| Command History | <p>This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Version    | Description                                                       |
|------------|-------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                                          |
| 9.2(1.0)   | Introduced on the Z9500.                                          |
| 8.3.19.0   | Introduced on the S4820T.                                         |
| 8.3.11.1   | Introduced on the Z9000.                                          |
| 8.3.7.0    | Introduced on the S4810.                                          |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.              |
| 8.1.1.0    | Introduced on the E-Series ExaScale.                              |
| 7.6.1.0    | Introduced on the S-Series.                                       |
| 7.5.1.0    | Introduced on the C-Series.                                       |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the E-Series. |

## Usage Information

To view the show output for multiple ports of a specified slot at a time, you can specify any random port number or a range of ports, or a combination of both.

To specify a port range, you can enter a hyphenated range of one or more port range values separated with commas; for example, `show interfaces status FortyGigE 1/0-4,7,9-11`. To enter any random number of ports, you can enter a comma-separated string of port numbers, for example `show interfaces status FortyGigE 1/0/1,9,11`

**NOTE:** The port-range option is only available for 1 Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, Fast Ethernet, FC, Port Channel, and VLAN interfaces.

## Related Commands

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

# show interfaces switchport

Display only virtual and physical interfaces in Layer 2 mode. This command displays the Layer 2 mode interfaces' IEEE 802.1Q tag status and VLAN membership.

## C9000 Series

### Syntax

```
show interfaces switchport [interface] [linecard slot-id]
```

### Parameters

#### *interface*

(OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port (ports or port-range) information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port (ports or port-range) information.
- Enter the keyword `backup` to view the backup interface for this interface.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit* *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit* *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**NOTE:** The **peGigE** or **peTenGigE** interface option is only visible when the feature extended bridge is enabled.

#### *linecard slot-id*

Enter the `linecard slot-id` parameters to specify the switch ports on a line card. The range of slot IDs is from 0 to 11.

**Command Modes** • EXEC

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                            |
|-------------------|------------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced peTenGigE interface support on the C9010.                   |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                               |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                              |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                               |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                               |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.                   |
| <b>8.2.1.0</b>    | Added support for 4093 VLANs on E-Series ExaScale.                     |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                                   |
| <b>7.6.1.0</b>    | Support added for hybrid port/native VLAN, introduced on the S Series. |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                            |

## Usage Information

To view the switchport information for multiple ports of a specified slot, you can specify any random port number or a range of ports, or a combination of both.

To specify a port range, you can enter a hyphenated range of one or more port range values separated with commas; for example, `show interfaces tengigabitethernet 10/0-1 switchport`

**NOTE:** The multiple port range value is supported only for the Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, Fast Ethernet, FC, Port Channel, and VLAN interfaces.

The following describes the `show interfaces switchport` command for the following example.

| Items                  | Description                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>            | Displays the interface's type, slot, and port number.                                                                                               |
| <b>802.1QTagged</b>    | Displays whether if the VLAN tagged ("True"), untagged ("False"), or hybrid ("Hybrid"), which supports both untagged and tagged VLANs by port 13/0. |
| <b>Vlan membership</b> | Lists the VLANs to which the interface is a member.                                                                                                 |

Vlan membership:
Q Vlans
U 1

```

### Related Commands

- [interface](#) — configures a physical interface on the switch.
- [show ip interface](#) — displays Layer 3 information about the interfaces.
- [show interfaces](#) — displays information on a specific physical interface or virtual interface.
- [show interfaces transceiver](#) — displays the physical status and operational status of an installed transceiver. The output also displays the transceiver's serial number.

## show interfaces transceiver

Display the physical status and operational status of an installed transceiver. The output also displays the transceiver's serial number.

### C9000 Series

#### Syntax

