| <b>Usage Information</b> | Although the passive interface does not send or receive routing updates, the network on that interface still includes in RIP updates sent using other interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                          |          |                          |          |                           |          |                          |         |                                                      |         |                          |         |                             |         |                             |         |                             |

| <b>Parameters</b> | <b>tag</b>                                                                                                                                                                                                                                                                          | (OPTIONAL) Enter the name of the IS-IS routing process.                                                        |
|                   | <b>level-1</b>                                                                                                                                                                                                                                                                      | (OPTIONAL) Enter the keywords <code>level-1</code> to redistribute only IS-IS Level-1 routes.                  |
|                   | <b>level-1-2</b>                                                                                                                                                                                                                                                                    | (OPTIONAL) Enter the keywords <code>level-1-2</code> to redistribute both IS-IS Level-1 and Level-2 routes.    |
|                   | <b>level-2</b>                                                                                                                                                                                                                                                                      | (OPTIONAL) Enter the keywords <code>level-2</code> to redistribute only IS-IS Level-2 routes.                  |
|                   | <b>metric metric-value</b>                                                                                                                                                                                                                                                          | (OPTIONAL) Enter the keyword <code>metric</code> then a number as the metric value. The range is from 0 to 16. |

**route-map *map-name*** (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 6.2.1.1  | Introduced on the E-Series. |

## redistribute ospf

Redistribute routing information from an OSPF process.

### C9000 Series

**Syntax** `redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]`

To disable redistribution, use the `no redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]` command.

**Parameters**

|                                   |                                                                                                                                                                    |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>          | Enter a number that corresponds to the OSPF process ID to redistribute. The range is from 1 to 65355.                                                              |
| <b>match external {1   2}</b>     | (OPTIONAL) Enter the keywords <code>match external</code> then the numbers 1 or 2 to indicate that external 1 routes or external 2 routes should be redistributed. |
| <b>match internal</b>             | (OPTIONAL) Enter the keywords <code>match internal</code> to indicate that internal routes should be redistributed.                                                |
| <b>metric <i>metric-value</i></b> | (OPTIONAL) Enter the keyword <code>metric</code> then a number as the metric value. The range is from 0 to 16.                                                     |
| <b>route-map <i>map-name</i></b>  | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of a configured route map.                                                                      |

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.2(1.0) | Introduced on the Z9500. |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

## router rip

To configure and enable RIP, enter ROUTER RIP mode.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>router rip</pre> <p>To disable RIP, use the <code>no router rip</code> command.</p>                                                                                                                                                                        |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                   |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

|                          |                                                                                 |
|--------------------------|---------------------------------------------------------------------------------|
| <b>Usage Information</b> | To enable RIP, assign a network address using the <code>network</code> command. |
|--------------------------|---------------------------------------------------------------------------------|

|                |                                                         |
|----------------|---------------------------------------------------------|
| <b>Example</b> | <pre>Dell(conf)#router rip Dell(conf-router_rip)#</pre> |
|----------------|---------------------------------------------------------|

|                         |                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <p><a href="#">network</a> — enables RIP.</p> <p><a href="#">exit</a> — returns to CONFIGURATION mode.</p> |
|-------------------------|------------------------------------------------------------------------------------------------------------|

# show config

Display the changes you made to the RIP configuration. The default values are not shown.

## C9000 Series

**Syntax** `show config`

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

### Example

```
Dell(conf-router_rip)#show config
!
router rip
 network 172.31.0.0
 passive-interface TenGigabitEthernet 0/1
Dell(conf-router_rip)#
```

# show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

## C9000 Series

**Syntax** `show ip rip database [ip-address mask]`

**Parameters**

|                   |                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-address</b> | (OPTIONAL) Specify an IP address in dotted decimal format to view RIP information on that network only. If you enter an IP address, also enter a mask for that IP address. |
| <b>mask</b>       | (OPTIONAL) Specify a mask, in /network format, for the IP address.                                                                                                         |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

#### Usage Information

The following describes the `show ip rip database` command shown in the following example.

| Field                                         | Description                                                   |
|-----------------------------------------------|---------------------------------------------------------------|
| <b>Total number of routes in RIP database</b> | Displays the number of RIP routes stored in the RIP database. |
| <b>100.10.10.0/24 directly connected</b>      | Lists the routes directly connected.                          |
| <b>150.100.0.0 redistributed</b>              | Lists the routes learned through redistribution.              |
| <b>209.9.16.0/24...</b>                       | Lists the routes and the sources advertising those routes.    |

#### Example

```
Dell#show ip rip database
Total number of routes in RIP database: 1624
204.250.54.0/24
 [50/1] via 192.14.1.3, 00:00:12, TenGigabitEthernet 0/15
204.250.54.0/24 auto-summary
203.250.49.0/24
 [50/1] via 192.13.1.3, 00:00:12, TenGigabitEthernet 0/14
203.250.49.0/24 auto-summary
210.250.40.0/24
 [50/2] via 1.1.18.2, 00:00:14, Vlan 18
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
210.250.40.0/24 auto-summary
207.250.53.0/24
 [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
 [50/2] via 1.1.10.2, 00:00:18, Vlan 10
207.250.53.0/24 auto-summary
208.250.42.0/24
 [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
 [50/2] via 1.1.10.2, 00:00:18, Vlan 10
208.250.42.0/24 auto-summary
```

## show running-config rip

Display the current RIP configuration.

### C9000 Series

**Syntax**            `show running-config rip`

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.8.1.0</b>  | Introduced on the S-Series. |
| <b>7.7.1.0</b>  | Introduced on the C-Series. |
| <b>7.6.1.0</b>  | Introduced on the E-Series. |

#### Example

```
show running-config rip
!
router rip
 distribute-list Test1 in
 distribute-list Test21 out
 network 10.0.0.0
 passive-interface TenGigabitEthernet 2/0
 neighbor 20.20.20.20
 redistribute ospf 999
 version 2
```

## timers basic

Manipulate the RIP timers for routing updates, invalid, holddown times, and flush time.

### C9000 Series

|               |                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>timers basic update <i>invalid holddown flush</i></pre> <p>To return to the default settings, use the <code>no timers basic</code> command.</p> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                        |                                                                                                                                                                                                                                                                                                                               |
|-------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>update</i></b>   | Enter the number of seconds to specify the rate at which RIP routing updates are sent. The range is from zero (0) to 4294967295. The default is <b>30 seconds</b> .                                                                                                                                                           |
|                   | <b><i>invalid</i></b>  | Enter the number of seconds to specify the time interval before routing updates are declared invalid or expired. The invalid value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> .                                                       |
|                   | <b><i>holddown</i></b> | Enter the number of seconds to specify a time interval during which the route is marked as unreachable but still sending RIP packets. The holddown value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> .                                 |
|                   | <b><i>flush</i></b>    | Enter the number of seconds to specify the time interval during which the route is advertised as unreachable. When this interval expires, the route is flushed from the routing table. The flush value should be greater than the update value. The range is from zero (0) to 4294967295. The default is <b>240 seconds</b> . |

| <b>Defaults</b>          | <ul style="list-style-type: none"> <li>• update = <b>30 seconds</b></li> <li>• invalid = <b>180 seconds</b></li> <li>• holddown = <b>180 seconds</b></li> <li>• flush = <b>240 seconds</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## Role-Based Access Control Commands

With Role-Based Access Control (RBAC), access and authorization is controlled based on a user's role. Users are granted permissions based on their user roles, not on their individual user ID. User roles are created for job functions and through those roles they acquire the permissions to perform their associated job function.

This section describes the syntax and usage of RBAC-specific commands. You can find information on other related security commands in this chapter:

# aaa authorization role-only

Configure authentication to use the user's role only when determining if access to commands is permitted.

## C9000

|                   | 9.5(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Introduced on the Z9000, S6000, S4820T, S4810, and MXL.                                                                                                     |
| Usage Information | <p>By default, access to commands are determined by the user's role (if defined) or by the user's privilege level. If the <code>aaa authorization role-only</code> command is enabled, then only the user's role is used.</p> <p>Before you enable role-based only AAA authorization:</p> <ol style="list-style-type: none"><li>1. Locally define a system administrator user role. This will give you access to login with full permissions even if network connectivity to remote authentication servers is not available.</li><li>2. Configure login authentication on the console. This ensures that all users are properly identified through authentication no matter the access point</li><li>3. Specify an authentication method (RADIUS, TACACS+, or Local).</li><li>4. Specify authorization method (RADIUS, TACACS+ or Local).</li><li>5. Verify the configuration has been applied to the console or VTY line.</li></ol> |                                                                                                                                                             |

## role

Changes command permissions for roles.

## C9000

|            |                                                                                                                                                                 |                                                                                                                                                                                                            |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | <code>role mode { { { addrole   deleterole } role-name }   reset } command</code><br>To delete access to a command, use the <code>no role mode role-name</code> |                                                                                                                                                                                                            |
| Parameters | <b><i>mode</i></b>                                                                                                                                              | Enter one of the following keywords as the mode for which you are controlling access:<br><br>configure for CONFIGURATION mode<br>exec for EXEC mode<br>interface for INTERFACE modes<br>line for LINE mode |

|                         |                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | route-map for Route-map mode                                                                                                                                 |
|                         | router for Router mode                                                                                                                                       |
| <b>addrole</b>          | Enter the keyword <code>addrole</code> to add permission to the command. You cannot add or delete rights for the sysadmin role.                              |
| <b>deleterole</b>       | Enter the keyword <code>deleterole</code> to remove access to the command. You cannot add or delete rights for the sysadmin role.                            |
| <b><i>role-name</i></b> | Enter a text string for the name of the user role up to 63 characters. These are 3 system defined roles you can modify: secadmin, netadmin, and netoperator. |
| <b>reset</b>            | Enter the keyword <code>reset</code> to reset all roles back to default for that command.                                                                    |
| <b>command</b>          | Enter the command's keywords to assign the command to a certain access level. You can enter one or more keywords.                                            |

#### Examples

```
Dell#show role mode configure username
Role access: sysadmin
```

```
Dell#show role mode configure management route
Role access: netadmin, sysadmin

Dell#show role mode configure management crypto-policy
Role access: secadmin, sysadmin
```

## show userroles

Display information on all defined user roles.

| Command History | Version         | Description                                         |
|-----------------|-----------------|-----------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                            |
|                 | <b>9.5(0.0)</b> | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

#### Example

```
Dell#show userroles
Role Inheritance Modes
netoperator
netadmin
secadmin
sysadmin
netoperator
testadmin netadmin
Exec
Exec Config Interface Line Router IP
Route-map Protocol MAC
Exec Config
Exec Config Interface Line Router IP
Route-map Protocol MAC
Exec Config Interface Line Router IP
Route-map Protocol MAC
```

## userrole

Create user roles for the role-based security model.

### C9000

**Syntax** `userrole name inherit existing-role-name`

To delete a role name, use the `no userrole name` command. Note that the reserved role names may not be deleted.

|                   |                                          |                                                                                                                                                             |
|-------------------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>name</i></b>                       | Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator). |
|                   | <b><i>inherit existing-role-name</i></b> | Enter the <code>inherit</code> keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).        |

**Defaults** none

**Command Modes** CONFIGURATION

| Command History | Version         | Description              |
|-----------------|-----------------|--------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version  | Description                                         |
|----------|-----------------------------------------------------|
| 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

#### Usage Information

Instead of using the system defined user roles, you can create a new user role that best matches your organization. When you create a new user role, you first inherit permissions from one of the system defined roles. Otherwise you would have to create a user role from scratch. You then restrict commands or add commands to that role. For information about this topic, See *Modifying Command Permissions for Roles*.

**NOTE:** You can change user role permissions on system pre-defined user roles or user-defined user roles.

#### Important Points to Remember

Consider the following when creating a user role:

- Only the system administrator and user-defined roles inherited from the system administrator can create roles and usernames. Only the system administrator, security administrator, and roles inherited from these can use the `role` command to modify command permissions. The security administrator and roles inherited by security administrator can only modify permissions for commands they already have access to.
- Make sure you select the correct role you want to inherit.

**NOTE:** If you inherit a user role, you cannot modify or delete the inheritance. If you want to change or remove the inheritance, delete the user role and create it again. If the user role is in use, you cannot delete the user role.

## AAA Accounting Commands

AAA Accounting enables tracking of services that users are accessing and the amount of network resources being consumed by those services. When you enable AAA Accounting, the network server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record is comprised of accounting AV pairs and is stored on the access control server.

As with authentication and authorization, you must configure AAA Accounting by defining a named list of accounting methods, and then applying that list to various interfaces.

### aaa accounting

Enable AAA Accounting and create a record for monitoring the accounting function.

#### C9000 Series

##### Syntax

```
aaa accounting {commands {level | role role-name | dot1x | exec | rest |
suppress | system} {name | default} {start-stop | wait-start | stop-only}
{radius | tacacs+}}
```

To disable AAA Accounting, use the `no aaa accounting {commands {level | role role-name | dot1x | exec | rest | suppress | system} {name | default} {start-stop | wait-start | stop-only} {radius | tacacs+} command`.

##### Parameters

|               |                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|
| <b>system</b> | Enter the keyword <code>system</code> to send accounting information of any other AAA configuration.       |
| <b>exec</b>   | Enter the keyword <code>exec</code> to send accounting information when a user has logged in to EXEC mode. |
| <b>dot1x</b>  | Enter the keyword <code>dot1x</code> to send accounting information when a dot1x user has logged in.       |

|                                           |                                                                                                                                                                                                                                                        |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>commands {/level   role role-name}</b> | Enter the keyword <code>command</code> then a privilege level for accounting of commands executed at that privilege level or enter the keyword <code>role</code> then the role name for accounting of commands executed by a user with that user role. |
| <b>dot1x</b>                              | Enter the keyword <code>dot1x</code> for dot1x events.                                                                                                                                                                                                 |
| <b>name   default</b>                     | Enter one of the following: <ul style="list-style-type: none"> <li>For <code>name</code>, enter a user-defined name of a list of accounting methods.</li> <li>For <code>default</code>, the default accounting methods used.</li> </ul>                |
| <b>start-stop</b>                         | Enter the keywords <code>start-stop</code> to send a “start accounting” notice at the beginning of the requested event and a “stop accounting” notice at the end of the event.                                                                         |
| <b>wait-start</b>                         | Enter the keywords <code>wait-start</code> to ensure that the TACACS+ security server acknowledges the start notice before granting the user’s process request.                                                                                        |
| <b>stop-only</b>                          | Enter the keywords <code>stop-only</code> to instruct the TACACS+ security server to send a “stop record accounting” notice at the end of the requested user process.                                                                                  |
| <b>radius</b>                             | Enter the keyword <code>radius</code> to use RADIUS service for exec and dot1x accounting.                                                                                                                                                             |
| <b>tacacs+</b>                            | Enter the keyword <code>tacacs+</code> to use TACACS+ service for accounting.                                                                                                                                                                          |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <b>9.14(1.5)</b> | Added support for RADIUS accounting.                                |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                            |
| <b>9.5(0.1)</b>  | Added support for roles on the Z9500.                               |
| <b>9.5(0.0)</b>  | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                                            |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                            |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                           |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                            |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                         |
| <b>7.5.1.0</b>   | Introduced on the C-Series.                                         |
| <b>6.3.1.0</b>   | Introduced on the E-Series.                                         |

**Usage Information** The `aaa-accounting dot1x default` command enables the default settings for Authentication, Authorization, and Accounting (AAA) dot1x accounting events. The command is disabled by default.

You can choose the `start-stop`, `stop-only` or the `wait-start` option to manage and monitor the dot1x event messages.

In the example below, TACACS+ accounting is used to track all usage of EXEC command and commands on privilege level 15.

Privilege level 15 is the default. If you want to track usage at privilege level 1 for example, use the `aaa accounting command 1` command. If you want to track usage by role name for the `secadmin`, for example, use `aaa accounting command role secadmin`.

## Example

```
Dell(conf)# aaa accounting exec default start-stop tacacs+
Dell(conf)# aaa accounting command 15 default start-stop tacacs+
```

```
Dell(conf)# aaa accounting command role secaadmin default start-stop tacacs+
```

#### Related Commands

- [enable password](#) — changes the password for the enable command.
- [login authentication](#) — enables AAA login authentication on the terminal lines.
- [password](#) — creates a password.
- [tacacs-server host](#) — specifies a TACACS+ server host.

## aaa accounting suppress

Prevent the generation of accounting records of users with the user name value of NULL.

### C9000 Series

#### Syntax

```
aaa accounting suppress null-username
```

To permit accounting records to users with user name value of NULL, use the `no aaa accounting suppress null-username` command.

#### Defaults

Accounting records are recorded for all users.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4280T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.3.1.0  | Introduced on the E-Series. |

#### Usage Information

The system issues accounting records for all users on the system, including users whose username string, due to protocol translation, is NULL. For example, a user who comes on line with the `aaa authentication login method-list none` command is applied. To prevent the accounting records from being generated for sessions that do not have user names associated to them, use the `aaa accounting suppress` command.

## accounting

Apply an accounting method list to terminal lines.

### C9000 Series

#### Syntax

```
accounting {exec | commands {level | role role-name} method-list
```

| Parameters       | <b><i>exec</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Enter the keyword <code>exec</code> to apply an EXEC level accounting method list.                                                                                                                                                              |         |             |                 |                          |                 |                                       |                 |                                                                  |                 |                          |                 |                          |                 |                           |                |                          |                |                             |                |                             |                |                             |

| <b>9.9(0.0)</b>        | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |                 |                          |                 |                                       |
| <b>9.5(0.1)</b>        | Added support for roles on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                                       |

| Version         | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| <b>9.5(0.0)</b> | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                        |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                       |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                        |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                        |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                     |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                     |
| <b>6.3.1.0</b>  | Introduced on the E-Series.                                     |

#### Usage Information

This command steps through all active sessions and then displays the accounting records for the active account functions.

#### Example

```
Dell#show accounting
Active accounted actions on tty2, User guest Priv 1 Role netoperator
Task ID 1, EXEC Accounting record, 00:00:30 Elapsed,
service=shell
Active accounted actions on tty3, User admin Priv 15 Role sysadmin
Task ID 2, EXEC Accounting record, 00:00:26 Elapsed,
service=shell
```

#### Related Commands

[aaa accounting](#) — enables AAA Accounting and creates a record for monitoring the accounting function.

## Authorization and Privilege Commands

To set command line authorization and privilege levels, use the following commands.

### authorization

Apply an authorization method list to terminal lines.

### C9000 Series

**Syntax** `authorization {exec | commands {level | role role-name}} method-list`

#### Parameters

|                                                 |                                                                                                                                                                                                                                                                           |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>exec</i></b>                              | Enter the keyword <code>exec</code> to apply an EXEC level authorization method list.                                                                                                                                                                                     |
| <b><i>commands {level   role role-name}</i></b> | Enter the keyword <code>commands</code> followed by either a privilege level for accounting of commands executed at that privilege level, or enter the keyword <code>role</code> then the role name for authorization of commands executed by a user with that user role. |
| <b><i>method-list</i></b>                       | Enter a method list that you defined using the <code>aaa accounting exec</code> or <code>aaa accounting commands</code> .                                                                                                                                                 |

**Defaults** none

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                             |
| <b>9.5(0.1)</b> | Added support for roles on the Z9500.                                |
| <b>9.5(0.0)</b> | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                             |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                             |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                            |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                             |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                          |
| <b>6.3.1.0</b>  | Introduced on the E-Series.                                          |

**Related Commands** [aaa authorization commands](#) — sets the parameters that restrict (or permit) a user's access to EXEC and CONFIGURATION level commands

[aaa authorization exec](#) — sets the parameters that restrict (or permit) a user's access to EXEC level commands.

## aaa authorization commands

Set parameters that restrict (or permit) a user's access to EXEC and CONFIGURATION level commands.

### C9000 Series

**Syntax** `aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none}`

Undo a configuration with the `no aaa authorization commands {level | role role-name} {name|default} {local | tacacs+ | none} command`.

|                   |                       |                                                                                                           |
|-------------------|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>commands level</b> | Enter the keyword <code>commands</code> then the command privilege level for command level authorization. |
|                   | <b>role role-name</b> | Enter the keyword <code>role</code> then the role name.                                                   |
|                   | <b>name</b>           | Define a name for the list of authorization methods.                                                      |
|                   | <b>default</b>        | Define the default list of authorization methods.                                                         |
|                   | <b>local</b>          | Use the authorization parameters on the system to perform authorization.                                  |
|                   | <b>tacacs+</b>        | Use the TACACS+ protocol to perform authorization.                                                        |
|                   | <b>none</b>           | Enter the keyword <code>none</code> to apply no authorization.                                            |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version         | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| <b>9.5(0.1)</b> | Added support for roles on the Z9500.                           |
| <b>9.5(0.0)</b> | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                        |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                       |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                        |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                        |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                     |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                     |
| <b>6.1.1.0</b>  | Added support for RADIUS.                                       |

## aaa authorization config-commands

Set parameters that restrict (or permit) a user's access to EXEC level commands.

### C9000 Series

| <b>Syntax</b>            | <pre>aaa authorization config-commands</pre> <p>Disable authorization checking for CONFIGURATION level commands using the <code>no aaa authorization config-commands</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

| <b>7.5.1.0</b>           | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |
| <b>Usage Information</b> | By default, the <code>aaa authorization commands</code> command configures the system to check both EXEC level and CONFIGURATION level commands. Use the command <code>no aaa authorization config-commands</code> to enable only EXEC-level command checking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

# aaa authorization exec

Set parameters that restrict (or permit) a user’s access to EXEC-level commands.

## C9000 Series

|                 |                                                                                                                                                                                                                                                                 |                                                                          |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Syntax          | <pre>aaa authorization exec {name   default} {local    tacacs+    if-<br/>authenticated    none}</pre> <p>To disable authorization checking for EXEC level commands, use the <code>no aaa authorization exec</code> command.</p>                                |                                                                          |
| Parameters      | <b>name</b>                                                                                                                                                                                                                                                     | Define a name for the list of authorization methods.                     |
|                 | <b>default</b>                                                                                                                                                                                                                                                  | Define the default list of authorization methods.                        |
|                 | <b>local</b>                                                                                                                                                                                                                                                    | Use the authorization parameters on the system to perform authorization. |
|                 | <b>tacacs+</b>                                                                                                                                                                                                                                                  | Use the TACACS+ protocol to perform authorization.                       |
|                 | <b>none</b>                                                                                                                                                                                                                                                     | Enter the keyword <code>none</code> to apply no authorization.           |
| Defaults        | none                                                                                                                                                                                                                                                            |                                                                          |

| Command History | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |                                                                          |

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Added support for RADIUS.   |

# privilege level (CONFIGURATION mode)

Change the access or privilege level of one or more commands.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Authentication and Password Commands

To manage access to the system, use the following the commands:

### aaa authentication enable

Configure AAA Authentication method lists for user access to EXEC privilege mode (the “Enable” access).

#### C9000 Series

|                        |                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

#### Usage Information

By default, the `Enable password` is used. If you configure `aaa authentication enable default`, the system uses the methods defined for `Enable access` instead.

Methods configured with the `aaa authentication enable` command are evaluated in the order they are configured. If authentication fails using the primary method, the system employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, the system proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

#### Related Commands

[enable password](#) — changes the password for the `enable` command.

[login authentication](#) — enables AAA login authentication on the terminal lines.

[password](#) — creates a password.

[radius-server host](#) — specifies a RADIUS server host.

[tacacs-server host](#) — specifies a TACACS+ server host.

## aaa authentication login

Configure AAA Authentication method lists for user access to EXEC mode (`Enable log-in`).

### C9000 Series

#### Syntax

```
aaa authentication login {method-list-name | default} method [... method4]
```

To return to the default setting, use the `no aaa authentication login {method-list-name | default}` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>method-list-name</i></b> | Enter a text string (up to 16 characters long) as the name of a user-configured method list that can be applied to different lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>default</i></b>          | Enter the keyword <code>default</code> to specify that the method list specified is the default method for all terminal lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>method</i></b>           | Enter one of the following methods: <ul style="list-style-type: none"> <li>• <code>enable</code>: use the password the <code>enable password</code> command defines in CONFIGURATION mode. Not available if <code>role-only</code> is in use.</li> <li>• <code>line</code>: use the password the <code>password</code> command defines in LINE mode. Not available if <code>role-only</code> is in use.</li> <li>• <code>local</code>: use the password for the userid contained in the local password database.</li> <li>• <code>none</code>: no authentication. Not available if <code>role-only</code> is in use.</li> <li>• <code>radius</code>: use the RADIUS servers configured with the <code>radius-server host</code> command.</li> </ul> |

- `tacacs+`: use the TACACS+ servers configured with the `tacacs-server host` command.

**... method4** (OPTIONAL) Enter up to four additional methods. In the event of a “no response” from the first method, the system applies the next configured method (up to four configured methods).

**Defaults** Not configured (that is, no authentication is performed).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                        |
| <b>9.5(0.1)</b> | Added support for roles on the Z9500.                           |
| <b>9.5(0.0)</b> | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                        |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                       |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                        |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                        |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                     |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                     |
| <b>6.2.1.0</b>  | Introduced on the E-Series.                                     |

**Usage Information** By default, the locally configured username password is used. If you configure `aaa authentication login default`, the system uses the methods this command defines for login instead.

Methods configured with the `aaa authentication login` command are evaluated in the order they are configured. If users encounter an error with the first method listed, the system applies the next method configured. If users fail the first method listed, no other methods are applied. The only exception is the local method. If the user’s name is not listed in the local database, the next method is applied. If the correct user name/password combination is not entered, the user is not allowed access to the switch.

 **NOTE:** If authentication fails using the primary method, the system employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, the system proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

After configuring the `aaa authentication login` command, configure the `login authentication` command to enable the authentication scheme on terminal lines.

Connections to the SSH server work with the following login mechanisms: local, radius, and tacacs.

**Related Commands**

- [login authentication](#) — enables AAA login authentication on the terminal lines.
- [password](#) — creates a password.
- [radius-server host](#) — specifies a RADIUS server host.
- [tacacs-server host](#) — specifies a TACACS+ server host.

## aaa reauthenticate enable

Enable re-authentication of user whenever there is a change in the authenticators.

**Syntax** `aaa reauthenticate enable`

|                          | To disable the re-authentication option, use the <code>no aaa reauthenticate enable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                  |                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|------------------|--------------------------|
| <b>Defaults</b>          | Disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                  |                          |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                  |                          |

| <b>9.11(0.0)</b>         | Introduced this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                  |                          |
| <b>Usage Information</b> | <p>When an operating system enables to change the user authenticators, the users might access resources and perform tasks that they do not have authorization.</p> <p>Once re-authentication is enabled, Dell Networking OS prompts the users to re-authenticate whenever there is a change in authenticators.</p> <p>The change in authentication happens when:</p> <ul style="list-style-type: none"> <li>• Add or remove an authentication server (RADIUS/TACACS+)</li> <li>• Modify an AAA authentication/authorization list</li> <li>• Change to role-only (RBAC) mode</li> </ul> <p>The re-authentication is also applicable for authenticated 802.1x devices. When there is a change in the authentication servers, the supplicants connected to all the ports are forced to re-authenticate.</p> |         |             |                  |                          |
| <b>Example</b>           | <pre>Dell(config)#aaa reauthenticate enable</pre> <pre>Dell(config)#aaa authentication login vty_auth_list radius Force all logged-in users to re-authenticate (y/n)?</pre> <pre>Dell(config)#radius-server host 192.100.0.12 Force all logged-in users to re-authenticate (y/n)?</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                  |                          |

## access-class

Restrict incoming connections to a particular IP address in a defined IP access control list (ACL).

### C9000 Series

| <b>Syntax</b>          | <pre>access-class access-list-name</pre> <p>To delete a setting, use the <code>no access-class</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                          |                 |                           |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|---------------------------|
| <b>Parameters</b>      | <b>access-list-name</b> Enter the name of an established IP Standard ACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |                 |                          |                 |                          |                 |                           |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                          |                 |                           |

| <b>9.2(1.0)</b>        | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |
| <b>8.3.19.0</b>        | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |                 |                          |                 |                          |                 |                           |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

#### Related Commands

[line](#) — applies an authentication method list to the designated terminal lines.

[ip access-list standard](#) — names (or selects) a standard access list to filter based on the IP address.

[ip access-list extended](#) — names (or selects) an extended access list based on the IP addresses or protocols.

## enable password

Change the password for the `enable` command.

### C9000 Series

#### Syntax

```
enable password [level level] [encryption-type] password
```

To delete a password, use the `no enable password [encryption-type] password [level level]` command.

#### Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>level level</i></b>     | (OPTIONAL) Enter the keyword <code>level</code> then a number as the level of access. The range is from 1 to 15.                                                                                                                                                                                                                                                   |
| <b><i>encryption-type</i></b> | (OPTIONAL) Enter the number 7 or 0 as the encryption type.<br><br>Enter a 7 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.<br><br>Use this parameter only with a password that you copied from the <code>show running-config</code> file of another Dell Networking router. |
| <b><i>password</i></b>        | Enter a text string, up to 32 characters long, as the clear text password.                                                                                                                                                                                                                                                                                         |

#### Defaults

No password is configured. *level* = **15**.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.0 | Introduced on the E-Series. |

### Usage Information

To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd]e`, you type "`abcd CNTL v ]e`". When the password is created, you do not use the CNTL + v key combination and enter "`abcd]e`".

 **NOTE:** The question mark (?) and the tilde (~) are not supported characters.

### Related Commands

[show running-config](#) — views the current configuration.

[privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

## enable sha256-password

Configure SHA-256 based password for the `enable` command.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>enable sha256-password [level level] [encryption-type] password</code><br><br>To delete a password, use the <code>no enable sha256-password [encryption-type] password [level level]</code> command.                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>      | <p><b>sha256-password</b> Enter the keyword <code>sha256-password</code> then the <code>encryption-type</code> or the password.</p> <p><b>level level</b> (OPTIONAL) Enter the keyword <code>level</code> then a number as the level of access. The range is from 1 to 15.</p> <p><b>encryption-type</b> (OPTIONAL) Enter the number 8 or 0 as the encryption type.<br/><br/>Enter 8 to enter the sha256-based hashed password.</p> <p><b>password</b> Enter a text string, up to 32 characters long, as the clear text password.</p> |
| <b>Defaults</b>        | No password is configured. <code>level</code> = <b>15</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The range is from 1 to 15. | <b><i>encryption-type</i></b> | (OPTIONAL) Enter the number 5 or 0 as the encryption type. |
| <b><i>level level</i></b>     | (OPTIONAL) Enter the keyword <code>level</code> then a number as the level of access. The range is from 1 to 15.                                                                                                                                                                                      |                           |                                                                                                                  |                               |                                                            |
| <b><i>encryption-type</i></b> | (OPTIONAL) Enter the number 5 or 0 as the encryption type.                                                                                                                                                                                                                                            |                           |                                                                                                                  |                               |                                                            |

Enter a 5 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

***password*** Enter a text string, up to 32 characters long, as the clear text password.

**Defaults** No password is configured. *level* = **15**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

**Usage Information** To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd]e`, you type `"abcd CNTL v ]e"`. When the password is created, you do not use the CNTL + v key combination and enter `"abcd]e"`.

 **NOTE:** The question mark (?) and the tilde (~) are not supported characters.

**Related Commands** [show running-config](#) — views the current configuration.  
[privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

## login authentication

To designate the terminal lines, apply an authentication method list.

### C9000 Series

**Syntax** `login authentication {method-list-name | default}`

To use the local user/password database for login authentication, use the `no login authentication` command.

**Parameters** ***method-list-name*** Enter the keywords `method-list-name` to specify that method list, created in the `aaa authentication login` command, to be applied to the designated terminal line.

**default** Enter the keyword `default` to specify that the default method list, created in the `aaa authentication login` command, is applied to the terminal line.

**Defaults** No authentication is performed on the console lines. Local authentication is performed on the virtual terminal and auxiliary lines.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

**Usage Information** If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

**Related Commands** [aaa authentication login](#) — selects the login authentication methods.

## password

Specify a password for users on terminal lines.

### C9000 Series

**Syntax** `password [encryption-type] password`  
To delete a password, use the `no password password` command.

**Parameters**

|                               |                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>encryption-type</i></b> | (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the password entered. The options are <ul style="list-style-type: none"><li>0 is the default and means the password is not encrypted and stored as clear text.</li><li>7 means that the password is encrypted and hidden.</li></ul> |
| <b><i>password</i></b>        | Enter a text string up to 32 characters long. The first character of the password must be a letter. You cannot use spaces in the password.                                                                                                                                                           |

**Defaults** No password is configured.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

#### Usage Information

The software prompts users for these passwords when the method for authentication or authorization used is "line".

#### Related Commands

[enable password](#) — sets the password for the `enable` command.

[login authentication](#) — configures an authentication method to log in to the switch.

[service password-encryption](#) — encrypts all passwords configured in the system.

[radius-server key](#) — configures a key for all RADIUS communications between the switch and the RADIUS host server.

[tacacs-server key](#) — configures a key for communication between a TACACS+ server and client.

[username](#) — establishes an authentication system based on user names.

## password-attributes

Configure the password attributes (strong password).

### C9000 Series

#### Syntax

```
password-attributes [min-length number] [max-retry number] [lockout-period
minutes] [character-restriction [upper number] [lower number] [numeric
number] [special-char number]]
```

To return to the default, use the `no password-attributes [min-length number] [max-retry number] [lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]]` command.

#### Parameters

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>min-length <i>number</i></b>      | (OPTIONAL) Enter the keywords <code>min-length</code> then the number of characters. The range is from 0 to 32 characters.                                                                                                                                                                                                                                                                      |
| <b>max-retry <i>number</i></b>       | (OPTIONAL) Enter the keywords <code>max-retry</code> then the number of maximum password retries. The range is from 0 to 16.                                                                                                                                                                                                                                                                    |
| <b>lockout-period <i>minutes</i></b> | (OPTIONAL) Enter the keyword <code>lockout-period</code> then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out sessions on the Telnet or SSH sessions for which there has been a consecutive failed login attempts. The console is not locked out. |
| <b>character-restriction</b>         | (OPTIONAL) Enter the keywords <code>character-restriction</code> to indicate a character restriction for the password.                                                                                                                                                                                                                                                                          |
| <b>upper <i>number</i></b>           | (OPTIONAL) Enter the keyword <code>upper</code> then the upper number. The range is from 0 to 31.                                                                                                                                                                                                                                                                                               |
| <b>lower <i>number</i></b>           | (OPTIONAL) Enter the keyword <code>lower</code> then the lower number. The range is from 0 to 31.                                                                                                                                                                                                                                                                                               |

|                                   |                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>numeric <i>number</i></b>      | (OPTIONAL) Enter the keyword <code>numeric</code> then the numeric number. The range is from 0 to 31.                               |
| <b>special-char <i>number</i></b> | (OPTIONAL) Enter the keywords <code>special-char</code> then the number of special characters permitted. The range is from 0 to 31. |

**Defaults** 0 minutes for the lock out period. The lockout-period is not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                       |
| <b>9.5(0.1)</b> | Introduced the <code>lockout-period</code> option on the Z9500.                                |
| <b>9.5(0.0)</b> | Introduced the <code>lockout-period</code> option on the Z9000, S6000, S4820T, S4810, and MXL. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                       |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                       |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                    |
| <b>6.3.1.0</b>  | Introduced on the E-Series.                                                                    |

**Example** In the following example, after 5 un-successful login attempts, the session (SSH/TELNET) goes into a locked state for 5 minutes. If all the 10 sessions are locked out with 5 un-successful attempts in each session, no users can login during the lockout-period.

```
Dell(conf)#password-attributes max-retry 5 lockout-period 5
```

**Related Commands** [password](#) — specifies a password for users on terminal lines.

## service obscure-passwords

Enable the obscuring of passwords and keys.

### C9000 Series

**Syntax** `service obscure-passwords`

Enable the obscuring of passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication, use the `service obscure-passwords` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                      |
|----------|------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                         |
| 9.6.0.0  | Introduced on the S4810, S4820T, S5000, S6000, Z9000, Z9500, MXL |

#### Usage Information

By default, the `service password-encryption` command stores encrypted passwords. For greater security, you can also use the `service obscure-passwords` command to prevent a user from reading the passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication by obscuring this information. Passwords and keys are stored encrypted in the configuration file and by default are displayed in the encrypted form when the configuration is displayed. Enabling the `service obscure-passwords` command displays asterisks instead of the encrypted passwords and keys. This command prevents a user from reading these passwords and keys by obscuring this information with asterisks.

Password obscuring masks the password and keys for display only but does not change the contents of the file. The string of asterisks is the same length as the encrypted string for that line of configuration. To verify that you have successfully obscured passwords and keys, use the `show running-config` command or `show startup-config` command.

If you are using role-based access control (RBAC), only the system administrator and security administrator roles can enable the `service obscure-password` command.

#### Related Commands

- [show running-config](#) — Display the current configuration and display changes from the default values.
- [service password-encryption](#) — Encrypts all passwords configured in the system.

## service password-encryption

Encrypt all passwords configured in the system.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>service password-encryption</code><br><br>To store new passwords as clear text, use the <code>no service password-encryption</code> command.             |
| <b>Defaults</b>        | Enabled.                                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

#### Usage Information

 **CAUTION:** Encrypting passwords with this command does not provide a high level of security. When the passwords are encrypted, you cannot return them to plain text

**unless you re-configure them. To remove an encrypted password, use the `no password password` command.**

To keep unauthorized people from viewing passwords in the switch configuration file, use the `service password-encryption` command. This command encrypts the clear-text passwords created for user name passwords, authentication key passwords, the privileged command password, and console and virtual terminal line access passwords.

To view passwords, use the `show running-config` command.

## secure-cli enable

Enable the secured CLI mode.

**Syntax** `secure-cli enable`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description              |
|-----------|--------------------------|
| 9.11(0.0) | Introduced this command. |

**Usage Information** The secured CLI mode prevents the users from enhancing the permissions or promoting the privilege levels. After entering the command, save the running-configuration.

Once you save the running-configuration, the secured CLI mode is enabled. If you do not want to enter the secured mode, do not save the running-configuration.

Once saved, to disable the secured CLI mode, you need to manually edit the startup-configuration file and reboot the system.

## show privilege

View your access level.

### C9000 Series

**Syntax** `show privilege`

From a **PE console**, use `show privilege` to view the current privilege level.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                         |
|----------|-------------------------------------|
| 9.9(0.0) | Introduced on the C9010 and C1048P. |
| 9.2(1.0) | Introduced on the Z9500.            |
| 8.3.19.0 | Introduced on the S4820T.           |
| 8.3.11.1 | Introduced on the Z9000.            |
| 8.3.7.0  | Introduced on the S4810.            |
| 7.6.1.0  | Introduced on the S-Series.         |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.0 | Introduced on the E-Series. |

Example

```
Dell#show privilege
Current privilege level is 15
Dell#
```

Example (PE Console)

```
Dell#show privilege
Current privilege level is 15.
```

Related Commands

[privilege level \(CONFIGURATION mode\)](#) — assigns access control to different command modes.

## show users

Allows you to view information on all users logged into the switch, including privilege level and or user role.

| 6.1.1.0  | Introduced on the E-Series.                                      |

Usage Information

The following describes the show userscommand shown in the following example.

| Field      | Description                                                       |
|------------|-------------------------------------------------------------------|
| (untitled) | Indicates with an asterisk (*) which terminal line you are using. |
| Line       | Displays the terminal lines currently in use.                     |
| User       | Displays the user name of all users logged in.                    |

| Field           | Description                          |
|-----------------|--------------------------------------|
| <b>Host(s)</b>  | Displays the terminal line status.   |
| <b>Location</b> | Displays the IP address of the user. |

#### Example

```
Dell#show users
Authorization Mode: role or privilege

Line User Role Privilege Host(s) Location
0 console 0 admin sysadmin 15 idle
*3 vty 1 sec1 secadmin 14 idle 172.31.1.4
4 vty 2 ml1 netadmin 12 idle 172.31.1.5
```

#### Related Commands

[username](#) — use to enter the user name.

## timeout login response

Specify how long the software waits for the login input (for example, the user name and password) before timing out.

### C9000 Series

#### Syntax

`timeout login response seconds`

To return to the default values, use the `no timeout login response` command.

#### Parameters

##### **seconds**

Enter a number of seconds the software waits before logging you out. The range is:

- VTY: the range is from 1 to 30 seconds, the default is **30 seconds**.
- Console: the range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).
- AUX: the range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).

#### Defaults

See the defaults settings shown in *Parameters*.

#### Command Modes

LINE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

#### Usage Information

The software measures the period of inactivity defined in this command as the period between consecutive keystrokes. For example, if your password is "password" you can enter "p" and wait 29 seconds to enter the next letter.

## username

Establish an authentication system based on user names.

**Syntax** `username name [access-class access-list-name] [nopassword | {password | secret | sha256-password} [encryption-type] password [dynamic-salt]] [privilege level] [role role-name]`

If you do not want a specific user to enter a password, use the `nopassword` option.

