Defaults

None

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### Version

### Description

#### **9.13(0.0)**

Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.

#### **9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

#### **9.10(0.0)**

Introduced on the S3148.

#### **9.10(0.0)**

Introduced on the S6100-ON.

#### **9.8(2.0)**

Introduced on the S3100 series.

#### **9.8(1.0)**

Introduced on the Z9100-ON.

#### **9.8(0.0P5)**

Introduced on the S4048-ON.

#### **9.8(0.0P2)**

Introduced on the S3048-ON.

#### **9.7(0.0)**

Introduced on the S6000-ON.

#### **9.2(1.0)**

Introduced on the Z9500.

#### **9.0.2.0**

Introduced on the S6000.

#### **9.0.0.0**

Introduced on the Z9000.

#### **8.3.19.0**

Introduced on the S4820T.

#### **8.3.8.0**

Introduced on the S4810.

#### **8.4.1.3**

Introduced on the E-Series.

## Usage Information

When you explicitly disable a BGP neighbor for a BFD session with the `neighbor bfd disable` command:

- The neighbor does not inherit the global BFD disable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: `interval`, `min_rx`, and `multiplier`.

When you remove the Disabled state of a BFD for a BGP session with a specified neighbor by entering the `no neighbor bfd disable` command, the BGP link with the neighbor returns to normal operation and uses the BFD session parameters globally configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.

## show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

### Syntax

```
show bfd [vrf vrf name] neighbors [interface] [detail]
```

### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf name</b> | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to display the BFD sessions with all neighbors within the VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>interface</b>    | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port/subport information.</li><li>• For a 25-Gigabit Ethernet interface, enter the keyword <code>twentyFiveGigE</code> then the slot/port/subport information.</li><li>• For a 50-Gigabit Ethernet interface, enter the keyword <code>fiftyGigE</code> then the slot/port/subport information.</li><li>• For a 100-Gigabit Ethernet interface, enter the keyword <code>hundredGigE</code> then the slot/port/subport information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>detail</b>       | (OPTIONAL) Enter the keyword <code>detail</code> to view detailed information about BFD neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Version            | Description                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>9.11(2.1P1)</b> | Introduced the <code>vrf</code> keyword on all the remaining Dell EMC Networking OS platforms.                  |
| <b>9.10(0.2)</b>   | Introduced the <code>vrf</code> keyword on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                                        |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                 |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                     |

| Version           | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                    |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                   |
| <b>8.3.8.0</b>    | Added support for BFD for BGP on the S4810.                                 |
| <b>8.4.1.3</b>    | Added support for BFD for BGP on the E-Series.                              |
| <b>8.2.1.0</b>    | Introduced on the E-Series.                                                 |
| <b>7.6.1.0</b>    | Introduced on the C-Series.                                                 |
| <b>7.5.1.0</b>    | Added support for BFD for VLAN and port-channel interfaces on the E-Series. |
| <b>7.4.1.0</b>    | Introduced BFD on physical ports on the E-Series.                           |

### Example

The following example shows the `show bfd neighbors` command output for the default VRF.

```
show bfd neighbors

*          - Active session role
Ad Dn      - Admin Down
B          - BGP
C          - CLI
I          - ISIS
O          - OSPF
O3         - OSPFv3
R          - Static Route (RTM)
M          - MPLS
V          - VRRP
VT         - Vxlan Tunnel

LocalAddr  RemoteAddr  Interface  State Rx-int Tx-int Mult  Clients
* 5.1.1.1  5.1.1.2    Po 30      Up    200    200    3      0
* 6.1.1.1  6.1.1.2    Vl 30      Up    200    200    3      0
* 7.1.1.1  7.1.1.2    Te 1/21/1/1 Up    200    200    3      0
```

The following example shows the `show bfd vrf neighbors` command output showing the nondefault VRF.

```
DellEMC(conf)#do sho bfd vrf vrf2 neighbors

*          - Active session role
Ad Dn      - Admin Down

## Related Commands

- [bfd all-neighbors](#) — establish BFD sessions with all neighbors discovered by the IS-IS protocol or OSPF protocol out of all interfaces.

# vrrp bfd

Establish a VRRP BFD session.

## Syntax

```
vrrp bfd {all-neighbors | neighbor ip-address} [interval interval min_rx min_rx multiplier value role {active | passive}]
```

To undo your VRRP BFD configuration, use the `no vrrp bfd {all-neighbors | neighbor ip-address } [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                         |

# Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically sent messages to update those routing tables.

**NOTE:** For more information about configuring the border gateway protocol (BGP), see the *BGP* section in the *Dell EMC Networking OS Configuration Guide*.

## BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

**NOTE:** Dell EMC Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

**NOTE:** Dell EMC Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the `show ip bgp` commands. To determine the comparable dot format for an ASN from a traditional format, use `ASN/65536`. `ASN%65536`. For more information about using the 2- or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

## address-family

Enable the IPv4 multicast or the IPv6 address family.

|                        |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                                                                                                                                                                           |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Added support for IPv6 VRF.               |
| <b>9.4.(0.0)</b>  | Added support for VRF.                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>6.5.1.0</b>    | Introduced                                |

## aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

|                        |                                                                                                                                                                                         |                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | aggregate-address <i>ip-address</i> mask [ <i>advertise-map map-name</i> ] [ <i>as-set</i> ] [ <i>attribute-map map-name</i> ] [ <i>summary-only</i> ] [ <i>suppress-map map-name</i> ] |                                                                                                                                                                                                                               |
| <b>Parameters</b>      | <b><i>ip-address mask</i></b>                                                                                                                                                           | Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).                                                              |
|                        | <b><i>advertise-map map-name</i></b>                                                                                                                                                    | (OPTIONAL) Enter the keywords <i>advertise-map</i> then the name of a configured route map to set filters for advertising an aggregate route.                                                                                 |
|                        | <b><i>as-set</i></b>                                                                                                                                                                    | (OPTIONAL) Enter the keyword <i>as-set</i> to generate path attribute information and include it in the aggregate.<br><br>AS_SET includes AS_PATH and community information from the routes included in the aggregated route. |
|                        | <b><i>attribute-map map-name</i></b>                                                                                                                                                    | (OPTIONAL) Enter the keywords <i>attribute-map</i> then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.                                                  |
|                        | <b><i>summary-only</i></b>                                                                                                                                                              | (OPTIONAL) Enter the keyword <i>summary-only</i> to advertise only the aggregate address. Specific routes are not advertised.                                                                                                 |
|                        | <b><i>suppress-map map-name</i></b>                                                                                                                                                     | (OPTIONAL) Enter the keywords <i>suppress-map</i> then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.                                                             |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                         |                                                                                                                                                                                                                               |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>ROUTER BGP ADDRESS FAMILY</li> <li>ROUTER BGP ADDRESS FAMILY IPv6</li> </ul>                                                                     |                                                                                                                                                                                                                               |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                           |                                                                                                                                                                                                                               |

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.3.7.0</b>    | Introduced on the S4810.        |
| <b>7.8.1.0</b>    | Introduced on the S-Series.     |
| <b>7.7.1.0</b>    | Introduced on the C-Series.     |

### Usage Information

At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the `as-set` parameter to the aggregate as the aggregate flaps to keep track of the changes in the AS\_PATH.

In route maps used in the `suppress-map` parameter, routes meeting the `deny` clause are not suppressed; in other words, they are allowed. The opposite is also true: routes meeting the `permit` clause are suppressed.

If the route is injected via the `network` command, that route still appears in the routing table if the `summary-only` parameter is configured in the `aggregate-address` command.

The `summary-only` parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the `neighbor distribute-list` command.

In the `show ip bgp` command, aggregates contain an 'a' in the first column and routes suppressed by the aggregate contain an 's' in the first column.

When an aggregate address is denied using a peer's outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; the value set in that attribute-map will not be shown in the output of the `show ip bgp aggregate route` command.

## bgp add-path

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

**Syntax** `bgp add-path [send | receive | both | enable] path-count`

|                   |                   |                                                                                                              |
|-------------------|-------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>send</b>       | Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.               |
|                   | <b>receive</b>    | Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.        |
|                   | <b>both</b>       | Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers. |
|                   | <b>enable</b>     | Enter the keyword <code>enable</code> to enable add-path support support for the node.                       |
|                   | <b>path-count</b> | Enter the number paths supported. The range is from 2 to 64.                                                 |

**Defaults** Disabled

- Command Modes**
- ROUTER BGP
  - ROUTER BGP-address-family

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.0</b>   | Introduced on the Z9000.                  |
| <b>8.3.8.0</b>    | Introduced on the S4810.                  |

**Usage Information** Using this command recycles all current sessions.

- Related Commands**
- [neighbor add-path](#) — specify that this neighbor/peer group can send/receive multiple path advertisements.

## bgp always-compare-med

Allows you to enable comparison of the MULTI\_EXIT\_DISC (MED) attributes in the paths from different external ASs.

**Syntax** `bgp always-compare-med`

To disable comparison of MED, enter `no bgp always-compare-med`.

**Defaults** Disabled (that is, the software only compares MEDs from neighbors within the same AS).

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version | Description                 |
|---------|-----------------------------|
| 8.2.1.0 | Introduced command.         |
| 7.7.1.0 | Introduced on the C-Series. |

#### Usage Information

Any update without a MED attribute is the least preferred route.

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp asnotation

Allows you to implement a method for AS number representation in the command line interface (CLI).

#### Syntax

`bgp asnotation [asplain | asdot+ | asdot]`

To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

#### Defaults

**asplain**

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                |

| 9.0.2.0    | Introduced on the S6000.                                   |
| 8.3.19.0   | Introduced on the S4820T.                                  |
| 8.3.11.1   | Introduced on the Z9000.                                   |
| 8.3.7.0    | Introduced on the S4810.                                   |
| 8.3.1.0    | Introduced the dynamic application of AS notation changes. |
| 8.2.1.0    | Introduced.                                                |

#### Usage Information

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octet-as-support` command after using dot or dot+ format, the AS numbers revert to asplain text.

When you apply an asnotation, it is reflected in the running-configuration. If you change the notation type, the running-config updates dynamically and the new notation shows.

#### Example