```
show interfaces [tengigabitethernet slot/port | fortyGigE slot/port |
peGigE pe-id/stack-unit/port | peTenGigE pe-id/stack-unit/port] transceiver
```

#### Parameters

- |                           |                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>tengigabitethernet</b> | For a 10G interface, enter the keyword <code>tengigabitethernet</code> then the slot/port (ports or port range) information. |
| <b>fortyGigE</b>          | For a 40G interface, enter the keyword <code>fortyGigE</code> then the slot/port (ports or port-range)information.           |

**peGigE** For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.

 **NOTE:** The **peGigE** or **peTenGigE** option is only visible when the feature extended bridge feature is enabled.

**peTenGigE** For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010.           |
| 9.9(0.0)   | Introduced on the C9010.                                                    |
| 9.2(1.0)   | Introduced on the Z9500.                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                    |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.                        |
| 8.1.1.0    | Introduced on the E-Series ExaScale.                                        |
| 7.8.1.0    | Output augmented with diagnostic data for pluggable media.                  |
| 7.7.1.0    | Removed three fields in the output: Vendor Name, Vendor OUI, and Vendor PN. |
| 7.6.1.0    | Introduced on the C-Series and S-Series.                                    |
| 6.5.4.0    | Introduced on the E-Series.                                                 |

**Usage Information**

The following describes the `show interfaces transceiver` command shown in the following example.

| Line                                 | Description                                                                                                |
|--------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Rx Power measurement type</b>     | Output depends on the vendor, typically either “Average” or “OMA” (Receiver optical modulation amplitude). |
| <b>Temp High Alarm threshold</b>     | Factory-defined setting, typically in Centigrade. Value differs between SFPs and SFP+.                     |
| <b>Voltage High Alarm threshold</b>  | Displays the interface index number that SNMP uses to identify the interface.                              |
| <b>Bias High Alarm threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                            |
| <b>TX Power High Alarm threshold</b> | Factory-defined setting. Value can differ between SFP and SFP+.                                            |
| <b>RX Power High Alarm threshold</b> | Factory-defined setting. Value can differ between SFP and SFP+.                                            |
| <b>Temp Low Alarm threshold</b>      | Factory-defined setting. Value can differ between SFP and SFP+.                                            |

| Line                                   | Description                                                                                                                                                                                                                                                       |

| <b>Voltage Low Warning threshold</b>   | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                                                                                                                                   |
| <b>Bias Low Warning threshold</b>      | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                                                                                                                                   |
| <b>TX Power Low Warning threshold</b>  | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                                                                                                                                   |
| <b>Power Low Warning threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                                                                                                                                   |
| <b>Temperature</b>                     | Current temperature of the SFPs. If this temperature crosses Temp High alarm/warning thresholds, the temperature high alarm/warning flag is set to true.                                                                                                          |
| <b>Voltage</b>                         | Current voltage of the SFPs. If this voltage crosses voltage high alarm/warning thresholds, the voltage high alarm/warning flag is set to true.                                                                                                                   |
| <b>Tx Bias Current</b>                 | Present transmission (Tx) bias current of the SFP. If this crosses bias high alarm/warning thresholds, the TX bias high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the TX bias low alarm/warning flag is set to true. |
| <b>Tx Power</b>                        | Present Tx power of the SFP. If this crosses Tx power alarm/warning thresholds, the Tx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Tx power low alarm/warning flag is set to true.                      |
| <b>Rx Power</b>                        | Present receiving (Rx) power of the SFP. This value is either average Rx power or OMA. This depends on the Rx Power measurement type displayed above. If this crosses Rx power alarm/warning thresholds, the Rx power high alarm/warning flag                     |

| Line                                 | Description                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | is set to true. If it falls below the low alarm/warning thresholds, the Rx power low alarm/warning flag is set to true.                                                           |
| <b>Data Ready state Bar</b>          | This field indicates that the transceiver has achieved power up and data is ready. This is set to true if data is ready to be sent and set to false if data is being transmitted. |
| <b>Rx LOS state</b>                  | This is the digital state of the Rx_LOS output pin. This is set to true if the operating status is down.                                                                          |
| <b>Tx Fault state</b>                | This is the digital state of the Tx Fault output pin.                                                                                                                             |
| <b>Rate Select state</b>             | This is the digital state of the SFP rate_select input pin.                                                                                                                       |
| <b>RS state</b>                      | This is the reserved digital state of the pin AS(1) per SFF-8079 and RS(1) per SFF-8431.                                                                                          |
| <b>Tx Disable state</b>              | If the admin status of the port is down, then this flag is set to true.                                                                                                           |
| <b>Temperature High Alarm Flag</b>   | This can be either true or false, depending on the Current voltage value displayed above.                                                                                         |
| <b>Voltage High Alarm Flag</b>       | This can be either true or false, depending on the Current Temperature value displayed above.                                                                                     |
| <b>Tx Bias High Alarm Flag</b>       | This can be either true or false, depending on the present Tx bias current value displayed above.                                                                                 |
| <b>Tx Power High Alarm Flag</b>      | This can be either true or false, depending on the Current Tx bias power value displayed above.                                                                                   |
| <b>Rx Power High Alarm Flag</b>      | This can be either true or false, depending on the Current Rx power value displayed above.                                                                                        |
| <b>Temperature Low Alarm Flag</b>    | This can be either true or false, depending on the Current Temperature value displayed above.                                                                                     |
| <b>Voltage Low Alarm Flag</b>        | This can be either true or false, depending on the Current voltage value displayed above.                                                                                         |
| <b>Tx Bias Low Alarm Flag</b>        | This can be either true or false, depending on the Tx bias current value displayed above.                                                                                         |
| <b>Tx Power Low Alarm Flag</b>       | This can be either true or false, depending on the Current Tx power value displayed above.                                                                                        |
| <b>Rx Power Low Alarm Flag</b>       | This can be either true or false, depending on the Current Rx power value displayed above.                                                                                        |
| <b>Temperature High Warning Flag</b> | This can be either true or false, depending on the Current Temperature value displayed above.                                                                                     |
| <b>Voltage High Warning Flag</b>     | This can be either true or false, depending on the Current Voltage value displayed above.                                                                                         |
| <b>Tx Bias High Warning Flag</b>     | This can be either true or false, depending on the Tx bias current value displayed above.                                                                                         |
| <b>Tx Power High Warning Flag</b>    | This can be either true or false, depending on the Current Tx power value displayed above.                                                                                        |
| <b>Rx Power High Warning Flag</b>    | This can be either true or false, depending on the Current Tx power value displayed above.                                                                                        |
| <b>Temperature Low Warning Flag</b>  | This can be either true or false, depending on the Current Temperature value displayed above.                                                                                     |
| <b>Voltage Low Warning Flag</b>      | This can be either true or false, depending on the Current Voltage value displayed above.                                                                                         |

| Line                             | Description                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Tx Bias Low Warning Flag</b>  | This can be either true or false, depending on the present Tx bias current value displayed above. |
| <b>Tx Power Low Warning Flag</b> | This can be either true or false, depending on the Current Tx power value displayed above.        |
| <b>Rx Power Low Warning Flag</b> | This can be either true or false, depending on the Current Rx power value displayed above.        |

To view the transceiver information for multiple ports of a specified slot, you can specify any random port number or a range of ports, or a combination of both.

To specify a port range, you can enter a hyphenated range of one or more port range values separated with commas; for example, show interfaces tengigabitethernet 10/0-2 transceiver

### Example

```
Dell# show interfaces tengigabitethernet 1/0 transceiver
SFP is present.