To delete authentication for a user, use the `no username name` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>name</i></b>             | Enter a text string for the name of the user up to 63 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                   | <b><i>access-class</i></b>     | Enter the keywords <code>access-class</code> then the name of a configured access control                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                   | <b><i>access-list-name</i></b> | list (either an IP access control list or MAC access control list).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b><i>nopassword</i></b>       | Enter the keyword <code>nopassword</code> to specify that the user should not enter a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b><i>password</i></b>         | Enter the keyword <code>password</code> then the <code>encryption-type</code> or the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b><i>encryption-type</i></b>  | Enter an encryption type for the <code>password</code> that you enter. <ul style="list-style-type: none"><li>• 0 directs the system to store the password as clear text. It is the default encryption type when using the <code>password</code> option.</li><li>• 8 to indicate that a password encrypted using a sha256 hashing algorithm follows. This encryption type is available with the <code>sha256-password</code> option only, and is the default encryption type for this option.</li><li>• 7 to indicate that a password encrypted using a DES hashing algorithm follows. This encryption type is available with the <code>password</code> option only.</li><li>• 5 to indicate that a password encrypted using an MD5 hashing algorithm follows. This encryption type is available with the <code>secret</code> option only, and is the default encryption type for this option.</li></ul> |
|                   | <b><i>password</i></b>         | Enter a string up to 32 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b><i>dynamic-salt</i></b>     | Enter the keyword <code>dynamic-salt</code> to have an additional random input in the password encryption process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b><i>privilege level</i></b>  | Enter the keyword <code>privilege</code> then a number from zero (0) to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | <b><i>role role-name</i></b>   | Enter the keyword <code>role</code> followed by the role name to associate with that user ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b><i>secret</i></b>           | Enter the keyword <code>secret</code> then the encryption type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b><i>sha256-password</i></b>  | Enter the keyword <code>sha256-password</code> then the <code>encryption-type</code> or the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Defaults** The default encryption type for `password` option is **0**. The default encryption type for `secret` option is **5**. The default encryption type for `sha256-password` option is **8**. The default value of `privilege level` is **1**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13.0.0  | Enhanced to display a warning message when a weak password is used. Introduced the <code>dynamic-salt</code> option on the MXL, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON. |
| 9.12(1.0) | Introduced on the S5048F-ON.                                                                                                                                                                                                                     |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                        |
| 9.10(0.0) | Introduced on the S3148.                                                                                                                                                                                                                         |

| Version            | Description                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>   | Added support for the <code>sha256-password</code> option for S3100, S3048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, Z9100-ON, MXL, and Z9500. |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                                           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                                               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                                               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                                               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                                               |
| <b>9.5(0.0)</b>    | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL.                                                                                          |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                                                                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                                                                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                                                                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                                                                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                                                                  |
| <b>7.7.1.0</b>     | Added support for the <code>secret</code> option and the MD5 password encryption. Extended the name from 25 to 63 characters.                             |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                                                               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                                                                               |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                                                                                               |

#### Usage Information

To view the defined user names, use the `show running-config user` command. You can use the `dynamic-salt` option only under the `secret` and the `password` options.

When you configure the password, the system alerts if your password does not match the following criteria. The system accepts your password even if these conditions are not met. Dell EMC Networking recommends selecting a strong password for enhanced security.

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !"#\$%&'()\*+,-./:;<=>?@[\\]^\_`{|}~")

#### Related Commands

- [password](#) — specifies a password for users on terminal lines.
- [show running-config](#) — views the current configuration.

## RADIUS Commands

The following RADIUS commands are supported by Dell Networking OS.

### aaa radius auth-method

Configure the authentication method to use with RADIUS for user access.

#### Syntax

```
aaa radius auth-method {pap | mschapv2}
```

To undo the RADIUS authentication method configuration, use the `no aaa radius auth-method` command.

|                          |                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                           |

## coa-disable-port

Configure NAS to reject disable-port requests from DAC.

**Syntax** `coa-disable-port`

To undo this configuration, enter the `no coa-disable-port` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

**Usage Information** • Configure `no coa-disable-port` DAS to drop radius CoA disable-port requests from DAC.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## coa-reauthenticate

Configure NAS to re-authenticate dot1x user session requests from DAC.

**Syntax** `coa-reauthenticate`

To ignore re-authentication requests, enter the `no coa-reauthenticate` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## debug radius

View RADIUS transactions to assist with troubleshooting.

### C9000 Series

**Syntax** `debug radius`

To disable debugging of RADIUS, use the `no debug radius` command.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

## da-rsp-timeout

Configure timeout value for the back end task to respond to DAC requests.

**Syntax** `da-rsp-timeout minutes`

To undo the configuration, enter the `no da-rsp-timeout` command.

**Defaults** 10 Minutes.

**Parameters** *minutes* Enter the time out value.

**Command Modes** • CONF-DYNAMIC-AUTH

**Usage Information** • Time for DAS to wait before the back end response is received.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## disconnect-user

Configure NAS to ignore DM requests corresponding to AAA users-sessions coming from the DAC.

**Syntax** `disconnect-user`

To undo this configuration, enter the `no disconnect-user` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## dynamic-auth-enable

Configure NAS to receive and process dynamic authorization messages.

|                        |                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>dynamic-auth-enable</pre> <p>To stop NAS from receiving and processing dynamic authorization messages, use the <code>no dynamic-auth-enable</code> command.</p>                                                                                               |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                                          |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>CONF-DYNAMIC-AUTH</li> </ul>                                                                                                                                                                                                |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell EMC Networking OS version history for this command.</p> |

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

|                          |                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If this configuration is not enabled, then dynamic authorization messages are not handled by the NAS. |
|--------------------------|-------------------------------------------------------------------------------------------------------|

## ip radius source-interface

Specify an interface's IP address as the source IP address for RADIUS connections.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>ip radius source-interface interface</pre> <p>To delete a source interface, use the <code>no ip radius source-interface</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>      | <p><b><i>interface</i></b></p> <p>Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>For Loopback interfaces, enter the keyword <code>loopback</code> then a number from zero (0) to 16838.</li> <li>For the Null interface, enter the keywords <code>null 0</code>.</li> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                             |
| 9.2(1.0) | Introduced on the Z9500.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.2.1.0  | Introduced on the E-Series.                          |

## port

Configures NAS port number to accept CoA or DM requests.

|                          |                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>port port-number</code><br>To remove the NAS port configuration, enter the <code>no port</code> command.                                                |
| <b>Defaults</b>          | 3799                                                                                                                                                          |
| <b>Parameters</b>        | <b><i>port-number</i></b> Enter the NAS port number to accept CoA and DM requests. The range is from 1 to 65535.                                              |
| <b>Command Modes</b>     | <ul style="list-style-type: none"><li>CONF-DYNAMIC-AUTH</li></ul>                                                                                             |
| <b>Usage Information</b> | <ul style="list-style-type: none"><li>Optionally specify dynamic authorization port number. Default port is 3799.</li></ul>                                   |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## radius dynamic-auth

Enters a new sub-mode, RADIUS-DYNAMIC-AUTH, which enables you to modify dynamic authorization settings.

|                          |                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>radius dynamic-auth</code><br>To remove the dynamic authorization method for RADIUS users, enter the <code>no radius dynamic-auth</code> command. |
| <b>Defaults</b>          | Disabled.                                                                                                                                               |
| <b>Command Modes</b>     | <ul style="list-style-type: none"><li>CONFIGURATION</li></ul>                                                                                           |
| <b>Usage Information</b> | <ul style="list-style-type: none"><li>All dynamic authorization commands are configured by entering this mode.</li></ul>                                |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## radius-server deadtime

Configure a time interval during which non-responsive RADIUS servers to authentication requests are skipped.

### C9000 Series

#### Syntax

```
radius-server deadtime seconds
```

To disable this function or return to the default value, use the `no radius-server deadtime` command.

#### Parameters

**seconds**

Enter a number of seconds during which non-responsive RADIUS servers are skipped. The range is from 0 to 2147483647 seconds. The default is **0 seconds**.

#### Defaults

**0 seconds**

#### Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## radius-server host

Configure a RADIUS server host.

### C9000 Series

#### Syntax

```
radius-server host {hostname | ipv4-address | ipv6-address} [auth-port
port-number] [retransmit retries] [timeout seconds] [key [encryption-type]
key]
```

|                   |                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>hostname</b>                    | Enter the name of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | <b>ipv4-address   ipv6-address</b> | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X) of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                   | <b>auth-port port-number</b>       | (OPTIONAL) Enter the keywords <code>auth-port</code> then a number as the port number. The range is from zero (0) to 65535. The default port-number is <b>1812</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b>retransmit retries</b>          | (OPTIONAL) Enter the keyword <code>retransmit</code> then a number as the number of attempts. This parameter overwrites the <code>radius-server retransmit</code> command. The range is from zero (0) to 100. The default is <b>3 attempts</b> .                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | <b>timeout seconds</b>             | (OPTIONAL) Enter the keyword <code>timeout</code> then the seconds the time interval the switch waits for a reply from the RADIUS server. This parameter overwrites the <code>radius-server timeout</code> command. The range is from 0 to 1000. The default is <b>5 seconds</b> .                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>key [encryption-type] key</b>   | <p>(OPTIONAL) Enter the keyword <code>key</code> then an optional encryption-type and a string up to 42 characters long as the authentication key. The RADIUS host server uses this authentication key and the RADIUS daemon operating on this switch.</p> <p>For the encryption-type, enter either zero (0) or 7 as the encryption type for the key entered. The options are:</p> <ul style="list-style-type: none"> <li>0 is the default and means the password is not encrypted and stored as clear text.</li> <li>7 means that the password is encrypted and hidden.</li> </ul> <p>Configure this parameter last because leading spaces are ignored.</p> |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                           |
|-----------------|-------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                              |
| <b>8.3.19.0</b> | Introduced on the S4820T.                             |
| <b>8.3.11.1</b> | Introduced on the Z9000.                              |
| <b>8.4.1.0</b>  | Added support for IPv6.                               |
| <b>8.3.7.0</b>  | Introduced on the S4810.                              |
| <b>7.7.1.0</b>  | Authentication key length increased to 42 characters. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                           |
| <b>6.2.1.0</b>  | Introduced on the E-Series.                           |

**Usage Information** To configure any number of RADIUS server hosts for each server host that is configured, use this command. The system searches for the RADIUS hosts in the order they are configured in the software.

The global default values for the `timeout`, `retransmit`, and `key` optional parameters are applied, unless those values are specified in the `radius-server host` or other commands. To return to the global default values, if you configure the `timeout`, `retransmit`, or `key` values, include those keywords when using the `no radius-server host` command syntax.

**Related Commands** [login authentication](#) — sets the database to be checked when a user logs in.  
[radius-server key](#) — sets an authentication key for RADIUS communications.

`radius-server retransmit` — sets the number of times the RADIUS server attempts to send information.

`radius-server timeout` — sets the time interval before the RADIUS server times out.

## radius-server key

Configure a key for all RADIUS communications between the switch and the RADIUS host server.

### C9000 Series

| <b>Syntax</b>                 | <code>radius-server key [encryption-type] key</code><br>To delete a password, use the <code>no radius-server key</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                               |                                                                                                                                                                                                                                                                                        |                   |                                                                                                                           |          |                          |          |                           |          |                          |         |                          |         |                                                       |         |                             |         |                             |         |                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------|----------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|---------|-------------------------------------------------------|---------|-----------------------------|---------|-----------------------------|---------|-----------------------------|
| <b>Parameters</b>             | <table><tr><td><b><i>encryption-type</i></b></td><td>(OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. # radius-server retransmit

Configure the number of times the switch attempts to connect with the configured RADIUS host server before declaring the RADIUS host server unreachable.

## C9000 Series

| Syntax           | <code>radius-server retransmit retries</code><br>To configure zero retransmit attempts, use the <code>no radius-server retransmit</code> command.<br>To return to the default setting, use the <code>radius-server retransmit 3</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

| Parameters       | <b>retries</b> Enter a number of attempts that the system tries to locate a RADIUS server. The range is from zero (0) to 100. The default is <b>3 retries</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |
| Defaults         | <b>3 retries</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

| Related Commands | <a href="#">radius-server host</a> — configures a RADIUS host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

# radius-server timeout

To reply to a request, configure the amount of time the RADIUS client (the switch) waits for a RADIUS host server .

## C9000 Series

|               |                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax        | <code>radius-server timeout seconds</code><br>To return to the default value, use the <code>no radius-server timeout</code> command.                                                    |
| Parameters    | <b>seconds</b> Enter the number of seconds between an unsuccessful attempt and when the system times out. The range is from zero (0) to 1000 seconds. The default is <b>5 seconds</b> . |
| Defaults      | <b>5 seconds</b>                                                                                                                                                                        |
| Command Modes | CONFIGURATION                                                                                                                                                                           |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

## Related Commands

[radius-server host](#) — configures a RADIUS host.

# rate-limit

Configure NAS to allow or reject RADIUS dynamic authorization (DA) packets based on the configurable rate limit value.

## Syntax

`rate-limit packets per minute`

To undo the configuration, enter the `no rate-limit` command.

## Defaults

30 packets per minute.

## Parameters

|                                 |                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b><i>packet per minute</i></b> | Enter the number of packets that you want processed per minute. The range is between 10 to 60 packets per minute. |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------|

## Command Modes

- CONF-DYNAMIC-AUTH

## Usage Information

- Packets are dropped after number of packets reaches the configured rate-limit.

## Command History

# replay-protection-window

Configure replay protection window period to drop the duplicate packets.

## Syntax

`replay-protection-window minutes`

To undo the configuration, enter the `no replay-protection-window` command.

## Defaults

5 Minutes.

## Parameters

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <b><i>minutes</i></b> | Enter the number of minutes to drop the packets. The range is from 1 to 10 minutes. |

## TACACS+ Commands

The Dell Networking OS supports TACACS+ as an alternate method for login authentication.

### debug tacacs+

To assist with troubleshooting, view TACACS+ transactions.

#### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>debug tacacs+</pre> <p>To disable debugging of TACACS+, use the <code>no debug tacacs+</code> command.</p>                                                                                                                                                 |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                                       |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.0</b>  | Introduced on the E-Series. |

## ip tacacs source-interface

Specify an interface's IP address as the source IP address for TACACS+ connections.

### C9000 Series

#### Syntax

```
ip tacacs source-interface interface
```

To delete a source interface, use the `no ip tacacs source-interface` command.

#### Parameters

##### ***interface***

Enter the following keywords and slot/port or number information:

- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16838.
- For the Null interface, enter the keywords `null 0`.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                          |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

## tacacs-server host

Specify a TACACS+ host.

|                        |                                                                                                                                                                |                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tacacs-server host {hostname   ipv4-address   ipv6-address} [port number] [timeout seconds] [key key]</code>                                             |                                                                                                                                                                                                                                    |
| <b>Parameters</b>      | <b>hostname</b>                                                                                                                                                | Enter the name of the TACACS+ server host.                                                                                                                                                                                         |
|                        | <b>ipv4-address   ipv6-address</b>                                                                                                                             | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X::X) of the TACACS+ server host.                                                                                                                                          |
|                        | <b>port number</b>                                                                                                                                             | (OPTIONAL) Enter the keyword <code>port</code> then a number as the port to be used by the TACACS+ server. The range is from zero (0) to 65535. The default is <b>49</b> .                                                         |
|                        | <b>timeout seconds</b>                                                                                                                                         | (OPTIONAL) Enter the keyword <code>timeout</code> then the number of seconds the switch waits for a reply from the TACACS+ server. The range is from 0 to 1000. The default is <b>10 seconds</b> .                                 |
|                        | <b>key key</b>                                                                                                                                                 | (OPTIONAL) Enter the keyword <code>key</code> then a string up to 42 characters long as the authentication key. This authentication key must match the key specified in the <code>tacacs-server key</code> for the TACACS+ daemon. |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |                                                                                                                                                                                                                                    |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |                                                                                                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                    |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                           |
|-----------------|-------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                              |
| <b>8.3.19.0</b> | Introduced on the S4820T.                             |
| <b>8.3.11.1</b> | Introduced on the Z9000.                              |
| <b>8.4.1.0</b>  | Added support for IPv6.                               |
| <b>8.3.7.0</b>  | Introduced on the S4810.                              |
| <b>7.7.1.0</b>  | Authentication key length increased to 42 characters. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                           |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                           |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>To list multiple TACACS+ servers to be used by the <code>aaa authentication login</code> command, configure this command multiple times.</p> <p>If you are not configuring the switch as a TACACS+ server, you do not need to configure the <code>port</code>, <code>timeout</code> and <code>key</code> optional parameters. If you do not configure a key, the key assigned in the <code>tacacs-server key</code> command is used.</p> |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Related  
Commands**

[aaa authentication login](#) — specifies the login authentication method.

[tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

## tacacs-server key

Configure a key for communication between a TACACS+ server and a client.

### C9000 Series

**Syntax**

```
tacacs-server key [encryption-type] key
```

To delete a key, use the `no tacacs-server key key` command.

**Parameters**

***encryption-type*** (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

***key*** Enter a text string, up to 42 characters long, as the clear text password. Leading spaces are ignored.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                           |
|----------|-------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                              |
| 9.2(1.0) | Introduced on the Z9500.                              |
| 8.3.19.0 | Introduced on the S4820T.                             |
| 8.3.11.1 | Introduced on the Z9000.                              |
| 8.3.7.0  | Introduced on the S4810.                              |
| 7.7.1.0  | Authentication key length increased to 42 characters. |
| 7.6.1.0  | Introduced on the S-Series.                           |
| 7.5.1.0  | Introduced on the C-Series.                           |
| 6.2.1.1  | Introduced on the E-Series.                           |

**Usage  
Information**

The key configured with this command must match the key configured on the TACACS+ daemon.

## Port Authentication (802.1X) Commands

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell Networking OS supports RADIUS and Active Directory environments using 802.1X Port Authentication.

# Important Points to Remember

The system limits network access for certain users by using VLAN assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- 802.1X is not supported on the LAG or the channel members of a LAG.
- If no VLAN is supplied by the RADIUS server or if 802.1X authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If 802.1X authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If 802.1X authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If port security is enabled on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If 802.1X is disabled on the port, it is returned to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

## dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

### C9000 Series

| <b>Syntax</b>           | <code>dot1x authentication</code><br>To disable dot1x globally, use the <code>no dot1x authentication</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |           |                                                            |          |                          |          |                          |          |                           |          |                          |          |                          |         |                                          |         |                                       |

| Version         | Description                                         |
|-----------------|-----------------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                            |
| <b>7.6.1.0</b>  | Introduced on the C-Series, S-Series, and E-Series. |

#### Usage Information

If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface is moved to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next re-authentication interval (`dot1x reauthentication`).

#### Related Commands

[dot1x port-control](#) — enables port-control on an interface.

[dot1x guest-vlan](#) — configures a guest VLAN for non-dot1x devices.

[show dot1x interface](#) — displays the 802.1X information on an interface.

## dot1x auth-server

Configure the authentication server to RADIUS.

### C9000 Series

**Syntax** `dot1x auth-server radius`

**Defaults** none

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                |
|------------------|------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                   |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                                   |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                  |
| <b>8.3.12.0</b>  | Introduced on the S4810.                                   |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                   |
| <b>7.6.1.0</b>   | Introduced on the C-Series and S-Series.                   |
| <b>7.4.1.0</b>   | Introduced on the E-Series.                                |

# dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

## C9000 Series

| Syntax            | <code>dot1x guest-vlan <i>vlan-id</i></code><br>To disable the guest VLAN, use the <code>no dot1x guest-vlan <i>vlan-id</i></code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                                     |

| Usage Information | <p>802.1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.</p> <p>If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication for the device occurs at the next re-authentication interval (<code>dot1x reauthentication</code>).</p> <p>If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (<code>dot1x auth-fail-vlan</code>).</p> <div><div>i</div><div><b>NOTE:</b> The layer 3 portion of guest VLAN and authentication fail VLANs can be created regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.</div></div> |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                                     |

# dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, the system attempts to authenticate the host based on its MAC address.

| <b>Usage Information</b> | To disable MAC authentication bypass on a port, enter the <code>no dot1x mac-auth-bypass</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

### C9000 Series

Syntax

dot1x max-eap-req *number*

To return to the default, use the no dot1x max-eap-req command.

Parameters

*number*

Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

## dot1x reauthentication

Enable periodic re-authentication of the client.

### C9000 Series

| <b>Syntax</b>           | <code>dot1x reauthentication [interval seconds]</code><br>To disable periodic re-authentication, use the <code>no dot1x reauthentication</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|---------------------------|-----------------|--------------------------|----------------|--------------------------|----------------|------------------------------------------|----------------|-----------------------------|
| <b>Parameters</b>       | <b>interval <i>seconds</i></b> (Optional) Enter the keyword <code>interval</code> then the interval time, in seconds, after which re-authentication is initiated. The range is from 1 to 31536000 (1 year). The default is <b>3600 (1 hour)</b> .                                                                                                                                                                                                                                                                                                                            |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>7.6.1.0</b>  | Introduced on the C-Series, S-Series, and E-Series.  |

#### Example

```
Dell#show dot1x int Te 2/32
802.1x information on Te 2/32:
```

```

Dot1x Status: Enable
Port Control: AUTO
Port Auth Status: UNAUTHORIZED
Re-Authentication: Disable
Untagged VLAN id: None
Guest VLAN: Enable
Guest VLAN id: 10
Auth-Fail VLAN: Enable
Auth-Fail VLAN id: 11
Auth-Fail Max-Attempts: 3
Tx Period: 30 seconds
Quiet Period: 60 seconds
ReAuth Max: 2
Supplicant Timeout: 30 seconds
Server Timeout: 30 seconds
Re-Auth Interval: 3600 seconds
Max-EAP-Req: 2
Auth Type: SINGLE_HOST
Auth PAE State: Initialize
Backend State: Initialize
Dell#

```

## SSH Server and SCP Commands

The Dell Networking OS supports secure shell (SSH) protocol versions 1.5 and 2.0. SSH is a protocol for secure remote login over an insecure network. SSH sessions are encrypted and use authentication.

### crypto cert generate

Generates a default key and a self-signed certificate. This command replaces the existing certificate with a new certificate.

### C9000 Series

**Syntax**

```
crypto cert generate {cert-file file-name key-file file-name} [cname
common-name] [country country-name] [email email-id] [length key-
length] [locality locality-name] [organization organization-name] [orgunit
organization-unit-name] [state state-name] [validity days]
```

|                   |                                              |                                                                                                                                                                                                            |
|-------------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>cert-file <i>file-name</i></b>            | Enter the keyword <code>cert-file</code> then the filename of the certificate to be generated.                                                                                                             |
|                   | <b>key-file <i>file-name</i></b>             | Enter the keyword <code>key-file</code> then the key filename to be generated.                                                                                                                             |
|                   | <b>cname <i>common-name</i></b>              | (OPTIONAL) Enter the keyword <code>cname</code> then the common name to be included in the certificate. The default is Dell Networking.                                                                    |
|                   | <b>country <i>country-name</i></b>           | (OPTIONAL) Enter the keyword <code>country</code> then the name of the country to be included in the certificate. The maximum number of characters allowed for the country-name is two. The default is US. |
|                   | <b>email <i>email-id</i></b>                 | (OPTIONAL) Enter the keyword <code>email</code> then the email-id to be included in the certificate.                                                                                                       |
|                   | <b>length <i>key-length</i></b>              | (OPTIONAL) Enter the keyword <code>length</code> then the key length in bits. The key length range is from 1024 to 4096 bits. The default is 2048 bits.                                                    |
|                   | <b>locality <i>locality-name</i></b>         | (OPTIONAL) Enter the keyword <code>locality</code> then the name of the locality to be included in the certificate. The default is San Jose.                                                               |
|                   | <b>organization <i>organization-name</i></b> | (OPTIONAL) Enter the keyword <code>organization</code> then the name of the organization to be included in the certificate. The default is Dell.                                                           |

|                                                            |                                                                                                                                                                                             |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>orgunit</b><br><b>organization-</b><br><b>unit-name</b> | (OPTIONAL) Enter the keyword <code>orgunit</code> then the organization unit name to be included in the certificate. The default is Dell Networking.                                        |
| <b>state</b> <b>state-name</b>                             | (OPTIONAL) Enter the keyword <code>state</code> then the name of the state to be included in the certificate. The default is California.                                                    |
| <b>validity</b> <b>days</b>                                | (OPTIONAL) Enter the keyword <code>validity</code> then the number of days the certificate is valid. The validity range is from 1 to 10000 days. The default value is 3650 days (10 years). |

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.6(0.0)</b> | Introduced on the S -Series and Z-Series switches. |

**Usage Information** The maximum number of characters allowed for the parameters, except the county-name, is **64**.

## crypto key generate

Generate keys for the SSH server.

### C9000 Series

**Syntax**  **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
crypto key generate {rsa | rsa1}
```

|                   |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>rsa</b>  | Enter the keyword <code>rsa</code> then the key size to generate a SSHv2 RSA host keys. The range is from 1024 to 2048 if you did not enable FIPS mode; if you enabled FIPS mode, you can only generate a 2048-bit key. The default is <b>1024</b> .<br> <b>NOTE:</b> You must have a license to access the FIPS mode. For more information, contact your Dell Networking representative. |
|                   | <b>rsa1</b> | Enter the keyword <code>rsa1</code> then the key size to generate a SSHv1 RSA host keys. The range is from 1024 to 2048. The default is <b>1024</b> .<br> <b>NOTE:</b> This option is not available in FIPS mode.                                                                                                                                                                         |

**Defaults** Key size **1024**; if you enable FIPS mode, the key size is **2048**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |

| Version         | Description                               |
|-----------------|-------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                  |
| <b>8.3.12.0</b> | Added support for FIPS mode on the S4810. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                  |
| <b>7.6.1.0</b>  | Introduced on the S-Series.               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.               |
| <b>6.1.1.0</b>  | Introduced on the E-Series.               |

#### Usage Information

The host keys are required for key-exchange by the SSH server. If the keys are not found when you enable the server (`ip ssh server enable`), the keys are automatically generated.

This command requires user interaction and generates a prompt prior to overwriting any existing host keys.

 **NOTE:** Only a user with superuser permissions should generate host-keys.

#### Example

```
Dell#conf
Dell(conf)#crypto key generate rsa1
Enter key size <1024-2048>. Default<1024>: 1024

Host key already exists. Do you want to replace. [y/n] :y
Dell(conf)#
```

#### Related Commands

[ip ssh server](#) — enables the SSH server.  
[show crypto](#) — displays the SSH host public keys.

## crypto key zeroize rsa

Removes the generated RSA host keys and zeroize the key storage location.

### C9000 Series

**Syntax** `crypto key zeroize rsa`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                             |
|-----------------|---------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                |
| <b>9.5(0.0)</b> | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

#### Related Commands

[crypto key generate](#) — Generate keys for SSH server

## debug ip ssh

Enables collecting SSH debug information.

|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Syntax</b>          | <code>ip scp topdir <i>directory</i></code><br>To return to the default setting, use the <code>no ip scp topdir</code> command.                                                                                                                           |                         |
| <b>Parameters</b>      | <b><i>directory</i></b>                                                                                                                                                                                                                                   | Enter a directory name. |
| <b>Defaults</b>        | The internal flash ( <code>flash:</code> ) is the default directory.                                                                                                                                                                                      |                         |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                             |                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |                         |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

**Usage Information** To configure the switch as an SCP server, use the `ip ssh server` command.

**Related Commands** [ip ssh server](#) — enables the SSH and SCP server on the switch.

## ip ssh authentication-retries

Configure the maximum number of attempts that should be used to authenticate a user.

### C9000 Series

**Syntax** `ip ssh authentication-retries 1-10`

**Parameters** **1-10** Enter the number of maximum retries to authenticate a user. The range is from 1 to 10. The default is **3**.

**Defaults** **3**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

**Usage Information** This command specifies the maximum number of attempts to authenticate a user on an SSH connection with the remote host for password authentication. SSH disconnects when the number of password failures exceeds authentication-retries.

## ip ssh challenge-response-authentication

Enable challenge response authentication for SSHv2.

|                          |                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                            |

| Version          | Description                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON, S6000, S6000–ON, S5000, S4810, S4820T, S3048–ON, S4048–ON, MXL, C9010, S3100 series, and Z9100-ON. |

#### Usage Information

- You can select one or more ciphers from the list.
- The default list of supported ciphers is same irrespective of whether FIPS mode is enabled or disabled.
- Client-supported cipher list gets preference over the server-supported cipher list in selecting the cipher for the SSH session.
- When the `cipher (-c)` option is used with the SSH CLI, it overrides the configured or default cipher list.
- When FIPS is enabled or disabled, the client ciphers get default configuration.

## ip ssh connection-rate-limit

Configure the maximum number of incoming SSH connections per minute.

### C9000 Series

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

#### Usage Information

The server-generated key is used for SSHv1 key-exchange.

## ip ssh mac

Configure the list of MAC algorithms supported on both SSH client and SCP.

#### Syntax

```
ip ssh mac mac-list
```

#### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac <i>mac-list</i></b> | <p>Enter the keyword <code>mac</code> then a space-delimited list of message authentication code (MAC) algorithms supported by the SSH client. The following MAC algorithms are available.</p> <p>When FIPS mode is enabled:</p> <ul style="list-style-type: none"> <li>• <code>hmac-sha2-256</code></li> <li>• <code>hmac-sha1</code></li> <li>• <code>hmac-sha1-96</code></li> </ul> <p>When FIPS mode is disabled:</p> <ul style="list-style-type: none"> <li>• <code>hmac-sha2-256</code></li> <li>• <code>hmac-sha1</code></li> <li>• <code>hmac-sha1-96</code></li> <li>• <code>hmac-md5</code></li> <li>• <code>hmac-md5-96</code></li> </ul> |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Defaults

The default list of MAC algorithm is in the order as shown below:

When FIPS mode is enabled:

- `hmac-sha2-256`
- `hmac-sha1`
- `hmac-sha1-96`

When FIPS mode is disabled:

- `hmac-sha2-256`
- `hmac-sha1`
- `hmac-sha1-96`
- `hmac-md5`
- `hmac-md5-96`

#### Command Modes

| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |  |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |  |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| Usage Information | With password authentication enabled, you can authenticate using the local, RADIUS, or TACACS+ password fallback order as configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                             |  |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## ip ssh pub-key-file

Specify the file used for host-based authentication.

### C9000 Series

|                      |                            |                                                        |  |
|----------------------|----------------------------|--------------------------------------------------------|--|
| <b>Syntax</b>        | ip ssh pub-key-file {WORD} |                                                        |  |
| <b>Parameters</b>    | <b><i>WORD</i></b>         | Enter the file name for the host-based authentication. |  |
| <b>Defaults</b>      | none                       |                                                        |  |
| <b>Command Modes</b> | CONFIGURATION              |                                                        |  |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Usage Information

This command specifies the file used for the host-based authentication. The `creates/` file overwrites the `flash://ADMIN_DIR/ssh/knownhosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

The file contains the OpenSSH-compatible public keys of the host for which host-based authentication is allowed. An example known host file format:

```
poclab4,123.12.1.123 ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAox/
QQp8xYhzOxn07yh4VGPAoUfgKoieTHO9G4sNV+ui+DWEc3cgYAcU5LailMU2ODrzhCwyDNp05tK
BU3t
ReG1o8AxLi6+S4hyEMqHzkzBFNVqHzpQc+Rs4p2urzV0F4pRKnaXdHf3Lk4D460HZRhhVrxqeNx
PDpEn WIMPJi0ds= ashwani@poclab4
```

 **NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the chassis.

## Example

```
Dell#conf
Dell(conf)# ip ssh pub-key-file flash://knownhosts
Dell(conf)#
```

## Related Commands

[show ip ssh client-pub-keys](#) — displays the client-public keys used for the host-based authentication.

# ip ssh mac

Configure the list of MAC algorithms supported on both SSH client and SCP.

## Syntax

```
ip ssh mac mac-list
```

## Parameters

### **mac** *mac-list*

Enter the keyword `mac` then a space-delimited list of message authentication code (MAC) algorithms supported by the SSH client. The following MAC algorithms are available.

When FIPS mode is enabled:

- `hmac-sha2-256`
- `hmac-sha1`
- `hmac-sha1-96`

When FIPS mode is disabled:

- `hmac-sha2-256`
- `hmac-sha1`

- `hmac-sha1-96`
- `hmac-md5`
- `hmac-md5-96`

## Defaults

The default list of MAC algorithm is in the order as shown below:

When FIPS mode is enabled:

- `hmac-sha2-256`
- `hmac-sha1`
- `hmac-sha1-96`

When FIPS mode is disabled:

- `hmac-sha2-256`
- `hmac-sha1`
- `hmac-sha1-96`
- `hmac-md5`
- `hmac-md5-96`

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the S6100–ON, S6000, S6000–ON, S5000, S4810, S4820T, S3048–ON, S4048–ON, MXL, C9010, S3100 series, and Z9100-ON. |

## Usage Information

- You can select one or more MAC algorithms from the list.
- Client-supported MAC list gets preference over the server-supported MAC list in selecting the MAC algorithm for the SSH session.
- When the `MAC (-m)` option is used with the SSH CLI, it overrides the configured or default MAC list.
- When FIPS is enabled or disabled, the client MACs get default configuration.

# ip ssh rekey

Configures the time rekey-interval or volume rekey-limit threshold at which to re-generate the SSH key during an SSH session.

## C9000 Series

## Syntax

`ip ssh rekey [time rekey-interval] [volume rekey-limit]`

To reset to the default, use `no ip ssh rekey [time rekey-interval] [volume rekey-limit]` command.

## Parameters

|                           |                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>time minutes</b>       | Enter the keywords <b>time</b> then the amount of time in minutes. The range is from 10 to 1440 minutes. The default is <b>60</b> minutes               |
| <b>volume rekey-limit</b> | Enter the keywords <b>volume</b> then the amount of volume in megabytes. The range is from 1 to 4096 to megabytes. The default is <b>1024 megabytes</b> |

## Defaults

The default time is **60** minutes. The default volume is **1024** megabytes.

| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

#### Example

```
Dell#conf
Dell(conf)# ip ssh rhostsfile flash://shosts
Dell(conf)#
```

#### Usage Information

This command specifies the rhost file used for host-based authentication. This `creates/` file overwrites the `flash:/ADMIN_DIR/ssh/shosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

This file contains hostnames and usernames, for which hosts and users, rhost-authentication can be allowed.

 **NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the switch.

# ip ssh rsa-authentication (Config)

Enable RSA authentication for the SSHv2 server.

## C9000 Series

| Syntax            | <code>ip ssh rsa-authentication enable</code><br>To disable RSA authentication, use the <code>no ip ssh rsa-authentication enable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                          |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

| Usage Information | Enabling RSA authentication allows the user to log in without being prompted for a password. In addition, the OpenSSH compatible SSHv2 RSA public key must be added to the list of authorized keys ( <code>ip ssh rsa-authentication my-authorized-keys device://filename</code> command).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                          |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

# ip ssh rsa-authentication (EXEC)

Add keys for the RSA authentication.

## C9000 Series

|               |                                                                                                                                                                                      |                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Syntax        | <pre>ip ssh rsa-authentication {my-authorized-keys WORD}</pre> <p>To delete the authorized keys, use the <code>no ip ssh rsa-authentication {my-authorized-keys}</code> command.</p> |                                                                                                  |
| Parameters    | <b>my-authorized-keys WORD</b>                                                                                                                                                       | Enter the keywords <code>my-authorized-keys</code> then the filename of the RSA authorized-keys. |
| Defaults      | none                                                                                                                                                                                 |                                                                                                  |
| Command Modes | EXEC                                                                                                                                                                                 |                                                                                                  |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Usage Information

If you want to log in without being prompted for a password, log in through RSA authentication. To do that, first add the SSHv2 RSA public keys to the list of authorized keys. This command adds the specified RSA keys to the following file: `flash://ADMIN_DIR/ssh/authorized-keys-username` (where username is the user associated with this terminal).

 **NOTE:** The `no` form of this command deletes the file `flash://ADMIN_DIR/ssh/ authorized-keys-username` file.

## Related Commands

`show ip ssh rsa-authentication` — displays the RSA authorized keys.

`ip ssh rsa-authentication (Config)` — enables RSA authentication.

# ip ssh server

Configure an SSH server. The SSH server is enabled by default.

## C9000 Series

### Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}]
```

To disable SSH server functions, use the `no ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}]` command.

### Parameters

|                                   |                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>                     | Enter the key word <code>enable</code> to start the SSH server.                                                                                                                                                                                                                                                                        |
| <b>ciphers <i>cipher-list</i></b> | <p>Enter the keyword <code>ciphers</code> and then a space-delimited list of ciphers that the SSH server supports.</p> <p>The following ciphers are available.</p> <ul style="list-style-type: none"><li>• 3des-cbc</li><li>• aes128-cbc</li><li>• aes192-cbc</li><li>• aes256-cbc</li><li>• aes128-ctr</li><li>• aes192-ctr</li></ul> |

- aes256-ctr

The default cipher list is used.

- 3des-cbc
- aes128-cbc
- aes192-cbc
- aes256-cbc
- aes128-ctr
- aes192-ctr
- aes256-ctr

**mac *hmac-*  
algorithm**

Enter the keyword `mac` then a space-delimited list of hash message authentication code (HMAC) algorithms supported by the SSH server for keying hashing for the message authentication.

The following HMAC algorithms are available:

- hmac-sha1
- hmac-sha1-96
- hmac-sha2-256

When FIPS is enabled, the default HMAC algorithm is `hmac-sha1-96`.

When FIPS is not enabled, the default HMAC algorithms are the following:

- hmac-md5
- hmac-md5-96
- hmac-sha1
- hmac-sha1-96
- hmac-sha2-256

**kex  
*key-exchange-*  
algorithm**

Enter the keyword `kex` and then a space-delimited list of key exchange algorithms supported by the SSH server.

The following key exchange algorithms are available:

- diffie-hellman-group-exchange-sha1
- diffie-hellman-group1-sha1
- diffie-hellman-group14-sha1

When FIPS is enabled, the default key-exchange-algorithm is `diffie-hellman-group14-sha1`.

When FIPS is not enabled, the default key-exchange-algorithms are the following:

- diffie-hellman-group-exchange-sha1
- diffie-hellman-group1-sha1,
- diffie-hellman-group14-sha1

**port *port-number*** (OPTIONAL) Enter the keyword `port` then the port number of the listening port of the SSH server. The range is from 1 to 65535. The default is **22**.

**[version {1 | 2}]** (OPTIONAL) Enter the keyword `version` then the SSH version 1 or 2 to specify only SSHv1 or SSHv2.

 **NOTE:** If you enable FIPS mode, you can only select version 2.

## Defaults

- Default listening port is **22**.
- Default cipher list is 3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
- When FIPS is enabled, the default is hmac-sha1-96.
- When FIPS is not enabled, the default is hmac-md5,hmac-md5-96,hmac-sha1,hmac-sha1-96,hmac-sha2-256.
- When FIPS is enabled, the default is diffie-hellman-group14-sha1.
- When FIPS is not enabled, the default is diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                                                        |
| 9.5(0.1) | Introduced the <code>cipher</code> , <code>kex</code> and <code>mac</code> options on the Z9500.                                |
| 9.5(0.0) | Introduced the <code>cipher</code> , <code>kex</code> and <code>mac</code> options on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                                                                        |
| 9.0.2.0  | Introduced on the S6000.                                                                                                        |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                       |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                        |
| 8.3.7.0  | Introduced on the S4810.                                                                                                        |
| 7.6.1.0  | Introduced on the S-Series.                                                                                                     |
| 7.5.1.0  | Introduced on the C-Series.                                                                                                     |
| 6.1.1.0  | Introduced on the E-Series.                                                                                                     |

**Usage Information** This command enables the SSH server and begins listening on a port. If a port is not specified, listening is on SSH default port 22.

**Example**

```
Dell# conf
Dell(conf)# ip ssh server port 45
Dell(conf)# ip ssh server enable
Dell#
```

**Related Commands** [show ip ssh](#) — displays the ssh information.

## ip ssh server dns enable

Enable or disable the DNS in SSH server configuration to resolve hostname for host-based authentication.

**Syntax** `ip ssh server dns enable`

To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13.0.1 | Introduced on the MXL, C9010, S3048-ON, S3100 series, S4810, S4820T, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6100-ON, S6010-ON, Z9500, Z9100-ON and FN-IOM. |

**Usage Information** To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.

# ip ssh source-interface

Specifies an interface's IP address as the source IP address for an outgoing SSH connections.

## C9000 Series

| Syntax            | <code>ip ssh source-interface interface</code><br>To delete a source interface, use the <code>no ip ssh source-interface</code> command.                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |         |             |          |                             |          |                          |          |                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|---------|-------------|----------|-----------------------------|----------|--------------------------|----------|---------------------------------------|
| Parameters        | <b>interface</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li><li>For Loopback interfaces, enter the keyword <code>loopback</code> then a number from zero (0) to 16838.</li><li>For the Null interface, enter the keywords <code>null 0</code>.</li><li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |  |         |             |          |                             |          |                          |          |                                       |

| Usage Information | <p>The <code>source-interface interface</code> attribute is applicable for both the <code>SSH client</code> as well as the <code>COPY (SCP)</code> commands. Using these attributes the client session tags an error to the user during run time, in case there is a mismatch between this command and the <code>ip ssh vrf</code> command.</p>                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |         |             |          |                             |          |                          |          |                                       |

# show ip ssh

Display information about established SSH sessions.

## C9000 Series

### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
show ip ssh
```

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| 9.11(0.0) | Updated the output to include challenge-response-authentication option. |
| 9.9(0.0)  | Introduced on the C9010.                                                |
| 9.2(1.0)  | Introduced on the Z9500.                                                |
| 8.3.19.0  | Introduced on the S4820T.                                               |
| 8.3.11.1  | Introduced on the Z9000.                                                |
| 8.3.7.0   | Introduced on the S4810.                                                |
| 7.6.1.0   | Introduced on the S-Series.                                             |
| 7.5.1.0   | Introduced on the C-Series.                                             |
| 6.1.1.0   | Introduced on the E-Series.                                             |

### Example

```
Dell# show ip ssh
SSH server : enabled.
SSH server version : v1 and v2.
SSH server vrf : default.
SSH server ciphers : aes256-ctr, aes256-cbc, aes192-ctr, aes192-cbc, aes128-ctr, aes128-cbc, 3des-cbc.
SSH server macs : hmac-sha2-256, hmac-sha1, hmac-sha1-96, hmac-md5, hmac-md5-96.
SSH server kex algorithms : diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication : disabled.
Challenge Response Auth : enabled.
 Vty Encryption HMAC Remote IP
 2 aes128-cbc hmac-md5 10.16.127.141
 4 aes128-cbc hmac-md5 10.16.127.141
* 5 aes128-cbc hmac-md5 10.16.127.141
Dell#
```

### Related Commands

- [ip ssh server](#) — configures an SSH server.
- [show ip ssh client-pub-keys](#) — displays the client-public keys.

# show ip ssh client-pub-keys

Display the client public keys used in host-based authentication.

freedom@poclab4

Dell#
```

## Related Commands

[ip ssh rsa-authentication \(Config\)](#) — configures the RSA authorized keys.