```
DellEMC(conf)# router bgp 1
DellEMC(conf-router_bgp)#bgp asnotation asdot
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot
```

```

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asdot+
DellEMC(conf-router_bgp)# ex

DellEMC(conf)#do show run | grep bgp
router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot+

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asplain
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run |grep bgp
router bgp 1
  bgp four-octet-as-support

DellEMC(conf)#

```

#### Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

#### Syntax

```
bgp bestpath as-path ignore
```

To return to the default, enter the `no bgp bestpath as-path ignore` command.

#### Defaults

Disabled (that is, the software considers the AS\_PATH when choosing a route as best).

**Command Modes** ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the S-Series.               |
| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

#### Usage Information

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp bestpath as-path multipath-relax

Include prefixes received from different AS paths during multipath calculation.

**Syntax** `bgp bestpath as-path multipath-relax`  
To return to the default BGP routing process, use the `no bgp bestpath as-path multipath-relax` command.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.4</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

**Usage Information** The `bestpath router bgp configuration mode` command changes the default bestpath selection algorithm. The `multipath-relax` option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.

## bgp bestpath med confed

Enable MULTI\_EXIT\_DISC (MED) attribute comparison on paths learned from BGP confederations.

**Syntax** `bgp bestpath med confed`  
To disable MED comparison on BGP confederation paths, enter the `no bgp bestpath med confed` command.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000–ON. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.7.1.0</b>  | Introduced on the C-Series. |

**Usage Information** The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI\_EXIT\_DISC) over paths with an advertised MED attribute.

**Syntax** `bgp bestpath med missing-as-best`  
To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the S-Series.               |
| <b>7.7.1.0</b>    | Introduced on the C-Series.               |
| <b>6.3.1.0</b>    | Introduced                                |

**Usage Information** The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

## bgp bestpath router-id ignore

Do not compare router-id information for external paths during best path selection.

**Syntax** `bgp bestpath router-id ignore`

To return to the default selection, use the `no bgp bestpath router-id ignore` command.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.3.1.0    | Introduced                                |

**Usage Information** Configuring this option retains the current best-path. When sessions are then reset, the oldest received path is chosen as the best-path.

## bgp client-to-client reflection

Allows you to enable route reflection between clients in a cluster.

**Syntax** `bgp client-to-client reflection`

To disable client-to-client reflection, use the `no bgp client-to-client reflection` command.

**Defaults** Enabled when a route reflector is configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON. |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.8.1.0</b>    | Introduced on the S-Series. |
| <b>7.7.1.0</b>    | Introduced on the C-Series. |

**Usage Information**

Route reflection to clients is not necessary if all client routers are fully meshed.

**Related Commands**

- [bgp cluster-id](#) — assign an ID to a BGP cluster with two or more route reflectors.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.

## bgp cluster-id

Assign a cluster ID to a BGP cluster with more than one route reflector.

**Syntax**

`bgp cluster-id {ip-address | number}`

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

**Parameters**

|                          |                                                                      |
|--------------------------|----------------------------------------------------------------------|
| <b><i>ip-address</i></b> | Enter an IP address as the route reflector cluster ID.               |
| <b><i>number</i></b>     | Enter a route reflector cluster ID as a number from 1 to 4294967295. |

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version | Description                 |
|---------|-----------------------------|
| 7.8.1.0 | Introduced on the S-Series. |
| 7.7.1.0 | Introduced on the C-Series. |

#### Usage Information

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the `bgp cluster-id` command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

#### Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and clients.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.
- [show ip bgp cluster-list](#) — view paths with a cluster ID.

## bgp confederation identifier

Configure an identifier for a BGP confederation.

#### Syntax

`bgp confederation identifier as-number`

To delete a BGP confederation identifier, use the `no bgp confederation identifier as-number` command.

#### Parameters

**as-number** Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                     |
|------------|-----------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                       |
| 9.10(0.0)  | Introduced on the S3148.                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                     |
| 9.7(0.0)   | Introduced on the S6000-ON.                                     |
| 9.2(1.0)   | Introduced on the Z9500.                                        |
| 9.0.2.0    | Introduced on the S6000.                                        |
| 8.3.19.0   | Introduced on the S4820T.                                       |
| 8.3.11.1   | Introduced on the Z9000.                                        |
| 8.3.7.0    | Introduced on the S4810.                                        |
| 7.8.1.0    | Introduced on the S-Series.                                     |
| 7.7.1.0    | Introduced on the C-Series. Added support for the 4-byte format |

#### Usage Information

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell EMC Networking OS accepts confederation EBGP peers without a LOCAL\_PREF attribute. The software sends AS\_CONFED\_SET and accepts AS\_CONFED\_SET and AS\_CONF\_SEQ.

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGP neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS\_SEQUENCE or AS\_CONFED\_SEQUENCE (in the case of confederations). If the first entry appears as an AS\_CONFED\_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

#### Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## bgp confederation peers

Specify the autonomous systems (ASs) that belong to the BGP confederation.

#### Syntax