## Related Commands

- [interface](#) — configures a physical interface on the switch.
- [show ip interface](#) — displays Layer 3 information about the interface.
- [show interfaces](#) — displays information on a specific physical interface or virtual interfaces.
- [show inventory](#) — displays the switch type, components (including media), Dell Networking OS version including hardware identification numbers and configured protocols.

# show interfaces vlan

Display VLAN statistics.

## C9000 Series

**Syntax**

`show interfaces vlan {vlan-id} [LINE] {description}`

**Parameters**

***vlan-id***

Enter the interface VLAN number. The range is from 1 to 4094.

**LINE**

(OPTIONAL) Enter the name of the VLAN.

**description**

Displays the VLAN interface information with description.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.7(0.0) | Introduced this command. |

**Example**

```
Dell#show interfaces vlan 10
Vlan 10 is up, line protocol is down
Address is 90:b1:1c:f4:99:ce, Current address is 90:b1:1c:f4:99:ce
Interface index is 1107787786
Internet address is not set
Mode of IPv4 Address Assignment: NONE
DHCP Client-ID: 90b11cf499ce
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 2d17h26m
Queueing strategy: fifo
Time since last interface status change: 2d17h26m
Input Statistics:
 0 packets, 0 bytes
Output Statistics:
 0 packets, 0 bytes, 0 underruns
```

**Related Commands**

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

# show range

Display all interfaces configured using the `interface range` command.

## C9000 Series

**Syntax**

`show range`

**Command Modes**

INTERFACE RANGE (config-if-range)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                           |
| <b>8.2.1.0</b>  | Added support for 4093 VLANs on E-Series ExaScale. |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.               |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                        |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                        |
| <b>6.1.1.0</b>  | Introduced.                                        |

#### Example

```
Dell(conf)#interface range peGigE 255/1/2
Dell(conf-if-range-pegig-255/1/2)#show range
interface peGigE255/1/2 - 0
```

#### Related Commands

- [interface](#) — configures a physical interface on the switch.
- [show ip interface](#) — displays Layer 3 information about the interfaces.
- [show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show running-config ecmp-group

Display interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution using the `ecmp-group monitoring enable` command. The ECMP group could have a LAG or a list of 10G/40 interfaces (not just LAG link-bundles).

### C9000 Series

| <b>7.6.1.0</b>           | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |
| <b>7.5.1.0</b>           | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |
| <b>Usage Information</b> | <p>The <code>shutdown</code> command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the <code>show ip interface brief</code> command. Disabled interfaces are listed as down.</p> <p>Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the <code>shutdown</code> command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter <code>no shutdown</code> on the port channel interface and at least one interface within that port channel.</p> <p>The <code>shutdown</code> and <code>description</code> commands are the only commands that you can configure on an interface that is a member of a port channel.</p>             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |
| <b>Related Commands</b>  | <p><a href="#">interface port-channel</a> — creates a port channel interface.</p> <p><a href="#">interface vlan</a> — creates a VLAN.</p> <p><a href="#">show ip interface</a> — displays the interface routing status. Add the keyword <code>brief</code> to display a table of interfaces and their status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |

## speed (for 10/100/1000/10000 interfaces)

Set the speed for 10/100/1000/10000 interfaces. Set both sides of a link to the same speed (10/100/1000/10000) or to auto or the link may not come up.

|                   |                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>speed {10   100   1000   10000   auto}</code><br><br>To return to the default setting, use the <code>no speed {10   100   1000   10000}</code> command. |
| <b>Parameters</b> | <b>10</b> Enter the keyword 10 to set the interface's speed to 10 Mb/s.                                                                                       |

**NOTE:** This interface speed is not supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card. If the command is entered for these interfaces, an error message appears.

- 100** Enter the keyword `100` to set the interface's speed to 10/100 Mb/s.  
**NOTE:** When this setting is enabled, only 100Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
- 1000** Enter the keyword `1000` to set the interface's speed to 1000 Mb/s. Auto-negotiation is enabled. For more information, refer to `negotiation auto`.  
**NOTE:** When this setting is enabled, only 1000Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
- 10000** Enter the keyword `10000` to set the interface's speed to 10000 Mb/s. Auto-negotiation is enabled. For more information, refer to `negotiation auto`.
- auto** Enter the keyword `auto` to set the interface to auto-negotiate its speed. Auto-negotiation is enabled. For more information, refer to `negotiation auto`.