# ssh

Open an SSH connection specifying the hostname, username, encryption cipher, HMAC algorithm, port number, and version of the SSH client.

## C9000 Series

## Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
ssh[vrf vrf-name] {hostname | ipv4 address | ipv6 address} [-c encryption
cipher | -l username | -m HMAC algorithm | -p port-number | -v {1 | 2}]
```

## Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to specify the VRF used with the SSH session.<br> <b>NOTE:</b> The VRF configured using this command has a higher precedence than the VRF configured using the <code>ip ssh vrf vrf-name</code> command. If you do not configure a VRF using this command, then the SSH client uses the configured VRF (if any). If there is a mismatch between VRFs that are configured using the <code>ip ssh source-interface</code> command and the <code>ssh vrf vrf-name</code> command, then an error is reported. |
| <b>hostname</b>     | (OPTIONAL) Enter the IP address or the host name of the remote device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf instance</i></b>               | (OPTIONAL) E-Series Only: Enter the keyword <code>vrf</code> then the VRF Instance name to open an SSH connection to that instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>ipv4 address</i></b>               | (OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>ipv6-address prefix-length</i></b> | (OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.                                                                                                                                                                                                                                                                                                       |
| <b><i>-c encryption cipher</i></b>       | Enable the "FIPS mode enable", this mode will support only v2 client.<br>"no fips mode enable"(disable) will support v1 & v2 client. This comment is applicable for both ciphers & HMAC algorithms: <ul style="list-style-type: none"> <li>• <code>3des-cbc</code></li> <li>• <code>aes128-cbc</code></li> <li>• <code>aes192-cbc</code></li> <li>• <code>aes256-cbc</code></li> <li>• <code>aes128-ctr</code></li> <li>• <code>aes192-ctr</code></li> <li>• <code>aes256-ctr</code></li> </ul>                                                                                                          |
| <b><i>-l username</i></b>                | (OPTIONAL) Enter the keyword <code>-l</code> then the user name used in this SSH session. The default is the user name of the user associated with the terminal.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>-m HMAC algorithm</i></b>          | Enter one of the following HMAC algorithms to use. (For v2 clients only):<br>"no fips mode enable"(disable) will support v1 & v2 client. <ul style="list-style-type: none"> <li>• <code>hmac-sha1</code>: Force ssh to use hmac-sha1 HMAC algorithm.</li> <li>• <code>hmac-sha1-96</code>: Force ssh to use hmac-sha1-96 HMAC algorithm.</li> <li>• <code>hmac-md5</code>: Force ssh to use hmac-md5 HMAC algorithm.</li> <li>• <code>hmac-md5-96</code>: Force ssh to use hmac-md5-96 HMAC algorithm.</li> <li>• <code>hmac-sha2-256</code> : Force ssh to use hmac-sha2-256 HMAC algorithm.</li> </ul> |
| <b><i>-p port-number</i></b>             | (OPTIONAL) Enter the keyword <code>-p</code> then the port number. The range is from 1 to 65535. The default is <b>22</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>-v {1   2}</i></b>                 | (OPTIONAL) Enter the keyword <code>-v</code> then the SSH version 1 or 2. The default is the version from the protocol negotiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Defaults** As shown in the *Parameters* section.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Removed the support for <code>hmac-sha2-256-96</code> algorithm.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>9.5(0.1)</b>  | Added support for the following ciphers and HMAC algorithms on the Z9000, S6000, S4820T, S4820T. <ul style="list-style-type: none"> <li>• <code>aes128-cbc</code></li> <li>• <code>aes192-cbc</code></li> <li>• <code>aes256-cbc</code></li> <li>• <code>aes128-ctr</code></li> <li>• <code>aes192-ctr</code></li> <li>• <code>aes256-ctr</code></li> <li>• <code>hmac-sha2-256</code></li> <li>• <code>hmac-sha2-256-96</code></li> </ul> |

| Version         | Description                                                                        |
|-----------------|------------------------------------------------------------------------------------|
| <b>9.4(0.0)</b> | Added support for VRF.                                                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                           |
| <b>8.3.12.0</b> | Added support for the <code>-c</code> and <code>-m</code> parameters on the S4810. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                           |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                        |
| <b>7.5.1.0</b>  | Added IPv6 support. Introduced on the C-Series.                                    |
| <b>6.1.1.0</b>  | Introduced on the E-Series.                                                        |

#### Usage Information

Dell Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

#### Example

```
Dell#ssh 10.11.8.12 ?
-c Encryption cipher to use (for v2 clients only)
-l User name option
-m HMAC algorithm to use (for v2 clients only)
-p SSH server port option (default 22)
-v SSH protocol version
<cr>

Dell#ssh 10.11.8.12 -c ?
3des-cbc Force ssh to use 3des-cbc encryption cipher

Dell#ssh 10.11.8.12 -m ?
hmac-sha1 Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96 Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-md5 Force ssh to use hmac-md5 HMAC algorithm
hmac-md5-96 Force ssh to use hmac-md5-96 HMAC algorithm
Dell#ssh vrf vrf1 10.10.10.2 -l admin
```

## Secure DHCP Commands

DHCP as defined by RFC 2131 provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

### clear ip dhcp snooping

Clear the DHCP binding table.

#### C9000 Series

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series. |

## ip dhcp snooping trust

Configure an interface as trusted.

### C9000 Series

**Syntax** `[no] ip dhcp snooping trust`

**Defaults** Untrusted

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series. |

## ip dhcp source-address-validation

Enable IP source guard.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>7.8.1.0</b>   | Introduced on the C-Series and S-Series.                   |

## ip dhcp snooping vlan

Enable DHCP Snooping on one or more VLANs.

### C9000 Series

|                      |                                                                               |
|----------------------|-------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>[no] ip dhcp snooping vlan <i>name</i></code>                           |
| <b>Parameters</b>    | <b><i>name</i></b> Enter the name of a VLAN on which to enable DHCP Snooping. |
| <b>Defaults</b>      | Disabled.                                                                     |
| <b>Command Modes</b> | CONFIGURATION                                                                 |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information**

When enabled, the system begins creating entries in the binding table for the specified VLANs.

 **NOTE:** Learning only happens if there is a trusted port in the VLAN.

**Related Commands**

[ip dhcp snooping trust](#) — configures an interface as trusted.

## show ip dhcp snooping

Display the contents of the DHCP binding table.

### C9000 Series

**Syntax**

```
show ip dhcp snooping binding
```

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

**Related Commands**

[clear ip dhcp snooping](#) — clears the contents of the DHCP binding table.

# ICMP Vulnerabilities

The internet control message protocol (ICMP) is a network-layer internet protocol that provides message packets to report errors and other information regarding IP packet processing back to the source. Dell Networking OS mainly addresses the following ICMP vulnerabilities:

- ICMP Mask Reply
- ICMP Timestamp Request
- ICMP Replies
- IP ID Values Randomness

You can configure the Dell Networking OS to drop ICMP reply messages. When you configure the `drop icmp` command, the system drops the ICMP reply messages from the front end and management interfaces. By default, the Dell Networking OS responds to all the ICMP messages. You can configure the Dell Networking OS to suppress the following ICMPv4 and ICMPv6 message types:

Table 11. Suppressed ICMPv4 message types

| ICMPv4 Message Types                         |
|----------------------------------------------|
| Echo reply (0)                               |
| All sub types of destination unreachable (3) |
| Source quench (4)                            |
| Redirect (5)                                 |
| Router advertisement (9)                     |
| Router solicitation (10)                     |
| Time exceeded (11)                           |
| IP header bad (12)                           |
| Timestamp request (13)                       |
| Timestamp reply (14)                         |
| Information request (15)                     |
| Information reply (16)                       |
| Address mask request (17)                    |
| Address mask reply (18)                      |

 **NOTE:** The Dell Networking OS does not suppress the ICMPv4 message type `Echo request (8)`.

Table 12. Suppressed ICMPv6 message types

| ICMPv6 Message Types        |
|-----------------------------|
| Destination unreachable (1) |
| Time exceeded (3)           |
| IPv6 header bad (4)         |
| Echo reply (129)            |
| Who are you request (139)   |
| Who are you reply (140)     |
| Mtrace response (200)       |
| Mtrace messages (201)       |

 **NOTE:**

The Dell Networking OS does not suppress the following ICMPv6 message types:

- Packet too big (2)
- Echo request (128)
- Multicast listener query (130)
- Multicast listener report (131)
- Multicast listener done (132)
- Router solicitation (133)
- Router advertisement (134)
- Neighbor solicitation (135)
- Neighbor advertisement (136)
- Redirect (137)
- Router renumbering (138)
- MLD v2 listener report (143)
- Duplicate Address Request (157)
- Duplicate Address Confirmation (158)

## drop icmp

Drops the ICMPv4 and ICMPv6 packets.

**Syntax** `drop {icmp | icmp6}`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other Platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11.0.0**

Introduced on the S4810, S4820T, S3048-ON, S3100 Series, S4048-ON, S5000, S6000, S6000-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON, S4048T-ON, C9000, and MXL.

### Usage Information

When the `drop icmp` feature is configured, the system drops the ICMP reply messages on the front end and management interfaces. By default, the Dell Networking OS responds to all the ICMP messages.

 **NOTE:** There is no separate CLI to enable IP ID randomness. By default, the IP ID in the kernel is randomized.

For more information on the ICMP message types, see the [ICMP Commands](#) section.

## System Security Commands

The following section lists the system security commands.

### boot-access password

Set a password for the boot loader.

**Syntax** `boot-access password [encryption-type] boot-password`

To remove the GRUB access password, use the `no boot-access password` command.

**Parameters** **encryption-type** (OPTIONAL) Enter an encryption type for the boot password.

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                          |

| <b>Usage Information</b> | <p>If you enable the boot access password, the system prompts for a password when you access the GRUB interface.</p> <p>When you configure the boot access password, ensure that your password meets the following criteria:</p> <ul style="list-style-type: none"> <li>• A minimum of eight characters in length</li> <li>• A minimum of one lower case letter (a to z)</li> <li>• A minimum of one upper case letter (A to Z)</li> <li>• A minimum of one numeric character (0 to 9)</li> <li>• A minimum of one special character including a space (" !"#%&amp;'()*+,-./:;&lt;=&gt;?@[\\]^_`{ }~")</li> </ul> <p>If your password does not meet the criteria, the system does not accept your password.</p> <p>When you upgrade the Dell EMC Networking OS image, ensure that you upgrade the boot loader.</p> <p> <b>CAUTION:</b> After configuring the boot access password, save it to a secure location. If you forget it, you will not be able to access the options in the startup menu. If you forget both the boot access password and the enable password, the system may become inaccessible.</p> |                                                                                                                                                                                          |

#### Example

```
DellEMC(conf) #boot-access password 7 Hg$7^5HMoiY%

* Warning - boot-access password will enable password protection in
*
* GRUB. Keep it safe. Forgetting this password and the CLI password
*
* may result in switch becoming inaccessible.
*

Do you want to configure boot-access password? Proceed [yes/no]:yes
DellEMC(conf) #
```

## generate hash

Generate a hash checksum for the given file or the startup configuration using the MD5, SHA1, or SHA256 algorithm.

| <b>Syntax</b>     | <code>generate hash {md5   sha1   sha256} {flash://filename   startup-config}</code> |                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b> | <b>md5   sha1   sha256</b><br><b>flash://filename</b><br><b>startup-config</b>       | Enter the keyword md5, sha1, or sha256 to generate .<br>Enter the keyword <code>flash:</code> and enter the filename to generate the hash checksum for any file in the flash drive using the MD5, SHA1, or SHA256 algorithm.<br>Enter the keyword <code>startup-config</code> to generate the hash checksum for the startup configuration using the MD5, SHA1, or SHA256 algorithm. |
| <b>Defaults</b>   | None                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                     |

**Command Modes** EXEC Privilege

**Command History**

**Version**

**Description**

**9.13(0.0)**

Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM.

**Usage Information**

Use the `generate hash` command to generate a hash checksum for your startup configuration, and use the hash to verify using the `verified boot hash` command.

**Example**

```
DellEMC#generate hash md5 startup-config
MD5SUM(/f10/flash/startup-config) : f81812a64eea202c5b2ef782639bafc3
```

## root-access password

Configure the root access password.

**Syntax**

`root-access password [encryption-type] root-password`

To reset to the default password, use the `no root-access password` command.

**Parameters**

**encryption-type** (OPTIONAL) Enter an encryption type for the root password that you enter.

- 0 directs the system to store the password as clear text.
- 7 directs the system to store the password with a dynamic salt.
- 9 directs the system to encrypt the clear text password and store the encrypted password in an inaccessible location.

**root-password** Enter the root password.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION

**Command History**

**Version**

**Description**

**9.13(0.0)**

Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM.

**Usage Information**

If you configure the `secure-cli` command on the system, the Dell EMC Networking OS resets any previously-configured root access password to the default root password without displaying any warning message. With the `secure-cli` command enabled on the system, the CONFIGURATION mode does not display the `root access password` option.

When you configure the root access password, ensure that your password meets the following criteria:

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !"#%&'()\*+,-./:;<=>?@[\\]^\_`{|}~")

If your password does not meet the criteria, the system does not accept your password.

If you use encryption type 9, the system stores the clear text password in an inaccessible location on the system. The `show running-configuration` command does not display the password. This configuration is not portable between different systems.

### Example

```
DellEMC)# show running-config | g root
root-access password 7
f4dc0cb9787722dd1084d17f417f164cc7f730d4f03d4f0215294cbd899614e3
```

## verified boot hash

Verify and store the hash value of the startup configuration.

### Syntax

```
verified boot hash startup-config hash value
```

### Parameters

|                       |                                                                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>startup-config</b> | Enter the keyword <code>startup-config</code> and then the hash value for the startup configuration. You can get the hash value for the startup configuration using the <code>generate hash</code> command. |
| <b>hash value</b>     | Enter the MD5, SHA1, or SHA256 hash.                                                                                                                                                                        |

### Defaults

None

### Command Modes

EXEC Privilege

### Command History

|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.13(0.0)</b> | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM. |

### Usage Information

Dell EMC Networking OS supports MD5, SHA1, and SHA256.

### Example

```
DellEMC# verified boot hash system-image A:
619A8C1B7A2BC9692A221E2151B9DA9E
```

## verified startup-config

Enable hash validation for the startup configuration during system startup.

### Syntax

```
verified startup-config
```

To disable hash validation for the startup configuration, use the `no verified startup-config` command.

### Defaults

Not configured

|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.13(0.0)</b> | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM. |

### Example

```
DellEMC(config)# verified startup-config
```

## Service Provider Bridging

Service provider bridging is composed of virtual local area network (VLAN) Stacking, Layer 2 Protocol Tunneling, and Provider Backbone Bridging as described in the *Dell Networking OS Configuration Guide Service Provider Bridging* chapter.

This chapter includes command line information (CLI) for the Dell Networking operating software Layer 2 Protocol Tunneling (L2PT). L2PT enables protocols to tunnel through an 802.1q tunnel.

For more information, refer to [VLAN Stacking](#), [Spanning Tree Protocol \(STP\)](#), and [GARP VLAN Registration \(GVRP\)](#).

### Important Points to Remember

- L2PT is enabled at the interface VLAN-Stack VLAN level. For more information about Stackable VLAN (VLAN-Stacking) commands, refer to [VLAN Stacking](#).
- The default behavior is to disable protocol packet tunneling through the 802.1q tunnel.
- Rate-limiting is required to protect against bridge protocol data units (BPDU) attacks.
- A port channel (including through link aggregation control protocol [LACP]) can be configured as a VLAN-Stack access or trunk port.
- Address resolution protocol (ARP) packets work as expected across the tunnel.
- Far-end failure detection (FEFD) works the same as with Layer 2 links.
- Protocols that use Multicast MAC addresses (for example, open shortest path first [OSPF]) work as expected and carry over to the other end of the VLAN-Stack VLAN.

#### Topics:

- [debug protocol-tunnel](#)
- [protocol-tunnel](#)
- [protocol-tunnel destination-mac](#)
- [protocol-tunnel enable](#)
- [protocol-tunnel rate-limit](#)
- [show protocol-tunnel](#)

### debug protocol-tunnel

Enable debugging to ensure incoming packets are received and rewritten to a new MAC address.

### C9000 Series

#### Syntax

```
debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]
```

To disable debugging, use the `no debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]` command.

#### Parameters

##### interface

Enter one of the following interfaces and slot/port information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

| <b>in   out   both</b>     | Enter the keyword <code>in</code> , <code>out</code> , or <code>both</code> to debug incoming interfaces, outgoing interfaces, or both incoming and outgoing interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                                                      |                |                          |                |                                                              |                |            |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|---------------------------|-----------------|--------------------------|----------------|------------------------------------------------------|----------------|--------------------------|----------------|--------------------------------------------------------------|----------------|------------|
| <b>vlan <i>vlan-id</i></b> | Enter the keyword <code>vlan</code> then the VLAN ID. The range is from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                                                      |                |                          |                |                                                              |                |            |
| <b>count <i>value</i></b>  | Enter the keyword <code>count</code> then the number of debug outputs. The range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                                                      |                |                          |                |                                                              |                |            |

| Version | Description                                                                                                                     |
|---------|---------------------------------------------------------------------------------------------------------------------------------|
| 8.5.1.1 | Added support for 802.1X, E-LMI, GMRP, GVRP, LLDP, LACP, MMRP, MVRP, and OAM 802.3ah protocol traffic to the E-Series ExaScale. |
| 8.2.1.0 | Introduced on the C-Series, E-Series, and E-Series ExaScale.                                                                    |
| 7.4.1.0 | Introduced                                                                                                                      |

#### Example

```
Dell#conf
Dell(conf)#interface vlan 2
Dell(conf-if-vl-2)#vlan-stack compatible
Dell(conf-if-vl-2)#member Te 1/2-3
Dell(conf-if-vl-2)#protocol-tunnel stp
Dell(conf-if-vl-2)#protocol-tunnel enable
```

#### Related Command

[show protocol-tunnel](#) — displays tunneling information for all VLANs.

## protocol-tunnel destination-mac

Overwrite the BPDU destination MAC address with a specific value.

### C9000 Series

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>protocol-tunnel destination-mac xstp address</code>                                                                                                            |
| <b>Parameters</b>      | <p><b>stp</b> Change the default destination MAC address used for L2PT to another value.</p>                                                                         |
| <b>Defaults</b>        | The default destination MAC is 01:01:e8:00:00:00.                                                                                                                    |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                  |
| 9.2(1.0) | Introduced on the Z9500.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 8.2.1.0  | Introduced on the C-Series, and S-Series. |
| 7.4.1.0  | Introduced                                |

#### Usage Information

When you enable VLAN-Stacking, no protocol packets are tunneled.

#### Related Command

[show protocol-tunnel](#) — displays tunneling information for all VLANs.

# protocol-tunnel enable

Enable protocol tunneling globally on the system.

## C9000 Series

| <b>Syntax</b>            | <code>protocol-tunnel enable</code><br>To disable protocol tunneling, use the <code>no protocol-tunnel enable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |

| <b>Usage Information</b> | The system must have the default CAM profile with the default microcode before you enable L2PT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |

# protocol-tunnel rate-limit

Enable traffic rate limiting per box.

## C9000 Series

| <b>Syntax</b>          | <code>protocol-tunnel rate-limit rate</code><br>To reset the rate limit to the default, use the <code>no protocol-tunnel rate-limit rate</code> command.                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|----------|---------------------------|
| <b>Parameters</b>      | <b>rate</b> Enter the rate in frames per second. The range is from 64 to 320 Kbps.                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                          |          |                          |          |                           |
| <b>Defaults</b>        | no default rate-limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                          |          |                          |          |                           |

| 9.9(0.0)               | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |
| 9.2(1.0)               | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |
| 8.3.19.0               | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                          |          |                          |          |                           |

| Version         | Description                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                         |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                         |
| <b>8.2.1.0</b>  | Introduced on the C-Series, E-Series TeraScale, and E-Series ExaScale. Maximum rate limit on E-Series reduced from 4000 to 3000. |
| <b>7.4.1.0</b>  | Introduced                                                                                                                       |

#### Example

```
Dell(conf)#interface vlan 4001
Dell(conf-if-vl-4001-stack)#protocol-tunnel rate-limit 100
```

#### Related Commands

[show protocol-tunnel](#) — displays tunneling information for all VLANs.  
[show running-config](#) — displays the current configuration.

## show protocol-tunnel

Display protocol tunnel information for all or a specified VLAN-Stack VLAN.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                       |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show protocol-tunnel [vlan <i>vlan-id</i>]</code>                                                                                                        |                                                                                                                                       |
| <b>Parameters</b>      | <b>vlan <i>vlan-id</i></b>                                                                                                                                     | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display information for the one VLAN. The range is from 1 to 4094. |
| <b>Defaults</b>        | none                                                                                                                                                           |                                                                                                                                       |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                 |
|-----------------|-------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                    |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                    |
| <b>8.2.1.0</b>  | Introduced on the C-Series, E-Series and E-Series ExaScale. |
| <b>7.4.1.0</b>  | Introduced                                                  |

#### Example

```
Dell#show protocol-tunnel
VLAN Protocols Rate-limit(Kbps) Interface
4001 STP,PVST - Te 1/17 Te 1/19
4002 STP,PVST - Te 1/16 Te 1/18
Dell#

Dell#show protocol-tunnel vlan 4001
VLAN Protocols Rate-limit(Kbps) Interface
4001 STP,PVST - Te 1/17 Te 1/19
```

**Example  
(Specific VLAN)**

```
Dell#show protocol-tunnel vlan 2
System Rate-Limit: 1000 Frames/second
Interface Vlan Protocol(s)
Tel1/2 2 STP, PVST
Dell#
```

**Related  
Commands**

[show running-config](#) — displays the current configuration.

The Dell Networking operating software (OS) supports sFlow commands on Dell Networking OS.

Dell Networking operating software sFlow monitoring system includes an sFlow Agent and an sFlow Collector.

- The sFlow Agent combines the flow samples and interface counters into sFlow datagrams and forwards them to the sFlow Collector.
- The sFlow Collector analyses the sFlow Datagrams received from the different devices and produces a network-wide view of traffic flows.

## Important Points to Remember

- Dell Networking recommends that the sFlow Collector be connected to the Dell Networking chassis through a line card port rather than the route processor module (RPM) Management Ethernet port.
- Dell Networking operating software exports all sFlow packets to the sFlow Collector. A small sampling rate can equate to many exported packets. A backoff mechanism is automatically applied to reduce this amount. Some sampled packets may be dropped when the exported packet rate is high and the backoff mechanism is about to or is starting to take effect. The dropEvent counter, in the sFlow packet, is always zero.
- sFlow sampling is done on a per-port basis.
- Community list and local preference fields are not filled up in the extended gateway element in the sFlow datagram.
- The 802.1P source priority field is not filled up in the extended switch element in the sFlow datagram.
- Only Destination and Destination Peer AS numbers are packed in the dst-as-path field in the extended gateway element.
- If the packet being sampled is redirected using policy-based routing (PBR), the sFlow datagram may contain incorrect extended gateway/router information.
- sFlow does not support packing extended information for IPv6 packets. Only the first 128 bytes of the IPv6 packet is shipped in the datagram.
- The source virtual local area network (VLAN) field in the extended switch element is not packed if there is a routed packet.
- The destination VLAN field in the extended switch element is not packed if there is a multicast packet.
- The sFlow sampling functionality is supported only for egress traffic and not for ingress traffic.
- The maximum number of packets that can be sampled and processed per second is:
  - 7500 packets when no extended information packing is enabled.
  - 7500 packets when only extended-switch information packing is enabled (refer to [sflow extended-switch enable](#)).
  - The outputPort field may not be filled correctly on PE port sampled packets.

# sflow collector

Configure a collector device to which sFlow datagrams are forwarded.

## C9000 Series

### Syntax

```
sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]
```

To delete a configured collector, use the `no sflow collector {ip-address | ipv6-address} agent-addr {ipv4-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]` command.

### Parameters

**sflow collector**  
**ip-address |**  
**ipv6-address**

Enter the IP address of the collector in dotted decimal format for IPv4 or x:x:x:x::x format for IPv6.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**agent-addr ip-**  
**address | ipv6-**  
**address**

Enter the keyword `agent-addr` followed by the sFlow agent IP address in dotted decimal format for IPv4 or x:x:x:x::x format for IPv6.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**number**

(OPTIONAL) Enter the user datagram protocol (UDP) port number. The range is from 0 to 65535. The default is 6343.

**max-datagram-**  
**size number**

(OPTIONAL) Enter the keyword `max-datagram-size` then the size number in bytes. The range is from 400 to 1500. The default is **1400**.

**vrf management**

(OPTIONAL) Enter the keyword `vrf` followed by the keyword `management` to configure the collector device corresponding to the default VRF and the management VRF respectively.

### Defaults

Not configured.

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced the Configuration Terminal Batch mode on C9010.                                            |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                                                              |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                           |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                           |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                                                                |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                              |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                             |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                              |
| <b>8.4.2.3</b>    | Added support for IPv6 sFlow collectors and agents on the E-series TeraScale, C-Series, and S-Series. |
| <b>8.4.1.1</b>    | Added support for IPv6 sFlow collectors and agents on the E-series ExaScale.                          |

| Version        | Description                                                                              |
|----------------|------------------------------------------------------------------------------------------|
| <b>8.3.7.0</b> | Introduced on the S4810.                                                                 |
| <b>8.2.1.0</b> | Introduced S-Series Stacking.                                                            |
| <b>8.1.1.0</b> | Introduced on the E-Series ExaScale.                                                     |
| <b>7.7.1.0</b> | Introduced on the S-Series.                                                              |
| <b>7.6.1.0</b> | Introduced on the C-Series.                                                              |
| <b>6.5.1.0</b> | Expanded the <code>no</code> form of the command to mirror the syntax used to configure. |
| <b>6.2.1.1</b> | Introduced on the E-Series.                                                              |

#### Usage Information

You can configure up to two sFlow collectors (IPv4 or IPv6). If two collectors are configured, traffic samples are sent to both.

The sFlow agent address is carried in a field in SFlow packets and is used by the collector to identify the sFlow agent.

In sFlow, the agent address is a single invariant IPv4 or IPv6 address used to identify the agent to the collector. It is usually assigned the address of a loopback interface on the agent, which provides invariance. The agent address is carried as a field in the payload of the sFlow packets.

As part of the sFlow-MIB, if the SNMP request originates from a configured collector, Dell Networking OS returns the corresponding configured agent IP in the MIB requests. Dell Networking OS checks to ensure that two entries are not configured for the same collector IP with a different agent IP. Should that happen, Dell Networking OS generates the following error: `%Error: Different agent-addr attempted for an existing collector.`

Use this command in Configuration Terminal Batch mode to configure the sFlow collectors in a dual-homing setup.

#### Example

```
Dell(conf)#sflow collector 10.1.1.25 agent-addr 10.1.1.10 vrf management
```

## sflow enable (Global)

Enable sFlow globally.

### C9000 Series

#### Syntax

`sflow enable`

To disable sFlow, use the `no sflow enable` command.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

CONFIGURATION TERMINAL BATCH

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                |
|-------------------|------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced the Configuration Terminal Batch mode on C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                   |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                |

| Version           | Description                          |
|-------------------|--------------------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.          |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.          |
| <b>9.0.2.0</b>    | Introduced on the S6000.             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.             |
| <b>8.3.7.0</b>    | Introduced on the S4810.             |
| <b>8.2.1.0</b>    | Introduced S-Series Stacking.        |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale. |
| <b>7.7.1.0</b>    | Introduced on the S-Series.          |
| <b>7.6.1.0</b>    | Introduced on the C-Series.          |
| <b>6.2.1.1</b>    | Introduced on the E-Series.          |

#### Usage Information

sFlow is disabled by default. In addition to this command, sFlow needs to be enable on individual interfaces where sFlow sampling is desired.

Use this command in Configuration Terminal Batch mode to enable sFlow in a dual-homing setup.

## sflow enable (Interface)

Enable sFlow on interfaces.

### C9000 Series

**Syntax** `sflow enable`

To disable sFlow, use the `no sflow enable` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                      |
|-----------------|--------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                         |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                         |
| <b>8.3.19.0</b> | Introduced on the S4820T.                        |
| <b>8.3.16.1</b> | Introduced on the MXL 10/40GbE Switch IO Module. |
| <b>8.3.11.1</b> | Introduced on the Z9000.                         |
| <b>8.3.7.0</b>  | Introduced on the S4810.                         |
| <b>8.2.1.0</b>  | Introduced on S-Series Stacking.                 |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.             |
| <b>7.7.1.0</b>  | Introduced on the S-Series.                      |
| <b>7.6.1.0</b>  | Introduced on the C-Series.                      |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                      |

## Usage Information

When you enable sFlow on an interface, flow sampling is done on any traffic going out of the interface.

 **NOTE:** After a physical port is a member of a LAG, it inherits the sFlow configuration from the LAG port.

# sf flow ingress-enable

Enable sFlow ingress on interfaces.

## C9000 Series

### Syntax

`sf flow ingress-enable`

To disable sFlow, use the `no sf flow ingress enable` command.

### Defaults

Disabled.

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                           |
|----------|-------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                              |
| 9.7(0.0) | Introduced on the S6000-ON.                           |
| 9.7(0.0) | Introduced on the S-Series, Z-Series, and MXL switch. |

## Usage Information

When you enable ingress sFlow on an interface, flow sampling is done on any incoming traffic.

 **NOTE:** After a physical port is a member of a LAG, it inherits the sFlow configuration from the LAG port.

## Related Commands

[sf flow enable \(Global\)](#) — turns sFlow globally.

# sf flow extended-switch enable

Enable packing information on a switch only.

## C9000 Series

### Syntax

`sf flow extended-switch enable`

To disable packing information, use the `no sf flow extended-switch [enable]` command.

### Parameters

**enable** Enter the keyword `enable` to enable global extended information.

### Defaults

Disabled.

### Command Modes

CONFIGURATION

CONFIGURATION TERMINAL BATCH

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                |
|-------------------|------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced the Configuration Terminal Batch mode on C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                   |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                |

| <b>9.0.2.0</b>    | Introduced on the S6000.                                   |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                   |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                   |
| <b>8.2.1.0</b>    | Introduced on S-Series Stacking.                           |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                       |
| <b>7.7.1.0</b>    | Introduced on the S-Series.                                |
| <b>7.6.1.0</b>    | Introduced on the C-Series.                                |
| <b>7.4.1.0</b>    | Introduced on the E-Series.                                |

#### Usage Information

Dell Networking OS enhances the sflow implementation for real time traffic analysis on the E-Series to provide extended gateway information in cases where the destination IP addresses are learned by different routing protocols and for cases where the destination is reachable over ECMP.

Use this command in Configuration Terminal Batch mode to enable the packing information in a dual-homing setup.

#### Related Commands

[show sflow](#) — displays the sFlow configuration.

## sflow max-header-size extended

Set the maximum header size of a packet to 256 bytes.

### C9000 Series

| Usage Information | <p>The polling interval for an interface is the maximum number of seconds between successive samples of counters sent to the collector. This command changes the global default counter polling (20 seconds) interval. You can configure an interface to use a different polling interval.</p> <p>Use this command in Configuration Terminal Batch mode to set the sFlow polling interval in a dual-homing setup.</p> |                             |
| Related Commands  | <a href="#">sflow polling-interval (Interface)</a> — sets the polling interval for an interface.                                                                                                                                                                                                                                                                                                                      |                             |

## sflow polling-interval (Interface)

Set the sFlow polling interval at an interface (overrides the global-level setting.)

### C9000 Series

| Usage Information | <p>Sample-rate is the average number of packets skipped before the sample is taken. This command changes the global default sampling rate. You can configure an interface to use a different sampling rate than the global sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power of 2 value. Select one of these two packet numbers and re-enter the command.</p> <p>Use this command in Configuration Terminal Batch mode to change the sampling rate in a dual-homing setup.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                           |         |             |           |                                                            |          |                          |            |                             |            |                             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                                  |         |                                      |         |                             |         |                             |         |                             |

For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, etc. The default is <b>32768</b> packets. |         |             |                 |                          |                 |                             |                |                          |                 |                           |                 |                          |                |                          |                |                                  |                |                                      |                |                             |                |                             |                |                             |

| <b>Usage Information</b> | This command changes the sampling rate for an interface. By default, the sampling rate of an interface is set to the same value as the current global default sampling rate if port is operationally down, otherwise sampling rate changes based on port line speed. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power-of-2 value. Select one of these two number and re-enter the command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                     |         |             |                 |                          |                 |                             |                |                          |                 |                           |                 |                          |                |                          |                |                                  |                |                                      |                |                             |                |                             |                |                             |
| <b>Related Commands</b>  | <a href="#">sflow sample-rate (Global)</a> — changes the sampling rate globally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                     |         |             |                 |                          |                 |                             |                |                          |                 |                           |                 |                          |                |                          |                |                                  |                |                                      |                |                             |                |                             |                |                             |

## show sflow

Display the current sFlow configuration.

|                   |                                     |                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show sflow [interface]</code> |                                                                                                                                                                                                                                                 |
| <b>Parameters</b> | <b>interface</b>                    | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li></ul> |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 100/1000 Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit* unit-number range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit* unit-number range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                       |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                          |
| <b>8.2.1.0</b>    | Introduced on S-Series Stacking.                                  |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                              |
| <b>7.7.1.0</b>    | Introduced on the S-Series.                                       |
| <b>7.6.1.0</b>    | Introduced on the C-Series.                                       |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                       |

**Usage Information** The `dropEvent` counter (sFlow samples dropped due to sub-sampling) shown in the following example always displays a value of zero.

**Example**

# show sflow linecard

Display sFlow information for a line card.

## C9000 Series

|                 |                                                                                                                                                                |                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Syntax          | show sflow linecard <i>slot-id</i>                                                                                                                             |                                                                                                                          |
| Parameters      | <i>slot number</i>                                                                                                                                             | Enter a slot number to view information on the line-card ports in that slot. The range of Z9500 slot IDs is from 0 to 2. |
| Command Modes   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                                    |                                                                                                                          |
| Command History | This guide is platform-specific. The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 6.2.1.1  | Introduced on the E-Series.          |

### Example

```
Dell# show sflow linecard 0
Linecard 0
 Samples rcvd from h/w :0
 Total UDP packets exported :0
 UDP packets exported via RPM :0
 UDP packets dropped :0

Dell# show sflow linecard 1
Linecard 1
 Samples rcvd from h/w :0
 Total UDP packets exported :0
 UDP packets exported via RPM :0
 UDP packets dropped :0

Dell# show sflow linecard 2
Linecard 2
 Samples rcvd from h/w :0
 Total UDP packets exported :0
 UDP packets exported via RPM :0
 UDP packets dropped :0
Dell#
```

# Simple Network Management Protocol (SNMP) and Syslog

This chapter contains commands to configure and monitor the simple network management protocol (SNMP) v1/v2/v3 and Syslog.

The chapter contains the following sections:

- [SNMP Commands](#)
- [Syslog Commands](#)

## Topics:

- [SNMP Commands](#)
- [Syslog Commands](#)

## SNMP Commands

The following SNMP commands are available in the Dell Networking operating software.

The simple network management protocol (SNMP) is used to communicate management information between the network management stations and the agents in the network elements. The system supports SNMP versions 1, 2c, and 3, supporting both read-only and read-write modes. The system sends SNMP traps, which are messages informing an SNMP management system about the network. The system supports up to 16 SNMP trap receivers.

## Important Points to Remember

- Typically, 5-second timeout and 3-second retry values on an SNMP server are sufficient for both LAN and WAN applications. If you experience a timeout with these values, the recommended best practice on Dell Networking switches (to accommodate their high port density) is to increase the timeout and retry values on your SNMP server to the following:
  - SNMP Timeout — greater than 3 seconds.
  - SNMP Retry count — greater than 2 seconds.
- If you want to query an E-Series switch using SNMP v1/v2/v3 with an IPv6 address, configure the IPv6 address on a non-management port on the switch.
- If you want to send SNMP v1/v2/v3 traps from an E-Series using an IPv6 address, use a non-management port.
- SNMP v3 informs are not currently supported with IPv6 addresses.
- If you are using access control lists (ACLs) in an SNMP v3 configuration, group ACL overrides user ACL if the user is part of that group.
- SNMP operations are not supported on a virtual local area network (VLAN).

## show snmp

Display the status of SNMP network elements.

### C9000 Series

**Syntax**                      `show snmp`

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

## Example

```
Dell#show snmp
 32685 SNMP packets input
 0 Bad SNMP version errors
 0 Unknown community name
 0 Illegal operation for community name supplied
 0 Encoding errors
 96988 Number of requested variables
 0 Number of altered variables
 31681 Get-request PDUs
 968 Get-next PDUs
 0 Set-request PDUs
 61727 SNMP packets output
 0 Too big errors (Maximum packet size 1500)
 9 No such name errors
 0 Bad values errors
 0 General errors
 32649 Response PDUs
 29078 Trap PDUs
Dell#
```

## Related Commands

[snmp-server community](#) — enables the SNMP and set community string.

# show snmp engineID

Display the identification of the local SNMP engine and all remote engines that are configured on the router.

## C9000 Series

**Syntax** `show snmp engineID`

- Command Modes**
- EXEC
  - EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

#### Example

```
Dell#show snmp engineID
Local SNMP engineID: 0000178B02000001E80214A8
Remote Engine ID IP-addr Port
80001F88043132333435 172.31.1.3 5009
80001F88043938373635 172.31.1.3 5008

Dell#
```

#### Related Commands

[snmp-server engineID](#) — configures local and remote SNMP engines on the router.

## show snmp group

Display the group name, security model, status, and storage type of each group.

### C9000 Series

**Syntax** `show snmp group`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

**Usage Information** The following Example displays a group named *ngroup*. The *ngroup* has a security model of version 3 (v3) with authentication (*auth*), the read and notify name is *nview* with no write view name specified, and finally the row status is active.

#### Example

```
Dell#show snmp group

groupname: ngroup security model: v3 auth
readview : nview writeview: no write view specified
notifyview: nview
row status: active

Dell#
```

**Related Commands** [snmp-server group](#) — configures an SNMP server group.

## show snmp supported-mibs

Display the list of SNMP MIBs supported by the platform.

**Syntax** `show snmp supported-mibs`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S3100, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

**Example**

```
DellEMC#show snmp supported-mibs
MIB OID

RFC1155-SMI -

```

show snmp user

Display the information configured on each SNMP user name.

C9000 Series

Syntax

show snmp user

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

Example

```
Dell#show snmp user
 User name: vlv2creadu
 Engine ID: 0000178B02000001E80214A8
 storage-type: nonvolatile active
 Authentication Protocol: None
 Privacy Protocol: None

Dell#
```

## snmp context

Enables you to map a bgp vrf instance within a SNMP context through community mapping, in SNMPv2c and SNMPv3.

**Syntax** [no] snmp context [*context name*]

**Parameters** *context name* Enter a unique name for the context.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                       |
|-----------|-----------------------------------|
| 9.13(0.0) | Introduced on all DNOS platforms. |

**Usage Information** This command is used for mapping SNMP context to a VRF instance within a community, in SNMPv2c and SNMPv3. The no version of this command turns off this feature.

## snmp ifmib ifalias long

Display the entire description string through the Interface MIB, which would be truncated otherwise to 63 characters.

### C9000 Series

**Syntax** snmp ifmib ifalias long

**Defaults** Interface description truncated beyond 63 characters.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

### Example

```
!----command run on host connected to switch:-----!
> snmpwalk -c public 10.10.10.130 .1.3.6.1.2.1.31 | grep -i alias | more
IF-MIB::ifAlias.134530304 = STRING: This is a port connected to Router2.
This is a
port connected to
IF-MIB::ifAlias.134792448 = STRING:

a port
connected to Router2. This is a port connected to Router2.
IF-MIB::ifAlias.134792448 = STRING:
```

## snmp mib community-map

Associate an SNMP community context (string) with an SNMP context community-map

### C9000 Series

| <b>Syntax</b>                                                                       | <code>snmp mib community-map name context name</code>                                                                                                     |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>                                                                     | Community name is limited to 20 characters.                                                                                                               |
| <b>Command Modes</b>                                                                | CONFIGURATION                                                                                                                                             |
| <b>Command History</b>                                                              | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |
| The following is a list of the Dell Networking OS version history for this command. |                                                                                                                                                           |
| Version                                                                             | Description                                                                                                                                               |
| <b>9.9(0.0)</b>                                                                     | Introduced on the C9010.                                                                                                                                  |

#### Example

```
Dell(conf)#snmp mib ?
community-map Map a SNMP community String with a SNMP context
Dell(conf)#snmp mib community-map ?
WORD Name of the Community(Max 20 chars)
Dell(conf)#snmp mib community-map rise1 ?
context Snmp Context
Dell(conf)#snmp mib community-map rise1 context ?
WORD SNMP Context Name(Max 32 chars)
```

## snmp-server contact

Configure contact information for troubleshooting this SNMP node.

### C9000 Series

|                                                                                                     |                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                                                                                       | <code>snmp-server contact text</code>                                                                                                                          |
| To delete the SNMP server contact information, use the <code>no snmp-server contact</code> command. |                                                                                                                                                                |
| <b>Parameters</b>                                                                                   | <b>text</b> Enter an alphanumeric text string, up to 55 characters long.                                                                                       |

```
Dell(conf)#snmp-server context line
```

|                         |                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">show snmp user</a> — displays the information configured on each SNMP user name. |
|-------------------------|----------------------------------------------------------------------------------------------|

## snmp-server community

Configure a new community string access for SNMPv1 v2 and v3.

### C9000 Series

|               |                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>snmp-server community community-name {ro   rw} [ipv6 ipv6-access-list-name [ipv6 ipv6-access-list-name   access-list-name   security-name name]   security-name name [ipv6 ipv6-access-list-name   access-list-name   security-name name]   access-list-name [ipv6 ipv6-access-list-name   access-list-name   security-name name]]]</code> |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To remove access to a community, use the `no snmp-server community community-string {ro | rw} [security-name name [access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]]` command.

## Parameters

|                              |                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>community-name</b>        | Enter a text string (up to 20 characters long) to act as a password for SNMP.                                    |
| <b>ro</b>                    | Enter the keyword <code>ro</code> to specify read-only permission.                                               |
| <b>rw</b>                    | Enter the keyword <code>rw</code> to specify read-write permission.                                              |
| <b>ipv6 access-list-name</b> | (Optional) Enter the keyword <code>ipv6</code> then an IPv6 ACL name (a string up to 16 characters long).        |
| <b>security-name name</b>    | (Optional) Enter the keywords <code>security-name</code> then the security name as defined by the community MIB. |
| <b>access-list-name</b>      | (Optional) Enter a standard IPv4 access list name (a string up to 16 characters long).                           |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

## Usage Information

The following example configures a community named *public* that is mapped to the security named *guestuser* with Read Only (`ro`) permissions.

The `security-name` parameter maps the community string to an SNMPv3 user/security name as defined by the community MIB.

If a community string is configured without a `security-name` (for example, `snmp-server community public ro`), the community is mapped to a default security-name/group:

- `v1v2creadu / v1v2creadg` — maps to a community with `ro` (read-only) permissions.
- `v1v2cwriteu/ v1v2cwriteg` — maps to a community with `rw` (read-write) permissions.

The `community-name` parameter indexes this command.

If you do not configure the `snmp-server community` command, you cannot query SNMP data. Only Standard IPv4 ACL and IPv6 ACL is supported in the optional `access-list-name`.

The command options `ipv6`, `security-name`, and `access-list-name` are recursive. In other words, each option can, in turn, accept any of the three options as a sub-option, and each of those sub-options can accept any of the three sub-options as a sub-option, and so forth. The second Example shows the creation of a standard IPv4 ACL called *snmp-ro-acl* and then assigning it to the SNMP community *guest*.

 **NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP; TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs, port rules are not valid for SNMP.

## Example

```
Dell#config
Dell(conf)# snmp-server community public ro
Dell(conf)# snmp-server community public ro security-name guestuser
Dell(conf)#
```

## Example

```
Dell(conf)# ip access-list standard snmp-ro-acl
Dell(config-std-nacl)#seq 5 permit host 10.10.10.224
Dell(config-std-nacl)#seq 10 deny any count
!