```
bgp confederation peers as-number [...as-number]
```

To return to the default, use the `no bgp confederation peers` command.

#### Parameters

|                            |                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>as-number</i></b>    | Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).                             |
| <b><i>...as-number</i></b> | (OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format). |

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                      |
|-------------------|------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                      |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                         |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                         |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                         |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                         |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                                      |
| <b>7.7.1.0</b>    | Introduced on the C-Series. Added support for the 4-byte format. |

## Usage Information

All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems.

After specifying autonomous systems numbers for the BGP confederation, recycle the peers to update their configuration.

## Related Commands

- [bgp confederation identifier](#) — configure a confederation ID.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

# bgp dampening

Enable BGP route dampening and configure the dampening parameters.

## Syntax

```
bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]
```

To disable route dampening, use the `no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]` command.

## Parameters

|                                  |                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>half-life</i></b>          | (OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is <b>15 minutes</b> .                                |
| <b><i>reuse</i></b>              | (OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route's Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is <b>750</b> .            |
| <b><i>suppress</i></b>           | (OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route's Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is <b>2000</b> . |
| <b><i>max-suppress-time</i></b>  | (OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is <b>60 minutes</b> .                                                                                                               |
| <b><i>route-map map-name</i></b> | (OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.<br><br>Only <code>match</code> commands in the configured route map are supported.                                                                                                                       |

## Defaults

Disabled.

## Command Modes

- ROUTER BGP
- ROUTER BGP-address-family

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |

#### Usage Information

If you enter the `bgp dampening` command, the default values for *half-life*, *reuse*, *suppress*, and *max-suppress-time* are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

#### Related Commands

- [show ip bgp dampened-paths](#) — view the BGP paths.

## bgp default local-preference

Change the default local preference value for routes exchanged between internal BGP peers.

#### Syntax

```
bgp default local-preference value
```

To return to the default value, use the `no bgp default local-preference` command.

#### Parameters

**value**

Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is **100**.

#### Defaults

100

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| <b>7.8.1.0</b>    | Introduced on the S-Series.               |
| <b>7.7.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced.                               |

#### Usage Information

This command is enabled by default, that is for all updates received from EBGp peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is increments. Use the `show ip bgp neighbors` command to view the “failed enforce-first-as check” counter.

If you disable the `enforce-first-as` command, it can be viewed using the `show ip protocols` command.

In the event of an enforce-first-as check failure, the existing BGP session is flapped.

#### Related Commands

- [show ip bgp neighbors](#) — view the information the BGP neighbors exchange.
- [show ip protocols](#) — view information on routing protocols.

## bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

#### Syntax

`bgp fast-external-fallover`

To disable fast external fallover, use the `no bgp fast-external-fallover` command.

#### Defaults

Enabled

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.8.1.0</b>    | Introduced on the S-Series. |
| <b>7.7.1.0</b>    | Introduced on the C-Series. |

#### Usage Information

The `bgp fast-external-fallover` command appears in the `show config` command output.

The fast external fallover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the `clear ip bgp` command in order for the configuration to take effect.

## bgp four-octet-as-support

Enable 4-byte support for the BGP process.

#### Syntax

`bgp four-octet-as-support`

To disable fast external fallover, use the `no bgp four-octet-as-support` command.

#### Defaults

Disabled (supports 2-byte format)

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON. |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.8.1.0</b>    | Introduced on the S-Series. |
| <b>7.7.1.0</b>    | Introduced on the C-Series. |

#### Usage Information

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp graceful-restart

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

**Syntax** `bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]`

To return to the default, use the `no bgp graceful-restart` command.

**Parameters**

|                                |                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>restart-time seconds</b>    | Enter the keyword <code>restart-time</code> then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is <b>120 seconds</b> . |
| <b>stale-path-time seconds</b> | Enter the keyword <code>stale-path-time</code> then the maximum number of seconds to wait before restarting a peer's stale paths. The default is <b>360 seconds</b> .                          |
| <b>role receiver-only</b>      | Enter the keyword <code>role receiver-only</code> to designate the local router to support graceful restart as a receiver only.                                                                |

**Defaults** as above

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |

**Usage Information** This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp non-deterministic-med

Compare MEDs of paths from different autonomous systems.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bgp non-deterministic-med</code><br><br>To return to the default, use the <code>no bgp non-deterministic-med</code> command.                            |
| <b>Defaults</b>        | Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).                                             |
| <b>Command Modes</b>   | ROUTER BGP                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell EMC Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (<code>no bgp non-deterministic-med</code>), Dell EMC Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.</p> <p>When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the <code>clear ip bgp</code> command to clear existing paths.</p> |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## bgp outbound-optimization

Enables outbound optimization for IBGP peer-group members.

|               |                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>bgp outbound-optimization</code><br><br>To disable outbound optimization, enter the <code>no bgp outbound-optimization</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Defaults</b>          | Enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |                  |                          |                 |                          |

| <b>Usage Information</b> | <p>The updates are sent to all the neighbors in the peer-group and all the neighbors have the same attributes including next-hop.</p> <p>Enabling or disabling outbound optimization dynamically resets all neighbor sessions.</p> <p>When you enable outbound optimization, all peers receive the same update packets. Also, the next-hop address, which is chosen as one of the addresses of the neighbor's reachable interface, is the same for all peers.</p>                |         |             |                  |                          |                 |                          |

## bgp recursive-bgp-next-hop

Enable next-hop resolution through other routes learned by BGP.

| <b>Syntax</b>          | <pre>bgp recursive-bgp-next-hop</pre> <p>To disable next-hop resolution, use the <code>no bgp recursive-bgp-next-hop</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                             |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |             |

| <b>7.2.1.0</b>         | Introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                             |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |             |

## Usage Information

This command is a *knob* to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

## Related Commands

- [clear ip bgp](#) — clear the ip bgp.

# bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

## Syntax

`bgp regex-eval-optz-disable`

To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

## Defaults

Enabled

## Command Modes

ROUTER BGP (conf-router\_bgp)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |
| 7.6.1.0    | Introduced                                |

## Usage Information

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expensive of RP1 processor memory.

## Examples

```
DellEMC(conf-router_bgp)# no bgp regex-eval-optz-disable
DellEMC(conf-router_bgp)# do show ip protocols
Routing Protocol is "ospf 22222"
  Router ID is 2.2.2.2
    Area           Routing for Networks
    51             10.10.10.0/00

Routing Protocol is "bgp 1"
  Cluster Id is set to 10.10.10.0
  Router Id is set to 10.10.10.0
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200