#### Defaults

**auto**

| Version           | Description                                          |
|-------------------|------------------------------------------------------|
| <b>9.10(0.0)</b>  | Added support for fanned-out 1 Gigabit SFP port.     |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                             |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                             |
| <b>8.3.7.0</b>    | Introduced on the S4810.                             |
| <b>8.3.1.0</b>    | Supported on LC-EH-GE-50P or the LC-EJ-GE-50P cards. |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                          |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                          |

#### E-Series legacy command

#### Usage Information

This command is found on the 10/100/1000/10000 Base-T Ethernet interfaces.

When you enable `auto`, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000/10000 interface, confirm the `negotiation auto` command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or `auto`, the software sets the link to auto-negotiation and you cannot change that setting.

**NOTE:** Starting with Dell Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with

the `speed` command. When you set the speed to **10** or **100 Mbps**, you can also use the `duplex` command.

If you use an active optical cable (AOC), you can convert the QSFP+ port to a 10 Gigabit SFP+ port or 1 Gigabit SFP port. You can use the `speed` command to enable the required speed.

## speed (Management interface)

Set the speed for the Management interface.

### C9000 Series

**Syntax** `speed {10 | 100 | auto}`

To return to the default setting, use the `no speed {10 | 100}` command.

|                   |             |                                                                                       |
|-------------------|-------------|---------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>10</b>   | Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s.            |
|                   | <b>100</b>  | Enter the keyword <code>100</code> to set the interface's speed to 10/100 Mb/s.       |
|                   | <b>auto</b> | Enter the keyword <code>auto</code> to set the interface to auto-negotiate its speed. |

**Defaults** `auto`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.9(0.0) | Introduced on the C9010.              |
| 9.2(1.0) | Introduced on the Z9500.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.11.1 | Introduced on the S55, S60, and S4810 |
| 8.1.1.0  | Introduced on the E-Series ExaScale.  |
| 7.5.1.0  | Introduced on the C-Series.           |
| 6.2.1.0  | Introduced on the E-Series.           |

**Usage Information** This command is found on the Management interface only.

**Related Commands**

- [interface ManagementEthernet](#) — configures the Management port on the system (either the Primary or Standby RPM).
- [management route](#) — configures a static route that points to the Management interface or a forwarding router.

# switchport

Place an interface in Layer 2 mode.

## C9000 Series

Syntax

```
switchport [backup interface {tengigabit slot/port | fortyGigE slot/port | port-channel number}]
```

To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a switchport backup interface is configured, first remove the backup configuration. To remove a switchport backup interface, enter the `no switchport backup interface {tengigabit slot/port | fortyGigE slot/port | port-channel number}` command.

Parameters

backup interface

Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keywords `backup interface` configures a backup port so that if the primary port fails, the backup port changes to the up state. If the primary later comes up, it becomes the backup.

tengigabit

Enter the keyword `tengigabit` if the backup port is a 10G port.

fortyGigE

Enter the keyword `fortyGigE` if the backup port is a 40G port.

port-channel

Enter the keywords `port-channel` if the backup port is a static or dynamic port channel.

slot/port

Specify the line card and port number of the backup port.

Defaults

Disabled (The interface is in Layer 3 mode.)

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                              |
|----------|------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                 |
| 9.2(1.0) | Introduced on the Z9500.                                                                 |
| 8.3.19.0 | Introduced on the S4820T.                                                                |
| 8.3.11.1 | Introduced on the Z9000.                                                                 |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                     |
| 8.4.1.0  | Added support for port-channel interfaces (the <code>port-channel number</code> option). |
| 8.3.7.0  | Introduced on the S4810.                                                                 |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                                     |
| 7.7.1.0  | Added the <code>backup interface</code> option.                                          |
| 7.6.1.0  | Introduced on the S-Series.                                                              |
| 7.5.1.0  | Introduced on the C-Series.                                                              |
| 6.2.1.0  | Introduced on the E-Series.                                                              |

Usage Information

If an IP address or VRRP group is assigned to the interface, you cannot use the `switchport` command on the interface. To use the `switchport` command on an interface, only the `no ip address` and `no shutdown` statements must be listed in the `show config` output.

When you enter the `switchport` command, the interface is automatically added to the default VLAN.

To use the `switchport backup interface` command on a port, first enter the `switchport` command. For more information, see the “Configuring Redundant Links” section in the “Layer 2” chapter of the *Dell Networking OS Configuration Guide*.

**Related Commands**

[interface port-channel](#) — creates a port channel interface.  
[show interfaces switchport](#) — displays information about switchport interfaces.

## wavelength

Set the wavelength for tunable 10-Gigabit SFP+ optics.

**Syntax**

`wavelength`

To retain the existing wavelength, use the `no wavelength` command.

**Defaults**

none

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

**Version**

**Description**

**9.10(0.0)**

Introduced on the S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, M I/O Aggregator, FN I/O Module, MXL, C9010, S3100 series, and Z9100-ON.

**Usage Information**

The wavelength can be configured only on a tunable 10-Gigabit SFP+ optic. The wavelength range is from 1528.3 nm to 1568.77nm.

If you configure the wavelength on a non-tunable optic, there is no change to the existing wavelength. The configured wavelength is saved in the running configuration and is applicable, when a tunable optic is used.

If you do not configure the wavelength on an inserted tunable optic, the existing wavelength is used.

**Example**

The following example shows the wavelength set for a tunable 10-Gigabit SFP+ optic:

**Related Commands**

- [show config](#) — displays the interface configuration.