Dell(conf)#snmp-server community guest ro snmp-ro-acl
Dell(conf)#
```

## Related Commands

[ip access-list standard](#) — names (or selects) a standard access list to filter based on IP address.

[ipv6 access-list](#) — configures an access list based on IPv6 addresses or protocols.

[show running-config](#) — displays the current SNMP configuration and defaults.

# snmp-server enable traps

Enable SNMP traps.

## C9000 Series

### Syntax

`snmp-server enable traps [notification-type] [notification-option]`

To disable traps, use the `no snmp-server enable traps [notification-type] [notification-option]` command.

### Parameters

- notification-type** Enter the type of notification from the following list:
- `bgp` — Enable notification of changes in the BGP process.
  - `config` — Enable notification of changes to startup or running configuration.
  - `dot1br` — Enable notification of changes to DOT1BR.
  - `ecfm` — Enable notification of changes to ECFM.
  - `ecmp` — Enable notification of traffic imbalance in ECMP or a link bundle.
  - `entity` — Enable notification of Entity Management Information Base (MIB) changes.
  - `envmon` — Enable notification when an environmental threshold is exceeded.
  - `ets` — Enable notification of ETS changes.
  - `fips` — Enable notification of a FIP Snooping state changes.
  - `hg-lbm` — Enable notification of hiGig link-bundle state changes.
  - `isis` — Enable notification of IS-IS adjacency state changes.
  - `pfc` — Enable notification of changes to PFC.
  - `lACP` — Enable notification of LACP state changes.
  - `snmp` — Enable SNMP notifications defined in RFC 1157.
  - `stp` — Enable notification of a state change in the spanning tree protocol (RFC 1493).
  - `vlt` — Enable notification of VLT state changes.
  - `vrrp` — Enable notification of a state change in a VRRP group.
  - `xstp` — Enable notification of a state change in MSTP (802.1s), RSTP (802.1w), and PVST+.
- notification-option** For the `envmon` notification-type, enter one of the following optional parameters:
- `cam-utilization`
  - `fan`

- `supply`
- `temperature`

For the `snmp notification-type`, enter one of the following optional parameters:

- `authentication`
- `coldstart`
- `linkdown`
- `linkup`

| <b>Defaults</b>          | Not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                 |                          |                 |                          |                 |                                               |                 |                           |                 |                          |                |                          |                |                               |                |                                                                   |                |                             |

## snmp-server engineID

Configure the name for both the local and remote SNMP engines on the router.

### C9000 Series

|                   |                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>snmp-server engineID [local engineID] [remote ip-address vrf management udp-port port-number engineID]</pre> <p>To return to the default, use the <code>no snmp-server engineID [local engineID] [remote ip-address vrf management udp-port port-number engineID]</code> command.</p> |
| <b>Parameters</b> | <p><b>local engineID</b> Enter the keyword <code>local</code> followed by the engine ID number that identifies the copy of the SNMP on the local device.</p>                                                                                                                               |

Format (as specified in RFC 3411): 12 octets.

- The first four octets are set to the private enterprise number.
- The remaining eight octets are the MAC address of the chassis.

|                                      |                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote ip-address</b>             | Enter the keyword <code>remote</code> followed by the IP address that identifies the copy of the SNMP on the remote device.                                                                          |
| <b>vrf management</b>                | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the keyword <code>management</code> to specify that management vrf will be used to reach the remote host.                                  |
| <b>udp-port port-number engineID</b> | Enter the keywords <code>udp-port</code> followed by the user datagram protocol (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> . |

**Defaults** As above.

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

**Usage Information** Changing the value of the SNMP Engine ID has important side effects. A user's password (entered on the command line) is converted to a message digest algorithm (MD5) or secure hash algorithm (SHA) security digest. This digest is based on both the password and the local Engine ID. The command line password is then destroyed, as required by RFC 2274. Because of this deletion, if the local value of the Engine ID changes, the security digests of SNMPv3 users is invalid and the users will have to be reconfigured.

For the remote Engine ID, the host IP and UDP port are the indexes to the command that are matched to either overwrite or remove the configuration.

**Related Commands** [show snmp engineID](#) — displays the SNMP engine and all the remote engines that are configured on the router.

[show running-config snmp](#) — displays the SNMP running configuration.

## snmp-server group

Configure a new SNMP group or a table that maps SNMP users to SNMP views.

### C9000 Series

**Syntax**

```
snmp-server group [group_name {1 | 2c | 3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a specified group, use the `no snmp-server group [group_name {v1 | v2c | v3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access`

`access-list-name` | `ipv6 access-list-name` | `access-list-name ipv6 access-list-name`] command.

## Parameters

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>group_name</i></b>                                 | Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults): <ul style="list-style-type: none"> <li>• <code>v1v2creadg</code> — maps to a community/security-name with <code>ro</code> permissions.</li> <li>• <code>1v2cwriteg</code> — maps to a community/security-name <code>rw</code> permissions.</li> </ul> |
| <b><i>1   2c   3</i></b>                                 | (OPTIONAL) Enter the security model version number (1, 2c, or 3): <ul style="list-style-type: none"> <li>• 1 is the least secure version.</li> <li>• 3 is the most secure of the security modes.</li> <li>• 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li> </ul> The default is <b>1</b> .                                                      |
| <b><i>auth</i></b>                                       | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                                                       |
| <b><i>noauth</i></b>                                     | (OPTIONAL) Enter the keyword <code>noauth</code> to specify no authentication of a packet.                                                                                                                                                                                                                                                                                                                                     |
| <b><i>priv</i></b>                                       | (OPTIONAL) Enter the keyword <code>priv</code> to specify both authentication and then scrambling of the packet.                                                                                                                                                                                                                                                                                                               |
| <b><i>read name</i></b>                                  | (OPTIONAL) Enter the keyword <code>read</code> then a name (a string of up to 20 characters long) as the read view name. The default is <b>GlobalView</b> and is assumed to be every object belonging to the internet (1.3.6.1) OID space.                                                                                                                                                                                     |
| <b><i>write name</i></b>                                 | (OPTIONAL) Enter the keyword <code>write</code> then a name (a string of up to 20 characters long) as the write view name.                                                                                                                                                                                                                                                                                                     |
| <b><i>notify name</i></b>                                | (OPTIONAL) Enter the keyword <code>notify</code> then a name (a string of up to 20 characters long) as the notify view name.                                                                                                                                                                                                                                                                                                   |
| <b><i>access access-list-name</i></b>                    | (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                                                                                       |
| <b><i>ipv6 access-list-name</i></b>                      | (Optional) Enter the keyword <code>ipv6</code> then the IPv6 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                                                             |
| <b><i>access-list-name<br/>ipv6 access-list-name</i></b> | (Optional) Enter both an IPv4 and IPv6 access list name.                                                                                                                                                                                                                                                                                                                                                                       |

## Defaults

As above.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.3.10.2</b> | Added support for the <code>access</code> parameter. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                          |

## Usage Information

The following Example specifies the group named *harig* as a version 3 user requiring both authentication and encryption and read access limited to the read named *rview*.

 **NOTE:** The number of configurable groups is limited to 16 groups.

## Example

```
Dell#conf
Dell(conf)# snmp-server group harig 3 priv read rview
Dell#
```

## Related Commands

[show snmp group](#) — displays the group name, security model, view status, and storage type of each group.

[show running-config](#) — displays the SNMP running configuration.

# snmp-server host

Configure the recipient of an SNMP trap operation.

## C9000 Series

### Syntax

```
snmp-server host ip-address | ipv6-address | hostname [vrf management traps
| informs] [version 1 | 2c | 3] [auth | no auth | priv] [community-string]
[udp-port port-number] [notification-type]
```

To remove the SNMP host, use the `no snmp-server host ip-address | ipv6-address | hostname [vrf management traps | informs] [version 1 | 2c | 3] [auth | noauth | priv] [community-string] [udp-port number] [notification-type]` command.

### Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>         | Enter the keyword <code>host</code> followed by the IP address of the host (Configurable hosts are limited to 16).                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>ipv6-address</i></b>       | Enter the keyword <code>host</code> then the IPv6 address of the host in the x:x:x:x::x format.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                    |
| <b><i>hostname</i></b>           | Enter the keyword <code>host</code> followed by the name of a host already configured and recognized by the switch.                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>vrf management</i></b>     | Enter the keyword <code>vrf</code> followed by the keyword <code>management</code> to specify that management vrf will be used to send traps and informs.                                                                                                                                                                                                                                                                                                               |
| <b><i>traps</i></b>              | (OPTIONAL) Enter the keyword <code>traps</code> to send trap notifications to the specified host. The default is <b>traps</b> .                                                                                                                                                                                                                                                                                                                                         |
| <b><i>informs</i></b>            | (OPTIONAL) Enter the keyword <code>informs</code> to send inform notifications to the specified host. The default is <b>traps</b> .                                                                                                                                                                                                                                                                                                                                     |
| <b><i>version 1   2c   3</i></b> | (OPTIONAL) Enter the keyword <code>version</code> to specify the security model then the security model version number 1, 2c, or 3: <ul style="list-style-type: none"><li>• Version 1 is the least secure version.</li><li>• Version 3 is the most secure of the security modes.</li><li>• Version 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li></ul> The default is version <b>1</b> . |
| <b><i>auth</i></b>               | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>noauth</i></b>             | (OPTIONAL) Enter the keyword <code>noauth</code> to specify no authentication of a packet.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>priv</i></b>               | (OPTIONAL) Enter the keyword <code>priv</code> to specify both authentication and then scrambling of the packet.                                                                                                                                                                                                                                                                                                                                                        |

**community-string**

Enter a text string (up to 20 characters long) as the name of the SNMP community.

**NOTE:** For version 1 and version 2c security models, this string represents the name of the SNMP community. The string can be set using this command; however, Dell Networking recommends setting the community string using the `snmp-server community` command before executing this command. For version 3 security model, this string is the USM user security name.

**udp-port port-number**

(OPTIONAL) Enter the keywords `udp-port` followed by the port number of the remote host to use. The range is from 0 to 65535. The default is **162**.

**notification-type**

(OPTIONAL) Enter one of the following keywords for the type of trap to be sent to the host:

- `bgp` — BGP state change.
- `config` — copy—configuration traps.
- `ecmp` — ecmp and link bundling traffic imbalance traps.
- `entity` — Entity state change.
- `envmon` — Environment monitor trap.
- `hg-lbm` — HiGig link bundle state change.
- `isis` — ISIS adjacency state change.
- `lACP` — LACP state change.
- `snmp` — SNMP notification (RFC 1157).
- `stp` — Spanning tree protocol notification (RFC 1493).
- `vlt` — VLT state change.
- `vrrp` — State change in a VRRP group.
- `xstp` — State change in MSTP (802.1s), RSTP (802.1w), and PVST+.

The default is all trap types, which are sent to the host.

#### Defaults

As above.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                    |
|-----------------|--------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                       |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                       |
| <b>9.1(0.0)</b> | Added support for config and ecmp traps.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                       |
| <b>8.4.1.0</b>  | Added support for VRRP traps.                                                  |
| <b>7.6.1.0</b>  | Added support for STP and xSTP notification types. Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                    |

#### Usage Information

In order to configure the router to send SNMP notifications, enter at least one `snmp-server host` command. If you enter the command with no keywords, all trap types are enabled for the host. If you do not enter an `snmp-server host` command, no notifications are sent.

In order to enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and type of notification (trap or inform), each succeeding command overwrites the previous command. Only the last `snmp-server host` command will be in effect. For example, if you enter an `snmp-server host inform` command for a host and then enter another `snmp-server host inform` command for the same host, the second command replaces the first command.

The `snmp-server host` command is used with the `snmp-server enable` command. Use the `snmp-server enable` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable` command and the `snmp-server host` command for that host must be enabled.

**NOTE:** For v1 / v2c trap configuration, if the community-string is not defined using the `snmp-server community` command prior to using this command, the default form of the `snmp-server community` command automatically is configured with the community-name the same as specified in the `snmp-server host` command.

### Configuring Informs

To send an inform, use the following steps:

1. Configure a remote engine ID.
2. Configure a remote user.
3. Configure a group for this user with access rights.
4. Enable traps.
5. Configure a host to receive informs.

#### Related Commands

[snmp-server enable traps](#) — enables SNMP traps.

[snmp-server community](#) — configures a new community SNMPv1 or SNMPv2c.

## snmp-server location

Configure the location of the SNMP server.

### C9000 Series

## Example

```
Dell(conf)#snmp-server location MAA_LAB
Dell(conf)#do show running-config snmp
!
snmp-server community public ro
snmp-server location MAA_LAB
```

## Related Commands

[show running-config snmp](#) — displays the SNMP running configuration.

# snmp-server packetsize

Set the largest SNMP packet size permitted. When the SNMP server is receiving a request or generating a reply, use the `snmp-server packetsize global` configuration command.

## C9000 Series

**Syntax** `snmp-server packetsize byte-count`

**Parameters** *byte-count* Enter one of the following values 8, 16, 24 or 32. Packet sizes are 8000 bytes, 16000 bytes, 32000 bytes, and 64000 bytes.

**Defaults** 8

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

# snmp-server trap-source

Configure a specific interface as the source for SNMP traffic.

## C9000 Series

**Syntax** `snmp-server trap-source interface`

To disable sending traps out a specific interface, use the `no snmp trap-source` command.

**Parameters** *interface* Enter the following keywords and slot/port or number information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

| <b>Defaults</b>          | The IP address assigned to the management interface is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                                      |                |                             |                |                             |

Configure a new user to an SNMP group.

### C9000 Series

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>snmp-server user name {group_name remote ip-address udp-port port-number} [1   2c   3] [encrypted] [auth {md5   sha} auth-password] [priv {des56   aes128} priv password] [access access-list-name   ipv6 access-list-name   access-list-name ipv6 access-list-name]</pre> <p>To remove a user from the SNMP group, use the <code>no snmp-server user name {group_name remote ip-address udp-port port-number} [1   2c   3] [encrypted] [auth {md5   sha} auth-password] [priv {des56   aes128} priv password] [access access-list-name   ipv6 access-list-name   access-list-name ipv6 access-list-name]</code> command.</p> |                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b> | <b>name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Enter the name of the user (not to exceed 20 characters), on the host that connects to the agent.                                                                                                                                                                                                                                                                                                         |
|                   | <b>group_name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):</p> <ul style="list-style-type: none"> <li>• <code>v1v2creadu</code> — maps to a community with <code>ro</code> permissions.</li> <li>• <code>1v2cwriteu</code> — maps to a community <code>rw</code> permissions.</li> </ul> |

|                                                   |                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote ip-address</b>                          | Enter the keywords <code>udp-port</code> then the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                |
| <b>udp-port port-number</b>                       | Enter the keywords <code>udp-port</code> then the UDP (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                |
| <b>1   2c   3</b>                                 | (OPTIONAL) Enter the security model version number (1, 2c, or 3): <ul style="list-style-type: none"> <li>• 1 is the least secure version.</li> <li>• 3 is the most secure of the security modes.</li> <li>• 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li> </ul> The default is <b>1</b> . |
| <b>encrypted</b>                                  | (OPTIONAL) Enter the keyword <code>encrypted</code> to specify the password appear in encrypted format (a series of digits, masking the true characters of the string).                                                                                                                                                                                                   |
| <b>auth</b>                                       | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                  |
| <b>md5   sha</b>                                  | (OPTIONAL) Enter the keyword <code>md5</code> or <code>sha</code> to designate the authentication level. <ul style="list-style-type: none"> <li>• <code>md5</code> — Message Digest Algorithm</li> <li>• <code>sha</code> — Secure Hash Algorithm</li> </ul>                                                                                                              |
| <b>auth-password</b>                              | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host. Minimum: eight characters long.                                                                                                                                                                                                               |
| <b>priv</b>                                       | (OPTIONAL) Enter the keywords <code>priv</code> to initiate a privacy authentication level setting.                                                                                                                                                                                                                                                                       |
| <b>des56   aes128</b>                             | (OPTIONAL) Enter the keyword <code>des56</code> or <code>aes128</code> to specify the encryption mode. <ul style="list-style-type: none"> <li>• <code>aes128</code> — Use 128 bit AES algorithm in CFB mode for encryption.</li> <li>• <code>des56</code> — Use 56 bit DES algorithm in CBC mode for encryption.</li> </ul>                                               |
| <b>priv password</b>                              | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent. Minimum: eight characters long.                                                                                                                                                                                    |
| <b>access access-list-name</b>                    | (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                                  |
| <b>ipv6 access-list-name</b>                      | (Optional) Enter the keyword <code>ipv6</code> then the IPv6 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                        |
| <b>access-list-name<br/>ipv6 access-list-name</b> | (Optional) Enter both an IPv4 and IPv6 access list name.                                                                                                                                                                                                                                                                                                                  |

**Defaults** As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                   |
|------------------|-----------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                      |
| <b>9.6.(0.0)</b> | Added aes 128 encryption algorithm parameter. |
| <b>9.4.(0.0)</b> | Added support for VRF.                        |
| <b>9.0.2.0</b>   | Introduced on the S6000.                      |

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.2(0.0)</b>                | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>8.3.19.0</b>                | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>                | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>                 | Introduced on the S4810.                                                                            |
| <b>7.6.1.0</b>                 | Introduced on the S-Series.                                                                         |
| <b>7.5.1.0</b>                 | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

## Usage Information

**NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP. TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs port rules are not valid for SNMP.

No default values exist for authentication or privacy algorithms and no default password exists. If you forget a password, you cannot recover it; the user must be reconfigured. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password is stored in the configuration in an encrypted form and displayed as encrypted in the `show running-config` command.

If you have an encrypted password, you can specify the encrypted string instead of the plain-text password. The following command is an Example of how to specify the command with an encrypted string.

**NOTE:** The number of configurable users is limited to 16.

## Example

```
Dell# snmp-server user privuser v3group v3 encrypted auth md5
9fc53d9d908118b2804fe80e3ba8763d priv des56
d0452401a8c3ce42804fe80e3ba8763d
```

## Usage Information

The following command is an example of how to enter a plain-text password as the string `authpasswd` for user `authuser` of group `v3group`.

## Example

```
Dell#conf
Dell(conf)# snmp-server user authuser v3group v3 auth md5 authpasswd
```

## Usage Information

The following command configures a remote user named `n3user` with a `v3` security model and a security level of `authNOPriv`.

## Example

```
Dell#conf
Dell(conf)# snmp-server user n3user ngroup remote 172.31.1.3 udp-port
5009 3
auth md5 authpasswd
```

## Related Commands

[show snmp user](#) — displays the information configured on each SNMP user name.

# snmp-server view

Configure an SNMPv3 view.

## C9000 Series

## Syntax

```
snmp-server view view-name oid-tree {included | excluded}
```

To remove an SNMPv3 view, use the `no snmp-server view view-name oid-tree {included | excluded}` command.

|                   |                         |                                                                                           |
|-------------------|-------------------------|-------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>view-name</i></b> | Enter the name of the view (not to exceed 20 characters).                                 |
|                   | <b><i>oid-tree</i></b>  | Enter the OID sub tree for the view (not to exceed 20 characters).                        |
|                   | <b><i>included</i></b>  | (OPTIONAL) Enter the keyword <code>included</code> to include the MIB family in the view. |
|                   | <b><i>excluded</i></b>  | (OPTIONAL) Enter the keyword <code>excluded</code> to exclude the MIB family in the view. |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

**Usage Information** The `oid-tree` variable is a full sub-tree starting from 1.3.6 and cannot specify the name of a sub-tree or a MIB. The following Example configures a view named `rview` that allows access to all objects under 1.3.6.1.

**Example**

```
Dell# conf
Dell#(conf) snmp-server view rview 1.3.6.1 included
```

**Related Commands** [show running-config snmp](#) — displays the SNMP running configuration.

## snmp-server vrf

Configures an SNMP agent to bind to a specific VRF.

### C9000 Series

**Syntax** `snmp-server vrf vrf-name`

To undo the SNMP agent configuration, use the `no snmp-server vrf vrf-name` command.

|                   |                            |                                                                                                           |
|-------------------|----------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> and then the name of the VRF to associate an SNMP agent with that VRF. |
|-------------------|----------------------------|-----------------------------------------------------------------------------------------------------------|

**Defaults** default

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                           |
|-----------------|---------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.              |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.           |
| <b>9.4(0.0)</b> | Introduced on the S-Series and Z9000. |

#### Usage Information

Use this command to bind an SNMP agent to a VRF. The SNMP agent processes the requests from the interfaces that belong to the specified VRF. If no VRF is specified, then the default VRF is used.

#### Related Commands

[show snmp user](#) — displays the information configured on each SNMP user name.

## snmp trap link-status

Enable the interface to send SNMP link traps, which indicate whether the interface is up or down.

### C9000 Series

#### Syntax

```
snmp trap link-status
```

To disable sending link trap messages, use the `no snmp trap link-status` command.

#### Defaults

Enabled.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

#### Usage Information

If the interface is expected to flap during normal usage, you could disable this command.

# Syslog Commands

The following commands allow you to configure logging functions on all Dell Networking switches.

## clear logging

Clear the messages in the logging buffer.

### C9000 Series

| <b>Syntax</b>            | <code>clear logging</code><br>From a <b>PE console</b> , use <code>clear logging</code> to clear the messages in the logging buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                                     |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

#### Related Commands

[logging trap](#) — limit messages logged to the Syslog servers based on severity.

## logging

Configure an IP address or host name of a Syslog server where logging messages are sent. Multiple logging servers of both IPv4 and/or IPv6 can be configured.

### C9000 Series

#### Syntax

```
logging {ip-address | ipv6-address | hostname} [{vrf management}]{udp {port}} | {tcp {port}}
```

To disable logging, use the `no logging {ip-address | ipv6-address | hostname} [{vrf management} | {udp {port}} | {tcp {port}}]` command.

#### Parameters

|                     |                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-address</b>   | Enter the IPv4 address in dotted decimal format.                                                                                                                                                                     |
| <b>ipv6-address</b> | Enter the IPv6 address in the x:x:x::X format.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros. |
| <b>hostname</b>     | Enter the name of a host already configured and recognized by the switch.                                                                                                                                            |
| <b>management</b>   | Management VRF name to be used to reach host.                                                                                                                                                                        |
| <b>udp</b>          | Enter the keyword <code>udp</code> to enable transmission of log message over UDP followed by port number. The default port is 514                                                                                   |
| <b>tcp</b>          | Enter the keyword <code>tcp</code> to enable transmission of log message over TCP followed by port number.                                                                                                           |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                            |
|----------|----------------------------------------------------------------------------------------|
| 9.x.x.x  | Introduced on the C9000.                                                               |
| 9.5(0.1) | Added <b>udp</b> and <b>tcp</b> keywords for the Z9500.                                |
| 9.5(0.0) | Added <b>udp</b> and <b>tcp</b> keywords for the S4810, S4820T, S6000, Z9000, and MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                               |
| 9.0.2.0  | Introduced on the S6000.                                                               |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>8.4.1.0</b>  | Added support for IPv6.     |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

#### Usage Information

Multiple logging servers of both IPv4 and/or IPv6 can be configured.

#### Related Commands

[logging on](#) — enables the logging asynchronously to logging buffer, console, Syslog server, and terminal lines.

[logging trap](#) — enables logging to the Syslog server based on severity.

## logging buffered

Enable logging and specify which messages are logged to an internal buffer. By default, all messages are logged to the internal buffer.

### C9000 Series

#### Syntax

```
logging buffered [level] [size]
```

To return to the default values, use the default `logging buffered` command.

To disable logging stored to an internal buffer, use the `no logging buffered` command.

#### Parameters

|                     |                                                                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>level</i></b> | (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following equivalent words: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is <b>7</b> or <b>debugging</b> . |
| <b><i>size</i></b>  | (OPTIONAL) Indicate the size, in bytes, of the logging buffer. The number of messages buffered depends on the size of each message. The range is from 40960 to 524288. The default is <b>40960 bytes</b> .                         |

#### Defaults

level = **7**; size = **40960 bytes**

| <b>7.5.1.0</b>  | Introduced on the C-Series. |

|                          |                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | When you decrease the buffer size, all messages stored in the buffer are lost. Increasing the buffer size does not affect messages stored in the buffer.                                                                                                                            |
| <b>Related Commands</b>  | <a href="#">clear logging</a> — clears the logging buffer.<br><a href="#">default logging buffered</a> — returns the logging buffered parameters to the default setting.<br><a href="#">show logging</a> — displays the logging setting and system messages in the internal buffer. |

## logging console

Specify which messages are logged to the console.

### C9000 Series

| <b>Syntax</b>           | <pre>logging console [level]</pre> <p>To return to the default values, use the <code>default logging console</code> command.</p> <p>To disable logging to the console, use the <code>no logging console</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

|                          | <b>8.3.7.0</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Introduced on the S4810.           |
| <b>Usage Information</b> | The Kernel core dump can be large and may take up to 5 to 30 minutes to upload. Dell Networking OS does not overwrite application core dumps so you should delete them as necessary to conserve space on the flash; if the flash is out of memory, the coredump is aborted. On the S-Series, if the FTP server is not reachable, the application coredump is aborted. Dell Networking OS completes the coredump process and wait until the upload is complete before rebooting the system. |                                    |

## logging extended

Logs security and audit events to a system log server.

### C9000 Series

| <b>Syntax</b>            | logging extended                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                 |                                                         |

|                          | <b>7.5.1.0</b>                                                                                                                                                                                                                                            | Introduced on the C-Series.                                                                                                                                                                                            |
| <b>Usage Information</b> | When you configure the snmp-server trap-source command, the system messages logged to the history table are also sent to the SNMP network management station.                                                                                             |                                                                                                                                                                                                                        |
| <b>Related Commands</b>  | <a href="#">show logging</a> — displays information logged to the history buffer.                                                                                                                                                                         |                                                                                                                                                                                                                        |

## logging history size

Specify the number of messages stored in the logging history table.

### C9000 Series

|                   |                                                                                                                                  |                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>logging history size size</code><br>To return to the default values, use the <code>no logging history size</code> command. |                                                                                                                        |
| <b>Parameters</b> | <b><i>size</i></b>                                                                                                               | Indicate a value as the number of messages to be stored. The range is from 0 to 500. The default is <b>1 message</b> . |
| <b>Defaults</b>   | <b>1 message</b>                                                                                                                 |                                                                                                                        |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**Usage Information** When the number of messages reach the limit you set with the `logging history size` command, older messages are deleted as newer ones are added to the table.

**Related Commands** [show logging](#) — displays information logged to the history buffer.

## logging monitor

Specify which messages are logged to Telnet applications.

### C9000 Series

**Syntax** `logging monitor [level]`

To disable logging to terminal connections, use the `no logging monitor` command.

**Parameters** *level* Indicate a value from 0 to 7 or enter one of the following parameters: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is **7** or **debugging**.

**Defaults** **7** or **debugging**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**Related Commands** [default logging monitor](#) — returns the logging monitor parameters to the default setting.

# logging on

Specify that debug or error messages are asynchronously logged to multiple destinations, such as the logging buffer, Syslog server, or terminal lines.

## C9000 Series

| Syntax            | <code>logging on</code><br><br>To disable logging to logging buffer, Syslog server and terminal lines, use the <code>no logging on</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                          |

**Usage Information** Syslog messages contain the IP address of the interface used to egress the router. By configuring the `logging source-interface` command, the Syslog packets contain the IP address of the interface configured.

**Related Commands** [logging](#) — enables logging to the Syslog server.

## logging synchronous

Synchronize unsolicited messages and output.

### C9000 Series

**Syntax** `logging synchronous [level level | all] [limit number-of-buffers]`  
 To disable message synchronization, use the `no logging synchronous [level level | all] [limit number-of-buffers]` command.

**Parameters**

|                                       |                                                                                                                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                            | Enter the keyword <code>all</code> to ensure that all levels are printed asynchronously.                                                                                                    |
| <b>level <i>level</i></b>             | Enter the keyword <code>level</code> then a number as the severity level. A high number indicates a low severity level and vice versa. The range is from 0 to 7. The default is <b>2</b> .  |
| <b>all</b>                            | Enter the keyword <code>all</code> to turn off all.                                                                                                                                         |
| <b>limit <i>number-of-buffers</i></b> | Enter the keyword <code>limit</code> then the number of buffers to be queued for the terminal after which new messages are dropped. The range is from 20 to 300. The default is <b>20</b> . |

**Defaults** Disabled. If enabled without the `level` or `number-of-buffers` options specified, `level = 2` and `number-of-buffers = 20` are the defaults.

| <b>Command Modes</b>     | LINE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

| <b>Usage Information</b> | <p>When you enable <code>logging synchronous</code>, unsolicited messages appear between software prompts and outputs. Only the messages with a severity at or below the set level are sent to the console.</p> <p>If the message queue limit is reached on a terminal line and messages are discarded, a system message appears on that terminal line. Messages may continue to appear on other terminal lines.</p>                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

| <b>7.5.1.0</b>         | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                     |                                                                                                                                                                                                                       |                 |                          |                 |                           |                 |                          |                |                          |                |                                  |                |                             |

|                          |                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To block a type of message parameter, set the logging trap level to a lower number. For example, to block severity messages at level 6, set the level to 5. |
| <b>Related Commands</b>  | <a href="#">logging</a> — enables the logging to another device.<br><a href="#">logging on</a> — enables logging.                                           |

## logging version

Displays syslog messages in a RFC 3164 or RFC 5424 format.

### C9000 Series

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>logging version {0 1}</code>                                                                                                                                   |
| <b>Defaults</b>        | 0                                                                                                                                                                    |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                        |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                             |
|-----------------|---------------------------------------------------------|
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                |
| <b>9.5(0.0)</b> | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>To display syslog messages in a RFC 3164 or RFC 5424 format, use the <b>log version</b> command in configuration mode. By default, the system log version is set to <b>0</b>.</p> <p>The following describes the two supported log messages formats:</p> <ul style="list-style-type: none"> <li>0 – Displays syslog messages format as described in RFC 3164, The BSD syslog Protocol</li> <li>1 – Displays SYSLOG message format as described in RFC 5424, The Syslog Protocol</li> </ul> |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
Dell(conf)#logging version ?
<0-1> Select syslog version (default = 0)
Dell(conf)#logging version 1
```

## show logging

Display the logging settings and system messages logged to the internal buffer of the switch.

### C9000 Series

|                   |                                                                                                                                                                  |                                                                                                         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show logging [number   history [reverse][number]   reverse [number]   summary]</code><br>From a <b>PE console</b> , use <code>show logging [number]</code> |                                                                                                         |
| <b>Parameters</b> | <b>number</b>                                                                                                                                                    | (OPTIONAL) Enter the number of messages displayed in the output. The range is from 1 to 65535.          |
|                   | <b>history</b>                                                                                                                                                   | (OPTIONAL) Enter the keyword <code>history</code> to view only information in the Syslog history table. |

|                |                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reverse</b> | (OPTIONAL) Enter the keyword <code>reverse</code> to view the Syslog messages in FIFO (first in, first out) order.                                        |
| <b>summary</b> | (OPTIONAL) Enter the keyword <code>summary</code> to view a table showing the number of messages per type and per slot. Slots *7* and *8* represent RPMs. |

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                         |
|-----------------|-------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010 and C1048P. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.            |
| <b>8.3.19.0</b> | Introduced on the S4820T.           |
| <b>8.3.11.1</b> | Introduced on the Z9000.            |
| <b>8.3.7.0</b>  | Introduced on the S4810.            |
| <b>7.6.1.0</b>  | Introduced on the S-Series.         |
| <b>7.5.1.0</b>  | Introduced on the C-Series.         |

**Example (Partial)**

```
Dell#show logging

```

## show logging kernellog

Display the kernel log for the specified hardware component.

### C9000 Series

#### Syntax

```
show logging kernellog {cp | rp | linecard slot-id | pe pe-id stack unit
unit-number}
```

From a **PE console**, use `show logging kernellog stack-unit unit number` to display the kernel logging information for a specified stack-unit.

#### Parameters

|                                |                                                                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cp</b>                      | Enter the keyword <code>cp</code> to display the kernel log for the Control Processor on the switch.                                                                                   |
| <b>rp</b>                      | Enter the keyword <code>rp</code> to display the kernel log for the Route Processor on the switch.                                                                                     |
| <b>linecard <i>slot-id</i></b> | Enter the <code>linecard <i>slot-id</i></code> parameters to specify the line-card ports for which you want to display the kernel log. The range of line-card slot IDs is from 0 to 2. |

|                               |                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pe pe-id</b>               | Enter the keyword <code>pe</code> and the port extender the ID to display the kernel log for the specified port extender. The PE ID range is from 0 to 255.     |
| <b>stack unit unit number</b> | Enter keyword <code>stack-unit</code> and the stack-unit number to display the kernel log for the specified stack unit. Stack-unit number range is from 0 to 7. |

**defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.11(0.0)</b> | Introduced on N20xx and N30xx series. |
| <b>9.9(0.0)</b>  | Introduced on the C9010 and C1048P.   |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.              |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |
| <b>8.3.11.1</b>  | Introduced on the Z9000.              |
| <b>8.3.7.0</b>   | Introduced on the S4810.              |
| <b>7.6.1.0</b>   | Introduced on the S-Series.           |

**Usage Information** This command displays internal software driver information, which may be useful during troubleshooting switch initialization errors, such as a downed port pipe.

In a dual homing setup, you can use this command only from the primary VLT peer.

## Examples

```

```

## terminal monitor

Configure the system to display messages on the monitor/terminal.

### C9000 Series

**Syntax** terminal monitor

To return to default settings, use the `terminal no monitor` command.

**defaults** Disabled.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

#### Related Commands

[logging monitor](#) — sets the logging parameters on the monitor/terminal.

## SNMP Traps

This chapter lists the traps sent by the Dell Networking operating software. Each trap is listed by the fields Message ID, Trap Type, and Trap Option.

**Table 13. SNMP Trap List**

| Message ID                                                                                                           | Trap Type | Trap Option |
|----------------------------------------------------------------------------------------------------------------------|-----------|-------------|
| COLD_START                                                                                                           | SNMP      | COLDSTART   |
| %SNMP-5-SNMP_COLD_START: SNMP COLD_START trap sent.                                                                  |           |             |
| WARM_START                                                                                                           | SNMP      | WARMSTART   |

## bpdu-destination-mac-address

Use the Provider Bridge Group address in Spanning Tree or GVRP PDUs.

### C9000 Series

| Syntax          | bpdu-destination-mac-address [stp   gvrp] provider-bridge-group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                 |         |             |          |                          |         |                          |          |                           |          |                          |         |                                          |

| 8.3.19.0        | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                 |         |             |          |                          |         |                          |          |                           |          |                          |         |                                          |
| 8.3.11.1        | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                 |         |             |          |                          |         |                          |          |                           |          |                          |         |                                          |
| 8.2.1.0         | Introduced on the C-Series and S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                 |         |             |          |                          |         |                          |          |                           |          |                          |         |                                          |

# bridge-priority

Set the bridge priority of the switch in an IEEE 802.1D spanning tree.

## C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                                                          |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bridge-priority {<i>priority-value</i>   primary   secondary}</code><br>To return to the default value, use the <code>no bridge-priority</code> command.                                                                                            |                                                                                                          |
| <b>Parameters</b>      | <b><i>priority-value</i></b>                                                                                                                                                                                                                              | Enter a number as the bridge priority value. The range is from 0 to 65535. The default is <b>32768</b> . |
|                        | <b>primary</b>                                                                                                                                                                                                                                            | Enter the keyword <code>primary</code> to designate the bridge as the root bridge.                       |
|                        | <b>secondary</b>                                                                                                                                                                                                                                          | Enter the keyword <code>secondary</code> to designate the bridge as a secondary root bridge.             |
| <b>Defaults</b>        | priority-value = <b>32768</b>                                                                                                                                                                                                                             |                                                                                                          |

|                        | <b>6.2.1.1</b>                                                                                                                                                                                                                                            | Introduced on the E-Series.                                                                              |

# debug spanning-tree

Enable debugging of the spanning tree protocol and view information on the protocol.

## C9000 Series

|                   |                                                                                                                                                                                                               |                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>debug spanning-tree {<i>stp-id</i> [all   bpdu   config   events   exceptions   general   root]   <i>protocol</i>}</code><br>To disable debugging, use the <code>no debug spanning-tree</code> command. |                                                                                                                       |
| <b>Parameters</b> | <b><i>stp-id</i></b>                                                                                                                                                                                          | Enter zero (0). The switch supports one spanning tree group with a group ID of 0.                                     |
|                   | <b><i>protocol</i></b>                                                                                                                                                                                        | Enter the keyword for the type of STP to debug, either <code>mstp</code> , <code>pvst</code> , or <code>rstp</code> . |
|                   | <b>all</b>                                                                                                                                                                                                    | (OPTIONAL) Enter the keyword <code>all</code> to debug all spanning tree operations.                                  |
|                   | <b>bpdu</b>                                                                                                                                                                                                   | (OPTIONAL) Enter the keyword <code>bpdu</code> to debug bridge protocol data units.                                   |
|                   | <b>config</b>                                                                                                                                                                                                 | (OPTIONAL) Enter the keyword <code>config</code> to debug configuration information.                                  |

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| <b>events</b>  | (OPTIONAL) Enter the keyword <code>events</code> to debug STP events.              |
| <b>general</b> | (OPTIONAL) Enter the keyword <code>general</code> to debug general STP operations. |
| <b>root</b>    | (OPTIONAL) Enter the keyword <code>root</code> to debug STP root transactions.     |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.  
The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.7.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Usage Information** When you enable `debug spanning-tree bpd` for multiple interfaces, the software only sends information on BPDUs for the last interface specified.

**Related Commands** [protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

## description

Enter a description of the spanning tree.

### C9000 Series

**Syntax** `description {description}`  
To remove the description from the spanning tree, use the `no description {description}` command.

**Parameters** **description** Enter a description to identify the spanning tree (80 characters maximum).

**Defaults** none

**Command Modes** SPANNING TREE (The prompt is “config-stp”.)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.  
The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.0 | Introduced on the S4810. |
| 7.7.1.0 | Introduced               |

**Related Commands**     [protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

## disable

Disable the spanning tree protocol globally on the switch.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <p><code>disable</code></p> <p>To enable Spanning Tree Protocol, use the <code>no disable</code> command.</p>                                                                                                                                                   |
| <b>Defaults</b>        | Enabled (that is, the spanning tree protocol is disabled.)                                                                                                                                                                                                      |

**Related Commands**     [protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

## forward-delay

The amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

### C9000 Series

|                   |                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <p><code>forward-delay seconds</code></p> <p>To return to the default setting, use the <code>no forward-delay</code> command.</p>                                                     |
| <b>Parameters</b> | <p><b>seconds</b>     Enter the number of seconds the system waits before transitioning STP to the Forwarding state. The range is from 4 to 30. The default is <b>15 seconds</b>.</p> |

| <b>Defaults</b>         | <b>15 seconds</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

#### Related Commands

[forward-delay](#) — changes the wait time before STP transitions to the Forwarding state.  
[max-age](#) — changes the wait time before STP refreshes protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the spanning tree bridge.

### C9000 Series

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>max-age seconds</code><br>To return to the default values, use the <code>no max-age</code> command.                                                            |
| <b>Parameters</b>      | <b>seconds</b> Enter a number of seconds the system waits before refreshing configuration information. The range is from 6 to 40. The default is <b>20 seconds</b> . |
| <b>Defaults</b>        | <b>20 seconds</b>                                                                                                                                                    |
| <b>Command Modes</b>   | SPANNING TREE                                                                                                                                                        |

| <b>7.5.1.0</b>         | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

#### Example