DellEMC(conf-router_bgp)#
```

## Related Commands

- [show ip protocols](#) — view information on all routing protocols enabled and active on the E-Series.

# bgp router-id

Assign a user-given ID to a BGP router.

## Syntax

```
bgp router-id ip-address
```

To delete a user-assigned IP address, use the `no bgp router-id` command.

## Parameters

***ip-address*** Enter an IP address in dotted decimal format to reset only that BGP neighbor.

## Defaults

The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.

**Command Modes** ROUTER BGP

| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

## Usage Information

Peering sessions are reset when you change the router ID of a BGP router.

This command automatically restarts the BGP instance for the configuration to take effect.

## clear ip bgp

Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

### Syntax

```
clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> |  
A.B.C.D {soft {in | out}} | X:X:X:X::X {soft {in | out}} | dampening |  
flap-statistics | ipv4 | ipv6 | peer-group]
```

### Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>*</b>                         | Enter an asterisk ( * ) to reset all BGP sessions.                                                                                                                                                                                                                                                                                                                                |
| <b>&lt;1-4294967295&gt;</b>      | Enter <1-4294967295> to clear peers with the AS number.                                                                                                                                                                                                                                                                                                                           |
| <b>&lt;0.1-65535.65535.5&gt;</b> | Enter <0.1-65535.65535> to clear peers with the AS number in dot format.                                                                                                                                                                                                                                                                                                          |
| <b>A.B.C.D</b>                   | Enter the BGP neighbor address in the A.B.C.D format to clear.                                                                                                                                                                                                                                                                                                                    |
| <b>X:X:X:X::X</b>                | Enter the BGP neighbor address in the X:X:X:X::X format to clear.                                                                                                                                                                                                                                                                                                                 |
| <b>soft</b>                      | (OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.<br><b>NOTE:</b> If you enter the <code>clear ip bgp ip-address soft</code> command, both inbound and outbound policies are reset.                                                                                     |
| <b>in</b>                        | (OPTIONAL) Enter the keyword <code>in</code> to activate only inbound policies.                                                                                                                                                                                                                                                                                                   |
| <b>out</b>                       | (OPTIONAL) Enter the keyword <code>out</code> to activate only outbound policies.<br><b>NOTE:</b> You must execute the <code>clear ip bgp soft out</code> command when ever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer's route refresh messages. |
| <b>dampening</b>                 | Enter the keyword <code>dampening</code> to clear the flap dampening information.                                                                                                                                                                                                                                                                                                 |
| <b>flap-statistics</b>           | Enter the keywords <code>flap-statistics</code> to clear the flap statistics information.                                                                                                                                                                                                                                                                                         |
| <b>ipv4</b>                      | Enter the ipv4 address family to clear.                                                                                                                                                                                                                                                                                                                                           |
| <b>ipv6</b>                      | Enter the ipv6 address family to clear.                                                                                                                                                                                                                                                                                                                                           |
| <b>peer-group</b>                | Enter the peer-group to clear all members of the peer-group.                                                                                                                                                                                                                                                                                                                      |

|-------------------|---------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                       |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                 |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                     |
| <b>9.7(0.0)</b>   | Added the <code>ipv4 multicast</code> and <code>ipv6 unicast</code> parameters. |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                        |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.8.1.0 | Introduced on the S-Series. |
| 7.7.1.0 | Introduced on the C-Series. |

#### Usage Information

After you enter this command, the software deletes the history routes and returns the suppressed routes to the Active state.

The `clear ip bgp dampening` command does not clear the history paths.

## clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

#### Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast]
[flap-statistics [ipv4-address mask | ipv6-address mask] | filter-list as-
path-name | regexp regular-expression]
```

#### Parameters

- |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4-address mask</b>         | (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ipv6-address mask</b>         | (OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>filter-list as-path-name</b>  | (OPTIONAL) Enter the keywords <code>filter-list</code> then the name of a configured AS-PATH list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>regexp regular-expression</b> | <p>(OPTIONAL) Enter the keyword <code>regexp</code> then regular expressions. Use one or a combination of the following:</p> <ul style="list-style-type: none"> <li>• <code>.</code> = (period) any single character (including a white space).</li> <li>• <code>*</code> = (asterisk) the sequences in a pattern (0 or more sequences).</li> <li>• <code>+</code> = (plus) the sequences in a pattern (1 or more sequences).</li> <li>• <code>?</code> = (question mark) sequences in a pattern (either 0 or 1 sequences).</li> </ul> <p> <b>NOTE:</b> Enter an escape sequence (CTRL+v) prior to entering the <code>?</code> regular expression.</p> <ul style="list-style-type: none"> <li>• <code>[ ]</code> = (brackets) a range of single-character patterns.</li> <li>• <code>( )</code> = (parenthesis) groups a series of pattern elements to a single element.</li> <li>• <code>{ }</code> = (braces) minimum and the maximum match count.</li> <li>• <code>^</code> = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.</li> <li>• <code>\$</code> = (dollar sign) the end of the output string.</li> </ul> |

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version           | Description                                           |
|-------------------|-------------------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                           |
| <b>9.7(0.0)</b>   | Added the ipv4 multicast and ipv6 unicast parameters. |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                              |
| <b>9.0.2.0</b>    | Introduced on the S6000.                              |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                             |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                              |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                           |
| <b>7.7.1.0</b>    | Introduced on the C-Series.                           |

**Usage Information** If you enter the `clear ip bgp flap-statistics` command without any parameters, all statistics are cleared.

**Related Commands**

- [show debugging](#) — view the enabled debugging operations.
- [show ip bgp flap-statistics](#) — view the BGP flap statistics.
- [undebug all](#) — disable all debugging operations.

## clear ip bgp peer-group

Reset a peer-group's BGP sessions.

**Syntax** `clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast | unicast] | ipv6 unicast] [soft {in | out}]`

**Parameters**

**peer-group-name** Enter the peer group name to reset the BGP sessions within that peer group.

**ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to reset ipv4 multicast routes.

**ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to reset ipv4 unicast routes.

**ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to reset ipv6 unicast routes.

**soft** (OPTIONAL) Enter the keyword `soft` to reset soft configuration.

**in** Enter the keyword `in` to re-configure soft inbound updates.

**out** Enter the keyword `out` to re-configure soft outbound updates.

| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |

| Version           | Description                                           |
|-------------------|-------------------------------------------------------|
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                           |
| <b>9.7(0.0)</b>   | Added the ipv4 multicast and ipv6 unicast parameters. |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                              |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                             |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                              |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                           |
| <b>7.7.1.0</b>    | Introduced on the C-Series.                           |

## debug ip bgp

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

**Syntax** `debug ip bgp [ vrf vrf-name | A.B.C.D | X:X:X:X::X | peer-group peer-group-name] [in | out]`

To disable all BGP debugging, use the `no debug ip bgp` command.