## Egress Interface Selection (EIS) Commands

The following commands are Egress Interface Selection (EIS) commands.

### application

Configure the management egress interface selection.

#### C9000 Series

**Syntax**

`application {all | application-type}`

To remove a management application configuration, use the `no application {all | application-type}` command.

**Parameters**

***application-type*** Enter any of the following keywords:

- For DNS, enter the keyword `dns`.
- For FTP, enter the keyword `ftp`.
- For NTP, enter the keyword `ntp`.
- For Radius, enter the keyword `radius`.
- For sFlow collectors, enter the keyword `sflow-collector`.
- For SNMP (traps and MIB responses), enter the keywords `snmp`.
- For SSH, enter the keyword `ssh`.
- For Syslog, enter the keyword `syslog`.
- For TACACS, enter the keyword `tacacs`.
- For Telnet, enter the keyword `telnet`.
- For TFTP, enter the keyword `tftp`.

**all** Configure all applications.

**Defaults** None.

**Command Modes** EIS Mode (`conf-mgmt-eis`)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                 |
|------------------|---------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                    |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                    |
| <b>9.2.(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

## clear management application pkt-cntr

Clear management application packet counters for all management application types.

### C9000 Series

**Syntax** `clear management application pkt-cntr`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                 |
|------------------|---------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                    |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                    |
| <b>9.2.(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

# management egress-interface-selection

To make configured application traffic egress through the management port instead of the front-end (FE) port, enable and configure a management egress interface.

## C9000 Series

| <b>Syntax</b>          | <code>management egress-interface-selection</code><br><br>To disable and remove management egress interface selection (EIS) configurations, use the <code>no management egress-interface-selection</code> command.                                                                                                                                                                                                                                                                                                               |         |             |          |                          |          |                          |          |                                             |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|----------|---------------------------------------------|
| <b>Defaults</b>        | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                          |          |                          |          |                                             |

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.                    |
| 9.2(1.0)  | Introduced on the Z9500.                    |
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

### Example

```
Dell# show management application pkt-cntr
dns : 2
ftp : 0
ntp : 0
radius : 0
sflow-collector : 0
snmp : 0
ssh : 0
syslog : 0
tacacs : 0
telnet : 0
tftp : 0
```

# show management application pkt-fallback-cntr

Display the number of packets for each application type that have been rerouted to the default routing table due to management port or route lookup failure.

## C9000 Series

|                 |                                                                                                                                                                                                                                                                 |

```

## Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell Networking OS, a LAG is also known as a Port Channel.

- The platform supports 4096 port channels and 16 members per port channel.

Because each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed.

Port Channel can be configured with port extender (PE) interface when feature extended bridge is enabled.

**i** **NOTE:** The Dell Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell Networking OS link aggregation control protocol (LACP) for dynamic LAGs, see the [Link Aggregation Control Protocol \(LACP\)](#) chapter. For more information about configuring and using Port Channels, see the *Dell Networking OS Configuration Guide*.

## channel-member

Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

### C9000 Series

#### Syntax

`channel-member interface`

To delete an interface from a Port Channel, use the `no channel-member interface` command.

#### Parameters

##### ***interface***

(OPTIONAL) Enter any of the following keywords and slot/port, *peid*/*stack-unit*/*port-id*, or number information:

- For a Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the *slot/port* information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the *slot/port* information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the *slot/port* information.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

|                        |                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not configured.                                                                                                                                           |
| <b>Command Modes</b>   | INTERFACE PORTCHANNEL                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                          |
|-------------------|------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced peTenGigE interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                             |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>    | Introduced on the S4810.                             |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                 |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                          |
| <b>6.2.1.0</b>    | Introduced on the E-Series.                          |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Use the <code>interface port-channel</code> command to access this command.                                                                                                                                                                                                                                                                                                                                 |
|                          | You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the <code>shutdown</code> , <code>description</code> , <code>mtu</code> , and <code>ip mtu</code> commands can be configured on an interface if it is added to a Port Channel. The <code>mtu</code> and <code>ip mtu</code> commands are only available when the chassis is in Jumbo mode. |

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">description</a> — assigns a descriptive text string to the interface. |
|                         | <a href="#">interface port-channel</a> — creates a Port Channel interface.        |
|                         | <a href="#">shutdown</a> — disables/enables the port channel.                     |

## group

Group two LAGs in a supergroup ("fate-sharing group" or "failover group").

## C9000 Series

|               |                                                                                           |
|---------------|-------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>group group_number port-channel number port-channel number</code>                   |
|               | To remove an existing LAG supergroup, use the <code>no group group_number</code> command. |

Parameters

group\_number

Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group.

port-channel number

Enter the keywords port-channel then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs.

Defaults

none

Command Modes

PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version

Description

9.9(0.0)

Introduced on the C9010.

9.2(1.0)

Introduced on the Z9500.

8.3.19.0

Introduced on the S4820T.

8.3.11.1

Introduced on the Z9000.

8.3.7.0

Introduced on the S4810.

8.1.1.0

Introduced on the E-Series ExaScale.

7.6.1.0

Introduced on the C-Series, E-Series, and S-Series.

Related Commands

port-channel failover-group

— accesses PORT-CHANNEL FAILOVER-GROUP mode to configure a LAG failover group.

show interfaces port-channel

— displays information on configured Port Channel groups.

Create a Port Channel interface, which is a link aggregation group (LAG) containing sixteen physical interfaces on the switch.

| <b>Syntax</b>          | <code>interface port-channel <i>channel-number</i></code><br>To delete a Port Channel, use the <code>no interface port-channel <i>channel-number</i></code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |

| <b>7.5.1.0</b>  | Introduced on C-Series.          |
| <b>6.2.1.0</b>  | Introduced on E-Series.          |

## Usage Information

Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the `switchport` command) or Layer 3 mode (by configuring an IP address) with an exception that when the PE ports are configured as a member of Port Channel you can configure that Port Channel in Layer 2 mode (using the `switchport` command) and add it to a VLAN.

In the Configuration Terminal Batch mode, you can configure the Port Channel in a dual-homing setup.

The `shutdown`, `description`, and `name` commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel, the interface can only have the `shutdown`, `description`, and `name` commands configured. The Port Channel's configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain both 100/1000 interfaces and GE interfaces. Based on the first interface configured in the Port Channel and enabled, the system determines if the Port Channel uses 100 Mb/s or 1000 Mb/s as the common speed. For more information, refer to [channel-member](#).

If a port extender (PE) is provisioned, cascade LAGs are created automatically (auto-LAGs). You cannot configure the port-channel created through the auto-LAG. The range for the port-channel created through auto-LAG is from 257 to 513.

If the line card is in a Jumbo mode chassis, you can also configure the `mtu` and `ip mtu` commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

**NOTE:** In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

## Example