```
Dell(config-stp)#show config
protocol spanning-tree 0
no disable
Dell(config-stp)#
```

## show spanning-tree 0

Display the spanning tree group configuration and status of interfaces in the spanning tree group.

### C9000 Series

**Syntax** `show spanning-tree 0 [active | brief | guard | interface interface | root | summary]`

|                   |                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>0</b>                                    | Enter 0 (zero) to display information about that specific spanning tree group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>active</b>                               | (OPTIONAL) Enter the keyword <code>active</code> to display only active interfaces in spanning tree group 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | <b>brief</b>                                | (OPTIONAL) Enter the keyword <code>brief</code> to display a synopsis of the spanning tree group configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                   | <b>guard</b>                                | (OPTIONAL) Enter the keyword <code>guard</code> to display the type of guard enabled on an STP interface and the current port state.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b>interface</b><br><b><i>interface</i></b> | (OPTIONAL) Enter the keyword <code>interface</code> and the type slot/port of the interface you want displayed. Type slot/port options are the following: <ul style="list-style-type: none"> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|                   | <b>root</b>                                 | (OPTIONAL) Enter the keyword <code>root</code> to display configuration information on the spanning tree group root.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b>summary</b>                              | (OPTIONAL) Enter the keyword <code>summary</code> to only the number of ports in the spanning tree group and their state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                       |
|----------|-------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                          |
| 9.2(1.0) | Introduced on the Z9500.                                          |
| 8.3.19.0 | Introduced on the S4820T.                                         |
| 8.3.11.1 | Introduced on the Z9000.                                          |
| 8.5.1.0  | Added support for 4-port 40G line cards on the E-Series ExaScale. |

| Version | Description                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------------------|
| 8.4.2.1 | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series TeraScale. |
| 8.3.7.0 | Introduced on the S4810.                                                                                     |
| 7.7.1.0 | Introduced on the S-Series.                                                                                  |
| 7.5.1.0 | Introduced on the C-Series.                                                                                  |
| 6.2.1.1 | Introduced on the E-Series.                                                                                  |

## Usage Information

Enable spanning tree group 0 prior to using this command.

The following describes the `show spanning-tree 0` command shown in the example.

| Field                         | Description                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>“Bridge Identifier...”</b> | Lists the bridge priority and the MAC address for this STP bridge.                                                                                                            |
| <b>“Configured hello...”</b>  | Displays the settings for hello time, max age, and forward delay.                                                                                                             |
| <b>“We are...”</b>            | States whether this bridge is the root bridge for the STG.                                                                                                                    |
| <b>“Current root...”</b>      | Lists the bridge priority and MAC address for the root bridge.                                                                                                                |
| <b>“Topology flag...”</b>     | States whether the topology flag and the detected flag were set.                                                                                                              |
| <b>“Number of...”</b>         | Displays the number of topology changes, the time of the last topology change, and on what interface the topology change occurred.                                            |
| <b>“Timers”</b>               | Lists the values for the following bridge timers: hold time, topology change, hello time, max age, and forward delay.                                                         |
| <b>“Times”</b>                | List the number of seconds since the last: <ul style="list-style-type: none"> <li>• hello time</li> <li>• topology change</li> <li>• notification</li> <li>• aging</li> </ul> |
| <b>“Port 1...”</b>            | Displays the Interface type slot/port information and the status of the interface (Disabled or Enabled).                                                                      |
| <b>“Port path...”</b>         | Displays the path cost, priority, and identifier for the interface.                                                                                                           |
| <b>“Designated root...”</b>   | Displays the priority and MAC address of the root bridge of the STG that the interface belongs.                                                                               |
| <b>“Designated port...”</b>   | Displays the designated port ID.                                                                                                                                              |

The following describes the `show spanning-tree 0 guard` command shown in the Example (Guard).

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | STP interface.                                                                                                          |
| <b>Instance</b>       | STP 0 instance.                                                                                                         |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

The `peGigE` ports and VP-LAG ports information is displayed as part of the `show spanning-tree 0` command output, only when the `guard` option is entered.

## Example

```
Dell#show spanning-tree 0

Executing IEEE compatible Spanning Tree Protocol
Bridge Identifier has priority 32768, Address 0001.e800.0a56
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Current root has priority 32768 address 0001.e800.0a56
Topology change flag set, detected flag set
Number of topology changes 1 last change occurred 0:00:05 ago
 from TenGigabitEthernet 1/3
Timers:hold 1, topology change 35
 hello 2, max age 20, forward_delay 15
Times:hello 1, topology change 1, notification 0, aging 2

Port 26 (TenGigabitEthernet 1/1) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.26
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.26, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 27 (TenGigabitEthernet 1/2) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.27
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.27, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 28 (TenGigabitEthernet 1/3) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.28
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.28, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:31, received 0
The port is not in the portfast mode

Dell#
```

## Example (Brief)

```
Dell#show span 0 brief
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32768
 Address 0001.e800.0a56
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 32768,
 Address 0001.e800.0a56
Configured hello time 2, max age 20, forward delay 15
Interface Designated
Name PortID Prio Cost Sts Cost Bridge ID PortID

Te 1/1 8.26 8 4 FWD 0 32768 0001.e800.0a56 8.26

|----------|------------|-----------|
| Te 0/2 0 | LIS        | Loopguard |
| Te 0/3 0 | EDS (Shut) | Bpduguard |

## spanning-tree 0

Assigns a Layer 2 interface to STP instance 0 and configures a port cost or port priority, or enables loop guard, root guard, or the Portfast feature on the interface.

### C9000 Series

#### Syntax

```
spanning-tree stp-id {cost cost | | portfast [bpduguard [shutdown-on-violation]] | priority priority}
```

To disable Spanning Tree group on an interface, use the `no spanning-tree stp-id {cost cost | portfast [bpduguard [shutdown-on-violation]] | priority priority}` command.

#### Parameters

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>stp-id</i></b>                                | Enter the STP instance ID. The range is 0.                                                                                                                                                                                                                                                                                                                                                            |
| <b>cost <i>cost</i></b>                             | Enter the keyword <code>cost</code> then a number as the cost. The range is from 1 to 65535. The defaults are: <ul style="list-style-type: none"> <li>10-Gigabit Ethernet interface = <b>2</b>.</li> <li>Port Channel interface with 10-Gigabit Ethernet = <b>1</b>.</li> </ul>                                                                                                                       |
| <b>portfast [bpduguard [shutdown-on-violation]]</b> | Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.<br><br>Enter the optional keyword <code>bpduguard</code> to disable the port when it receives a BPDU.<br><br>Enter the optional keyword <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled. |
| <b>priority <i>priority</i></b>                     | Enter keyword <code>priority</code> then a number as the priority. The range is from zero (0) to 15. The default is <b>8</b> .                                                                                                                                                                                                                                                                        |

#### Defaults

cost = depends on the interface type; priority = **8**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                    |
| <b>8.3.10.1</b> | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the S4810.                                      |
| <b>8.4.2.1</b>  | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series TeraScale, C-Series, and S-Series. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                    |
| <b>8.2.1.0</b>  | Introduced the <code>shutdown-on-violation</code> option.                                                                   |
| <b>7.7.1.0</b>  | Introduced on the S-Series.                                                                                                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                                                 |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

If you enable `portfast bpduguard` on an interface and the interface receives a BPDU, the software disables the interface and sends a message stating that fact. The port is in `ERR_DISABLE` mode, yet appears in the `show interface` commands as enabled. If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

STP loop guard and root guard are supported on a port or port-channel enabled in any Spanning Tree mode: Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and Per-VLAN Spanning Tree Plus (PVST+).

Root guard is supported on any STP-enabled port or port-channel except when used as a stacking port. When enabled on a port, root guard applies to all VLANs configured on the port.

STP root guard and loop guard cannot be enabled at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

Do not enable Portfast BPDU guard and loop guard at the same time on a port. Enabling both features may result in a port that remains in a blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

To display the type of STP guard (Portfast BPDU, root, or loop guard) enabled on a port, enter the `show spanning-tree 0` command.

On PE ports and on VP-LAGs (lags formed with PE ports):

- `spanning-tree with bpduguard shutdown-on-violation` is enabled by default.
- `no spanning tree` command is valid

Hence, you cannot issue the `spanning-tree stp-id` command on the PE ports (peGigE ports) and issuing this command on VP-LAG ports results in a failure.

## Storm Control

The Dell Networking operating software storm control feature allows you to limit or suppress traffic during a traffic storm (Broadcast/Unknown Unicast Rate Limiting or Multicast on the C-Series and S-Series).

Storm control is supported on Dell Networking OS.

### Important Points to Remember

- Interface commands can only be applied on physical interfaces (virtual local area networks [VLANs] and link aggregation group [LAG] interfaces are not supported).
- An INTERFACE-level command only supports storm control configuration on ingress.
- An INTERFACE-level command overrides any CONFIGURATION-level ingress command for that physical interface, if both are configured.
- You can apply the CONFIGURATION-level storm control commands at ingress or egress and are supported on all physical interfaces.
- When storm control is applied on an interface, the percentage of storm control applied is calculated based on the advertised rate of the line card. It is not based on the speed setting for the line card.
- Do not apply per-VLAN quality of service (QoS) on an interface that has storm control enabled (either on an interface or globally).
- When you enable broadcast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 1 is configured for the data traffic, the traffic goes to queue 1 instead of queue 0.
- Similarly, if you enable unicast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 2 is configured for the data traffic, the traffic goes to queue 2 instead of queue 0.

**NOTE:** Bi-directional traffic (unknown unicast and broadcast) along with egress storm control causes the configured traffic rates split between the involved ports. The percentage of traffic that each port receives after the split is not predictable. These ports can be in the same/different port pipes or the same/different line cards.

**NOTE:** The policy discard drop counters are common across storm-control drops, ACL drops and QoS drops. Therefore, if your configuration includes ACL and QoS, those drops are also computed and displayed in the policy discard drops counter field along with storm-control drops. The packets dropped by the storm control feature can be monitored by viewing the value of the Policy Discard Drops field of the output of the `show hardware stack-unit stack-unit-number drops` command.

|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>7.6.1.0</b>  | Introduced on the C-Series and S-Series.             |

#### Example

```
Dell#show storm-control multicast tengigabitethernet 1/0

Multicast storm control configuration

Interface Direction Packets/Second

Te 1/0 Ingress 5
```

## show storm-control unknown-unicast

Display the storm control unknown-unicast configuration.

### C9000 Series

| <b>Usage Information</b> | Broadcast storm control is valid on Layer 2/Layer 3 interfaces only. Layer 2 broadcast traffic is treated as unknown-unicast traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                                                                        |                |                             |

# storm-control broadcast (Interface)

Configure the percentage of broadcast traffic allowed on an interface (ingress only).

## C9000 Series

| Syntax          | <code>storm-control broadcast [packets_per_second in]</code><br><br>To disable broadcast storm control on the interface, use the <code>no storm-control broadcast [packets_per_second in]</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                              |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                                                                        |         |                             |

| 7.5.1.0         | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                              |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                                                                        |         |                             |
| 7.4.1.0         | E-Series Only: Added the <code>percentage decimal value</code> option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                              |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                                                                        |         |                             |
| 6.5.1.0         | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                              |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                                                                        |         |                             |

# storm-control multicast (Configuration)

Configure the packets per second (pps) of multicast traffic allowed into the C-Series and S-Series networks only.

## C9000 Series

|                 |                                                                                                                                                                                                                 |                                                                                                              |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Syntax          | <pre>storm-control multicast packets_per_second in</pre> <p>To disable storm-control for multicast traffic into the network, use the <code>no storm-control multicast packets_per_second in</code> command.</p> |                                                                                                              |
| Parameters      | <b>packets_per_second in</b>                                                                                                                                                                                    | Enter the packets per second of multicast traffic allowed into the network. The range is from 0 to 33554368. |
| Defaults        | none                                                                                                                                                                                                            |                                                                                                              |
| Command Modes   | CONFIGURATION (conf)                                                                                                                                                                                            |                                                                                                              |
| Command History | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p>                                            |                                                                                                              |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-series and S-Series. |

**Usage Information**

Broadcast traffic (all 0xFs) should be counted against the broadcast storm control meter, not against the multicast storm control meter. It is possible, however, that some multicast control traffic may get dropped when storm control thresholds are exceeded.

## storm-control multicast (Interface)

Configure the percentage of multicast traffic allowed on an C-Series or S-Series interface (ingress only) network only.

### C9000 Series

**Syntax**

`storm-control multicast packets_per_second in`

To disable multicast storm control on the interface, use the `no storm-control multicast packets_per_second in` command.

**Parameters**

**packets\_per\_second in** Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults**

none

**Command Modes**

INTERFACE (conf-if-interface-slot/port)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-series and S-Series. |

## storm-control pfc-llfc

Shut down a port if it receives more IEEE 802.1Qbb priority-based flow control (PFC) or IEEE 802.3X (Ethernet PAUSE) link-level flow control (LLFC) frames than the configured rate.

**Syntax**

`storm-control pfc-llfc pps in shutdown`

|                          |                                                                                                                                                                                                 |                                                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>        | <b>pfc-llfc <i>pps</i></b>                                                                                                                                                                      | Enter a <i>pps</i> value to specify the threshold for flow-control traffic. The range is from 0 to 33554368 packets per second. |
|                          | <b>shutdown</b>                                                                                                                                                                                 | Enter the keyword <code>shutdown</code> to shut down the port when flow-control traffic exceeds the configured rate.            |
| <b>Defaults</b>          | None                                                                                                                                                                                            |                                                                                                                                 |

| <b>Usage Information</b> | Unknown Unicast Storm-Control is valid for Layer 2 and Layer 2/Layer 3 interfaces.                                                                                                                                                                              |                                                                                                              |

# storm-control unknown-unicast (Interface)

Configure percentage of unknown-unicast traffic allowed on an interface (ingress only).

## C9000 Series

**Syntax** `storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]`

To disable unknown-unicast storm control on the interface, use the `no storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]` command.

|                   |                                            |                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>percentage decimal_value [in   out]</b> | E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%.<br><br>The percentage is from 0 to 100: <ul style="list-style-type: none"><li>0% blocks all related traffic.</li><li>100% allows all traffic into the interface.</li></ul> The decimal range is from 0.1 to 0.9. |
|                   | <b>wred-profile name</b>                   | E-Series Only: (Optionally) Enter the keywords <code>wred-profile</code> followed by the profile name to designate a wred-profile.                                                                                                                                                                                                                                                        |
|                   | <b>packets_per_second in</b>               | C-Series and S-Series Only: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554431.                                                                                                                                                                                                                                                  |

**Defaults** none

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.  
  
The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                            |
|----------|------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                               |
| 9.2(1.0) | Introduced on the Z9500.                                               |
| 8.3.19.0 | Introduced on the S4820T.                                              |
| 8.3.11.1 | Introduced on the Z9000.                                               |
| 8.3.7.0  | Introduced on the S4810.                                               |
| 7.6.1.0  | Introduced on the S-Series.                                            |
| 7.5.1.0  | Introduced on the C-Series.                                            |
| 7.4.1.0  | E-Series Only: Added the <code>percentage decimal_value</code> option. |
| 6.5.1.0  | Introduced on the E-Series.                                            |

# SupportAssist

SupportAssist sends troubleshooting data securely to Dell. SupportAssist in this Dell Networking OS release does not support automated email notification at the time of hardware fault alert, automatic case creation, automatic part dispatch, or reports. SupportAssist requires Dell Networking OS 9.9(0.0) and SmartScripts 9.7 or later to be installed on the Dell Networking device. For more information on SmartScripts, see *Dell Networking Open Automation guide*.

**NOTE:** SupportAssist is enabled by default on the system. To disable SupportAssist, enter the `eula-consent support-assist reject` command in Global Configuration mode and save the configuration.

## Topics:

|                          | <b>9.10(0.0)</b>                                                                                                                                                               | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                                                |
|                          | <b>9.9(0.0)</b>                                                                                                                                                                | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.                      |
| <b>Usage Information</b> | <ul style="list-style-type: none"> <li>• When you run the command, the system displays a message with the information directing to the URL for further information.</li> </ul> |                                                                                                               |

- Even before you accept or reject the EULA, the configuration data is sent to the default centrally deployed SupportAssist Server. If you reject the EULA, the configuration data is not transmitted to the SupportAssist server.
- If there is an existing SupportAssist configuration, the configuration is not removed and the feature is disabled.

### Example

Accept the EULA:

```
Dell(conf)# eula-consent support-assist accept
I accept the terms of the license agreement. You can reject
the license agreement by configuring this command
'eula-consent support-assist reject'.
```

By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration & performance information and related data ("Collected Data") and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: [www.dell.com/aeula](http://www.dell.com/aeula), you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dells Privacy Policy, available at: [www.dell.com/privacypolicycountryspecific](http://www.dell.com/privacypolicycountryspecific), in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell,. You further agree to allow Dell to transmit and store the Collected Data from SupportAssist in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dells affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection, transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.

Reject the EULA:

```
Dell(conf)#eula-consent support-assist reject
Aug 24 22:35:38: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-SUPASSIST_EVT: Event
monitor service stopped
I do not accept the terms of the license agreement. The SupportAssist
feature has
been deactivated and can no longer be used.
To enable SupportAssist configurations, accept the terms of the license
agreement
by configuring this command 'eula-consent support-assist accept'.
Dell(conf)#
Dell(conf)#
Aug 24 22:35:49: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-
SUPASSIST_PKG_UNINSTALLED: SupportAssist package uninstalled
Dell(conf)#
```

## Related Commands

- [support-assist](#) — moves to the SupportAssist Configuration mode.

# support-assist

Move to the SupportAssist configuration mode.

## Syntax

`support-assist`

To remove all the configuration of the SupportAssist service, use the `no support-assist` command.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11(0.0)**

Introduced on the M I/O Aggregator and FN IOM.

**9.10(0.0)**

Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.

**9.9(0.0)**

Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.

## Usage Information

If you reject the EULA, the data is not transmitted to the SupportAssist server.

## Related Commands

- [eula-consent](#) — accept or reject the EULA.

# support-assist activate

Launch the configuration wizard that enables SupportAssist service and guides through a series of commands to configure SupportAssist.

## Syntax

`support-assist activate`

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11(0.0)**

Introduced on the M I/O Aggregator and FN IOM.

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

**9.10(0.0)**

Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.

**9.9(0.0)**

Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.

## Usage Information

You are guided through a series of queries to configure SupportAssist. The generated commands are added to the running configuration, including the DNS resolve commands, if configured.

This command starts the configuration wizard for the SupportAssist. At any time, you can exit by entering Ctrl-C. If necessary, you can skip some data entry.

Once you exit the wizard, the Dell Networking OS starts a full transfer.

# support-assist activity

Trigger an activity event immediately.

**Syntax** `support-assist activity {full-transfer | core-transfer} start now`

**Parameters**

|                      |                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>full-transfer</b> | Enter the keyword <code>full-transfer</code> to specify transfer of configuration, inventory, logs, and other information. |
| <b>core-transfer</b> | Enter the keyword <code>core-transfer</code> to specify transfer of core files.                                            |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** Use the command to trigger the activity that enables transfer of information. You can choose a full transfer that includes all the details or core transfer that includes only the core files.

 **NOTE:** The full transfer includes the core files as well in the information sent. The core transfer does not send core files that are older than 30 days.

## SupportAssist Commands

Dell Networking OS supports the following SupportAssist mode commands.

### activity

Move to the SupportAssist Activity mode for an activity. Allow the user to configure customized details for a specific activity.

**Syntax** `activity {activity-name}`

To remove all customized detail for a specific activity, use the `no activity {activity-name}` command.

**Parameters**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>activity-name</b> | Enter one of the following keywords: <ul style="list-style-type: none"><li>Enter the keyword <code>full-transfer</code> to enable or disable full transfer. You can create a custom file to transfer the outputs from a set of show commands. By default, the full transfer runs once in every 30 days.</li><li>Enter the keyword <code>core-transfer</code> to enable or disable core transfer.</li><li>Enter the keyword <code>event-transfer</code> to enable or disable event transfer. You can create a custom file to monitor a set of events.</li></ul> |

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                    |
|-----------|------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM. |

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
|                  | Introduced the <code>core-transfer</code> and <code>event-transfer</code> parameters.    |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

#### Usage Information

By default, each activity follows a set of default actions using a default schedule. Using this command, you can customize the set of actions and disable a certain activity.

## contact-company

Configure the contact information for the company.

**Syntax** `contact-company name {company-name} [company-next-name] ... [company-next-name]`

To remove the contact company information, use the `no contact-company` command.

**Parameters**

***company-name*** Enter the name for the company. If there are multiple words in the name, use optional additional fields.

***company-next-name*** (OPTIONAL) Enter the next components of the company name, up to 5 components are allowed.

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

#### Usage Information

You can configure only one contact-company.

It is not possible to remove the components of the company name. The `no` form of the command removes the entire contact-company entry.

This command is optional for SupportAssist service configuration.

## contact-person

Configure the contact name for an individual.

**Syntax** `contact-person [first <first-name>] last <last-name>`

To remove the contact person and all their details, use the `no contact-person [first <first-name>] last <last-name>` command.

**Parameters**

***first-name*** (Optional) Enter the first name for the contact person. This is optional provided each contact person name is unique. To include a space, enter a space within double quotes.

***last-name*** Enter the last name for the contact person. To include a space, enter a space within double quotes.

|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** Each contact person must be unique by their name.  
You can configure only one contact person.  
It is not possible to remove the first name or last name. The no form of the command removes the entire contact-person entry.  
This command is optional for SupportAssist service configuration.

## enable

Enable all activities and severs for the SupportAssist service.

**Syntax** `enable all`  
To disable the SupportAssist activities temporarily, use the `no enable all` command.

**Parameters** **all** Enter the keyword `all` to enable all SupportAssist service activities.

**Defaults** Enabled or All Enabled

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

## server

Configure the name of the remote SupportAssist Server and move to SupportAssist Server mode.

**Syntax** `server {default | server-name}`  
To delete a server, use the `no server server-name` command.

**Parameters** **default** Enter the keyword `default` for the default server.  
**server-name** Enter the name of the custom server to which the logs would be transferred. To include a space, enter a space within double quotes.

**Defaults** Default server has URL `stor.g3.ph.dell.com`

**Command Modes** SUPPORTASSIST

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11(0.0)**

Introduced on the M I/O Aggregator and FN IOM.

**9.10(0.0)**

Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.

**9.9(0.0)**

Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.

## Usage Information

The server-name is used as a reference only and is not required to be used as part of a URL definition.

There is a reserved name of `default` for the default server at `stor.g3.ph.dell.com`. You can customize the defaults for this server by entering the `server default` command and use the custom commands.

You can configure one additional server.

# SupportAssist Activity Commands

Dell Networking OS supports the following SupportAssist Activity mode commands.

## action-manifest get

Copy an action-manifest file for an activity to the system.

### Syntax

```
action-manifest get tftp | ftp | flash <file-specification> <local-file-name>
```

### Parameters

#### **file-specification**

Enter the full file specification for the action-manifest file. For example:

- `tftp://hostip/filepath`
- `ftp://userid:password@hostip/filepath`
- `scp://userid:password@hostip/filepath`

#### **local-file-name**

Enter the name of the local action-manifest file, up to 32 characters long. Allowable characters are: a to z, A to Z, 0 to 9, -, \_, and space.

### Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER

SUPPORTASSIST ACTIVITY EVENT-TRANSFER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

### Description

**9.11(0.0)**

Introduced on the M I/O Aggregator and FN IOM.

**9.10(0.0)**

Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.

**9.9(0.0)**

Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.

## Usage Information

The remote file specification for full transfer includes the protocol that is used to copy the file from the remote system.

The default Manifest-file for full transfer includes records like alarms, logs, operational, and configuration data.

## Related Commands

- [action-manifest install](#) — configure the action-manifest to use for a specific activity.
- [action-manifest show](#) — view the list of action-manifest for a specific activity.
- [action-manifest remove](#) — remove the action-manifest file for an activity.

## action-manifest install

Configure action-manifest to transfer a set of customized records for full transfer and to monitor a set of specified events for event transfer.

|                          |                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <pre>action-manifest install {default   &lt;local-file-name&gt;}</pre> <p>To revert to the default action-manifest file, use the <code>action-manifest install default</code> command.</p>                                                                                                                                                                         |                                                                                                                      |
| <b>Parameters</b>        | <b>default</b>                                                                                                                                                                                                                                                                                                                                                     | Enter the keyword <code>default</code> to revert back to the default set of actions for an activity.                 |
|                          | <b>local-file-name</b>                                                                                                                                                                                                                                                                                                                                             | Enter the name of the local action-manifest file. #### Usage Information

Enter the specific SupportAssist activity mode and then enable it.

 **NOTE:** By default, the full transfer includes the core files. When you disable the core transfer activity, the full transfer excludes the core files.

#### Related Commands

- [activity](#) — move user to the SupportAssist Activity mode for that activity.

## SupportAssist Company Commands

Dell Networking OS supports the following SupportAssist Company mode commands.

### address

Configure the address information for the company.

#### Syntax

```
address [city company-city] [{province | region | state} name] [country company-country] [{postalcode | zipcode} company-code]
```

To remove a portion of the company address information, use the `no address [city | province | region | state | country | postalcode | zipcode]` command. For example, to remove the city alone, use the `no address city` command.

To remove the complete company contact information, use the `no address` command.

#### Parameters

|                                          |                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>city company-city</b>                 | (OPTIONAL) Enter the keyword <code>city</code> then the city or town for the company site. To include a space, enter a space within double quotes.                                                                      |
| <b>province   region   state name</b>    | (OPTIONAL) Enter the keyword <code>province</code> , <code>region</code> or <code>state</code> then the name of province, region or state for the company site. To include a space, enter a space within double quotes. |
| <b>country company-country</b>           | (OPTIONAL) Enter the keyword <code>country</code> then the country for the company site. To include a space, enter a space within double quotes.                                                                        |
| <b>postalcode   zipcode company-code</b> | (OPTIONAL) Enter the keyword <code>postalcode</code> or <code>zipcode</code> then the postal code or zip code for the company site, as one string with no spaces.                                                       |

**Command Modes** SUPPORTASSIST COMPANY

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

#### Usage Information

The optional parameters must be provided in the following order: `city state country postalcode`. If specified in a different order, the command returns an error as follows:

```
Dell(conf-supportassist-cmpy-test)# address city Minneapolis postalcode 55344 country USA state Minnesota
```

```
% Error: Invalid input at "^" marker.
```

This command is optional for SupportAssist service configuration.

#### Example

```
Dell(conf-supportassist-cmpy-test)# address city Minneapolis state
Minnesota country USA postalcode 55344
```

## street-address

Configure the street address information for the company.

#### Syntax

```
street-address {address1} [address2]...[address8]
```

To remove the street address, use the `no street-address` command.

#### Parameters

**address1** Enter the street address for the company.

**address2..address8** (OPTIONAL) Enter the street address of the company site. Up to 8 fields are allowed.

**Command Modes** SUPPORTASSIST COMPANY

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

#### Usage Information

This command is optional for SupportAssist service configuration.

## territory

Configure the territory and set the coverage for the company site.

#### Syntax

```
territory company-territory
```

To remove the company territory information, use the `no territory` command.

#### Parameters

**company-territory** Enter the territory name for the company. To include a space, enter a space within double quotes. Use three-letter country codes like USA, IND, FRA, GER and so on.

## time-zone

Configure the time zone for contacting the person.

|                      |                                                                                                                                                                              |                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>time-zone zone +-HH:MM[start-time HH:MM] [end-time HH:MM]</code><br>To remove the time zone, use the <code>no time-zone [zone   start-time   end-time]</code> command. |                                                                                                                                              |
| <b>Parameters</b>    | <b>zone +-HH:MM</b>                                                                                                                                                          | Enter the keyword <code>zone</code> then a time difference from GMT expressed as HH:MM. This number may be preceded by either a + or – sign. |
|                      | <b>start-time HH:MM</b>                                                                                                                                                      | Enter the keywords <code>start-time</code> then a starting time expressed as HH:MM. Use the 24-hour clock format.                            |
|                      | <b>stop-time HH:MM</b>                                                                                                                                                       | Enter the keywords <code>stop-time</code> then a stopping time expressed as HH:MM. Use the 24-hour clock format.                             |
| <b>Command Modes</b> | SUPPORTASSIST PERSON                                                                                                                                                         |                                                                                                                                              |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Usage Information

This command is optional for SupportAssist service configuration.

# SupportAssist Server Commands

Dell Networking OS supports the following SupportAssist Server mode commands.

## proxy-ip-address

Configure a proxy for reaching the SupportAssist remote server.

### Syntax

```
proxy-ip-address {ipv4-address | ipv6-address} port port-number [username
userid password [encryption-type] password]
```

To remove the proxy, use the `no proxy-ip-address` command.

### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4-address</b>     | Enter the IP address of the proxy server in a dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ipv6-address</b>     | Enter the IPv6 address of the proxy server in the x:x:x:x:x format.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.<br> <b>NOTE:</b> To use the IPv6 address, the Open Automation package should also support IPv6 communications. For this purpose, SupportAssist requires Dell Networking Open Automation 9.10(0.0) package or later. |
| <b>port port-number</b> | Enter the keyword <code>port</code> then the TCP/IP port number. The port number range is from 1024 to 65534.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>username userid</b>  | (OPTIONAL) Enter the keyword <code>username</code> then the user ID used for the proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>password</b>         | Enter the keyword <code>password</code> then the encryption-type or the user password.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>encryption-type</b>  | (OPTIONAL) Enter an encryption type for the <code>password</code> you enter. <ul style="list-style-type: none"><li>• 0 directs the system to interpret the password as clear text.</li><li>• 7 indicates that the password is encrypted using a DES hashing algorithm.</li></ul>                                                                                                                                                                                                                                                                 |
| <b>password</b>         | Enter a string up to 32 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Defaults

encryption-type for the password is 0.

### Command Modes

SUPPORTASSIST SERVER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Usage Information

The URL should be formatted to follow the ISO format.

# show eula-consent

Display the EULA for the feature.

**Syntax** `show eula-consent {support-assist | other feature}`

**Parameters** **support-assist | *other feature*** Enter the keywords `support-assist` or the text corresponding to other feature.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Example

```
Dell# show eula-consent support-assist

SupportAssist EULA has been: Accepted

Additional information about the SupportAssist EULA is as follows:

By installing SupportAssist, you allow Dell to save your contact
information
(e.g. name, phone number and/or email address) which would be used to
provide
technical support for your Dell products and services. Dell may use the
information
for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic
information, which
may include but is not limited to configuration information, user
supplied contact
information, names of data volumes, IP addresses, access control lists,
diagnostics &
performance information, network configuration information, host/server
configuration
& performance information and related data (Collected Data) and
transmits this
information to Dell. By downloading SupportAssist and agreeing to be
bound by these
terms and the Dell end user license agreement, available at:
www.dell.com/aeula,
you agree to allow Dell to provide remote monitoring services of your IT
environment
and you give Dell the right to collect the Collected Data in accordance
with Dells
Privacy Policy, available at: www.dell.com/privacypolicycountryspecific,
in order to
enable the performance of all of the various functions of SupportAssist
during your
entitlement to receive related repair services from Dell,. You further
agree to
allow Dell to transmit and store the Collected Data from SupportAssist
in accordance
with these terms. You agree that the provision of SupportAssist may
```

```

involve
international transfers of data from you to Dell and/or to Dells
affiliates,
subcontractors or business partners. When making such transfers, Dell
shall ensure
appropriate protection is in place to safeguard the Collected Data being
transferred
in connection with SupportAssist. If you are downloading SupportAssist
on behalf
of a company or other legal entity, you are further certifying to Dell
that you
have appropriate authority to provide this consent on behalf of that
entity. If you
do not consent to the collection, transmission and/or use of the
Collected Data,
you may not download, install or otherwise use SupportAssist.
Dell#

```

## show running-config

Display the current configuration and changes from the default values.

**Syntax** `show running-config support-assist`

**Parameters**

|                       |                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <b>support-assist</b> | Enter the keyword <code>support-assist</code> to view the detailed configuration for the feature. |
|-----------------------|---------------------------------------------------------------------------------------------------|

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

```

# System Time and Date

The commands in this chapter configure time values on the system, either using the Dell Networking operating software, or the hardware, or using the network time protocol (NTP). With NTP, the switch can act only as a client to an NTP clock host.

For more information, refer to the “Network Time Protocol” section of the *Management* chapter in the *Dell Networking OS Configuration Guide*.

## Topics:

- [clock set](#)
- [clock summer-time date](#)
- [clock summer-time recurring](#)
- [clock timezone](#)
- [debug ntp](#)
- [ntp authenticate](#)
- [ntp authentication-key](#)
- [ntp control-key-passwd](#)
- [ntp broadcast client](#)
- [ntp disable](#)
- [ntp master <stratum>](#)
- [ntp offset-threshold](#)
- [ntp server](#)
- [ntp source](#)
- [ntp step-threshold](#)
- [ntp trusted-key](#)
- [show clock](#)
- [show ntp associations](#)
- [show ntp status](#)
- [show ntp vrf associations](#)

## clock set

Set the software clock in the switch.

### C9000 Series

|                      |                                                   |                                                                                                                                                      |
|----------------------|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>clock set <i>time month day year</i></code> |                                                                                                                                                      |
| <b>Parameters</b>    | <b><i>time</i></b>                                | Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.                                |
|                      | <b><i>month</i></b>                               | Enter the name of one of the 12 months, in English. You can enter the number of a day and change the order of the display to time day month year.    |
|                      | <b><i>day</i></b>                                 | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time month day year. |
|                      | <b><i>year</i></b>                                | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                               |
| <b>Defaults</b>      | Not configured.                                   |                                                                                                                                                      |
| <b>Command Modes</b> | EXEC Privilege                                    |                                                                                                                                                      |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Usage Information

You can change the order of the `month` and `day` parameters to enter the time and date as `time day month year`. You cannot delete the software clock.

The software clock runs only when the software is up. The clock restarts, based on the hardware clock, when the switch reboots.

Dell Networking recommends using an outside time source, such as NTP, to ensure accurate time on the switch.

## Example

```
Dell#clock set 16:20:00 19 may 2001
Dell#
```

# clock summer-time date

Set a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

## C9000 Series

### Syntax

```
clock summer-time time-zone date start-month start-day start-year start-time end-month end-day end-year end-time [offset]
```

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

### Parameters

|                           |                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>time-zone</i></b>   | Enter the three-letter name for the time zone. This name is displayed in the <code>show clock</code> output.                                                       |
| <b><i>start-month</i></b> | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to <code>time day month year</code> .        |
| <b><i>start-day</i></b>   | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to <code>time day month year</code> . |
| <b><i>start-year</i></b>  | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                                             |
| <b><i>start-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                                         |
| <b><i>end-day</i></b>     | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to <code>time day month year</code> . |
| <b><i>end-month</i></b>   | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to <code>time day month year</code> .        |
| <b><i>end-time</i></b>    | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                                         |
| <b><i>end-year</i></b>    | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                                             |

**offset** (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is **60 minutes**.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Related Commands**

- [clock summer-time recurring](#) — sets a date (and time zone) on which to convert the switch to daylight saving time each year.
- [show clock](#) — displays the current clock settings.

## clock summer-time recurring

Set the software clock to convert to daylight saving time on a specific day each year.

### C9000 Series

**Syntax** `clock summer-time time-zone recurring [start-week start-day start-month start-time end-week end-day end-month end-time [offset]]`

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

**Parameters**

**time-zone** Enter the three-letter name for the time zone. This name is displayed in the show clock output. You can enter up to eight characters.

**start-week** (OPTIONAL) Enter one of the following as the week that daylight saving begins and then enter values for start-day through end-time:

- **week-number**: Enter a number from 1 to 4 as the number of the week in the month to start daylight saving time.
- **first**: Enter this keyword to start daylight saving time in the first week of the month.
- **last**: Enter this keyword to start daylight saving time in the last week of the month.

**start-day** Enter the name of the day that you want daylight saving time to begin. Use English three letter abbreviations; for example, Sun, Sat, Mon, and so on. The range is from Sun to Sat.

**start-month** Enter the name of one of the 12 months in English.

**start-time** Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>end-week</i></b>  | Enter the one of the following as the week that daylight saving ends: <ul style="list-style-type: none"> <li>• <code>week-number</code>: enter a number from 1 to 4 as the number of the week to end daylight saving time.</li> <li>• <code>first</code>: enter the keyword <code>first</code> to end daylight saving time in the first week of the month.</li> <li>• <code>last</code>: enter the keyword <code>last</code> to end daylight saving time in the last week of the month.</li> </ul> |
| <b><i>end-day</i></b>   | Enter the weekday name that you want daylight saving time to end. Enter the weekdays using the three letter abbreviations; for example Sun, Sat, Mon, and so on. The range is from Sun to Sat.                                                                                                                                                                                                                                                                                                     |
| <b><i>end-month</i></b> | Enter the name of one of the 12 months in English.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>end-time</i></b>  | Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>offset</i></b>    | (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is <b>60 minutes</b> .                                                                                                                                                                                                                                                                                                                                                       |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                                  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                                                                  |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                                  |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                                                               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                                                               |
| <b>7.4.1.0</b>  | Updated the <code>start-day</code> and <code>end-day</code> options to allow for using the three-letter abbreviation of the weekday name. |
| <b>6.1.1.0</b>  | Introduced on the E-Series.                                                                                                               |

**Related Commands**

- [clock summer-time date](#) — sets a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.
- [show clock](#) — displays the current clock settings

## clock timezone

Configure a timezone for the switch.

### C9000 Series

**Syntax** `clock timezone timezone-name offset`

To delete a timezone configuration, use the `no clock timezone` command.

**Parameters**

***timezone-name*** Enter the name of the timezone. You cannot use spaces.

**offset**

Enter one of the following:

- a number from 1 to 23 as the number of hours in addition to universal time coordinated (UTC) for the timezone.
- a minus sign (-) then a number from 1 to 23 as the number of hours.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information** Coordinated universal time (UTC) is the time standard based on the International Atomic Time standard, commonly known as Greenwich Mean time. When determining system time, include the differentiator between UTC and your local timezone. For example, San Jose, CA is the Pacific Timezone with a UTC offset of -8.

## debug ntp

Display Network Time Protocol (NTP) transactions and protocol messages for troubleshooting.

**Syntax** `debug ntp {level level-number}`

To disable debugging of NTP transactions, use the `no debug ntp {level level-number}` command.

**Parameters**

|              |                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level</b> | Enter the keyword <code>level</code> then the level-number to display information about NTP logs. The log level range is from 1 to 6. <ul style="list-style-type: none"><li>• 1 is the most important log level.</li><li>• 6 is the least important log level.</li></ul> |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

# ntp authenticate

Enable authentication of NTP traffic between the switch and the NTP time serving hosts.

## C9000 Series

| <b>Syntax</b>            | <code>ntp authenticate</code><br>To disable NTP authentication, use the <code>no ntp authentication</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

| <b>key</b>        | Enter the authentication key in the previously specified format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                         |            |                                                                                  |             |                                                                                   |          |                                                                                |          |                                                                         |            |                                                                  |
| <b>Defaults</b>   | NTP authentication is not configured by default. If you do not specify the option [0   7], <b>0</b> is selected by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                   |                                                                                                                                                                                                         |            |                                                                                  |             |                                                                                   |          |                                                                                |          |                                                                         |            |                                                                  |

## Command Modes CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| 9.14(1.0)  | Introduced the <code>sha1</code> option. Also, introduced on the S4810 and S4820T. |
| 9.14(0.0)  | The trusted-key range value is from 1 to 65534.                                    |
| 9.12(1.0)  | Introduced on the S5048F-ON.                                                       |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                           |
| 8.2.1.0    | Added options [0   7] for entering the authentication key.                         |
| 7.6.1.0    | Introduced on the S-Series.                                                        |
| 7.5.1.0    | Introduced on the C-Series.                                                        |
| 6.1.1.0    | Introduced on the E-Series.                                                        |

**Usage Information** After configuring the `ntp authentication-key` command, configure the `ntp trusted-key` command to complete NTP authentication.

Dell EMC Networking OS versions 8.2.1.0 and later use an encryption algorithm to store the authentication key that is different from previous Dell EMC Networking OS versions; beginning in version 8.2.1.0, Dell EMC Networking OS uses DES encryption to store the key in the startup-config when you enter the `ntp authentication-key` command. Therefore, if your system boots with a startup-configuration from an Dell EMC Networking OS versions prior to 8.2.1.0 in which you have configured `ntp authentication-key`, the system cannot correctly decrypt the key, and cannot authenticate NTP packets. In this case you must re-enter this command and save the running-config to the startup-config.

**Related Commands**

- [ntp authenticate](#) — enables NTP authentication.
- [ntp trusted-key](#) — configures a trusted key.

## ntp control-key-passwd

Configure control key password for NTPQ authentication. NTP control key supports encrypted and unencrypted option.

**Syntax** `ntp control-key-passwd [encryption-type] password`

To delete the control key, use the `no ntp control-key-passwd [encryption-type] password` command.

**Parameters**

***encryption-type*** (OPTIONAL) Enter one of the following numbers:

- 0 (zero) directs the system to store the password as clear text. It is the default encryption type when using the password option.

- 7 (seven) indicates that a password is encrypted using a DES hashing algorithm. It specifies a hidden authentication data.
- WORD is the un-encrypted (cleartext) authentication data.

***password***

Enter a string up to 32 characters as the password.

#### Defaults

NTPQ

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

#### Version

#### Description

**9.14(0.0)**

Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.

#### Usage

#### Information

NTP control key is not configured by default. If the encryption-type (0 or 7) is not specified, then 0 is selected by default.

## ntp broadcast client

Set up the interface to receive NTP broadcasts from an NTP server.

### C9000 Series

#### Syntax

`ntp broadcast client`

To disable broadcast, use the `no ntp broadcast client` command.

#### Defaults

Disabled.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

#### Version

#### Description

**9.9(0.0)**

Introduced on the C9010.

**9.2(1.0)**

Introduced on the Z9500.

**8.3.19.0**

Introduced on the S4820T.

**8.3.11.1**

Introduced on the Z9000.

**8.3.7.0**

Introduced on the S4810.

**7.6.1.0**

Introduced on the S-Series.

**7.5.1.0**

Introduced on the C-Series.

**6.1.1.0**

Introduced on the E-Series.

# ntp disable

Prevent an interface from receiving NTP packets.

## C9000 Series

| <b>Syntax</b>          | <code>ntp disable</code><br><br>To re-enable NTP on an interface, use the <code>no ntp disable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|---------|-----------------------------|---------|-----------------------------|---------|-----------------------------|
| <b>Defaults</b>        | Disabled (that is, if you configure an NTP host, all interfaces receive NTP packets)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                      |
| <b>9.6(0.0)</b> | Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                         |

## ntp offset-threshold

Configure the threshold time interval before which the system generates an NTP audit log message if the time difference from the NTP server is greater than a threshold value (offset-threshold).

|                        |                                                                                                                                                               |                                                                                                                      |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ntp offset-threshold threshold-value</code><br>To disable the threshold value, use the <code>no ntp offset-threshold</code> command.                    |                                                                                                                      |
| <b>Parameters</b>      | <b>offset-threshold</b><br><b>threshold-value</b>                                                                                                             | (Optional) Enter the keyword <code>offset-threshold</code> and then the threshold value. The range is from 0 to 999. |
| <b>Defaults</b>        | Zero (0).                                                                                                                                                     |                                                                                                                      |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                      |

| Version          | Description                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                                                  |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                                                   |
| <b>9.10(0.0)</b> | Introduced on the S3038-ON, S4048-ON, S3100 Series, S4810P, S4820T, S5000, S6000, S6000-ON, S6100-ON, Z9500, and Z9100-ON. |

**Usage Information** The `ntp offset-threshold` command does not time synchronization.

**Example**