|                   |                                   |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf vrf-name</b>               | Enter the keyword <code>vrf</code> and then the name of the VRF to debug BGP information corresponding to that VRF.<br> <b>NOTE:</b> Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF. |
|                   | <b>A.B.C.D</b>                    | Enter the IPv4 address of the neighbor in dotted decimal format.                                                                                                                                                                                                                                                                  |
|                   | <b>X:X:X:X::X</b>                 | (OPTIONAL) Enter an IPv6 address.                                                                                                                                                                                                                                                                                                 |
|                   | <b>peer-group peer-group-name</b> | Enter the keywords <code>peer-group</code> then the name of the peer group to debug.                                                                                                                                                                                                                                              |
|                   | <b>in</b>                         | (OPTIONAL) Enter the keyword <code>in</code> to view only information on inbound BGP routes.                                                                                                                                                                                                                                      |
|                   | <b>out</b>                        | (OPTIONAL) Enter the keyword <code>out</code> to view only information on outbound BGP routes.                                                                                                                                                                                                                                    |
|                   | <b>A.B.C.D</b>                    | Enter the IP address of peer in the A.B.C.D format.                                                                                                                                                                                                                                                                               |
|                   | <b>X:X:X:X::X</b>                 | Enter the IPv6 IP address of peer in the X:X:X:X::X format.                                                                                                                                                                                                                                                                       |
|                   | <b>dampening</b>                  | Enter the keyword <code>dampening</code> to view BGP dampening.                                                                                                                                                                                                                                                                   |
|                   | <b>events</b>                     | Enter the keyword <code>events</code> to view BGP protocol events.                                                                                                                                                                                                                                                                |
|                   | <b>ipv4</b>                       | Enter the ipv4 IP address to view the IPV4 route information.                                                                                                                                                                                                                                                                     |
|                   | <b>ipv6</b>                       | Enter the ipv6 IP address to view the IPV6 route information.                                                                                                                                                                                                                                                                     |
|                   | <b>keepalives</b>                 | Enter the keyword <code>keepalives</code> to view BGP keepalives.                                                                                                                                                                                                                                                                 |
|                   | <b>notifications</b>              | Enter the keyword <code>notifications</code> to view BGP notifications.                                                                                                                                                                                                                                                           |
|                   | <b>soft-reconfiguration</b>       | Enter the keywords <code>soft-reconfiguration</code> to view only information on inbound BGP soft reconfiguration.                                                                                                                                                                                                                |

**updates** Enter the keyword `updates` to view BGP updates.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.4.(0.0)  | Added support for VRF.                    |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |

**Usage Information** To view information on both incoming and outgoing routes, do not include the `in` and `out` parameters in the debugging command. The `in` and `out` parameters cancel each other; for example, if you enter the `debug ip bgp in` command and then enter the `debug ip bgp out` command, you do not see information on the incoming routes.

Entering a `no debug ip bgp` command removes all configured debug commands for BGP.

- Related Commands**
- [debug ip bgp events](#) — view information about BGP events.
  - [debug ip bgp keepalives](#) — view information about BGP keepalives.
  - [debug ip bgp notifications](#) — view information about BGP notifications.
  - [debug ip bgp updates](#) — view information about BGP updates.
  - [show debugging](#) — view enabled debugging operations.

## debug ip bgp dampening

View information on routes being dampened.

**Syntax** `debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening`

To disable debugging, use the `no debug ip bgp dampening` command.

**Parameters** **vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to view information on dampened routes corresponding to that VRF.

|                       |                                                                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4 multicast</b> | (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes. |
| <b>ipv4 unicast</b>   | (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 unicast routes.   |
| <b>ipv6 unicast</b>   | (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.     |

**Command Modes** EXEC Privilege

| <b>7.7.1.0</b>    | Introduced on the C-Series.                    |
| <b>7.6.1.0</b>    | Introduced IPv6 MGBP support for the E-Series. |

## debug ip bgp events

Display information on local BGP state changes and other BGP events.

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]` command.

|                   |                                   |                                                                                                                                       |
|-------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf vrf-name</b>               | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display BGP state changes corresponding to that VRF. |
|                   | <b>A.B.C.D</b>                    | (OPTIONAL) Enter the IPv4 address of the neighbor.                                                                                    |
|                   | <b>X:X:X:X::X</b>                 | (OPTIONAL) Enter an IPv6 address.                                                                                                     |
|                   | <b>peer-group peer-group-name</b> | (OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.                                                 |
|                   | <b>in</b>                         | (OPTIONAL) Enter the keyword <code>in</code> to view only events on inbound BGP messages.                                             |

**out** (OPTIONAL) Enter the keyword `out` to view only events on outbound BGP messages.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp keepalives

Display information about BGP keepalive messages.

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]`

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]` command.

**Parameters**

|                                   |                                                                                         |
|-----------------------------------|-----------------------------------------------------------------------------------------|
| <b>A.B.C.D</b>                    | (OPTIONAL) Enter the IPv4 address of the neighbor.                                      |
| <b>X:X:X:X::X</b>                 | (OPTIONAL) Enter an IPv6 address.                                                       |
| <b>peer-group peer-group-name</b> | (OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.   |
| <b>in</b>                         | (OPTIONAL) Enter the keyword <code>in</code> to view only inbound keepalive messages.   |
| <b>out</b>                        | (OPTIONAL) Enter the keyword <code>out</code> to view only outbound keepalive messages. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                           |
|------------|-------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.             |

| 7.8.1.0    | Introduced on the S-Series.                           |
| 7.7.1.0    | Introduced on the C-Series.                           |

#### Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

#### Syntax

```
debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name]
notifications [in | out]
```

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

#### Parameters

|                                   |                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------|
| <b>A.B.C.D</b>                    | (OPTIONAL) Enter the IPv4 address of the neighbor.                                              |
| <b>X:X:X:X::X</b>                 | (OPTIONAL) Enter an IPv6 address.                                                               |
| <b>peer-group peer-group-name</b> | (OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.           |
| <b>in</b>                         | (OPTIONAL) Enter the keyword <code>in</code> to view BGP notifications received from neighbors. |
| <b>out</b>                        | (OPTIONAL) Enter the keyword <code>out</code> to view BGP notifications sent to neighbors.      |

**Command Modes** EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Added ipv6 support.         |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.8.1.0</b>    | Introduced on the S-Series. |
| <b>7.7.1.0</b>    | Introduced on the C-Series. |

#### Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp soft-reconfiguration

Enable soft-reconfiguration debug.