```
Dell(conf)# int port-channel 2
Dell(conf-if-po-2)#
```

## Related Commands

- [channel-member](#) — adds a physical interface to the LAG.
- [interface](#) — configures a physical interface.
- [interface loopback](#) — configures a Loopback interface.
- [interface null](#) — configures a null interface.
- [interface vlan](#) — configures a VLAN.
- [shutdown](#) — disables/enables the port channel.

# minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in “oper up” status for the LAG to be also in “oper up” status.

## C9000 Series

### Syntax

```
minimum-links number
```

| Parameters        | <i>number</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Enter the number of links in a LAG that must be in “oper up” status. The range is from 1 to 16. The default is <b>1</b> . |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |                |                             |

| Usage Information | <p>If you use this command to configure the minimum number of links in a LAG that must be in “oper up” status, the LAG must have at least that number of “oper up” links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                           |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |                |                             |

| <b>7.6.1.0</b>         | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |

## Usage Information

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, refer to the “Port Channel” chapter in the *Dell Networking OS Configuration Guide*.

## Related Command

[group](#) — groups two LAGs in a supergroup (“fate-sharing group”).  
[show interfaces port-channel](#) — displays information on configured Port Channel groups.

# show config

Display the current configuration of the selected LAG.

## C9000 Series

### Syntax

`show config`

### Command Modes

INTERFACE PORTCHANNEL

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.0</b>  | Introduced on the E-Series. |

### Example

```
Dell(conf-if-po-1)# show config
!
interface Port-channel 1
 no ip address
 shutdown
Dell(conf-if-po-1)#
```

# show interfaces port-channel

Display information on configured Port Channel groups.

## C9000 Series

### Syntax

`show interfaces port-channel [channel-number] [brief]`

### Parameters

**channel-number** For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 128.

**brief** (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                    |
|-----------------|--------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                       |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                       |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.                                           |
| <b>7.6.1.0</b>  | Introduced on the S-Series. Modified to display the LAG failover group status. |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                    |

**Usage Information** To view the show output for multiple ports of a specified slot at a time, you can specify any random port number or a range of ports, or a combination of both.

To specify a port range, you can enter a hyphenated range of one or more port range values separated with commas; for example, `show interfaces port-channel 1-2,7`. To enter any random number of ports, you can enter a comma-separated string of port numbers, for example `show interfaces port-channel 1,7`

 **NOTE:** The port-range option is only available for 1 Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, Fast Ethernet, FC, Port Channel, and VLAN interfaces.

The following describes the `show interfaces port-channel` command shown in the following example.

| Field                          | Description                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Port-Channel 1...</b>       | Displays the LAG's status. In the Example, the status of the LAG's LAG fate-sharing group ("Failover-group") is listed.        |
| <b>Hardware is...</b>          | Displays the interface's hardware information and its assigned MAC address.                                                    |
| <b>Port-channel is part...</b> | Indicates whether the LAG is part of a LAG fate-sharing group ("Failover-group").                                              |
| <b>Internet address...</b>     | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.            |
| <b>MTU 1554...</b>             | Displays link and IP MTU.                                                                                                      |
| <b>LineSpeed</b>               | Displays the interface's line speed. For a port channel interface, it is the line speed of the interfaces in the port channel. |
| <b>Members in this...</b>      | Displays the interfaces belonging to this port channel.                                                                        |
| <b>ARP type:...</b>            | Displays the ARP type and the ARP timeout value for the interface.                                                             |
| <b>Last clearing...</b>        | Displays the time when the <code>show interfaces</code> counters were cleared.                                                 |
| <b>Queueing strategy.</b>      | States the packet queuing strategy. FIFO means first in first out.                                                             |
| <b>packets input...</b>        | Displays the number of packets and bytes into the interface.                                                                   |

| Field                        | Description                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input 0 IP packets...</b> | Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet. |
| <b>0 64-byte...</b>          | Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.                                                                               |
| <b>Received 0...</b>         | Displays the type and number of errors or other specific packets received. This information is displayed over three lines.                                                                                        |
| <b>Output 0...</b>           | Displays the type and number of packets sent out the interface. This information is displayed over three lines.                                                                                                   |
| <b>Rate information...</b>   | Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.                                                                                    |
| <b>Time since...</b>         | Displays the time since the last change in the configuration of this interface.                                                                                                                                   |

#### Example (peGigE)