```
DellEMC(config)# ntp offset-threshold 4
```

## ntp server

Configure an NTP time-serving host.

|                   |                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ntp server[vrf vrf-name] {hostname   ipv4-address   ipv6-address} [key<br/>keyid] [prefer] [version number] [minpoll] [maxpoll]</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b> | <b>vrf vrf-name</b><br><b>ipv4-address  <br/>ipv6-address</b><br><b>hostname</b><br><b>key keyid</b><br><b>prefer</b>                        | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to configure an NTP time-serving host corresponding to that VRF.<br>Enter an IPv4 address (A.B.C.D) or IPv6 address (X:X:X::X) of NTP server.<br>Enter the host name of the server.<br>(OPTIONAL) Enter the keyword <code>key</code> and a number as the NTP peer key. The range is from 1 to 65534.<br>(OPTIONAL) Enter the keyword <code>prefer</code> to indicate that this peer has priority over other servers. |

|                                        |                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>version number</b>                  | (OPTIONAL) Enter the keyword <code>version</code> and a number to correspond to the NTP version used on the server. The range is from 1 to 4. |
| <b>minpoll <i>polling-interval</i></b> | (OPTIONAL) Enter the keyword <code>minpoll</code> then the polling-interval. The polling interval range is from 4 to 16.                      |
| <b>maxpoll <i>polling-interval</i></b> | (OPTIONAL) Enter the keyword <code>maxpoll</code> then the polling-interval. The polling interval range is from 4 to 16.                      |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b>  | The trusted-key range value is increased from 1 to 65534. Also, introduced the <code>minpoll</code> and <code>maxpoll</code> polling interval options. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                                               |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                                        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                                            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                                            |
| <b>9.6(0.0)</b>   | Added support for VRF.                                                                                                                                 |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                                                                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                                               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                                               |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                                               |
| <b>8.4.1.0</b>    | Added IPv6 support.                                                                                                                                    |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                                            |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                                            |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                                                            |

**Usage Information** You can configure multiple time-serving hosts. From these time-serving hosts, the Dell EMC Networking OS chooses one NTP host with which to synchronize. To determine which server is selected, use the `show ntp associations` command.

Because many polls to NTP hosts can affect network performance, Dell EMC Networking recommends limiting the number of hosts configured.

By default, the system performs a time synchronization if the time difference from the time source is greater than one second.

When the Dell EMC Networking OS NTP client receives inconsistent timestamp in the origin timestamp field, it logs the syslog message. It is due to the older versions of NTPD server implementation. Upgrade the system to the latest NTPD package in the NTP server and the system logs the following NTP syslog message:

```
Dell EMC# May 30 13:27:46 %STKUNIT2-:CP %ntp-6-: receive:
Unexpected origin timestamp 0xdeb95bee.06ba346e does not match aorg
0000000000.00000000 from server@10.16.151.117 xmt 0xdeb95bee.30907a87
```

In general, the packet denied services are dropped with no further action except incrementing the statistics counters. In certain cases, a more proactive response is required to cause the client to slow down the process. A special packet is created to serve this purpose, and it is called the kiss-o-Death (KoD) packet. When the Dell EMC Networking OS client receives KoD packets, it logs the following syslog message:

```
Dell EMC# May 27 14:32:13 %STKUNIT1-:CP %ntp-6-: receive: KoD packet
from 300::2 has inconsistent xmt/org/rec timestamps. Ignoring.
```

## Related Commands

- [show ntp associations](#)—displays the NTP servers that are configured and their status.

# ntp source

Specify an interface's IP address to be included in the NTP packets.

## Syntax

```
ntp source interface
```

To delete the configuration, use the `no ntp source` command.

## Parameters

### interface

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Version

### Description

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <b>9.13.0.0</b>   | Added support for configuring Management interface. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                         |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                            |
| <b>9.0.2.0</b>    | Introduced on the S6000.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                            |

| Version | Description                              |
|---------|------------------------------------------|
| 8.5.1.0 | Added support for 4-port 40G line cards. |
| 7.6.1.0 | Introduced on the S-Series.              |
| 7.5.1.0 | Introduced on the C-Series.              |
| 6.1.1.0 | Introduced on the E-Series.              |

## ntp step-threshold

Configure the step-threshold time interval.

| <b>Syntax</b>            | <code>ntp step-threshold value</code><br>To return to the default NTP step-threshold value, use the <code>no ntp step-threshold</code> command.                                                                                           |         |             |           |                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>        | <b>value</b> Enter the threshold value in milliseconds. The range is from 128 to 5000 milliseconds (5 seconds).                                                                                                                           |         |             |           |                                                                                                                                     |
| <b>Defaults</b>          | 128 milliseconds                                                                                                                                                                                                                          |         |             |           |                                                                                                                                     |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                             |         |             |           |                                                                                                                                     |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command-Line Reference Guide</i> .                                                                             |         |             |           |                                                                                                                                     |

| 9.14(2.3)                | Introduced on the C9000, S3048-ON, S3100 series, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.                                                                                                       |         |             |           |                                                                                                                                     |
| <b>Usage Information</b> | The <code>ntp step-threshold</code> command is used to configure a step threshold value from 128 to 5000 milliseconds (5 seconds). You can use the <code>no</code> form of the command to reset to the default value of 128 milliseconds. |         |             |           |                                                                                                                                     |
| <b>Example</b>           | <pre>DellEMC(config)# ntp step-threshold 5000</pre>                                                                                                                                                                                       |         |             |           |                                                                                                                                     |

## ntp trusted-key

Set a key to authenticate the system to which NTP synchronizes.

| <b>Syntax</b>          | <code>ntp trusted-key number</code><br>To delete the key, use the <code>no ntp trusted-key number</code> command.                                                                                                                                                                                           |         |             |           |                                                           |           |                                           |           |                          |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------|-----------------------------------------------------------|-----------|-------------------------------------------|-----------|--------------------------|
| <b>Parameters</b>      | <b>number</b> Enter a number as the trusted key ID. The range is from 1 to 65534.                                                                                                                                                                                                                           |         |             |           |                                                           |           |                                           |           |                          |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                                                             |         |             |           |                                                           |           |                                           |           |                          |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                               |         |             |           |                                                           |           |                                           |           |                          |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                               |         |             |           |                                                           |           |                                           |           |                          |

| Version                | Description                                                                                                                                                                                                                                                                                                 |         |             |           |                                                           |           |                                           |           |                          |
| 9.14(0.0)              | The trusted-key range value is increased from 1 to 65534.                                                                                                                                                                                                                                                   |         |             |           |                                                           |           |                                           |           |                          |
| 9.10(0.1)              | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                                                                                   |         |             |           |                                                           |           |                                           |           |                          |
| 9.10(0.0)              | Introduced on the S3148.                                                                                                                                                                                                                                                                                    |         |             |           |                                                           |           |                                           |           |                          |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100–ON.     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048–ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048–ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>7.6.1.0</b>    | Introduced on the S-Series.     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.     |
| <b>6.1.1.0</b>    | Introduced on the E-Series.     |

#### Usage Information

The number parameter in the `ntp trusted-key` command must be the same number as the number parameter in the `ntp authentication-key` command. If you change the `ntp authentication-key` command, you must also change the `ntp trusted-key` command.

#### Related Commands

- [ntp authentication-key](#)—sets an authentication key for NTP.
- [ntp authenticate](#)—enables the NTP authentication parameters you set.

## show clock

Display the current clock settings.

## C9000 Series

#### Syntax

```
show clock [detail]
```

From a **PE console**, use `show clock`.

#### Parameters

**detail** (OPTIONAL) Enter the keyword `detail` to view the source information of the clock.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                         |
|-----------------|-------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010 and C1048P. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.            |
| <b>8.3.19.0</b> | Introduced on the S4820T.           |
| <b>8.3.11.1</b> | Introduced on the Z9000.            |
| <b>8.3.7.0</b>  | Introduced on the S4810.            |
| <b>7.6.1.0</b>  | Introduced on the S-Series.         |
| <b>7.5.1.0</b>  | Introduced on the C-Series.         |

| Version        | Description                 |
|----------------|-----------------------------|
| <b>6.1.1.0</b> | Introduced on the E-Series. |

#### Example

```
Dell#show clock
11:05:56.949 UTC Thu Oct 25 2001
Dell#
```

#### Example (PE Console)

```
Dell#show clock
13:24:32.298 UTC Tue Jul 7 2015
```

#### Example (Detail)

```
Dell#show clock detail
12:18:10.691 UTC Wed Jan 7 2009
Time source is RTC hardware
Summer time starts 02:00:00 UTC Sun Mar 8 2009
Summer time ends 02:00:00 ABC Sun Nov 1 2009
Dell#
```

#### Related Commands

[clock summer-time recurring](#)— displays the time and date from the switch hardware clock.

## show ntp associations

Display the NTP master and peers.

**Syntax** `show ntp associations`

**Command Modes**

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.1.1.0</b>    | Introduced on the E-Series.               |

Usage Information

The following describes the `show ntp associations` command shown in the Example below.

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (none)    | One or more of the following symbols could be displayed: <ul style="list-style-type: none"><li>• * means synchronized to this peer.</li><li>• # means almost synchronized to this peer.</li><li>• + means the peer was selected for possible synchronization.</li><li>• - means the peer is a candidate for selection.</li><li>• x means designated falsesticker by the intersection algorithm.</li></ul> |
| remote    | Displays the remote IP address of the NTP peer.                                                                                                                                                                                                                                                                                                                                                           |
| ref clock | Displays the IP address of the remote peer's reference clock.                                                                                                                                                                                                                                                                                                                                             |
| st        | Displays the peer's stratum, that is, the number of hops away from the external time source. A in this column means the NTP peer cannot reach the time source.                                                                                                                                                                                                                                            |
| when      | Displays the last time the switch received an NTP packet.                                                                                                                                                                                                                                                                                                                                                 |
| poll      | Displays the polling interval (in seconds).                                                                                                                                                                                                                                                                                                                                                               |
| reach     | Displays the reachability to the peer (in octal bitstream).                                                                                                                                                                                                                                                                                                                                               |
| delay     | Displays the time interval or delay for a packet to complete a round-trip to the NTP time source (in milliseconds).                                                                                                                                                                                                                                                                                       |
| offset    | Displays the relative time of the NTP peer's clock to the switch clock (in milliseconds).                                                                                                                                                                                                                                                                                                                 |
| offset    | Displays the relative time of the NTP peer's clock to the switch clock (in milliseconds).                                                                                                                                                                                                                                                                                                                 |
| disp      | Displays the dispersion.                                                                                                                                                                                                                                                                                                                                                                                  |
| LOCAL(0)  | Indicates that the local machine has synced with itself. Generally, only a NTP master syncs with itself. Synchronization of the local machine takes place to this peer.                                                                                                                                                                                                                                   |
| .LOCL.    | Indicates the reference clock of the NTP master.                                                                                                                                                                                                                                                                                                                                                          |

Example (without ntp master configuration)

|                                                                   |        |              |    |      |      |       |       |         |       |  |

| Dell EMC#                                                         |        |              |    |      |      |       |        |         |      |    |

In the above example,

- LOCAL(0) indicates that the local machine synchronizes with itself.
- .LOCL. indicates reference clock of the NTP master.

**Command History**                    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100–ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100–ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

**Usage Information**                    The following describes the show ntp status command shown in the Example below.

| Field                   | Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| “Clock is...”           | States whether or not the switch clock is synchronized, which NTP stratum the system is assigned and the IP address of the NTP peer. |
| “frequency is...”       | Displays the frequency (in ppm), stability (in ppm) and precision (in Hertz) of the clock in this system.                            |
| “reference time is...”  | Displays the reference time stamp.                                                                                                   |
| “clock offset is...”    | Displays the system offset to the synchronized peer and the time delay on the path to the NTP root clock.                            |
| “root dispersion is...” | Displays the root and path dispersion.                                                                                               |
| “peer mode is...”       | State what NTP mode the switch is. This should be Client mode.                                                                       |

**Example**

```
DellEMC#> show ntp status
Clock is synchronized, stratum 4, reference is 10.16.151.117, vrf-id is 0
frequency is 0.000 ppm, stability is 0.000 ppm, precision is -18
reference time dec0e68a.07b308ac [Wed, Apr 7 0 9:42:34.030 UTC] UTC
clock offset is 0.000000 msec, root delay is 152.003 msec
root dispersion is 1381.293 msec, peer dispersion is 937.690 sec
```

```
peer mode is client
DellEMC#
```

**Related  
Commands**

- [show ntp associations](#) — displays information on the NTP master and peer configurations.

## show ntp vrf associations

Displays the NTP servers configured for the VRF instance <vrf-name>.

### C9000 Series

**Syntax**                    show ntp [vrf] <vrf-name> associations.

```
Dell#show ntp vrf ? management
Dell#show ntp vrf management ?
associations NTP associations
```

**Command Modes**    EXEC  
                     EXEC Privilege

**Command History**    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version            | Description                 |
|--------------------|-----------------------------|
| <b>9.9(0.0)</b>    | Introduced on the C9010.    |
| <b>9.6(0.0)</b>    | Added support for VRF.      |
| <b>9.4.(0.0)</b>   | Added support for VRF.      |
| <b>9.0.2.0</b>     | Introduced on the S6000.    |
| <b>8.3.11.1</b>    | Introduced on the Z9000.    |
| <b>8.4.1.0</b>     | Added IPv6 support.         |
| <b>7.6.1.0</b>     | Introduced on the S-Series. |
| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

# Tunneling Commands

Tunnel interfaces create a logical tunnel for IPv4 or IPv6 traffic. You can configure DCSP, hop-limits and flow-labels. To enable a tunnel interface, use the following commands.

## Topics:

- [ip unnumbered](#)
- [ipv6 unnumbered](#)
- [tunnel allow-remote](#)
- [tunnel destination](#)
- [tunnel dscp](#)
- [tunnel flow-label](#)
- [tunnel hop-limit](#)
- [tunnel keepalive](#)
- [tunnel-mode](#)
- [tunnel source](#)

## ip unnumbered

Configure a tunnel interface to operate without a unique IPv4 address and select the interface from which the tunnel borrows its address.

## C9000 Series

|                          |                                                                                                                                                                                                                                    |                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <b>Syntax</b>            | <b>ip unnumbered</b> <i>{interface-type interface-number}</i>                                                                                                                                                                      |                                                      |
|                          | To set the tunnel back to default logical address use the <b>no ip unnumbered</b> command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv6 address. |                                                      |
| <b>Parameters</b>        | <b><i>interface-type</i></b><br><b><i>interface-number</i></b>                                                                                                                                                                     | Enter the interface type, followed by a slot number. |
| <b>Defaults</b>          | None                                                                                                                                                                                                                               |                                                      |
| <b>Command Modes</b>     | INTERFACE TUNNEL                                                                                                                                                                                                                   |                                                      |
| <b>Command History</b>   | This guide is platform-specific. |                          | The following is a list of the Dell Networking OS version history for this command.                                                                                                                                                |                                                      |
|                          | <b>Version</b>                                                                                                                                                                                                                     | <b>Description</b>                                   |
|                          | <b>9.9(0.0)</b>                                                                                                                                                                                                                    | Introduced on the C9010.                             |
|                          | <b>9.7(0.0)</b>                                                                                                                                                                                                                    | Introduced on the S6000-ON.                          |
|                          | <b>9.3(0.1)</b>                                                                                                                                                                                                                    | Introduced on the S6000 and Z9000.                   |
|                          | <b>9.4(0.1)</b>                                                                                                                                                                                                                    | Introduced on the S4810, S4820T, S6000 and Z9000.    |
| <b>Usage Information</b> | The ip unnumbered command fails in two conditions:                                                                                                                                                                                 |                                                      |
|                          | <ul style="list-style-type: none"> <li>• If the logical ip address is configured.</li> </ul>                                                                                                                                       |                                                      |

- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ip unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical ip address is identified from one of the address family.

## ipv6 unnumbered

Configure a tunnel interface to operate without a unique IPv6 address and select the interface from which the tunnel borrows its address.

### C9000 Series

**Syntax** `ipv6 unnumbered {interface-type interface-number}`

To set the tunnel back to default logical address use the **no ipv6 unnumbered** command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv4 address.

**Parameters** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**interface-type** Enter the interface type, followed by the type, slot and port information.  
**interface-number**

**Defaults** None.

**Command Modes** INTERFACE TUNNEL

| Command History | Version         | Description                                       |
|-----------------|-----------------|---------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                          |
|                 | <b>9.7(0.0)</b> | Introduced on the S6000-ON.                       |
|                 | <b>9.3(0.1)</b> | Introduced on the S6000 and Z9000.                |
|                 | <b>9.4(0.0)</b> | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage Information** The ip unnumbered command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ipv6 unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical ip address is identified from one of the address family.

## tunnel allow-remote

Configure an IPv4 or IPv6 address or prefix whose tunneled packets are accepted for decapsulation. If you do not configure allow-remote entries, tunneled packets from any remote peer address is accepted.

This feature is supported on Dell Networking OS.

## C9000 Series

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                         |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <b>tunnel allow-remote</b> { <i>ip-address</i>   <i>ipv6-address</i> } [ <i>mask</i> ]<br><br>To delete a configured allow-remote entry use the <b>no</b> tunnel allow-remote command. Any specified address/mask values must match an existing entry for the delete to succeed. If the address and mask are not specified, this command deletes all allow-remote entries.                                                                             |                                                                                                                                                                                                                         |

|                        | <b>9.9(0.0)</b>                                                                                                                                                                                                | Introduced on the C9010.                           |
|                        | <b>9.7(0.0)</b>                                                                                                                                                                                                | Introduced on the S6000-ON.                        |
|                        | <b>9.3(0.0)</b>                                                                                                                                                                                                | Introduced on the S4810, S4820T, S6000 and Z9000.  |

### Usage Information

The tunnel interface is inoperable without a valid tunnel destination address for the configured Tunnel mode.

To establish a logical tunnel to the particular destination address, use the destination address of the outer tunnel header. If you configure a tunnel interface or source address, the tunnel destination must be compatible.

## tunnel dscp

Configure the method to set the DSCP in the outer tunnel header.

### C9000 Series

#### Syntax

```
tunnel dscp {mapped | value}
```

To use the default tunnel mapping behavior, use the `no tunnel dscp value` command.

#### Parameters

|               |                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mapped</b> | Enter the keyword <code>mapped</code> to map the original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.                                                                                      |
| <b>value</b>  | Enter a value to set the DSCP value in the tunnel header. The range is from 0 to 63. The default value of <b>0</b> denotes mapping of original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel. |

#### Defaults

0 (Mapped)

#### Command Modes

INTERFACE TUNNEL (conf-if-tu)

#### Command History

| Version         | Description                                    |
|-----------------|------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                       |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                    |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                       |
| <b>9.3(0.0)</b> | Introduced on the S6000, S4810, S4820T, Z9000. |

### Usage Information

This command configures the method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or the IPv6 traffic class in the outer IP header.

A value of 0 copies original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

## tunnel flow-label

Configure the method to set the IPv6 flow label value in the outer tunnel header.

### C9000 Series

#### Syntax

```
tunnel flow-label value
```

To return to the default value of 0, use the `no tunnel flow-label value` command.

#### Parameters

|              |                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>value</b> | Enter a value to set the IPv6 flow label value in the tunnel header. The range is from 0 to 1048575. The default value is <b>0</b> . |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------|

|                          |                                                                                      |                                                |
|--------------------------|--------------------------------------------------------------------------------------|------------------------------------------------|
| <b>Defaults</b>          | <b>0</b> (Mapped original packet flow-label value to tunnel header flow-label value) |                                                |
| <b>Command Modes</b>     | INTERFACE TUNNEL (conf-if-tu)                                                        |                                                |
| <b>Command History</b>   | <b>Version</b>                                                                       | <b>Description</b>                             |
|                          | <b>9.9(0.0)</b>                                                                      | Introduced on the C9010.                       |
|                          | <b>9.7(0.0)</b>                                                                      | Introduced on the S6000-ON.                    |
|                          | <b>9.3(0.0)</b>                                                                      | Introduced on the S6000, S4810, S4820T, Z9000. |
| <b>Usage Information</b> | This command is only valid for tunnel interfaces with an IPv6 outer header.          |                                                |

## tunnel hop-limit

Configure the method to set the IPv4 time-to-live or the IPv6 hop limit value in the outer tunnel header.

### C9000 Series

|                          |                                                                                                                                                                             |                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>tunnel hop-limit value</code><br>To restore the default tunnel hop-limit, use the <code>no tunnel hop-limit</code> command.                                           |                                                                                                                                                 |
| <b>Parameters</b>        | <b>value</b>                                                                                                                                                                | Enter the hop limit (ipv6) or time-to-live (ipv4) value to include in the tunnel header. The range is from 0 to 255. The default is <b>64</b> . |
| <b>Defaults</b>          | <b>64</b> (Time-to-live for IPv4 outer tunnel header or hop limit for IPv6 outer tunnel header)                                                                             |                                                                                                                                                 |
| <b>Command Modes</b>     | INTERFACE TUNNEL (conf-if-tu)                                                                                                                                               |                                                                                                                                                 |

| <b>Syntax</b>     | <code>tunnel keepalive {ip-address   ipv6-address}[interval {seconds}] [attempts {count   unlimited}]</code><br>To disable the tunnel keepalive probes use the <b>no tunnel keepalive</b> command. |                                                                                                                                         |
| <b>Parameters</b> | <b>ip-address ipv6 address</b>                                                                                                                                                                     | Enter the IPv4 or IPv6 address of the peer to which the keepalive probes will be sent.                                                  |
|                   | <b>interval seconds</b>                                                                                                                                                                            | Enter the keyword <code>interval</code> then the interval time, in seconds, after which the restart process to keepalive probe packets. |

|                  |                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|                  | The range is from 5 to 255. The default is 5.                                                                                       |
| <b>count</b>     | (OPTIONAL) Enter the keyword <b>count</b> to count packets processed by the filter.<br>The range is from 3 to 10. The default is 3. |
| <b>unlimited</b> | Enter the keyword <b>unlimited</b> to specify the unlimited number of keepalive probe packets.                                      |

**Defaults** Tunnel keepalive is disabled.

**Command Modes** INTERFACE TUNNEL

| Command History | Version         | Description                                       |
|-----------------|-----------------|---------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                          |
|                 | <b>9.7(0.0)</b> | Introduced on the S6000-ON.                       |
|                 | <b>9.4(0.0)</b> | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage Information**

Enabling tunnel keepalive causes ICMP echo packets to be sent to the keepalive target. The ICMP echo will be sourced from the tunnel interface logical IPv4 or IPv6 address and will be tunnel encapsulated. The response will be accepted whether it returns tunnel encapsulated or not.

When configuring tunnel keepalive at both end points of a tunnel interface it is recommended to set the tunnel keepalive target to the logical IPv4 or IPv6 address of the far end tunnel peer, rather than to the tunnel destination. This reduces the chance of both ends of the tunnel staying in keepalive down state. If both ends get into a keepalive down state that does not clear in a few seconds, then performing shutdown - no shutdown sequence on one end should bring both ends back to up.

## tunnel-mode

Enable a tunnel interface.

.

## C9000 Series

**Syntax** `tunnel mode { ipip | ipv6 | ipv6ip } [decapsulate-any]`  
To disable an active tunnel interface, use the **no tunnel** mode command.

|                   |                               |                                                                                                  |
|-------------------|-------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>ipip</i></b>            | Enable tunnel in RFC 2003 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv4 tunnel. |
|                   | <b><i>ipv6</i></b>            | Enable tunnel in RFC 2473 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv6 tunnel. |
|                   | <b><i>ipv6ip</i></b>          | Enable tunnel in RFC 4213 mode and encapsulate IPv6 datagrams inside an IPv4 tunnel.             |
|                   | <b><i>decapsulate-any</i></b> | (Optional) Enable tunnel in multipoint receive-only mode.                                        |

**Defaults** There is no default tunnel mode.

**Command Modes** INTERFACE TUNNEL

| Command History | Version         | Description                        |
|-----------------|-----------------|------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.           |
|                 | <b>9.7(0.0)</b> | Introduced on the S6000-ON.        |
|                 | <b>9.3(0.1)</b> | Introduced on the S6000 and Z9000. |

| Version  | Description                        |
|----------|------------------------------------|
| 9.4(0.0) | Added the decapsulate-any command. |

#### Usage Information

To enable a tunnel interface, use this command. You must define a tunnel mode for the tunnel to function. If you previously defined the tunnel destination or source address, the tunnel mode must be compatible.

Including the decapsulate-any option causes the command to fail if any of the following tunnel transmit options are configured: tunnel destination, tunnel dscp, tunnel flow-label, tunnel hop-limit, or tunnel keepalive. Conversely, if you configure any tunnel allow-remote entries, the `tunnel-mode` command fails unless the decapsulate-any option is included.

Configuration of IPv6 commands over decapsulate-any tunnel causes an error.

## tunnel source

Set a source address for the tunnel.

## C9000 Series

**Syntax** `tunnel source {ip-address | ipv6-address | interface-type-number | anylocal}`

To delete the current tunnel source address, use the `no tunnel source` command.

#### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>            | Enter the source IPv4 address in A.B.C.D format.                                                                                                                                                                                                                                                                                                                                           |
| <b><i>ipv6-address</i></b>          | Enter the source IPv6 address in X:X:X:X format.                                                                                                                                                                                                                                                                                                                                           |
| <b><i>interface-type-number</i></b> | <ul style="list-style-type: none"> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b><i>anylocal</i></b>              | Enter the <code>anylocal</code> command to allow the multipoint receive-only tunnel to decapsulate tunnel packets destined to any local ip address.                                                                                                                                                                                                                                        |

**Defaults** none

**Command Modes** INTERFACE TUNNEL (conf-if-tu)

#### Command History

| Version  | Description                                      |
|----------|--------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                         |
| 9.7(0.0) | Introduced on the S6000-ON.                      |
| 9.4(0.0) | Added the tunnel source anylocal command.        |
| 9.2(0.0) | Introduced on the MXL 10/40GbE Switch IO Module. |

#### Usage Information

Added an optional keyword “**anylocal**” to the tunnel source command. The anylocal argument can be used in place of the ip address or interface, but only with the multipoint receive-only mode tunnels. The tunnel source `anylocal` command allows the multipoint receive-only tunnel to decapsulate tunnel packets addressed to any IPv4 or IPv6 (depending on the tunnel mode) address configured on the switch that is operationally **Up**.

# Uplink Failure Detection (UFD)

Uplink failure detection (UFD) provides detection of the loss of upstream connectivity and, if you use this with NIC teaming, automatic recovery from a failed link.

## clear ufd-disable

Re-enable one or more downstream interfaces on the switch/router that are in a UFD-Disabled Error state so that an interface can send and receive traffic.

| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |

| Version         | Description                     |
|-----------------|---------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.        |
| <b>8.3.19.0</b> | Introduced on the S4820T.       |
| <b>8.3.12.0</b> | Introduced on the S4810.        |
| <b>8.4.2.3</b>  | Introduced on the S-Series S50. |

#### Usage Information

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

#### Related Commands

- [upstream](#) — assigns a port or port-channel to the uplink-state group as an upstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## downstream auto-recover

Enable auto-recovery so that UFD-disabled downstream ports in an uplink-state group automatically come up when a disabled upstream port in the group comes back up.

### C9000 Series

#### Syntax

```
downstream auto-recover
```

To disable auto-recovery on downstream links, use the `no downstream auto-recover` command.

#### Defaults

The auto-recovery of UFD-disabled downstream ports is enabled.

#### Command Modes

UPLINK-STATE-GROUP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                     |
|-----------------|---------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.        |
| <b>9.2(1.0)</b> | Introduced on the Z9500.        |
| <b>8.3.19.0</b> | Introduced on the S4820T.       |
| <b>8.3.12.0</b> | Introduced on the S4810.        |
| <b>8.4.2.3</b>  | Introduced on the S-Series S50. |

#### Related Commands

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# downstream disable links

Configure the number of downstream links in the uplink-state group that are disabled if one upstream link in an uplink-state group goes down.

## C9000 Series

| <b>Syntax</b>            | <code>downstream disable links {<i>number</i>  all}</code><br>To revert to the default setting, use the <code>no downstream disable links</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                              |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                                 |

# enable

Enable uplink state group tracking for a specific UFD group.

## C9000 Series

|                        |                                                                                                                                                                      |  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Syntax</b>          | <code>enable</code><br>To disable upstream-link tracking without deleting the uplink-state group, use the <code>no enable</code> command.                            |  |
| <b>Defaults</b>        | Upstream-link tracking is automatically enabled in an uplink-state group.                                                                                            |  |
| <b>Command Modes</b>   | UPLINK-STATE-GROUP                                                                                                                                                   |  |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                     |
|----------|---------------------------------|
| 9.9(0.0) | Introduced on the C9010.        |
| 9.2(1.0) | Introduced on the Z9500.        |
| 8.3.19.0 | Introduced on the S4820T.       |
| 8.3.12.0 | Introduced on the S4810.        |
| 8.4.2.3  | Introduced on the S-Series S50. |

#### Related Commands

- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## show running-config uplink-state-group

Display the current configuration of one or more uplink-state groups.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show running-config uplink-state-group [<i>group-id</i>]</code>                                                                                          |
| <b>Parameters</b>      | <b><i>group-id</i></b> Displays the current configuration of all uplink-state groups or a specified group. The valid group-id values are from 1 to 16.         |
| <b>Defaults</b>        | none                                                                                                                                                           |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                     |
|----------|---------------------------------|
| 9.9(0.0) | Introduced on the C9010.        |
| 9.2(1.0) | Introduced on the Z9500.        |
| 8.3.19.0 | Introduced on the S4820T.       |
| 8.3.12.0 | Introduced on the S4810.        |
| 8.4.2.3  | Introduced on the S-Series S50. |

#### Example

```
Dell#show running-config uplink-state-group
!
no enable
uplink state track 1
downstream TengigabitEthernet 0/2,4,6,11-19
upstream TengigabitEthernet 0/48, 52
upstream PortChannel 1
!
uplink state track 2
downstream TengigabitEthernet 0/1,3,5,7-10
upstream TengigabitEthernet 0/56,60
```

#### Related Commands

- [show uplink-state-group](#) — displays the status information on a specified uplink-state group or all groups.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# show uplink-state-group

Display status information on a specified uplink-state group or all groups.

|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>After you enter the command, to assign upstream and downstream interfaces to the group, enter Uplink-State-Group Configuration mode.</p> <p>An uplink-state group is considered to be operationally up if at least one upstream interface in the group is in the Link-Up state.</p> <p>An uplink-state group is considered to be operationally down if no upstream interfaces in the group are in the Link-Up state. No uplink-state tracking is performed when a group is disabled or in an operationally down state.</p> <p>To disable upstream-link tracking without deleting the uplink-state group, use the <code>no enable</code> command in uplink-state-group configuration mode.</p> |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example

```

Dell(conf)#uplink-state-group 16
Dell(conf-uplink-state-group-16)#Dec 3 00:46:45: %SYSTEM:CP %IFMGR-5-
ASTATE_UP: Changed uplink state group
Admin state to up: Group 16

```

## Related Commands

- [show running-config uplink-state-group](#) — displays the current configuration of one or more uplink-state groups.
- [show uplink-state-group](#) — displays the status information on a specified uplink-state group or all groups.

# upstream

Assign a port or port-channel to the uplink-state group as an upstream interface.

## C9000 Series

### Syntax

`upstream interface`

To delete an upstream interface, use the `no upstream interface` command.

### Parameters

#### ***interface***

Enter one of the following interface types:

- 10-Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
- 40-Gigabit Ethernet: `fortyGigE {slot/port | slot/port-range}`
- Port channel: `port-channel {1-512 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `tengigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

### Defaults

none

### Command Modes

UPLINK-STATE-GROUP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

#### **Version**

#### **Description**

**9.9(0.0)**

Introduced on the C9010.

**9.2(1.0)**

Introduced on the Z9500.

**8.3.19.0**

Introduced on the S4820T.

**8.3.12.0**

Introduced on the S4810.

**8.4.2.3**

Introduced on the S-Series S50.

### Usage

#### Information

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

### Example

```
Dell(conf-uplink-state-group-16)# upstream tengigabitethernet 1/10-15
Dell(conf-uplink-state-group-16)#
```

### Related

#### Commands

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## Virtual Link Trunking (VLT)

Virtual link trunking (VLT) allows physical links between two chassis to appear as a single virtual link to the network core. VLT eliminates the requirement for Spanning Tree protocols by allowing link aggregation group (LAG) terminations on two separate distribution or core switches, and by supporting a loop-free topology.

VLT provides Layer 2 multipathing, creating redundancy through increased bandwidth and enabling multiple parallel paths between nodes and load-balancing traffic where alternative paths exist.

**NOTE:** When you launch the VLT link, the VLT peer-ship is not established if any of the following is **TRUE**:

- The VLT System-MAC configured on both the VLT peers do not match.
- The VLT Unit-Id configured on both the VLT peers are identical.
- The VLT System-MAC or Unit-Id is configured only on one of the VLT peers.
- The VLT domain ID is not the same on both peers.

If the VLT peer-ship is already established, changing the System-MAC or Unit-Id does not cause VLT peer-ship to go down.

Also, if the VLT peer-ship is already established and the VLT Unit-Id or System-MAC are configured on both peers, then changing the CLI configurations on the VLT Unit-Id or System-MAC is rejected.

When the VLT peer-ship is already established, you can remove the VLT Unit-Id or System-MAC configuration from either or both peers. However, removing configuration settings can cause the VLT ports to go down.

|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.2(0.2)</b> | Added support for IPv6.                                                                             |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

# clear vlt statistics

Clear the statistics on VLT operations.

## C9000 Series

|                   |                                                                                       |                                               |
|-------------------|---------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Syntax</b>     | <code>clear vlt statistics [arp   domain   igmp-snoop   mac   multicast   ndp]</code> |                                               |
| <b>Parameters</b> | <b>domain</b>                                                                         | Clear the VLT statistics for the domain.      |
|                   | <b>multicast</b>                                                                      | Clear the VLT statistics for multicast.       |
|                   | <b>mac</b>                                                                            | Clear the VLT statistics for the MAC address. |
|                   | <b>arp</b>                                                                            | Clear the VLT statistics for ARP.             |
|                   | <b>igmp-snoop</b>                                                                     | Clear the VLT statistics for IGMP snooping.   |
|                   | <b>ndp</b>                                                                            | Clear the VLT statistics for NDP.             |

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.2(0.2)</b> | Added <code>multicast</code> and <code>ndp</code> parameters.                                       |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.12.0</b> | Introduced on the S4810.                                                                            |

**Example**

```
Dell(conf-vlt-domain)#do clear vlt statistics
Sure want to Clear VLT Statistics [confirm] yes
Dell(conf-vlt-domain)#
```

**Related Commands** [show vlt statistics](#) — displays statistics on VLT operations.

## delay-restore

Configure the delay in bringing up VLT ports after reload or peer-link restoration between the VLT peer switches.

### C9000 Series

**Syntax** `delay-restore`

**Parameters** **delay-restore** Enter the amount of time, in seconds, to delay bringing up the VLT ports after the VLT device is reloaded or after the peer-link is restored between VLT peer switches. The range from 1 to 1200. The default is **90 seconds**.

**Defaults** Not configured.

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |

| <b>8.3.19.0</b>          | Introduced on the S8420T.                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                           |                 |                          |
| <b>8.3.12.0</b>          | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                           |                 |                          |
| <b>Usage Information</b> | <p>To delay the system from bringing up the VLT port for a brief period to allow IGMP Snooping and Layer 3 routing protocols to converge, use the <code>delay-restore</code> parameter. Use this feature:</p> <ul style="list-style-type: none"> <li>• after a VLT device is reloaded.</li> <li>• after the time when active VLTi link failed and restored.</li> </ul> |         |             |                 |                           |                 |                          |
| <b>Related Commands</b>  | <p><a href="#">show vlt statistics</a> — displays statistics on VLT operations.</p>                                                                                                                                                                                                                                                                                    |         |             |                 |                           |                 |                          |

## lacp ungroup member-independent

Enables bare metal provisioning (BMP) booting of a top of rack (ToR) device through VLT nodes

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |                                                            |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Syntax</b>          | <code>lacp ungroup member-independent {vlt   port-channel}</code>                                                                                                                                                                                               |                                                            |
| <b>Parameters</b>      | <b>port-channel</b>                                                                                                                                                                                                                                             | Force all LACP port-channel members to become switchports. |
|                        | <b>vlt</b>                                                                                                                                                                                                                                                      | Force all VLT LACP members to become switchports.          |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                 |                                                            |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                   |                                                            |

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.12.0</b> | Added port-channel parameter on the S4810.                                                          |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>LACP on the VLT ports (on a VLT switch or access device), which are members of the virtual link trunk, is not brought up until the VLT domain is recognized on the access device.</p> <p>During BMP reload, the ToR device or the device connected to the VLT port-channel must reach the DHCP server with the boot and configuration images. During boot-up, only untagged DHCP requests are sent to the DHCP server to receive an offer. To ungroup the VLT and port-channel configurations, use the <code>no lacp ungroup member independent</code> command on a VLT port channel, depending on whether the port channel is VLT or non-VLT. The DHCP server must be configured to start in BMP mode. If switches are connected using LACP port-channels like the VLT peer and ToR, use the <code>port-channel</code> parameter on the ToR-side configuration to allow member ports of an ungrouped LACP port-channel to inherit VLAN membership of that port channel to ensure untagged packets that are sent by a VLT peer device reach the DHCP server located on the ToR.</p> |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example