#### Syntax

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration
```

To disable, use the `debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration` command.

#### Parameters

|                        |                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------|
| <b>A.B.C.D</b>         | (OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.                          |
| <b>X:X:X:X::X</b>      | (OPTIONAL) Enter an IPv6 address.                                                                    |
| <b>peer-group-name</b> | (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.. |

#### Defaults

Disabled

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Added support for VRF.                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |
| 7.2.1.0  | Introduced.                 |

#### Usage Information

This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

## debug ip bgp updates

Allows you to view information about BGP updates.

#### Syntax

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]` command.

#### Parameters

|                                     |                                                                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                 | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view BGP updates information corresponding to that VRF.                                                     |
| <b>A.B.C.D</b>                      | (OPTIONAL) Enter an IPv4 address of the neighbor.                                                                                                                                            |
| <b>X:X:X:X::X</b>                   | (OPTIONAL) Enter an IPv6 address.                                                                                                                                                            |
| <b>peer-group peer-group-name</b>   | (OPTIONAL) Enter the keyword <code>peer-group</code> followed by the name of the peer group.                                                                                                 |
| <b>in</b>                           | (OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.                                                                                               |
| <b>out</b>                          | (OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.                                                                                                    |
| <b>prefix-list prefix-list-name</b> | (OPTIONAL) Enter the keyword <code>prefix-list</code> then the name of an established prefix list. If the prefix list is not configured, the default is <b>permit</b> (to allow all routes). |
| <b>ip-address</b>                   | (OPTIONAL) Enter the IP address of the peer neighbor in dotted decimal format.                                                                                                               |
| <b>peer-group-name</b>              | (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.                                                                                          |

| 8.3.7.0    | Introduced on the S4810.    |
| 7.8.1.0    | Introduced on the S-Series. |
| 7.7.1.0    | Introduced on the C-Series. |

#### Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## default-metric

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

#### Syntax

`default-metric number`

To return to the default setting, use the `no default-metric` command.

#### Parameters

***number***

Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.

#### Defaults

0

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description                 |
|---------|-----------------------------|
| 7.8.1.0 | Introduced on the S-Series. |
| 7.7.1.0 | Introduced on the C-Series. |

|                          |                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The <code>default-metric</code> command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.                                                                                                        |
| <b>Related Commands</b>  | <ul style="list-style-type: none"> <li>• <a href="#">bgp always-compare-med</a> — enable comparison of all BGP MED attributes.</li> <li>• <a href="#">redistribute</a> — redistribute routes from other routing protocols into BGP.</li> </ul> |

## deny bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

|                         |                                                                                                                                                                                                                  |                                                                                                                                                               |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>           | <code>deny bandwidth</code><br>To disable this setting, enter the <code>no deny bandwidth</code> command.                                                                                                        |                                                                                                                                                               |
| <b>Parameters</b>       | <b>bandwidth</b>                                                                                                                                                                                                 | Enter the keyword <code>bandwidth</code> to specify extended-community attribute as the matching criteria for denying traffic. The range is from 0 to 102400. |
| <b>Defaults</b>         | N/A                                                                                                                                                                                                              |                                                                                                                                                               |
| <b>Command Modes</b>    | EXTENDED COMMUNITY LIST                                                                                                                                                                                          |                                                                                                                                                               |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.8.1.0     | Introduced on the S-Series.               |
| 7.7.1.0     | Introduced on the C-Series.               |
| pre-7.7.1.0 | Introduced.                               |

## Related Commands

- [router bgp](#) — enter ROUTER mode on the switch.

# maximum-paths

Configure the maximum number of parallel routes (multipath support) BGP supports.

## Syntax

```
maximum-paths {ebgp | ibgp} number
```

To return to the default values, enter the `no maximum-paths` command.

## Parameters

|               |                                                                                          |
|---------------|------------------------------------------------------------------------------------------|
| <b>ebgp</b>   | Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes. |
| <b>ibgp</b>   | Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes. |
| <b>number</b> | Enter a number as the maximum number of parallel paths.                                  |

## Defaults

none

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.                                                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                    |
| <b>8.3.8.0</b>    | Support from 2 to 64 paths on the S4810. Command syntax changed to <code>max-path</code> (was <code>maximum-paths</code> ). |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                                    |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                                                                                                 |
| <b>7.7.1.0</b>    | Introduced on the C-Series.                                                                                                 |

#### Usage Information

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## neighbor activate

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

|                        |                                                                                                                                                                                                                                                                                                                          |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |

## Usage Information

By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use `activate` in the new context, the neighbor/peer group enables for AFI/SAFI. It is possible to activate or de-activate a peer from the IPv4/IPv6 unicast address family.

**NOTE:** The `no neighbor peer ip-address activate` command takes precedence over the `no neighbor peer-group-name activate` command.

The following tables list the neighbor activation and its expected results for IPv4 and IPv6 address families:

**Table 1. Neighbor activation and update status for peers activated for IPv4 address family**

| S.No | Peer – IPv4 address family | Peer group  | Update status for IPv4 prefixes |
|------|----------------------------|-------------|---------------------------------|
| 1.   | Activate                   | Activate    | Send Updates                    |
| 2.   | Activate                   | No-Activate | Send Updates                    |
| 3.   | No-Activate                | Activate    | Stop Updates                    |
| 4.   | No-Activate                | No-Activate | Stop Updates                    |

**Table 2. Neighbor activation and update status for peers activated for IPv6 unicast address family**

| S.No | Peer– IPv6 unicast address family | Peer group  | Update status for IPv6 prefixes |
|------|-----------------------------------|-------------|---------------------------------|
| 1.   | Activate                          | Activate    | Send Updates                    |
| 2.   | Activate                          | No-Activate | Send Updates                    |
| 3.   | No-Activate                       | Activate    | Send Updates                    |
| 4.   | No-Activate                       | No-Activate | Stop Updates                    |

## neighbor add-path

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

**Syntax** `neighbor [ip-address | peer-group-name] add-path [send | receive | both] path-count`

**Parameters**

- ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** (OPTIONAL) Enter the name of the peer group.
- send** Enter the keyword `send` to indicate that the system sends multiple paths to peers.

|                         |                                                                                                                                                                                                                        |                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|                         | <b>receive</b>                                                                                                                                                                                                         | Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.        |
|                         | <b>both</b>                                                                                                                                                                                                            | Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers. |
|                         | <b><i>path-count</i></b>                                                                                                                                                                                               | Enter the number paths supported. | 7.7.1.0    | Introduced on the C-Series.               |

## neighbor advertisement-start

To send BGP routing updates, set the minimum interval before starting.

|                        |                                                                                                                                                               |                                                                                                                          |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>neighbor {ip-address} advertisement-start seconds</code>                                                                                                |                                                                                                                          |
|                        | To return to the default value, use the <code>no neighbor {ip-address} advertisement-start</code> command.                                                    |                                                                                                                          |
| <b>Parameters</b>      | <b><i>ip-address</i></b>                                                                                                                                      | (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.                                                |
|                        | <b><i>seconds</i></b>                                                                                                                                         | Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds. |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                                                                                          |

| 7.8.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |

## neighbor allowas-in

Set the number of times an AS number can occur in the AS path.

**Syntax** `neighbor {ip-address | peer-group-name} allowas-in number`  
 To return to the default value, use the `no neighbor {ip-address | peer-group-name} allowas-in` command.

**Parameters**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.                             |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group to set the advertisement interval for all routers in the peer group. |
| <b><i>number</i></b>          | Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.      |

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |

| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |

**Usage Information** You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

**Related Commands**

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor default-originate

Inject the default route to a BGP peer or neighbor.

**Syntax** `neighbor {ip-address | peer-group-name} default-originate [route-map map-name]`

To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-originate` command.

**Parameters**

|                                  |                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>         | (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.                    |
| <b><i>peer-group-name</i></b>    | Enter the name of the peer group to set the default route of all routers in that peer group. |
| <b><i>route-map map-name</i></b> | (OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map. |

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 7.8.1.0    | Introduced on the S-Series.               |
| 7.7.1.0    | Introduced on the C-Series.               |

**Usage Information** If you apply a route map to a BGP peer or neighbor with the `neighbor default-originate` command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the `neighbor default-originate` command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.

When you apply a default route to a BGP peer or peer group using the `neighbor default-originate` command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the `clear ip bgp` command.

In case of eBGP, the `neighbor default-originate` command does not support *extended-community* as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the `neighbor default-originate` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor default-originate` command.

## neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

|                        |                                                                                                                                                                                        |                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Syntax</b>          | <code>neighbor {ip-address   peer-group-name} description text</code><br>To delete a description, use the <code>no neighbor {ip-address   peer-group-name} description</code> command. |                                                                |
| <b>Parameters</b>      | <b><i>ip-address</i></b>                                                                                                                                                               | Enter the IP address of the neighbor in dotted decimal format. |
|                        | <b><i>peer-group-name</i></b>                                                                                                                                                          | Enter the name of the peer group.                              |

| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

## neighbor distribute-list

Distribute BGP information via an established prefix list.

|               |                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>neighbor {ip-address   peer-group-name} distribute-list prefix-list-name {in   out}</code> |
|---------------|--------------------------------------------------------------------------------------------------|

To delete a neighbor distribution list, use the `no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}` command.

#### Parameters

|                                |                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>       | Enter the IP address of the neighbor in dotted decimal format.                                                                             |
| <b><i>peer-group-name</i></b>  | Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.                                     |
| <b><i>prefix-list-name</i></b> | Enter the name of an established prefix list.<br>If the prefix list is not configured, the default is <b>permit</b> (to allow all routes). |
| <b>in</b>                      | Enter the keyword <code>in</code> to distribute only inbound traffic.                                                                      |
| <b>out</b>                     | Enter the keyword <code>out</code> to distribute only outbound traffic.                                                                    |

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the S-Series.               |
| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

#### Usage Information

Other BGP filtering commands include: `neighbor filter-list`, `ip as-path access-list`, and `neighbor route-map`.

#### Related Commands

- [neighbor route-map](#) — assign a route map to a neighbor or peer group.

## neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

#### Syntax