```

Dell(conf)#do sho int po 111
Port-channel 111 is up, line protocol is up
Created by LACP protocol
Hardware address is 34:17:eb:00:21:91, Current address is
34:17:eb:00:21:91
Interface index is 1258348032
Minimum number of links to bring Port-channel up is 1
Internet address is not set
Mode of IPv4 Address Assignment : NONE
DHCP Client-ID :3417eb002191
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 5000 Mbit
Members in this channel: PeGi 1/0/36(U) PeGi 1/0/37(U) PeGi 1/0/38(U)
PeGi 1/0/39(U) PeGi 1/0/46(U)
ARP type: ARPA, ARP Timeout 04:00:00
Queueing strategy: fifo
Input Statistics:
 31035168 packets, 24674745108 bytes
 17 64-byte pkts, 1278919 over 64-byte pkts, 2729921 over 127-byte
pkts
 5457788 over 255-byte pkts, 10924046 over 511-byte pkts, 10644476
over 1023-byte pkts
 497 Multicasts, 0 Broadcasts, 31034654 Unicasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 30771019 packets, 24493783827 bytes, 0 underruns
 16 64-byte pkts, 1247561 over 64-byte pkts, 2706754 over 127-byte
pkts
 5417155 over 255-byte pkts, 10823333 over 511-byte pkts, 10576198
over 1023-byte pkts
 481 Multicasts, 0 Broadcasts, 30770539 Unicasts
 0 throttles, 0 discarded, 0 collisions, 0 wredrops
Rate info (interval 299 seconds):
 Input 1555.00 Mbits/sec, 244550 packets/sec, 31.88% of line-rate
 Output 676.00 Mbits/sec, 106216 packets/sec, 13.86% of line-rate
Time since last interface status change: 00:01:41

```

#### Example

```

Dell# show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1 is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Te 0/5 Te 0/18
ARP type: ARPA, ARP timeout 04:00:00
Last clearing of "show interfaces" counters 00:00:00
Queueing strategy: fifo

```

```

44507301 packets input, 3563070343 bytes
Input 44506754 IP Packets, 0 Vlans 0 MPLS
41 64-byte pkts, 44502871 over 64-byte pkts, 249 over 127-byte pkts
407 over 255-byte pkts, 3127 over 511-byte pkts, 606 over 1023-byte
pkts
Received 0 input symbol errors, 0 runts, 0 giants, 0 throttles
0 CRC, 0 IP Checksum, 0 overrun, 0 discarded
1218120 packets output, 100745130 bytes, 0 underruns
Output 5428 Multicasts, 4 Broadcasts, 1212688 Unicasts
1216142 IP Packets, 0 Vlans, 0 MPLS
0 throttles, 0 discarded
Rate info (interval 299 sec):
Input 01.50Mbits/sec, 2433 packets/sec
Output 00.02Mbits/sec, 4 packets/sec
Time since last interface status change: 00:22:34

Dell#

```

## Usage Information

The following describes the `show interfaces port-channel brief` command shown in the following example.

| Field             | Description                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LAG</b>        | Lists the port channel number.                                                                                                                                                                                                                                                                                                                  |
| <b>Mode</b>       | Lists the mode: <ul style="list-style-type: none"> <li>• L3 — for Layer 3</li> <li>• L2 — for Layer 2</li> </ul>                                                                                                                                                                                                                                |
| <b>Status</b>     | Displays the status of the port channel. <ul style="list-style-type: none"> <li>• down — if the port channel is disabled (shutdown)</li> <li>• up — if the port channel is enabled (no shutdown)</li> </ul>                                                                                                                                     |
| <b>Uptime</b>     | Displays the age of the port channel in hours:minutes:seconds.                                                                                                                                                                                                                                                                                  |
| <b>Ports</b>      | Lists the interfaces assigned to this port channel.                                                                                                                                                                                                                                                                                             |
| <b>(untitled)</b> | Displays the status of the physical interfaces (up or down). <ul style="list-style-type: none"> <li>• In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU.</li> <li>• In Layer 3 port channels, the primary port is not indicated.</li> </ul> |

## Example

```

Dell# sh int por 1 br

LAG Mode Status Uptime Ports
1 L2 up 00:00:08 Te 2/0 (Up) *
 Te 2/1 (Down)
 Te 2/2 (Up)

Dell#

```

## Example (port-range)

```

Dell#show interfaces port-channel 1-2 brief
Codes: L - LACP Port-channel
 O - OpenFlow Controller Port-channel
 A - Auto Port-channel
 I - Internally Lagged

LAG Mode Status Uptime Ports
1 L3 down 00:00:00 Te 11/1 (Down)

```

## Related Commands

[show lacp](#) — displays the LACP matrix.

# show port-channel-flow

Display an egress port in a given port-channel flow.

## C9000 Series

### Syntax