```
Dell (conf)#lacp ungroup member-independent ?
port-channel LACP port-channel members become switchports
vlt All VLT LACP members become
switchports
```

# multicast peer-routing timeout

Configure the time for a VLT node to retain synced multicast routes or synced multicast outgoing interface (OIF) after a VLT peer node failure.

## C9000 Series

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>multicast peer-routing timeout value</code><br>To restore the default value, use the <code>no multicast peer-routing timeout</code> command.                                                                                                    |
| <b>Parameters</b>      | <b>value</b> Enter the timeout value in seconds. The range is from 1 to 1200. The default is 150.                                                                                                                                                     |
| <b>Command Modes</b>   | VLT DOMAIN (conf-vlt-domain)                                                                                                                                                                                                                          |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.2(0.2)</b> | Introduced on the Z9000, S4810, and S4820T.                                                         |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |

# peer-link port-channel

Configure the specified port channel as the chassis interconnect trunk between VLT peers in the domain.

## C9000 Series

|                        |                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>peer-link port-channel port-channel-number {peer-down-vlan vlan id}</code>                                                                                                                                                                                         |
| <b>Parameters</b>      | <b>port-channel-number</b> Enter the port-channel number that acts as the interconnect trunk.<br><b>peer-down-vlan vlan id</b> Enter the keyword <code>peer-down-vlan</code> then a VLAN ID to configure the VLAN that the VLT peer link uses when the VLT peer is down. |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                          |
| <b>Command Modes</b>   | VLT DOMAIN                                                                                                                                                                                                                                                               |

| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.12.0</b> | Added support for the <b>peer-down-vlan</b> parameter.                                              |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

#### Usage Information

To configure the VLAN from where the VLT peer forwards packets received over the VLTi from an adjacent VLT peer that is down, use the **peer-down-vlan** parameter. When a VLT peer with bare metal provisioning (BMP) is booting up, it sends untagged DHCP discover packets to its peer over the VLTi. To ensure that the DHCP discover packets are forwarded to the VLAN that has the DHCP server, use this configuration.

## peer-routing

Enable L3 VLT peer-routing. This command is applicable for both IPV6/ IPV4.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |

| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

#### Usage Information

After you configure a VLT domain on each peer switch and connect (cable) the two VLT peers on each side of the VLT interconnect, the system elects a primary and secondary VLT peer device. To configure the primary and secondary roles before the election process, use the `primary-priority` command. Enter a lower value on the primary peer and a higher value on the secondary peer.

If the primary peer fails, the secondary peer (with the higher priority) takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role (there is no preemption).

## show vlt brief

Displays summarized status information about VLT domains currently configured on the switch.

| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.8.0</b>  | Introduced on the S4810.  |

#### Usage Information

The version shown in the `show vlt brief` output command displays the VLT version number which is different from the Dell Networking OS version number. VLT version numbers are begin with odd numbers such as 3 or 5.

#### Example (Brief)

```
Dell(conf) #show vlt brief
VLT Domain Brief

Domain ID: 10
Role: Primary
Role Priority: 32768
ICL Link Status: Up
Heart Beat Status: Not Established
VLT Peer Status: Up
Version: 5 (1)
```

```
Local System MAC address: 00:01:e8:8b:14:3c
Remote System MAC address: 00:01:e8:8b:15:20
Remote Sytem Version: 5 (1)
Delay-Restore timer: 90 seconds
```

## show vlt backup-link

Displays information on the backup link operation.

| <b>Syntax</b>          | <code>show vlt backup-link</code>                                                                                                                              |
| <b>Default</b>         | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | EXEC                                                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.8.0</b>  | Introduced on the S4810.  |

#### Example

```
Dell_VLTpeer1# show vlt backup-link

VLT Backup Link

Destination: 10.11.200.18
Peer HeartBeat status: Up
HeartBeat Timer Interval: 1
HeartBeat Timeout: 3
UDP Port: 34998
HeartBeat Messages Sent: 1026
HeartBeat Messages Received: 1025
```

## show vlt counters

Displays the counter information.

### C9000 Series

|                   |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show vlt counters [arp  igmp-snoop   interface   mac   ndp]</code>                                 |
| <b>Parameters</b> |                                                                                                          |
| <b>arp</b>        | Enter the keyword <code>arp</code> to display the ARP counter information for the VLT.                   |
| <b>igmp-snoop</b> | Enter the keywords <code>igmp-snoop</code> to display the igmp-snooping counter information for the VLT. |

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <b>interface</b> | Enter the keyword <code>interface</code> to display the interface counter information for the VLT. |
| <b>mac</b>       | Enter the keyword <code>mac</code> to display the MAC address counter information for the VLT.     |
| <b>ndp</b>       | Enter the keyword <code>ndp</code> to display the VLT counter information for NDP.                 |

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |

**Usage Information** If you do not add a parameter such as `arp` or `mac`, the output displays all of the counters.

#### Example

```
Dell# show vlt counter
Total VLT counters

L2 Total MAC-Address Count :
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
ARP entries count :
```

#### Example (igmp-snoop)

```
Dell# show vlt counter igmp-snoop
Total IGMP VLT counters

IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 5
```

#### Example (igmp-snoop interface port-channel)

```
Dell#show vlt counter igmp-snoop interface port-channel 2
VLT Port-ID: 2 IGMP Counter

IGMP MRouter Vlans count : 0
IGMP Mcast Groups count : 5

Dell# show vlt counter igmp-snoop interface port-channel 100
VLT Port-ID: 100 IGMP Counter

IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 0
Ve
```

#### Example (NDP and Non-VLT ARP)

```
Dell#show vlt counters
Total VLT Counters

L2 Total MAC-Address Count: 2
Total Arp Entries Learnt : 0
Total Arp Entries Synced : 0
Total Non-VLT Arp entries Learnt: 0
```

```

Total Non-VLT Arp Entries Synced 0
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
Total VLT Ndp Entries Learnt : 2
Total VLT Ndp Entries Synced : 0
Total Non-VLT Ndp Entries Learnt : 0
Total Non-VLT Ndp Entries Synced : 0

```

## show vlt detail

Displays detailed status information about VLT port-channels currently configured on the switch.

### C9000 Series

**Syntax** `show vlt detail`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.8.0</b>  | Introduced on the S4810.  |

#### Example

```

Dell#show vlt detail
Local LAG Id Peer LAG Id Local Status Peer Status Active VLANs

10 10 UP UP 100, 200, 300, 400,

```

## show vlt inconsistency

Display run-time inconsistencies in the incoming interface (IIF) for spanned multicast routes.

### C9000 Series

**Syntax** `show vlt inconsistency ip mroute`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.2(0.2)</b> | Introduced on the Z9000, S4810, and S4820T.                                                         |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |

#### Example

```
Dell#show vlt inconsistency ip mroute
Spanned Multicast Routing IIF Inconsistency

Multicast Route LocalIIF PeerIIF

(22.22.22.200, 225.1.1.2) VLAN 5 VLAN 6
(*, 225.1.1.2) VLAN 15 te 0/5
Dell#
```

## show vlt mismatch

Display mismatches in VLT parameters.

### C9000 Series

**Syntax**            show vlt mismatch

**Command Modes**   EXEC

**Command History**   This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

Version

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.                                                            |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                                                         |
| <b>9.7(0.0)</b> | Introduced the support for Q-in-Q implementation over VLT on the S-Series and Z-Series.             |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.2)</b> | Introduced on the Z9000, S4810, and S4820T.                                                         |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |

#### Example

```
Dell#show vlt mismatch
Domain

Parameters Local Peer

Unit-ID 0 1
```

```

Vlan-config

Vlan-ID Local Mode Peer Mode

100 -- L3
Vlan IPV4 Multicast Status

Vlan-ID Local Status Peer Status

4094 Active Inactive
Dell#

```

**Example  
for Q-in-Q  
implementation  
over VLT**

```

Dell#show vlt mismatch
Domain

Parameters Local Peer

PB for stp Enabled Disabled

Vlan-type-config

Codes:: P - Primary, C - Community, I - Isolated, N - Normal vlan, M -
Vlan-stack

Vlan-ID Local Peer

100 N M

Port-type-config

Codes:: p - PVLAN Promiscuous port, h - PVLAN Host port, t - PVLAN Trunk
port,
 mt - Vlan-stack trunk port, mu - Vlan-stack access port, n -
Normal port

Vlt Lag Local Peer

128 mt mu

Vlan-stack protocol-type

Local Peer

0x4100 0x8100

VLT-VLAN config

Local Lag Peer Lag Local VLANs Peer VLANs

128 128 4094 100
Dell#

```

# show vlt private-vlan

Display the private VLAN (PVLAN) associated with the VLT LAG for VLT peer nodes.

## C9000 Series

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                             |

|                   | 9.9(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Introduced on the C9010.                    |
|                   | 9.5(0.1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Introduced on the Z9500.                    |
|                   | 9.4(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Introduced on the S6000.                    |
|                   | 9.3(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Introduced on the Z9000, S4810, and S4820T. |
| Usage Information | If you add an ICL or VLTi link as a member of a primary VLAN, the ICL becomes a part of the primary VLAN and its associated secondary VLANs, similar to the behavior for normal trunk ports. VLAN symmetry is not validated if you associate an ICL to a PVLAN. Similarly, if you dissociate an ICL from a PVLAN, although the PVLAN symmetry exists, ICL is removed from that PVLAN in such a case. The <b>ICL Status</b> field denotes the type of the VLAN port of the VLTi link configured in a PVLAN. |                                             |
| Example           | <pre>Dell#show vlt private-vlan vlan-id  Codes: C- Community, I - Isolated, V - Internally tagged, T - tagged, * - VLT Pvlan Primary      Secondary      ICL Status 10               20 (C)          V               30 (I)          V  40               50 (C)          T               60 (I)          T</pre>                                                                                                                                                                                           |                                             |

# show vlt role

Displays the VLT peer status, role of the local VLT switch, VLT system MAC address and system priority, and the MAC address and priority of the local VLT device.

|                 | 9.9(0.0)                                                                                                                                                       | Introduced on the C9010. |
|                 | 9.5(0.1)                                                                                                                                                       | Introduced on the Z9500. |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.8.0</b>  | Introduced on the S4810.  |

#### Example

```
Dell_VLTpeer1# show vlt role

VLT Role

VLT Role: Primary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:bc
Local System Role Priority: 32768

Dell_VLTpeer2# show vlt role

VLT Role

VLT Role: Secondary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:e6
Local System Role Priority: 32768
```

## show vlt statistics

Displays statistics on VLT operations.

### C9000 Series

| <b>Syntax</b>          | <code>show vlt statistics [arp   domain   igmp-snoop   mac   multicast   ndp]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |               |                                            |                  |                                           |                 |                                                 |                 |                                                              |                   |                                               |            |                                     |

| <b>9.9(0.0)</b>        | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                            |                  |                                           |                 |                                                 |                 |                                                              |                   |                                               |            |                                     |
| <b>9.5(0.1)</b>        | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                            |                  |                                           |                 |                                                 |                 |                                                              |                   |                                               |            |                                     |
| <b>9.2(0.2)</b>        | Added parameters <code>multicast</code> and <code>ndp</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |                                            |                  |                                           |                 |                                                 |                 |                                                              |                   |                                               |            |                                     |

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                                     |
| 9.0.0.0  | Introduced on the Z9000.                                     |
| 8.3.19.0 | Introduced on the S4820T.                                    |
| 8.3.12.0 | Added support in the output for ARP, MAC, and IGMP snooping. |
| 8.3.8.0  | Introduced on the S4810.                                     |

## Related Commands

[clear vlt statistics](#) — clears the statistics on VLT operations.

## Example

 **NOTE:** The following example shows the statistics for *all* of the VLT parameters. If you enter a specific keyword, such as *mac*, only the statistics for that VLT parameter displays.

```

| <b>Usage Information</b> | <p>When you create a VLT domain on a switch, Dell Networking OS automatically creates a VLT-system MAC address used for internal system operations.</p> <p>To reconfigure the default MAC address for the domain by entering a new MAC address in the format nn:nn:nn:nn:nn:nn, use the <code>system-mac</code> command.</p> <p>You must also reconfigure the same MAC address on the VLT peer switch.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |                                                  |         |             |                 |                          |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                |                          |

## unit-id

Explicitly configure the default unit ID of a VLT peer switch.

### C9000 Series

|                   |                                                                                                                                                                                    |                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>unit-id [0   1]</code>                                                                                                                                                       |                                                                                                                |
| <b>Parameters</b> | <b>0   1</b>                                                                                                                                                                       | Configure the default unit ID of a VLT peer switch. Enter 0 for the first peer or enter 1 for the second peer. |
| <b>Defaults</b>   | Automatically assigned based on the MAC address of each VLT peer. The peer with the lower MAC address is assigned unit 0; the peer with the higher MAC address is assigned unit 1. |                                                                                                                |

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

**Usage Information** When you create a VLT domain on a switch, Dell Networking OS automatically assigns a unique unit ID (0 or 1) to each peer switch. The unit IDs are used for internal system operations. Use the `unit-id` command to explicitly configure the unit ID of a VLT peer. Configure a different unit ID (0 or 1) on each peer switch.

To minimize the time required for the VLT system to determine the unit ID assigned to each peer switch when one peer reboots, use this command.

## vlt domain

Enable VLT on a switch, configure a VLT domain, and enter VLT-domain configuration mode.

### C9000 Series

**Syntax** `vlt domain domain-id`

**Parameters** ***domain-id*** Enter the Domain ID number. Configure the same domain ID on the peer switch. The range of domain IDs is from 1 to 1000.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>  | Introduced on the S4810.                                                                            |

|                          |                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The VLT domain ID must be the same between the two VLT devices. If the domain ID is not the same, a syslog message is generated and VLT does not launch. |
| <b>Related Commands</b>  | <a href="#">show vlt</a> — uses the <code>show vlt brief</code> command to display the delay-restore value.                                              |

## vlt-peer-lag port-channel

Associate the port channel to the corresponding port channel in the VLT peer for the VLT connection to an attached device.

## VLT Proxy Gateway

The Virtual link trucking (VLT) proxy gateway feature allows a VLT domain to locally terminate and route L3 packets that are destined to a L3 end point in another VLT domain. Enable the VLT proxy gateway using the link layer discover protocol (LLDP) method or the static configuration. For more information, refer to *Dell Networking OS Command Line Reference Guide*.

### peer-domain-link port-channel exclude-vlan

Configure the VLT port channel, which is connected to remote VLT domain for Proxy Gateway and configure the VLANs that needs to be excluded from VLT Proxy Gateway.

|                          | <b>9.5(0.1)</b>                                                                                                                                                                                                                                                                           | Introduced on the Z9500.                           |
|                          | <b>9.4(0.0)</b>                                                                                                                                                                                                                                                                           | Introduced on the S4810, S4820T, S6000, and Z9000. |
| <b>Usage Information</b> | <p>The configuration is cached and sent to LLDP only in one of the following conditions:</p> <ol style="list-style-type: none"> <li>1) The port-channel connecting the two VLT domains, across DC, must be a VLT LAG</li> <li>2) The protocol lldp command is globally enabled</li> </ol> |                                                    |

3) The proxy-gateway LLDP configuration is applied.

#### Example

```
Dell(conf)#vlt-domain 1
Dell(conf-vlt-domain)#proxy-gateway lldp
```

## proxy-gateway peer-timeout

Enable the VLT node to timeout the transmission of peer's mac address when the VLT peer is down.

### C9000 Series

**Syntax** [no] peer-timeout *value*

**Parameters** *value* Enter the timeout value in seconds. The range is from 1 to 65535.

**Command Modes** VLT DOMAIN PROXY GW LLDP

#### Command History

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.7(0.0) | Introduced on the S6000-ON.                                    |
| 9.7(0.0) | Removed the default value on the S-Series and Z-Series.        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch. |

#### Usage Information

In a square VLT topology with a single link connecting to the remote peers, If a VLT peer goes down, the local VLT node must be prompted to stop transmitting it's peer's MAC address. You can configure the `peer-timeout value` command to stop the local VLT node from transmitting the peer MAC address within the configured peer timeout value. The default timeout value is infinity. You must enable the `vlt-peer-mac transmit` to configure a peer time out value.

#### Example

```
Dell(conf-vlt-domain-proxy-gw-lldp)# peer-timeout 5
```

## proxy-gateway static

Enable the proxy-gateway feature using static configurations.

### C9000 Series

**Syntax** [no] proxy-gateway static

**Command Modes** VLT DOMAIN

| Version  | Description                                    |
|----------|------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                       |
| 9.7(0.0) | Introduced on the S6000-ON.                    |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, Z9000. |

#### Usage Information

When proxy-gateway static configuration is added, the setting is saved in the Layer 2 module. When you remove the static proxy gateway configuration, each `proxy-gateway static mac` configured is deleted from the Layer 2 module.

## Example

```
Dell(conf)#vlt-domain 1
Dell(conf-vlt-domain)#proxy-gateway static
```

## remote-mac-address exclude-vlan

Configure the proxy-gateway static entry and exclude a VLAN or a range of VLANs from proxy routing.

### C9000 Series

#### Syntax

```
[no] remote-mac-address mac-address [exclude-vlan vlan-range]
```

#### Parameters

|                           |                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote-mac-address</b> | Specify the mac-addresses of the VLT peers which are in the remote VLT Domain.                                                                                                                                                                                                                              |
| <b>mac-address</b>        | Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                                           |
| <b>vlan-range</b>         | Enter the VLAN IDs in which proxy gateway is not needed. The VLANs are excluded from doing proxy gateway. The value can be a single VLAN ID or comma-separated, VLAN IDs or a range of VLAN IDs or a combination. For example:<br><br>Comma-separated: 3, 4, 6<br>Range: 5-10<br>Combination: 3, 4, 5-10, 8 |

**Command Modes** VLT DOMAIN PROXY GW STATIC

#### Command History

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.7(0.1)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.1)</b> | Introduced on the S4048-ON.                        |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                        |
| <b>9.4(0.0)</b> | Introduced on the S4810, S4820T, S6000, and Z9000. |

#### Usage Information

You can configure the MAC address, of a VLT peer in remote VLT Domain, to be associated with the static VLT proxy gateway and exclude a VLAN or a range of VLANs from proxy routing..

#### Example

```
Dell(conf)#vlt-domain 1
Dell(conf-vlt-domain)#proxy-gateway static
Dell(conf-vlt-domain-proxy-gw-static)#remote-mac-address
00:01:e8:06:95:ac exclude-vlan 3
```

## show vlt-proxy-gateway

Display the VLT proxy gateway configuration.

### C9000 Series

#### Syntax

```
show vlt-proxy-gateway [info] {lldp | static}
```

#### Parameters

|               |                                                                  |
|---------------|------------------------------------------------------------------|
| <b>lldp</b>   | Display details about the LLDP VLT proxy gateway configuration   |
| <b>static</b> | Display details about the static VLT proxy gateway configuration |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                           |
| 9.7(0.1) | Introduced on the S3048-ON.                        |
| 9.7(0.1) | Introduced on the S4048-ON.                        |
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information**

At any point of time the proxy-gateway feature may go operationally down for the following reasons,

- 1) LLDP globally disabled
- 2) LLDP disabled per port
- 3) VLT port-channel is down
- 4) LLDP neighbor down

So, the proxy-gateway feature could be operationally down though properly configured and this will be reported in the “show command”.

When more than one VLT port-channel terminates on the same TOR, output of the `show vlt proxy-gateway info lldp` command may show the port-channel id incorrectly.

**Example**

```
Dell#show vlt proxy-gateway
VLT Proxy Gateway Brief

Config Mode: LLDP
Global LLDP Config Status: Enabled
peer-mac-transmit Status: Disabled

Dell#show vlt proxy-gateway info static
Mac Address Exclude Vlan

00:01:e8:8a:e8:f7 3,7-8
00:01:e8:8b:1c:c0 3,7-8

Dell#show vlt proxy-gateway info lldp
LagId Mac Address Exclude Vlan

Po 55 00:01:e8:8a:e8:f7 3,7-8 << Macs learnt via port-channel 55
Po 55 00:01:e8:8b:1c:c0 3,7-8
```

## vlt-peer-mac transmit

Enable the device to transmit peer MAC address along with its own mac-address (in LLDP TLV packets) to the remote VLT Domain.

### C9000 Series

**Syntax** [no] vlt-peer-mac transmit

**Command Modes** VLT DOMAIN PROXY GW LLDP

**Command History**

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

| Version   | Description                                        |
|-----------|----------------------------------------------------|
| 9.7(0.1)  | Introduced on the S3048-ON.                        |
| 9.7(0.1)  | Introduced on the S4048-ON.                        |
| 9.7(0.0)  | Introduced on the S6000-ON.                        |
| 9.5.(0.1) | Introduced on the Z9500                            |
| 9.4(0.0)  | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage  
Information**

This command enables the device to transmit its VLT peer's MAC address along with its own MAC address to the remote VLT domain. By default, a node sends only its own MAC address to the remote VLT domain. This configuration is applicable only for a LLDP proxy gateway.

**Example**

```
Dell(conf-vlt-domain-proxy-gw-lldp)# vlt-peer-mac transmit
```

# Virtual Router Redundancy Protocol (VRRP)

Virtual router redundancy protocol (VRRP) is supported by the Dell Networking operating system.

## IPv4 VRRP Commands

The following are IPv4 VRRP commands.

### advertise-interval

Set the time interval between VRRP advertisements.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                                                           |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | advertise-interval {seconds   centisecs centisecs }                                                                                                            |                                                                                                                                                                           |
|                        | To return to the default settings, use the <code>no advertise-interval</code> command.                                                                         |                                                                                                                                                                           |
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                 | Enter a number of seconds. The range is from 1 to 255. The default is <b>1 second</b> .                                                                                   |
|                        | <b>centisecs</b>                                                                                                                                               | Enter the keyword <code>centisecs</code> followed by the number of centisecs in multiple of 25 centisecs. The range is 25 to 4075 centisecs in multiples of 25 centisecs. |
|                        | <b>centisecs</b>                                                                                                                                               |                                                                                                                                                                           |
| <b>Defaults</b>        | 1 second or 100 centisecs.                                                                                                                                     |                                                                                                                                                                           |
| <b>Command Modes</b>   | INTERFACE-VRRP                                                                                                                                                 |                                                                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                           |
|                        | The following is a list of the Dell Networking OS version history for this command.                                                                            |                                                                                                                                                                           |

| Version         | Description                                                              |
|-----------------|--------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                 |
| <b>9.5(0.1)</b> | Added support for centisecs on the Z9500.                                |
| <b>9.5(0.0)</b> | Added support for centisecs on the Z9000, S6000, S4820T, S4810, and MXL. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                 |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                              |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                              |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                                              |

**Usage Information** Dell Networking recommends keeping the default setting for this command. If you do change the time interval between VRRP advertisements on one router, change it on all routers.

## authentication-type

Enable authentication of VRRP data exchanges.

### C9000 Series

|                          |                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>authentication-type simple [encryption-type] password</code><br>To delete an authentication type and password, use the <code>no authentication-type</code> command. |                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>        | <b>simple</b>                                                                                                                                                             | Enter the keyword <code>simple</code> to specify simple authentication.                                                                                                                                                                                                                            |

| <b>Usage Information</b> | The given password is encrypted by the system and the <code>show config</code> displays an encrypted text string for any of the encrypted typed used.                     |                                                                                                                                                                                                                                                                                                    |

## clear counters vrrp

Clear the counters maintained on VRRP operations.

### C9000 Series

|                   |                                                                  |                                                                               |
|-------------------|------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>clear counters vrrp [vrrp-id] [ipv6] [vrf vrf-name]</code> |                                                                               |
| <b>Parameters</b> | <b>vrrp-id</b>                                                   | (OPTIONAL) Enter the number of the VRRP group ID. The range is from 1 to 255. |

|                            |                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6</b>                | (OPTIONAL) Enter the keyword <code>ipv6</code> to clear counters from the IPv6 VRRP group.                                                                         |
| <b>vrf <i>vrf-name</i></b> | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear counters that are maintained on the VRRP operations corresponding to that VRF. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                              |
|------------------|------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                 |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.              |
| <b>9.4.(0.0)</b> | Added support for VRF.                   |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>   | Introduced on the S6000.                 |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>   | Introduced on the S4810.                 |
| <b>7.6.1.0</b>   | Introduced on the S-Series.              |
| <b>7.5.1.0</b>   | Introduced on the C-Series.              |
| <b>6.2.1.1</b>   | Introduced on the E-Series.              |

#### Example

```
Dell#clear counters vrrp vrf indus
Clear "show vrrp" counters of all vrrp groups on all interfaces in VRF
indus [confirm] yes
```

## debug vrrp

Enable debugging of VRRP.

## C9000 Series

**Syntax** `debug vrrp interface [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}`

To disable debugging, use the `no debug vrrp interface [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}` command.

**Parameters**

***interface*** Enter the following keywords and slot/port or number information

- For Port Channel interface types, enter the keywords `port-channel` then the number. The range is from 1 to 128.
- For a 40-Gigabit Ethernet interface, enter the keyword `FortyGigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a VLAN interface, enter the keyword `vlan` then the VLAN ID. The VLAN ID range is from 1 to 4094.

|                               |                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------|
| <b><code>vrrp-id</code></b>   | (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.                             |
| <b><code>all</code></b>       | Enter the keyword <code>all</code> to enable debugging of all VRRP groups.                |
| <b><code>bfd</code></b>       | Enter the keyword <code>bfd</code> to enable debugging of VRRP BFD interactions.          |
| <b><code>database</code></b>  | Enter the keyword <code>database</code> to enable debugging of configuration changes.     |
| <b><code>interface</code></b> | Enter the keyword <code>interface</code> to enable debugging of interface state changes.. |
| <b><code>ipv6</code></b>      | Enter the keyword <code>ipv6</code> to enable debugging for IPv6.                         |
| <b><code>packets</code></b>   | Enter the keyword <code>packets</code> to enable debugging of VRRP control packets.       |
| <b><code>state</code></b>     | Enter the keyword <code>state</code> to enable debugging of VRRP state changes.           |
| <b><code>timer</code></b>     | Enter the keyword <code>timer</code> to enable debugging of the VRRP timer.               |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.              |
| <b>6.2.1.1</b>  | Introduced on the E-Series.              |

**Usage Information** If no options are specified, debug is active on all interfaces and all VRRP groups.

## description

Configure a short text string describing the VRRP group.

## C9000 Series

**Syntax** `description text`  
To delete a VRRP group description, use the `no description` command.

**Parameters** **`text`** Enter a text string up to 80 characters long.

**Defaults** Not enabled.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## disable

Disable a VRRP group.

### C9000 Series

**Syntax** `disable`

To re-enable a disabled VRRP group, use the `no disable` command.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** To enable VRRP traffic, assign an IP address to the VRRP group using the `virtual-address` command and enter `no disable`.

**Related Commands** [virtual-address](#) — specifies the IP address of the virtual router.

# hold-time

Specify a delay (in seconds) before a switch becomes the MASTER virtual router. By delaying the initialization of the VRRP MASTER, the new switch can stabilize its routing tables.

## C9000 Series

| Syntax            | <code>hold-time {seconds   centisecs centisecs}</code><br>To return to the default value, use the <code>no hold-time</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                |         |             |                 |                          |                 |                                           |                 |                                                                          |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|-------------------------------------------|-----------------|--------------------------------------------------------------------------|-----------------|--------------------------|----------------|--------------------------|-----------------|---------------------------|-----------------|--------------------------|----------------|--------------------------|----------------|-----------------------------|----------------|-----------------------------|----------------|-----------------------------|
| Parameters        | <b>seconds</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Enter the number of seconds. The range is from 0 to 65535. The default is <b>zero (0) seconds</b> .                                                            |         |             |                 |                          |                 |                                           |                 |                                                                          |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

# preempt

To preempt or become the MASTER router, permit a BACKUP router with a higher priority value.

## C9000 Series

|          |                                                                                          |
|----------|------------------------------------------------------------------------------------------|
| Syntax   | <code>preempt</code><br>To prohibit preemption, use the <code>no preempt</code> command. |
| Defaults | Enabled (that is, a BACKUP router can preempt the MASTER router).                        |

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## priority

Specify a VRRP priority value for the VRRP group. The VRRP protocol uses this value during the MASTER election process.

### C9000 Series

**Syntax** `priority priority`

To return to the default value, use the `no priority` command.

**Parameters** ***priority*** Enter a number as the priority. Enter 255 only if the router's virtual address is the same as the interface's primary IP address (that is, the router is the OWNER). The range is from 1 to 255. The default is **100**.

**Defaults** **100**

| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual address with same IP address as the interface's primary IP address and change the priority of the VRRP group to 255.

If you set the `priority` command to 255 and the `virtual-address` is not equal to the interface's primary IP address, an error message appears.

## show config

View the non-default VRRP configuration.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                         |  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|--|
| <b>Syntax</b>          | <code>show config [verbose]</code>                                                                                                                             |                                                                                                                         |  |
| <b>Parameters</b>      | <b>verbose</b>                                                                                                                                                 | (OPTIONAL) Enter the keyword <code>verbose</code> to view all VRRP group configuration information, including defaults. |  |
| <b>Command Modes</b>   | VRRP                                                                                                                                                           |                                                                                                                         |  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                         |  |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Example**

```
Dell(conf-if-vrid-4)#show con
vrrp-group 4
 virtual-address 119.192.182.124
!
```

## show vrrp

View the VRRP groups that are active. If no VRRP groups are active, the Dell Networking OS returns `No Active VRRP group`.

### C9000 Series

|                   |                                                                            |                                                                                                                                                                                                                                                         |  |
|-------------------|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Syntax</b>     | <code>show vrrp [vrrp-id] [interface   brief   ipv6   vrf vrf-name]</code> |                                                                                                                                                                                                                                                         |  |
| <b>Parameters</b> | <b>vrrp-id</b>                                                             | (OPTIONAL) Enter the Virtual Router Identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                  |  |
|                   | <b>interface</b>                                                           | OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For Port Channel interface types, enter the keywords <code>port-channel</code> then the number. The range is from 1 to 128.</li></ul> |  |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then the VLAN ID. The VLAN ID range is from 1 to 4094.

|                            |                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b>               | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                               |
| <b>ipv6</b>                | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                               |
| <b>vrf <i>vrf-name</i></b> | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view active VRRP groups corresponding to that VRF. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                              |
|------------------|------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                 |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.              |
| <b>9.4.(0.0)</b> | Added support for VRF.                   |
| <b>9.0.2.0</b>   | Introduced on the S6000.                 |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                 |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>   | Introduced on the S4810.                 |
| <b>7.6.1.0</b>   | Introduced on the S-Series.              |
| <b>7.5.1.0</b>   | Introduced on the C-Series.              |
| <b>6.2.1.1</b>   | Introduced on the E-Series.              |

**Usage Information** The following describes the `show vrrp brief` command shown in the following example.

| Item               | Description                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>   | Lists the interface type, slot and port on which the VRRP group is configured.                                                                                                                                                                                                                                       |
| <b>Grp</b>         | Displays the VRRP group ID.                                                                                                                                                                                                                                                                                          |
| <b>Pri</b>         | Displays the priority value assigned to the interface. If the <code>track</code> command is configured to track that interface and the interface is disabled, the cost is subtracted from the priority value assigned to the interface.                                                                              |
| <b>Pre</b>         | States whether preempt is enabled on the interface. <ul style="list-style-type: none"> <li>• Y = Preempt is enabled.</li> <li>• N = Preempt is not enabled.</li> </ul>                                                                                                                                               |
| <b>State</b>       | Displays the operational state of the interface by using one of the following: <ul style="list-style-type: none"> <li>• NA/IF (the interface is not available).</li> <li>• MASTER (the interface associated with the MASTER router).</li> <li>• BACKUP (the interface associated with the BACKUP router).</li> </ul> |
| <b>Master addr</b> | Displays the IP address of the MASTER router.                                                                                                                                                                                                                                                                        |

| Item                   | Description                                                                          |
|------------------------|--------------------------------------------------------------------------------------|
| <b>Virtual addr(s)</b> | Displays the virtual IP addresses of the VRRP routers associated with the interface. |

## Usage Information

The following describes the `show vrrp` command shown in the following example.

| Field                             | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TenGigabitEthernet 12/3...</b> | Displays the Interface, the VRRP group ID, and the network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network address.                                                                                                                                                                                           |
| <b>State: master...</b>           | Displays the interface's state: <ul style="list-style-type: none"> <li>• Na/If (not available)</li> <li>• master (MASTER virtual router)</li> <li>• backup (BACKUP virtual router)</li> </ul> the interface's priority and the IP address of the MASTER.                                                                                            |
| <b>Hold Down:...</b>              | This line displays additional VRRP configuration information: <ul style="list-style-type: none"> <li>• Hold Down displays the hold down timer interval in seconds.</li> <li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li> <li>• AdvInt displays the Advertise Interval in seconds.</li> </ul>       |
| <b>Adv rcvd:...</b>               | This line displays counters for the following: <ul style="list-style-type: none"> <li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li> <li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li> <li>• Gratuitous ARP sent displays the number of gratuitous ARPs sent.</li> </ul> |
| <b>Virtual MAC address</b>        | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                                 |
| <b>Virtual IP address</b>         | Displays the virtual IP address of the VRRP router to which the interface is connected.                                                                                                                                                                                                                                                             |
| <b>Authentication:...</b>         | States whether authentication is configured for the VRRP group. If it is, the authentication type and the password are listed.                                                                                                                                                                                                                      |
| <b>Tracking states..</b>          | This line is displayed if the <code>track</code> command is configured on an interface. Below this line, the following information on the tracked interface is displayed: <ul style="list-style-type: none"> <li>• Dn or Up states whether the interface is down or up.</li> <li>• the interface type slot/port information.</li> </ul>             |

## Example

```
Dell>show vrrp

2.1.1.20
Authentication:
type: simple
```

```
Dell#show vrrp vrf indus brief

Interface Group Pri Pre State Master addr Virtual addr(s) Description

Te 1/20 IPv4 10 200 Y Master 2.1.1.1 2.1.1.20
Dell#
```

## version

Set VRRP protocol version for IPv4 group.

## C9000 Series

#### Syntax

```
version {2 | 3 | both}
```

To return to the default setting, use the `no version` command.

|                   |             |                                                                                                                     |
|-------------------|-------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>2</b>    | Enter the 2 parameter to specify VRRP version 2 as defined by RFC 3768, <i>Virtual Router Redundancy Protocol</i> . |
|                   | <b>3</b>    | Enter the 2 parameter to specify VRRP version 3 as defined in RFC 5798, <i>Virtual Router Redundancy</i> .          |
|                   | <b>both</b> | Enter the both keyword for in-service migration from VRRP version 2 to VRRP version 3.                              |

**Defaults** 2

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                             |
|-----------------|---------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                |
| <b>9.5(0.0)</b> | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information** You can use the version both command to migrate from VRRPv2 to VRRPv3. When you set the VRRP protocol version to both, the switch sends only VRRPv3 advertisements but can receive either VRRPv2 or VRRPv3 packets. To migrate an IPv4 VRRP group from VRRPv2 to VRRPv3:

1. Set the switches with the lowest priority to “both”.
2. Set the switch with the highest priority to version to 3.
3. Set all the switches from both to version 3.

 **NOTE:** Do not run VRRP version 2 and version 3 in the same group for an extended period of time.

#### Example

```
Dell(conf-if-te-0/0-vrid-100)#version ?
2 VRRPv2
3 VRRPv3
both Interoperable, send VRRPv3 receive both

Dell(conf-if-te-0/0-vrid-100)#version 3
```

## virtual-address

Configure up to 12 IP addresses of virtual routers in the VRRP group. To start sending VRRP packets, set at least one virtual address for the VRRP group.

### C9000 Series

**Syntax** `virtual-address ip-address1 [... ip-address12]`

To delete one or more virtual IP addresses, use the `no virtual-address ip-address1 [... ip-address12]` command.

**Parameters**

***ip-address1*** Enter an IP address of the virtual router in dotted decimal format. The IP address must be on the same subnet as the interface’s primary IP address.

***... ip-address12*** (OPTIONAL) Enter up to 11 additional IP addresses of virtual routers in dotted decimal format. Separate the IP addresses with a space. The IP addresses must be on the same subnet as the interface’s primary IP address.

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                 |
| <b>Command Modes</b>   | VRRP                                                                                                                                                                                                                                                            |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version         | Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                    |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                    |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                 |
| <b>7.4.1.0</b>  | Introduced support for telnetting to the VRRP group IP address assigned using this command. |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                                                                 |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>The VRRP group only becomes active and sends VRRP packets when a virtual IP address is configured. When you delete the virtual address, the VRRP group stops sending VRRP packets.</p> <p>A system message appears after you enter or delete the <code>virtual-address</code> command.</p> <p>To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual address with the same IP address as the interface's primary IP address and change the priority of the VRRP group to 255.</p> <p>You can ping the virtual addresses configured in all VRRP groups.</p> |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## vrrp delay minimum

Set the delay time for VRRP initialization after an interface comes up.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>vrrp delay minimum <i>seconds</i></code>                                                                                                                                                                                                                  |
| <b>Parameters</b>      | <p><b><i>seconds</i></b> Enter the number of seconds for the delay for VRRP initialization after an interface becomes operational. The range is from 0 to 900 (0 indicates no delay).</p>                                                                       |
| <b>Defaults</b>        | 0                                                                                                                                                                                                                                                               |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                                       |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>9.0.0.0</b>  | Introduced on the Z9000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |

| Version | Description              |
|---------|--------------------------|
| 8.3.8.0 | Introduced on the S4810. |

### Usage Information

This command applies to a single interface. When used with the `vrrp delay reload` CLI, the later timer rules the VRRP enabling. For example, if `vrrp delay reload` is 600 and the `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

### Related Command

[vrrp delay reload](#) — sets the delay time for VRRP initialization after a system reboot.

## vrrp delay reload

Set the delay time for VRRP initialization after a system reboot.

## C9000 Series

**Syntax** `vrrp delay reload seconds`

**Parameters** ***seconds*** Enter the number of seconds for the delay. The range is from 0 to 900 (0 indicates no delay).

**Defaults** 0

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

### Usage Information

This command applies to all the VRRP configured interfaces on a system. When used with the `vrrp delay minimum` CLI, the later timer rules the VRRP enabling. For example, if `vrrp delay reload` is 600 and the `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

Save the configuration and reload the system for the delay timers to take effect.

### Related Command

[vrrp delay minimum](#) — sets the delay time for VRRP initialization after a line card reboot.

# vrrp-group

Assign a VRRP ID to an interface. You can configure up to 255 VRRP groups per interface.

## C9000 Series

| Syntax            | vrrp-group vrrp-id                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                             |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

Monitor an interface and lower the priority value of the VRRP group on that interface if it is disabled.

## C9000 Series

|            |                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | <code>track interface [priority-cost cost]</code><br>To disable monitoring, use the <code>no track interface</code> command. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Parameters | <b><i>interface</i></b>                                                                                                      | OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> followed by the slot/port information.</li><li>For a Loopback interface, enter the keyword <code>loopback</code> followed by a number from 0 to 16383.</li><li>For a Port Channel interface, enter the keywords <code>port-channel</code> followed by the number. The range of port-channel IDs is 1 to 128.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> followed by the slot/port information.</li></ul> |

- For SONET interfaces, enter the keyword `sonet` followed by the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `FortyGigE` followed by the slot/port information.
- For a tunnel interface, enter the keyword `tunnel` followed by the slot/port information.
- For a VLAN interface, enter the keyword `vlan` followed by the VLAN ID. The VLAN ID range is from 1 to 4094.
- For a port extender (PE) Gigabit Ethernet interface, enter the keyword `peGigE` followed by the *pe-id* /stack-unit *unit number* / *port-ID* number.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

#### ***priority-cost***

(OPTIONAL) Enter a number as the amount to be subtracted from the priority value. The range is 1 to 254. The default is **10**.

**Defaults** priority cost = **10**

**Command Modes** VRRP

#### **Command History**

#### **Version**

#### **Description**

**9.13.0.1P1**

Introduced `peTenGigE` interface support on the C9010.

**9.9(0.0)**

Introduced on the C9010.

**9.8(0.0)**

Introduced on the S3048-ON and S4048-ON.

**9.7(0.0)**

Introduced on the S6000-ON.

**9.2.(1.0)**

Introduced on the Z9500.

**9.0.2.0**

Introduced on the S6000.

**7.6.1.0**

Introduced on the S-Series (S50 only).

**7.5.1.0**

Introduced on the C-Series.

**6.2.1.1**

Introduced on the E-Series.

#### **Usage Information**

If the interface is disabled, the cost value is subtracted from the priority value and forces a new MASTER election if the priority value is lower than the priority value in the BACKUP virtual routers.

## IPv6 VRRP Commands

The following are IPv6 VRRP commands.

- `clear counters vrrp ipv6`
- `debug vrrp ipv6`
- `show vrrp ipv6`
- `vrrp-ipv6-group`

The following commands apply to IPv4 and IPv6:

- `advertise-interval`
- `clear counters vrrp ipv6`
- `description`
- `disable`
- `hold-time`
- `preempt`
- `priority`
- `show config`
- `virtual-address`

# clear counters vrrp ipv6

Clear the counters recorded for IPv6 VRRP groups.

|                 |                                                                                                                                                                |                                                                                                                                         |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Syntax          | clear counters vrrp ipv6 [vrid   vrf instance]                                                                                                                 |                                                                                                                                         |
| Parameters      | vrid                                                                                                                                                           | (OPTIONAL) Enter the number of an IPv6 VRRP group. The range is from 1 to 255.                                                          |
|                 | vrf instance                                                                                                                                                   | (OPTIONAL) Enter the name of a VRF instance (32 characters maximum) to clear the counters of all IPv6 VRRP groups in the specified VRF. |
| Command Modes   | EXEC Privilege                                                                                                                                                 |                                                                                                                                         |
| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                         |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.                                                                                                      |
| 9.2.(1.0) | Introduced on the Z9500.                                                                                                      |
| 8.3.19.0  | Introduced on the S4820T.                                                                                                     |
| 8.3.10.0  | Introduced on the S4810.                                                                                                      |
| 8.4.1.0   | Introduced on E-Series ExaScale, C-Series, and S-Series. Support was added for IPv6 VRRP groups in non-default VRF instances. |
| 8.3.2.0   | Introduced on the E-Series TeraScale.                                                                                         |

# debug vrrp ipv6

Enable debugging of VRRP.

|              |                                                                                |
|--------------|--------------------------------------------------------------------------------|
| <b>state</b> | Enter the keyword <code>state</code> to enable debugging of VRRP state changes |
| <b>timer</b> | Enter the keyword <code>timer</code> to enable debugging of the VRRP timer.    |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                      |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.                                                                                      |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                                                                                   |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                     |
| <b>8.3.10.0</b> | Introduced on the S4810.                                                                                                      |
| <b>8.4.1.0</b>  | Introduced on E-Series ExaScale, C-Series, and S-Series. Support was added for IPv6 VRRP groups in non-default VRF instances. |
| <b>8.3.2.0</b>  | Introduced on the E-Series TeraScale.                                                                                         |

**Usage Information** If no options are specified, debug is active on all interfaces and all VRRP groups.

## show vrrp ipv6

View the IPv6 VRRP groups that are active. If no VRRP groups are active, the Dell Networking OS returns `No Active VRRP group`.