```
neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]
```

To disallow and disconnect connections, use the `no neighbor {ip-address | peer-group-name} ebgp-multihop` command.

#### Parameters

|                               |                                                                |
|-------------------------------|----------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the neighbor in dotted decimal format. |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group.                              |

**ttl** (OPTIONAL) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is **255**.

**Defaults** Disabled.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the S-Series.               |
| <b>7.7.1.0</b>    | Introduced on the C-Series.               |

**Usage Information** To prevent loops, the `neighbor ebgp-multihop` command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

## neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

**Syntax** `neighbor {ipv4-address | peer-group-name} fall-over`  
To disable, use the `no neighbor {ipv4-address | peer-group-name} fall-over` command.

**Parameters** **ipv4-address** Enter the IP address of the neighbor in dotted decimal format.  
**peer-group-name** Enter the name of the peer group.

**Defaults** Disabled.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |

| Version          | Description                              |
|------------------|------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.              |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.              |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.              |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>   | Introduced on the S6000.                 |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>   | Introduced on the S4810.                 |
| <b>7.8.1.0</b>   | Introduced on the S-Series.              |
| <b>7.7.1.0</b>   | Introduced on the C-Series.              |
| <b>7.4.1.0</b>   | Introduced                               |

#### Usage Information

When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

#### Related Commands

- [show ip bgp neighbors](#) — display information on the BGP neighbors.

## neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

#### Syntax

```
neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} local-as` command.

#### Parameters

|                               |                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the neighbor in dotted decimal format.                                                                                                                    |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group to set the advertisement interval for all routers in the peer group.                                                                             |
| <b><i>as-number</i></b>       | Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format). |
| <b>no prepend</b>             | Specifies that local AS values do not prepend to announcements from the neighbor.                                                                                                 |

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.8.1.0</b>    | Introduced on the S-Series. |
| <b>7.7.1.0</b>    | Introduced on the C-Series. |

#### Usage Information

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.

#### Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor maximum-prefix

Control the number of network prefixes received.

#### Syntax

```
neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold]
[warning-only]
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} maximum-prefix maximum` command.

#### Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the neighbor in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>maximum</i></b>         | Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>threshold</i></b>       | (OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is <b>75</b> .                                                                                                                                                                                                                                                                                                   |
| <b><i>warning-only</i></b>    | (OPTIONAL) Enter the keyword <code>warning-only</code> to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.<br><div>  <b>NOTE:</b> When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives. </div> |

#### Defaults

threshold = **75**

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                     |
|------------|---------------------------------|
| 9.10(0.0)  | Introduced on the S3148.        |
| 9.10(0.0)  | Introduced on the S6100-ON.     |
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.0    | Introduced on the S4810.        |
| 7.8.1.0    | Introduced on the S-Series.     |
| 7.7.1.0    | Introduced on the C-Series.     |

#### Usage Information

If you configure the `neighbor maximum-prefix` command and the neighbor receives more prefixes than the `neighbor maximum-prefix` command configuration allows, the neighbor goes down and the `show ip bgp summary` command displays (prfxd) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the `clear ip bgp` command for the neighbor or the peer group to which the neighbor belongs or you enter the `neighbor shutdown` and `neighbor no shutdown` commands.

#### Related Commands

- [show ip bgp summary](#) — display the current BGP configuration.

## neighbor password

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

#### Syntax

```
neighbor {ip-address | peer-group-name} password [encryption-type] password
```

To delete a password, use the `no neighbor {ip-address | peer-group-name} password` command.

#### Parameters

|                               |                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the router to be included in the peer group.                                                                              |
| <b><i>peer-group-name</i></b> | Enter the name of a configured peer group.                                                                                                        |
| <b><i>encryption-type</i></b> | (OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.                            |
| <b><i>password</i></b>        | Enter a text string up to 80 characters long. The first character of the password must be a letter.<br><br>You cannot use spaces in the password. |

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| <b>7.8.1.0</b>    | Introduced on the S-Series.     |
| <b>7.7.1.0</b>    | Introduced on the C-Series.     |

#### Usage Information

This command automatically restarts the neighbor session for the configuration to take effect.

Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the `peer-group-name` parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]
:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from
[peer's IP address] : 11502 to [local router's IP address] :179
```

## neighbor peer-group (assigning peers)

Allows you to assign one peer to an existing peer group.

#### Syntax

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.

To disable dmzlink-dw for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

#### Parameters

- ip-address*** Enter the IP address of the router to be included in the peer group.
- peer-group-name*** Enter the name of a configured peer group.

## dmzlink-bw

Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

**NOTE:** If `dmzlink-bw` is configured for a peer, in order for the BGP peer to advertise the prefixes with `dmzlink-bw` attached to it, you must reset the peer or peer-group using the `clear ip bgp session` command.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                  |
|------------|----------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.    |
| 9.10(0.0)  | Introduced on the S3148.                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                  |
| 9.8(2.0)   | Introduced on the S3100 series.              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                  |
| 9.7(0.0)   | Added the <code>dmzlink-bw</code> parameter. |
| 9.2(1.0)   | Introduced on the Z9500.                     |
| 9.0.2.0    | Introduced on the S6000.                     |
| 8.3.19.0   | Introduced on the S4820T.                    |
| 8.3.11.1   | Introduced on the Z9000.                     |
| 8.3.7.0    | Introduced on the S4810.                     |
| 7.8.1.0    | Introduced on the S-Series.                  |
| 7.7.1.0    | Introduced on the C-Series.                  |

**Usage Information** You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group's configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- [neighbor advertisement-interval](#)
- [neighbor distribute-list](#)
- [neighbor route-map](#)
- [neighbor route-reflector-client](#)

if a neighbor's configuration is more specific than its peer group's configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor's configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the remote-as for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

## Related Commands

- [clear ip bgp](#) — reset BGP sessions.
- [neighbor peer-group \(creating group\)](#) — create a peer group.
- [show ip bgp peer-group](#) — view BGP peers.
- [show ip bgp neighbors](#) — view BGP neighbors configurations.

## neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

|                        |                                                                                                                                                               |

## neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

|                      |                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>neighbor peer-group-name peer-group passive [ sessions]</code><br>To delete a passive peer-group, use the <code>no neighbor peer-group-name peer-group passive</code> command. |
| <b>Parameters</b>    | <b>peer-group-name</b> Enter a text string up to 16 characters long as the name of the peer group.                                                                                   |
| <b>Defaults</b>      | Not configured.                                                                                                                                                                      |
| <b>Command Modes</b> | ROUTER BGP                                                                                                                                                                           |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |

| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.2(1.0)   | Introduced on the Z9500.                                |
| 9.0.2.0    | Introduced on the S6000.                                |
| 8.3.19.0   | Introduced on the S4820T.                               |
| 8.3.11.1   | Introduced on the Z9000.                                |
| 8.3.8.0    | Introduced the <code>limit</code> keyword on the S4810. |
| 8.3.7.0    | Introduced on the S4810.                                |
| 7.8.1.0    | Introduced on the S-Series.                             |
| 7.7.1.0    | Introduced on the C-Series.                             |

## Usage Information

After you configure a peer group as passive, assign it a subnet using the `neighbor soft-reconfiguration inbound` command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

## Related Commands

- [neighbor soft-reconfiguration inbound](#) — assign a subnet to a dynamically configured BGP neighbor.
- [neighbor remote-as](#) — assign an indirectly connected AS to a neighbor or peer group.

# neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

## Syntax

```
neighbor {ip-address | peer-group-name} remote-as number
```

To delete a remote AS entry, use the `no neighbor {ip-address | peer-group-name} remote-as number` command.

## Parameters

|                               |                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the neighbor to enter the remote AS in its routing table.                                 |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group. |
| <b><i>number</i></b>          | Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).                 |

## Defaults

Not configured.

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                       |
|-------------------|---------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.         |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                          |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                       |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                   |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                       |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                       |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                       |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                       |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                          |
| <b>8.3.7.0</b>    | Introduced on the S4810.                          |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                       |
| <b>7.7.1.0</b>    | Introduced on the C-Series. Added 4-byte support. |

#### Usage Information

To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the `number` parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (Shutdown).

This command automatically restarts the neighbor session for the configuration to take effect.

#### Related Commands

- [router bgp](#) — enter ROUTER BGP mode and configures routes in an AS.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

## neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

#### Syntax

```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

#### Parameters

- ip-address*** Enter the IP address of the neighbor to remove the private AS numbers.
- peer-group-name*** Enter the name of the peer group to remove the private AS numbers.

#### Defaults

Disabled (that is, private AS number are not removed).

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version           | Description                                       |
|-------------------|---------------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                       |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                       |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                       |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                          |
| <b>9.0.2.0</b>    | Introduced on the S6000.                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                          |
| <b>8.3.7.0</b>    | Introduced on the S4810.                          |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                       |
| <b>7.7.1.0</b>    | Introduced on the C-Series. Added 4-byte support. |

#### Usage Information

Applies to EBGp neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGp neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

## neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

#### Syntax

```
neighbor {ip-address | peer-group-name} route-map map-name {in | out}
```

To remove the route map, use the `no neighbor {ip-address | peer-group-name} route-map map-name {in | out}` command.

#### Parameters

|                               |                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the neighbor in dotted decimal format.                                                                      |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group.                                                                                                   |
| <b><i>map-name</i></b>        | Enter the name of an established route map.<br>If the Route map is not configured, the default is <b>deny</b> (to drop all routes). |
| <b>in</b>                     | Enter the keyword <code>in</code> to filter inbound routes.                                                                         |
| <b>out</b>                    | Enter the keyword <code>out</code> to filter outbound routes.                                                                       |

 **NOTE:** This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.3.7.0</b>    | Introduced on the S4810.        |
| <b>7.8.1.0</b>    | Introduced on the S-Series.     |
| <b>7.7.1.0</b>    | Introduced on the C-Series.     |

#### Usage Information

When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.

If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

## neighbor route-reflector-client

Configure the router as a route reflector and the specified neighbors as members of the cluster.

#### Syntax

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

#### Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group.  
All routers in the peer group receive routes from a route reflector.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000–ON. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.7.1.0</b>  | Introduced on the C-Series. |

## Usage Information

A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need not to be fully meshed. By default, when you use `no route reflector`, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the `no neighbor route-reflector-client` command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the `no bgp client-to-client reflection` command.

This command automatically restarts the neighbor session for the configuration to take effect.

## Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and the clients.

# neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

## Syntax

```
neighbor {ip-address | peer-group-name} send-community [extended | standard]
```

To disable sending a COMMUNITY attribute, use the `no neighbor {ip-address | peer-group-name} send-community` command.

## Parameters

|                               |                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>      | Enter the IP address of the peer router in dotted decimal format.                                    |
| <b><i>peer-group-name</i></b> | Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group. |
| <b>extended</b>               | (OPTIONAL) Enter the keyword <code>extended</code> to send extended community attribute.             |
| <b>standard</b>               | (OPTIONAL) Enter the keyword <code>standard</code> to send standard community attribute.             |

## Defaults

Not configured and COMMUNITY attributes are not sent to neighbors.

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |

| Version                | Description                     |
|------------------------|---------------------------------|
| <b>9.10(0.0)</b>       | Introduced on the S6100-ON.     |
| <b>9.8(2.0)</b>        | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>        | Introduced on the Z9100-ON.     |
| <b>9.8(0.0P5)</b>      | Introduced on the S4048-ON.     |
| <b>9.8(0.0P2)</b>      | Introduced on the S3048-ON.     |
| <b>9.7(0.0)</b>        | Introduced on the S6000-ON.     |
| <b>9.2(1.0)</b>        | Introduced on the Z9500.        |
| <b>Version 9.0.2.0</b> | Introduced on the S6000.        |
| <b>8.3.11.1</b>        | Introduced on the Z9000.        |
| <b>7.8.1.0</b>         | Introduced on the S-Series.     |
| <b>7.7.1.0</b>         | Introduced on the C-Series.     |

#### Usage Information

To configure a COMMUNITY attribute, use the `set community` command in ROUTE-MAP mode.

In order that settings corresponding to the `neighbor send-community` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor send-community` command.

If you do not set any of the optional parameters (standard or extended), then both standard as well as extended attributes are sent. If you set either the standard or extended parameter, only the attribute that is specified is sent.

## neighbor shutdown

Disable a BGP neighbor or peer group.

#### Syntax

`neighbor {ip-address | peer-group-name} shutdown`

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name}no shutdown` command.

#### Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group to disable or enable all routers within the peer group.

#### Defaults

Enabled (that is, BGP neighbors and peer groups are disabled.)

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