### C9000 Series

**Syntax** `show vrrp ipv6 [vrid] [interface] [brief] [vrf vrf-name]`

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrid</b>         | (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>interface</b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then the VLAN ID. The VLAN ID range is from 1 to 4094.</li> </ul> |
| <b>brief</b>        | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to view IPv6 VRRP groups corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                           |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON.           |
| 9.7(0.0) | Introduced on the S6000-ON. Added support for VRF. |
| 9.2(1.0) | Introduced on the Z9500.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.10.0 | Introduced on the S4810.                           |
| 8.3.2.0  | Introduced on the E-Series TeraScale.              |

#### Usage Information

The following describes the `show vrrp ipv6` command shown in the following example.

| Line                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Beginning with</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>GigabitEthernet..</b>   | Displays the Interface, the VRRP group ID, and the network address. If the interface is no sending VRRP packets, 0.0.0.0 appears as the network address.                                                                                                                                                                                                                                                                                                                                                  |
| <b>VRF</b>                 | VRF instance to which the interface (on which the VRRP group is configured) belongs.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>State: master...</b>    | Displays the interface's state: <ul style="list-style-type: none"><li>• Na/If (not available).</li><li>• master (MASTER virtual router).</li><li>• backup (BACKUP virtual router).</li></ul> the interface's priority and the IP address of the MASTER.                                                                                                                                                                                                                                                   |
| <b>Hold Down:...</b>       | This line displays additional VRRP configuration information: <ul style="list-style-type: none"><li>• Hold Down displays the hold down timer interval in seconds.</li><li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li><li>• AdvInt displays the Advertise Interval in seconds.</li></ul>                                                                                                                                                                 |
| <b>Adv rcvd:...</b>        | This line displays counters for the following: <ul style="list-style-type: none"><li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li><li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li><li>• Bad pkts rcvd displays the number of invalid packets received on the interface.</li></ul>                                                                                                                                            |
| <b>Virtual MAC address</b> | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Virtual IP address</b>  | Displays the virtual IP address of the VRRP router to which the interface is connected.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Tracking states...</b>  | Displays information on the tracked interfaces or objects configured for a VRRP group ( <code>track</code> command), including: <ul style="list-style-type: none"><li>• UP or DOWN state of the tracked interface or object (Up or Dn).</li><li>• Interface type and slot/port or object number, description, and time since the last change in the state of the tracked object.</li><li>• Cost subtracted from the VRRP group priority if the state of the tracked interface/object goes DOWN.</li></ul> |

#### Example

```
Dell#show vrrp ipv6

TenGigabitEthernet 5/6, IPv6 VRID: 255, Version: 3, Net:
fe80::201:e8ff:fe7a:6bb9
VRF: 0 default-vrf
```

```
State: Master, Priority: 101, Master: fe80::201:e8ff:fe7a:6bb9 (local)
Hold Down: 0 centisec, Preempt: TRUE, AdvInt: 100 centisec
Accept Mode: FALSE, Master AdvInt: 100 centisec
Adv rcvd: 0, Bad pkts rcvd: 0, Adv sent: 64
Virtual MAC address:
 00:00:5e:00:02:ff
Virtual IP address:
 1::255 fe80::255
```

## vrrp-ipv6-group

Assign an interface to a VRRP group.

### C9000 Series

**Syntax** `vrrp-ipv6-group vrid`

**Parameters** ***vrid*** Enter the virtual-router ID number of the VRRP group. The VRID range is from 1 to 255.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                                 |
| <b>9.2.(1.0)</b> | Introduced on the Z9500.                                                                                 |
| <b>8.4.2.1</b>   | The range of valid VRID values on the E-Series when VRF microcode is loaded in CAM changed from 1 to 15. |
| <b>8.4.1.0</b>   | Introduced on the E-Series ExaScale, C-Series, and S-Series.                                             |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                                |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                                                                 |
| <b>8.3.2.0</b>   | Introduced on the E-Series TeraScale.                                                                    |

**Usage Information** The VRRP group only becomes active and sends VRRP packets when a link-local virtual IP address is configured. When you delete the virtual address, the VRRP group stops sending VRRP packets.

 **NOTE:** Configure the same VRID on neighboring routers (Dell Networking or non-Dell Networking) in the same VRRP group in order for all routers to interoperate.

**Related Commands** [virtual-address](#) — assigns up to 12 virtual IP addresses per VRRP group.

# Virtual Routing and Forwarding (VRF)

Virtual Routing and Forwarding (VRF) allows multiple instances of a routing table to co-exist on the same router at the same time.

|                          | <b>9.7(0.0)</b>                                                                                                                                                                                                                                                                                | Introduced on the S6000-ON.                                                                                                         |
|                          | <b>9.4(0.0)</b>                                                                                                                                                                                                                                                                                | Introduced on the S-Series and Z9000.                                                                                               |
| <b>Usage Information</b> | Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the <code>no ip unknown-unicast</code> command previously. This will be the default configuration after reload.                                                         |                                                                                                                                     |

# ipv6 unknown-unicast

Disable soft forwarding of unknown IPv6 destination packets.

## C9000 Series

|                          |                                                                                                                                                                                            |                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|

| <b>9.9(0.0)</b>          | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                  |         |             |                 |                          |                 |                                          |                 |                                       |                  |                                       |
| <b>9.8(0.0)</b>          | Introduced on the S3048-ON and S4048-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                  |         |             |                 |                          |                 |                                          |                 |                                       |                  |                                       |
| <b>9.7(0.0)</b>          | Introduced on the S6000-ON and Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                  |         |             |                 |                          |                 |                                          |                 |                                       |                  |                                       |
| <b>9.4.(0.0)</b>         | Introduced on the S-Series and Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                  |         |             |                 |                          |                 |                                          |                 |                                       |                  |                                       |
| <b>Usage Information</b> | <p>Use this command to attach an interface to a configured VRF. You can attach an interface to either a non-default VRF or a management VRF. To assign a port-back to a default VRF, remove VRF association from the interface. You can use this only if there is no IP address configured on the interface.</p> <p>There must be no prior Layer 3 configuration on the interface when configuring VRF.</p> <p>VRF must be enabled prior to implementing this command.</p> <p>You can configure an IP subnet or address on a physical or VLAN interface that overlaps the same IP subnet or address configured on another interface only if the interfaces are assigned to different VRFs. If two interfaces are assigned to the same VRF, you cannot configure overlapping IP subnets or the same IP address on them.</p> |                                                                                  |         |             |                 |                          |                 |                                          |                 |                                       |                  |                                       |

# ip route-export

Enable route leaking between VRFs. Export or share IPv4 routes corresponding to one VRF with other non-default VRFs.

## C9000 Series

|                   |                                                 |                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>ip route-export tag [route-map-name]</pre> |                                                                                                                                                                                                                     |
| <b>Parameters</b> | <b>route-export</b>                             | Enter the <code>route-export</code> keyword to leak or share routes between VRFs.                                                                                                                                   |
|                   | <b>tag</b>                                      | Enter a <i>tag</i> (export route target) to expose routes to other VRFs. This tag acts as an identifier for exported routes. You can use this identifier while importing these routes into another non-default VRF. |
|                   | <b>route-map-name</b>                           | (Optional) Enter the name of the route-map to filter the exported routes.                                                                                                                                           |

You can leak global routes for VRF. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. As a result, it is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

|                 | <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.                            |
|                 | <b>9.7(0.0)</b> | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information** Use the `ip route-export tag` command without specifying the route-map attribute to export all the routes corresponding to a source VRF. This action exposes source VRF routes to various other VRFs, which then import these routes using the `ip route-import tag` command. In Dell Networking OS, you can configure only one route-export per VRF as only one set of routes can be exposed for leaking (or sharing). However, you can configure multiple route-import targets because a VRF accepts routes from multiple VRFs.

You can expose a unique set of routes from the source VRF for sharing with other VRFs. When there are two VRFs export routes, there is no option to discretely filter leaked routes from each source VRF. You cannot import one set of routes from one VRF and another set of routes from another VRF.

Only active routes are eligible for sharing. For example, if one VRF has two routes corresponding to BGP and OSPF, and the BGP route is inactive, the OSPF route takes precedence over BGP. The inactive BGP route is not shared even when the target VRF has the filtering options enabled to match BGP.

**Related Commands** [ip route-import](#) – imports routes from another VRF.

## ip route-import

Import IPv4 routes leaked by another VRF using the tag specified by that VRF during route-export process.

### C9000 Series

**Syntax** `ip route-import tag [route-map-name]`

This tag acts as an identifier for exported routes. You can use this identifier while importing these routes into another non-default VRF.                                                                                                                                                                                      |
|                          | <b>route-map-name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | (Optional) Enter the name of the route-map to filter the exported routes. You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes will be duplicated into the VRF's RTM. As a result, it is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs. |

| <b>Usage Information</b> | You can use the <code>ip route-export tag</code> command without specifying the route-map attribute to export all the routes corresponding to a source VRF. This action exposes source VRF's routes to various other VRFs, which then import these routes using the <code>ip route-import tag</code> command. In Dell Networking OS, you can configure at most one route-export per VRF as only one set of routes is exposed for leaking. However, you can configure multiple route-import targets because a VRF accepts routes from multiple VRFs. |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                          | You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. You cannot import one set of routes from one VRF and another set of routes from another VRF.                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                          | Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the Target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Related  
Commands**

[ipv6 route-import](#) – imports IPv6 routes from another VRF.

## ipv6 route-import

Import IPv6 routes leaked by another VRF using the tag specified by that VRF during export of these routes.

### C9000 Series

**Syntax** `ipv6 route-import tag [route-map-name]`

**Parameters**

|                       |                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-import</b>   | Enter the keyword route-import to import IPv6 routes into the VRF.                                                                                                                                                                                                                                                                                                          |
| <b>tag</b>            | Enter a tag (ASN number) to specify an import route target for importing routes from another VRF. To import leaked routes from another VRF, you must use the same ASN number that is specified as the export route target at the source VRF.                                                                                                                                |
| <b>route-map-name</b> | Enter the name of the route-map to filter the imported routes.<br> <b>NOTE:</b> You must use the route-map attribute while importing routes from the global RTM. Route-maps enable you to filter routes at the import end based on the matching criteria that you define in the route-map. |

**Command Modes** VRF MODE  
CONFIGURATION

**Command  
History**

| Version         | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                            |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.                            |
| <b>9.7(0.0)</b> | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage  
Information**

It is possible to configure multiple import conditions per VRF depending on the exporting VRF. The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

**Related  
Commands**

[ipv6 route-export](#) – exports IPv6 routes to another VRF.

## match source-protocol

Specify matching criteria while exporting or importing routes.

### C9000 Series

**Syntax** `match source-protocol {bgp | isis | ospf | connected | static}`

**Parameters**

|                  |                                                                                         |
|------------------|-----------------------------------------------------------------------------------------|
| <b>bgp</b>       | Enter the keyword bgp to leak or share routes corresponding to the BGP protocol.        |
| <b>isis</b>      | Enter the keyword isis to leak or share routes corresponding to the ISIS protocol.      |
| <b>ospf</b>      | Enter the keyword ospf to leak or share routes corresponding to the OSPF protocol.      |
| <b>connected</b> | Enter the keyword connected to leak or share connected routes corresponding to the VRF. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
|                          | <b>static</b>                                                                                                                                                                                                                                                                                                                                                                                                                                           | Enter the keyword static to leak or share static routes corresponding to the VRF. |
| <b>Command Modes</b>     | ROUTE MAP MODE                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                   |

| <b>Usage Information</b> | Use this command to associate a management port with a management VRF. When you execute this command, the management ports corresponding to both the ACTIVE unit as well as the STANDBY unit are associated with the management VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                  |                                       |

# maximum dynamic-routes

Specify the maximum number of dynamic (protocol) routes a VRF can have.

## C9000 Series

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                                                                                                                                       |                          |                                                                                                                                                                                                                                                                                                                   |                     |                                                                                                                                                                              |

| <b>warning-threshold</b> | Warning threshold value is expressed as a percentage of the limit value. When the number of routes reaches the specified percentage of the limit, a warning message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional dynamic routes will not be allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |              |                                                                                                                                       |                          |                                                                                                                                                                                                                                                                                                                   |                     |                                                                                                                                                                              |
| <b>warning-only</b>      | When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic routes reaches the limit. Additional dynamic routes will still allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |              |                                                                                                                                       |                          |                                                                                                                                                                                                                                                                                                                   |                     |                                                                                                                                                                              |
| <b>Defaults</b>          | No limit is set on the maximum number of dynamic routes for a VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |              |                                                                                                                                       |                          |                                                                                                                                                                                                                                                                                                                   |                     |                                                                                                                                                                              |
| <b>Command Modes</b>     | CONFIGURATION-VRF                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |              |                                                                                                                                       |                          |                                                                                                                                                                                                                                                                                                                   |                     |                                                                                                                                                                              |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON and Z9500.    |
| 9.4(0.0) | Introduced on the S-Series.              |

## Usage Information

If the maximum route limit is not specified for a VRF, then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.

# show ip vrf

Display information corresponding to the VRFs that are configured in the system.

## C9000 Series

### Syntax

```
show ip [vrf vrf-name]
```

### Parameters

**vrf vrf-name** Enter the keyword vrf and then the name of the VRF to display information corresponding to that VRF..

### Command Modes

EXEC  
EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.                 |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0)  | Introduced on the S6000-ON.              |
| 9.4.(0.0) | Introduced on the S-Series and Z9000.    |

## Example

```
Dell#show ip vrf
VRF-Name VRF-ID Interfaces
default 0 Te 0/0-13,18-47,
 Fo 0/48,52,56,60,
 Ma 0/0,
 Ma 1/0,

 Ma 3/0,
 Ma 4/0,
 Ma 5/0,
 Ma 6/0,
 Ma 7/0,
 Ma 8/0,
 Ma 9/0,
 Ma 10/0,
```

```

Nu 0,
test1 1 Vl 1
test2 2 Te 0/14,16-17
management 64 Te 0/15

Dell#show ip vrf test1
VRF-Name VRF-ID Interfaces
test1 1 Te 0/14,16-17

```

## show run vrf

Displays configuration information corresponding to all the VRFs in the system.

### C9000 Series

**Syntax** `show run vrf vrf-name`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF..

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                              |
|------------------|------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                 |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON and Z9500.    |
| <b>9.4.(0.0)</b> | Introduced on the S-Series and Z9000.    |

**Usage Information** Use this command to display information from the running-config corresponding to either a specific VRF or all the VRFs in the system.

#### Example

```

Dell#show run vrf test3
!
ip vrf test3
description "IT Department"

```

# VLAN Stacking

With the virtual local area network (VLAN)-stacking feature (also called stackable VLANs and QinQ), you can “stack” VLANs into one tunnel and switch them through the network transparently.

For more information about basic VLAN commands, see the *Virtual LAN (VLAN) Commands* section in the [Layer 2](#) chapter.

## Important Points to Remember

- If you do not enable the spanning tree protocol (STP) across the stackable VLAN network, STP bridge protocol data units (BPDUs) from the customer’s networks are tunneled across the stackable VLAN network.
  - If you do enable STP across the stackable VLAN network, STP BPDUs from the customer’s networks are consumed and not tunneled across the stackable VLAN network unless you enable protocol tunneling.
- NOTE:** For more information about protocol tunneling on the E-Series, see [Service Provider Bridging](#).
- Layer 3 protocols are not supported on a stackable VLAN network.
  - Assigning an IP address to a stackable VLAN is supported when all the members are only stackable VLAN trunk ports. IP addresses on a stackable VLAN-enabled VLAN are not supported if the VLAN contains stackable VLAN access ports. This facility is provided for the simple network management protocol (SNMP) management over a stackable VLAN-enabled VLAN containing only stackable VLAN trunk interfaces. Layer 3 routing protocols on such a VLAN are not supported.
  - Dell Networking recommends that you do not use the same MAC address, on different customer VLANs, on the same stackable VLAN.
  - Interfaces configured using stackable VLAN access or stackable VLAN trunk commands do not switch traffic for the default VLAN. These interfaces are switch traffic only when they are added to a non-default VLAN.
  - Starting with the Dell Networking OS version 7.8.1 for C-Series and S-Series (Dell Networking OS version 7.7.1 for E-Series, 8.2.1.0 for E-Series ExaScale), a vlan-stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the vlan-stack trunk port is also a member of an untagged vlan, the port must be in Hybrid mode. See [portmode hybrid](#).
  - VLAN stacking is not supported on Port Extender (PE) ports and on LAGs with port extender ports.
  - VLAN stacking interface commands are blocked (hidden) on PE ports.
  - VLAN stacking interface commands will fail on the VP-LAG (LAG with PE ports).

### Topics:

- [member](#)
- [vlan-stack access](#)
- [vlan-stack compatible](#)
- [vlan-stack dot1p-mapping](#)
- [vlan-stack protocol-type](#)
- [vlan-stack trunk](#)

## member

Assign a stackable VLAN access or trunk port to a VLAN. The VLAN must contain the `vlan-stack compatible` command in its configuration.

## C9000 Series

### Syntax

```
member interface
```

To remove an interface from a Stackable VLAN, use the `no member interface` command.

| Version | Description                              |
|---------|------------------------------------------|
| 7.6.1.0 | Introduced on the C-Series and S-Series. |

Usage Information

Prior to enabling this command, to place the interface in Layer 2 mode, enter the `switchport` command.

To remove the access port designation, remove the port (using the `no member interface` command) from all stackable VLAN enabled VLANs.

vlan-stack compatible

Enable the stackable VLAN feature on a VLAN.

C9000 Series

Syntax

vlan-stack compatible

To disable the Stackable VLAN feature on a VLAN, use the `no vlan-stack compatible` command.

Defaults

Not configured.

Command Modes

CONF-IF-VLAN

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

Usage Information

Prior to disabling the stackable VLAN feature, remove the members.

To view the stackable VLANs, use the `show vlan` command in EXEC Privilege mode. Stackable VLANs contain members, designated by the M in the Q column of the command output.

Example

```
Dell#show vlan

Codes: * - Default VLAN, G - GVRP VLANs

 NUM Status Q Ports
* 1 Inactive
 2 Active M Te 2/13
 M Te 2/0-2
 3 Active M Po1(Te 2/14-15)
 M Te 2/18
 M Te 2/3
 4 Active M Po1(Te 2/14-15)
 M Te 2/18
 M Te 2/4
 5 Active M Po1(Te 2/14-15)
 M Te 2/18
```

## vlan-stack dot1p-mapping

Map C-Tag dot1p values to a S-Tag dot1p value. You can separate the C-Tag values by commas and dashed ranges are permitted. Dynamic mode CoS overrides any Layer 2 QoS configuration in case of conflicts.

### C9000 Series

| Syntax          | vlan-stack dot1p-mapping c-tag-dot1p values sp-tag-dot1p value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                        |         |             |          |                          |          |                          |          |                           |         |                          |         |                                          |

## vlan-stack protocol-type

Define the stackable VLAN tag protocol identifier (TPID) for the outer VLAN tag (also called the VMAN tag). If you do not configure this command, the system assigns the value 0x9100.

### C9000 Series

For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> |                                                                                                                                                                               |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                               |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                               |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                              |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                               |
| <b>8.2.1.0</b>  | Introduced on the E-Series ExaScale. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| <b>8.2.1.0</b>  | Introduced on the E-Series ExaScale.                                                                   |
| <b>7.6.1.0</b>  | Introduced on the C-Series and S-Series.                                                               |

#### Usage Information

For specific interoperability limitations regarding the S-Tag TPID, see the *Dell Networking OS Configuration Guide*.

The four characters you enter in the CLI for number are interpreted, as shown in the following table.

| Number      | Resulting TPID |
|-------------|----------------|
| <b>1</b>    | 0x0001         |
| <b>10</b>   | 0x0010         |
| <b>81</b>   | 0x0081         |
| <b>8100</b> | 0x8100         |

#### Related Commands

- [portmode hybrid](#) — sets a port (physical ports only) to accept both tagged and untagged frames. A port configured this way is identified as a hybrid port in report displays.
- [vlan-stack trunk](#) — specifies a Layer 2 port or port channel as a trunk port to the Stackable VLAN network.

## vlan-stack trunk

Specify a Layer 2 port or port channel as a trunk port to the Stackable VLAN network.

### C9000 Series

#### Syntax

```
vlan-stack trunk
```

To remove a trunk port designation from the selected interface, use the `no vlan-stack trunk` command.

#### Defaults

Not configured.

**Command Modes** INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Netowrking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

| Version        | Description                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------|
| <b>8.3.7.0</b> | Introduced on the S4810.                                                                               |
| <b>8.2.1.0</b> | Introduced on the E-Series ExaScale. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| <b>7.8.1.0</b> | Functionality augmented for C-Series and S-Series to enable multi-purpose use of the port.             |
| <b>7.7.1.0</b> | Functionality augmented for E-Series to enable multi-purpose use of the port.                          |
| <b>7.6.1.0</b> | Introduced on the C-Series and S-Series.                                                               |

## Usage Information

Prior to using this command, to place the interface in Layer 2 mode, execute the `switchport` command.

To remove the trunk port designation, first remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

A VLAN-Stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the VLAN-Stack trunk port is also a member of an untagged VLAN, the port must be in Hybrid mode. Refer to [portmode hybrid](#).

In Example 1, a VLAN-Stack trunk port is configured and then also made part of a single-tagged VLAN.

In Example 2, the tag protocol identifier (TPID) is set to 8848. The “Te 2/10” port is configured to act as a VLAN-Stack access port, while the “Te 1/0” port acts as a VLAN-Stack trunk port, switching stackable VLAN traffic for VLAN 10, while also switching untagged traffic for VLAN 30 and tagged traffic for VLAN 40. (To allow VLAN 30 traffic, the native VLAN feature is required, by executing the `portmode hybrid` command. Refer to [portmode hybrid](#) in Interfaces.

## Example 1

```
Dell(conf-if-te-0/42)#switchport
Dell(conf-if-te-0/42)#vlan-stack trunk
Dell(conf-if-te-0/42)#show config
!
interface TenGigabitEthernet 0/42
 no ip address
 switchport
 vlan-stack trunk
 no shutdown
Dell(conf-if-te-0/42)#interface vlan 100
Dell(conf-if-vl-100)#vlan-stack compatible
Dell(conf-if-vl-100-stack)#member gigabitethernet 0/42
Dell(conf-if-vl-100-stack)#show config
!
interface Vlan 100
 no ip address
 vlan-stack compatible
 member TenGigabitEthernet 0/42
 shutdown
Dell(conf-if-vl-100-stack)#interface vlan 20
Dell(conf-if-vl-20)#tagged tengigabitethernet 0/42
Dell(conf-if-vl-20)#show config
!
interface Vlan 20
 no ip address
 tagged TenGigabitEthernet 0/42
 shutdown
Dell(conf-if-vl-20)#do show vlan
Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 G - GVRP tagged, M - Vlan-stack

 NUM Status Description Q Ports
* 1 Inactive
 20 Active T Te 0/42
 100 Active M Te 0/42
Dell(conf-if-vl-20)#
```

## Example 2

```
Dell(config)#vlan-stack protocol-type 88A8
Dell(config)#interface tengigabitethernet 2/10
Dell(conf-if-te-2/10)#no shutdown
Dell(conf-if-te-2/10)#switchport
Dell(conf-if-te-2/10)#vlan-stack access
Dell(conf-if-te-2/10)#exit

Dell(config)#interface tenGigabitethernet 1/0
Dell(conf-if-te-1/0)#no shutdown
Dell(conf-if-te-1/0)#portmode hybrid
Dell(conf-if-te-1/0)#switchport
Dell(conf-if-te-1/0)#vlan-stack trunk
Dell(conf-if-te-1/0)#exit

Dell(config)#interface vlan 10
Dell(conf-if-vlan)#vlan-stack compatible
Dell(conf-if-vlan)#member Te 0/0, Te 1/0, Te 2/10
Dell(conf-if-vlan)#exit

Dell(config)#interface vlan 30
Dell(conf-if-vlan)#untagged TenGi 1/0
Dell(conf-if-vlan)#exit
Dell(config)#

Dell(config)#interface vlan 40
Dell(conf-if-vlan)#tagged TenGi 1/0
Dell(conf-if-vlan)#exit
Dell(config)#
```

# X.509v3

X.509v3 is a standard for public key infrastructure (PKI) to manage digital certificates and public key encryption. This standard specifies a format for public-key certificates or digital certificates.

Dell Networking OS supports X.509v3 standards.

## Topics:

- [crypto ca-cert delete](#)
- [crypto ca-cert install](#)
- [crypto cert delete](#)
- [crypto cert generate](#)
- [crypto cert install](#)
- [crypto x509 ocsf](#)
- [crypto x509 revocation](#)
- [debug crypto](#)
- [logging secure](#)
- [crypto x509 ca-keyid](#)
- [ocsp-server](#)
- [ocsp-server prefer](#)
- [show crypto ca-cert](#)
- [show crypto cert](#)

## crypto ca-cert delete

Deletes a CA certificate.

**Syntax** `crypto ca-cert delete [index]`

**Parameters** **index** (Optional) Enter the keyword `index` to specify the index of the CA certificate. If index is not specified, the system deletes all of the installed CA certificates.

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Before deleting a CA certificate, the system checks whether that certificate is an issuer of other installed certificate on the system. If so, the system informs you to delete other installed certificates first.

**Related Commands** [crypto ca-cert install](#)[crypto cert generate](#)[crypto ca-cert install](#)

# crypto ca-cert install

Downloads and installs the certificate of a Certificate Authority (CA) on to the device.

**Syntax** `crypto ca-cert install path`

**Parameters** *path*

Enter the path where the CA certificate is available for download. The format that you use to specify the location of the CA certificate also includes the protocol that is used to contact the CA. You can use the following options that you can use to download and install a certificate from the CA:

- tftp — `tftp://ca-ip-address/tftp/CAcert.pem`
- usbflash: — `usbflash:/certs/CAcert.pem`
- ftp — `ftp://userid:password@ca-ip-address/certs/CAcert.pem`
- scp — `scp://userid:password@ca-ip-address/certs/CAcert.pem`
- http — `http://192.168.1.100/certs/CAcert.pem`
- flash — `flash://filepath/filename`

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Upon successful installation, the system displays a notification on the device. If remote logging is configured, the notification is also sent to the syslog server. Contents of the CA certificate's subject are displayed.

**Related Commands**

- [crypto cert install](#)

# crypto cert delete

Deletes a trusted certificate.

**Syntax** `crypto cert delete`

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin

- `secadmin`

The certificate matching the current FIPS state is deleted. If the system is in FIPS mode, the FIPS certificate is deleted. If the system is in non-FIPS mode, the non-FIPS certificate is deleted.

Before deleting the system's trusted certificate, the system prompts you to specify whether to proceed with deletion. If you proceed, the system deletes the certificate and also the private key.

#### Related Commands

- [crypto ca-cert install](#)
- [crypto cert generate](#)

## crypto cert generate

Generates a Certificate Signing Request (CSR) or a self-signed certificate.

#### Syntax

```
crypto cert generate {self-signed | request} [cert-file cert-path key-file
{private | key-path}] [country 2-letter code] [state state] [locality city]
[organization organization-name] [orgunit unit-name] [cname common-name]
[email email-address] [validity days] [length length] [altname alt-name]
```

#### Parameters

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>self-signed</b>                    | Enter the keyword <code>self-signed</code> to create a self-signed certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>request</b>                        | Enter the keyword <code>request</code> to create a certificate signing request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cert-file</b>                      | Enter the keyword <code>cert-file</code> to specify that the certificate needs to be created.<br><b>NOTE:</b> If the <code>cert-file</code> option is not specified in the command, then the system interactively prompts you to fill in rest of the fields of the certificate signing request (CSR).                                                                                                                                                                                                                                                                                                                                 |
| <b>cert-path</b>                      | Enter the path to locally store the self-signed certificate or CSR. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the CSR file is stored. You can then export the CSR to a CA using the "copy" command. Following is an example of a path that you can specify: <code>flash://certs/s4810-001-request.csr</code> .                                                                                                                                                                                                                            |
| <b>key-file</b>                       | Enter the keyword <code>key-file</code> to specify the private key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>private</b>                        | Enter the keyword <code>private</code> to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>key-path</b>                       | Enter the absolute or relative location on the device where the key is stored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>country 2-letter-code</b>          | (OPTIONAL) Enter the keyword <code>country</code> followed by the two letter code that is used to identify the country name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>state state</b>                    | (OPTIONAL) Enter the keyword <code>state</code> followed by the name of the state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>locality city</b>                  | (OPTIONAL) Enter the keyword <code>locality</code> followed by the name of the city.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>organization organization-name</b> | (OPTIONAL) Enter the keyword <code>organization</code> followed by the name of the organization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>orgunit unit-name</b>              | (OPTIONAL) Enter the keyword <code>orgunit</code> followed by the name of the unit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>cname common-name</b>              | Enter the keyword <code>cname</code> followed by the common name that you want to assign.<br><b>NOTE:</b> Common Name is an important attribute while creating a CSR or a self-signed certificate. Common name is the main identity presented to connecting entities. By default, the device's host name acts as the common name. However, you can still configure a different common name for the device. For example, you can specify an IP address to act as a Common Name for the device. If the Common Name does not match the device's presented identity, then even a properly signed certificate does not validate correctly. |

|                                   |                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>email <i>email-address</i></b> | (OPTIONAL) Enter the keyword <code>email</code> followed a valid email address used for communication with the organization.                                                                                                                                                                                                                                 |
| <b>validity <i>days</i></b>       | (OPTIONAL) Enter the keyword <code>validity</code> followed by the number of days for which the certificate is valid.<br> <b>NOTE:</b> For CSRs, validity has no effect. For self-signed certificates, if validity is not specified, it defaults to 3650 days, or 10 years. |
| <b>length <i>length</i></b>       | (OPTIONAL) Enter the keyword <code>length</code> followed by a bit length value. The default key length for both FIPS and non-FIPS mode is 2048. Minimum key length value for FIPS mode is 2048. The range is from 2048 to 4096. Minimum key length value for non-FIPS mode is 1024. The range is from 1024 to 4096.                                         |
| <b>altname <i>altname</i></b>     | (OPTIONAL) Enter the keyword <code>altname</code> followed by the subject alternate name for the organization. For example, <code>altname IP:192.168.1.100</code> .                                                                                                                                                                                          |

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version         | Description             |
|-----------------|-------------------------|
| <b>9.11.0.0</b> | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

If the `cert-file` option is not specified in the command, then the system interactively prompts you to fill in various fields of the certificate signing request (CSR). You are prompted to fill out some metadata information for the certificate. The following example shows the fields that you are prompted to fill:

```
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a
DN.
There are quite a few fields but you can leave some blank.
For some fields there will be a default value; if you enter '.', the
field will be left blank.

Country Name (2 letter code) [US]:
State or Province Name (full name) [Some-State]:California
Locality Name (eg, city) []:San Francisco
Organization Name (eg, company) []:Starfleet Command
Organizational Unit Name (eg, section) []:NCC-1701A
Common Name (eg, YOUR name) [S4810-001]:
Email Address []:scotty@starfleet.com
```

You can enter only 256 characters per command. If you have field values that are larger than 256 characters in length, use the interactive mode of the command.

**Related Commands**

- [crypto ca-cert install](#)

## crypto cert install

Installs a trusted certificate on a device.

**Syntax** `crypto cert install cert-file cert-path key-file {key-path | private} [password passphrase]`

## Parameters

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cert-file</b>                     | Enter the keyword <code>cert-file</code> to specify that the certificate needs to be downloaded.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>cert-path</b>                     | <p>Enter the path where the certificate is locally stored. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the certificate file is stored. Following are example of a path that you can specify: <code>flash://certs/s4810-001-request.crt</code> and <code>usbflash:/certs/s4810-001-cert.pem</code></p> <p><b>NOTE:</b> Before installing a trusted certificate, you first need to download it from a remote CA using the copy command.</p> |
| <b>key-file</b>                      | Enter the keyword <code>key-file</code> to specify the private key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>private</b>                       | Enter the keyword <code>private</code> to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.                                                                                                                                                                                                                                                                                                                                         |
| <b>key-path</b>                      | <p>Enter the absolute or relative location on the device where the key is stored.</p> <p><b>NOTE:</b> After the certificate is successfully installed, the private key is deleted from the specified location and copied to the hidden location in NVRAM.</p>                                                                                                                                                                                                                                                                       |
| <b>password</b><br><b>passphrase</b> | <p>(Optional) Enter the keyword <code>password</code> followed by the password phrase used to decrypt the private key.</p> <p><b>NOTE:</b> You can generate the private key and certificate on another host. While doing so, you must keep the private key encrypted with a passphrase so that the private key is not compromised during transport. The password phrase acts a facility to decrypt the private key before installing it on the switch.</p>                                                                          |

## Defaults

NA.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

## Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Certain parameters must be met in order for this command to succeed:

- The downloaded certificate should be formatted properly.
- In order for verification to work, the CA certificate must be installed on the system before running this command.
- The downloaded certificate's public key must correspond to the private key.
- If the certificate is not self-signed, then the CA certificate (from the CA that has signed the certificate) must be installed on the system prior to running this command for verification to work.

**NOTE:** It is possible for the switch to store two types of certificates: one for the FIPS mode and one for the non-FIPS mode. If the system is in FIPS mode, the certificate is installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate is installed as the non-FIPS certificate. When FIPS mode is enabled or disabled, the certificates (and keys) are switched by the system.

**NOTE:** For the switch, there are two possible certificates stored - one for FIPS mode, one for non-FIPS mode. If the system is in FIPS mode, the certificate will be installed as the FIPS certificate.

If the system is in non-FIPS mode, the certificate will be installed as the non-FIPS certificate. When FIPS mode is enabled/disabled, the certificates (and keys) are switched by the system.

#### Related Commands

- [crypto ca-cert install](#)

## crypto x509 ocspp

Configures the OCSPP behavior.

**Syntax** `crypto x509 ocspp [nonce] [sign-requests]`

**Parameters**

|                      |                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nonce</b>         | Enter the keyword <code>nonce</code> to use the nonce feature for the OCSPP requests to OCSPP responder communication. This is a one-time value that must be returned in the OCSPP response. If the OCSPP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature. |
| <b>sign-requests</b> | Enter the keyword <code>sign-requests</code> to sign the OCSPP requests to OCSPP responder communication with the system's own certificate so that the OCSPP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.                                                                                 |

**Defaults** NA.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

**Related Commands**

- [crypto cert generate](#)
- [crypto cert install](#)

## crypto x509 revocation

Configure the revocation check behavior for the certificate.

**Syntax** `crypto x509 revocation ocspp {accept | reject}`

**Parameters**

|               |                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ocspp</b>  | Enter the method used to check certificate revocation details. In this release, OCSPP is the only option that is supported. So, you can specify OCSPP as the method-list value. |
| <b>accept</b> | Enter the keyword <code>accept</code> to accept the presented certificate and log in if OCSPP retrieval fails.                                                                  |
| <b>reject</b> | Enter the keyword <code>reject</code> to reject the presented certificate and log in if OCSPP retrieval fails.                                                                  |

**Defaults** `crypto x509 revocation ocspp accept`

**Command Modes** • CONFIGURATION Mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Related Commands** • [crypto x509 ocsdp](#)

## debug crypto

This command allows you to test a certificate chain file for validity and checking revocation outside of its use in TLS communication.

**Syntax** `debug crypto {flash://path}`

**Parameters** **path** Enter the path to a local file where a certificate chain is stored in PEM format.

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

You can use this command to verify an X509 certificate outside of use with Syslog over TLS.

**Related Commands** • [crypto cert install](#)  
• [crypto cert generate](#)  
• [crypto ca-cert install](#)

## logging secure

Creates a log file for various events related to X.509v3 certificates.

**Syntax** `logging {hostname} {secure | tcp | udp} [vrf vrf-name] [sha1 fingerprint] [port port-number]`

**Parameters** **hostname** Enter the name of the host or device for which you wish to record logs corresponding to the certificates.

 **NOTE:** The hostname can be an IPV4 address, an IPV6 address, or a DNS hostname—with or without DNS suffix.

**secure** Enter the keyword `secure` to enable the Syslog feature to communicate with a compatible Syslog server using the secure TLS protocol over the default port (6514). The range is from 1024 to 65535.

|                                |                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcp</b>                     | Enter the keyword <code>tcp</code> to enable TCP.                                                                                                                                                                                                                                                                                                                   |
| <b>udp</b>                     | Enter the keyword <code>udp</code> to enable UDP.                                                                                                                                                                                                                                                                                                                   |
| <b>vrf <i>vrf-name</i></b>     | Enter the keyword <code>vrf</code> followed by the name of the VRF.                                                                                                                                                                                                                                                                                                 |
| <b>sha1 <i>fingerprint</i></b> | Enter the keyword <code>sha1</code> followed by the finger print. This option is only available when the secure option is configured. This new option enables the Syslog feature to compare the received certificate's sha-1 fingerprint against this configured sha-1 fingerprint. If present, only the fingerprint is used for certificate revocation validation. |
| <b>port <i>port-number</i></b> | Enter the keyword <code>port</code> followed by the port number. The default port number is 6514 for secure logging.                                                                                                                                                                                                                                                |

**Defaults** None.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.11.0.0</b> | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

Following are the pre-requisites to configure logging:

- The logging command must be configured to enable event logging.
- A certificate must be installed on the switch. This certificate is only used for secure logging.
- At least one CA certificate must be installed on the switch so that the logging server's certificate can be verified. If a SHA1 fingerprint is present, only the fingerprint is used for certificate revocation validation.

**Related Commands**

- [crypto cert install](#)
- [crypto ca-cert install](#)
- [crypto cert generate](#)

## crypto x509 ca-keyid

Creates a per-certificate configuration context using the specified subject key identifier.

**Syntax** `crypto x509 ca-keyid subject-key-identifier`  
Use to the `no crypto x509 ca-keyid` command to remove this configuration.

**Parameters**

|                                      |                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------|
| <b><i>subject-key-identifier</i></b> | Enter the content of the <code>SubjectKeyIdentifier</code> field from the CA certificate. |
|--------------------------------------|-------------------------------------------------------------------------------------------|

 **NOTE:** To get the subject key identifier details, enter the `show crypto ca-cert` command. This command displays the CA certificate details.

**Defaults** None.

**Command Modes** • CONFIGURATION Mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

#### Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

When you use this command, the device maps the current certificate context in the certificate store to a CA certificate through the subject key identifier field. The subject key identifier field contains the SHA-1 hash of the CA's public key. This configuration provides a way to uniquely identify a CA and associate it with any CA-specific settings.

This context is used to store certificate-specific settings such as alternate CRL and OCSP locations. Incoming X.509 certificates whose `AuthorityKeyIdentifier` extensions match the configured subject key identifier has these settings applied to them.

The `crypto x509 ca-keyid` command when used with the `ocsp-server` command in the global configuration mode creates a per-certificate configuration context under which the remaining commands are entered.

#### Related Commands

- [ocsp-server](#)
- [crypto x509 ocsp](#)

## ocsp-server

Configures OCSP server on a CA.

**Syntax** `ocsp-server url [nonce] [sign-requests]`

#### Parameters

|                      |                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>url</b>           | Enter the URL for the OCSP responder using standard URI format. Either http or https protocol can be used. For example, <code>http://[1100::101]:8888</code> .                                                                                                                                                                                                                               |
| <b>nonce</b>         | Enter the keyword <code>nonce</code> to use the nonce feature for the OCSP requests to OCSP responder communication. This number is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature. |
| <b>sign-requests</b> | Enter the keyword <code>sign-requests</code> to sign the OCSP requests to OCSP responder communication with the system's own certificate so that the OCSP responder may verify the requestor. The <code>sign-requests</code> feature is off by default. The no version of the command disables signing of requests.                                                                          |

**Defaults** None.

**Command Modes** CERTIFICATE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

#### Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Multiple OCSP responders may be configured per CA. The system tries each one until it gets a valid response. No priority may be specified or guaranteed; the system tries them in the order in which they were configured.

**Related  
Commands**

- [crypto x509 ocs](#)

## ocsp-server prefer

Configures OCSP responder preference. You can configure the preference or order that the CA or a device should follow while contacting multiple OCSP responders.

**Syntax** `ocsp-server prefer`

**Defaults** None.

**Command Modes** CERTIFICATE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

When this command is specified, the system checks the configured OCSP URLs before checking the URL of the OCSP server in the authorityInfoAccess extension of the certificate. If this command is not specified, then the system checks the OCSP server in the authorityInfoAccess extension of the certificate before checking the configured OCSP servers.

**Related  
Commands**

- [crypto x509 ocs](#)

## show crypto ca-cert

Displays the certificate information corresponding to the root CA.

**Syntax** `show crypto ca-certs`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

This show command should display the index, the certificate's subject field in plaintext, not-before and not-after dates, and the fingerprint in hexadecimal format. The index assigned to each CA certificate is used by the crypto cert delete certificate-authority command to allow the user to specify which certificate authority to remove.

**Related  
Commands**

- [crypto ca-cert install](#)

# show crypto cert

Displays the certificate information that is specified.

| Syntax            | show crypto cert {path}                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                             |  |         |             |          |                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|---------|-------------|----------|--------------------------|
| Parameters        | path                                                                                                                                                                                                                                                                                                                                                                               | (OPTIONAL) Enter the path to a local file where a certificate chain is stored in PEM format. If a path is not specified, display the certificate that is currently installed on the system. |  |         |             |          |                          |
| Defaults          | None.                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                             |  |         |             |          |                          |