```
show port-channel-flow outgoing-port-channel number incoming-interface
interface {source-ip address destination-ip address} | {source-port number
destination-port number} | {src-mac address dest-mac address {vlan vlanid |
ether-type}}
```

### Parameters

#### outgoing-port-channel *number*

Enter the keywords `outgoing-port-channel` then the number of the port channel to display flow information.

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

#### incoming-interface *interface*

Enter the keywords `incoming-interface` then the interface type and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Gigabit Ethernet interface, enter the keyword `gigabitethernet` then the slot/port information.
- For a port extender (PE) Gigabit Ethernet interface, enter the keyword `peGigE` then the *peid/stack-unit/port-pipe id* information.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

 **NOTE:** The **peGigE** or **peTenGigE** option is available only when the extended bridge feature is enabled.

#### source-ip *address*

Enter the keywords `source-ip` then the IP source address in IP address format.

#### destination-ip *address*

Enter the keywords `destination-ip` then the IP destination address in IP address format.

#### source-port *number*

Enter the keywords `source-port` then the source port number. The range is from 1 to 65536. The default is **None**.

#### destination-port *number*

Enter the keywords `destination-port` then the destination port number. The range is from 1 to 65536. The default is **None**.

#### source-mac *address*

Enter the keywords `source-mac` then the MAC source address in the `nn:nn:nn:nn:nn:nn` format.

#### destination-mac *address*

Enter the keywords `destination-mac` then the MAC destination address in the `nn:nn:nn:nn:nn:nn` format.

#### vlan *vlan-id*

Enter the keywords `vlan` then the VLAN-id. The range is from 0 to 4094.

#### ether-type

Enter the keywords `ether-type` in the `XX:XX` format.

**Command Modes** EXEC

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                          |
|-------------------|------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced peTenGigE interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                             |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                             |
| <b>8.3.10.0</b>   | Introduced on the S4810.                             |

#### Usage Information

Because this command calculates based on a Layer 2 hash algorithm, use this command to display flows for switched Layer 2 packets, not for routed packets (use the `show ip flow` command to display routed packets).

The `show port-channel-flow` command returns the egress port identification in a given port-channel if a valid flow is entered. A mismatched flow error occurs if MAC-based hashing is configured for a Layer 2 interface and you are trying to display a Layer 3 flow.

The output displays three entries:

- Egress port for unfragmented packets.
- In the event of fragmented packets, the egress port of the first fragment.
- In the event of fragmented packets, the egress port of the subsequent fragments.

**NOTE:** In the `show port channel flow` command output, the egress port for an unknown unicast, multicast, or broadcast traffic is not displayed.

The following example shows the `show port-channel-flow outgoing-port-channel number incoming-interface interface source-mac address destination-mac address`

- Load-balance is configured for MAC
- Load-balance is configured for IP 4-tuple/2-tuple
- A non-IP payload is going out of Layer 2 LAG interface that is a member of VLAN with an IP address

#### Example

```
Dell#show port-channel-flow port-channel 1 incoming-interface te 2/0
source-mac 00:00:50:00:00:00 destination-mac 00:00:a0:00:00:00

Egress Port for port-channel 1, for the given flow, is Te 2/1
```

#### Example: peGigE

```
Dell#show port-channel-flow port-channel 111 incoming-interface pegigE
111/0/33
src-mac 00:01:0b:00:00:00 dest-mac 00:01:0b:00:03:00 vlan 111 ether-
type ff:ff

Egress Port information for port-channel 111, for the given flow,is
PeGi 111/0/38.
```

## HiGig Port Channel Commands

High-Gigabit Ethernet (HiGig) port channels are used to transmit data between internal backplane ports on line-card (leaf) and switch fabric module (SFM - spine) network processing units (NPUs). You can configure an SNMP trap to be generated when traffic distribution in a HiGig port channel is uneven.

**NOTE:** HiGig port channels on the backplane are also referred to as *HiGig link bundles*.

The backplane port channels operate as HiGig link bundles to transmit data traffic between line-card and SFM NPUs. There are 10 line-cards and 2 SFM NPUs. The 6 SFM (spine) NPUs comprise the switch fabric module.

Each line-card has one NPU numbered 0. SFM NPUs are numbered 0 to 1.

Line-card and SFM NPUs use HiGig port channels to transmit data.

- An SFM NPU uses 10 HiGig port channels, one port channel to transmit data to each line-card NPU. Each HiGig port channel in an SFM NPU consists of three HiGig links.
- A line-card NPU supports 24 front-end I/O ports and six backplane HiGig ports. The six backplane links are members of two HiGig port channel that connects the line-card NPU to each SFM NPU. Three HiGig links in the port channel are used to connect to each SFM NPU.

## clear hardware hg-stats

Clear traffic statistics from a HiGig port in a HiGig link bundle/port channel on a line-card or switch fabric module (SFM) NPU.

Example

```

Dell#clear hardware linecard 0 hg-stats unit 0 port 27

Dell#show hardware linecard 0 hg-stats unit 0 port 27
Higig Port Statistics:
HiGigabitEthernet 0/0/27,
Input Statistics:
 0 packets, 0 bytes
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 0 packets, 0 bytes 0 underruns
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts 0 Unicasts
 0 throttles, 0 discarded, 0 collisions 0 wredDrops
 0 Green WredDrops 0 Yellow WredDrops, 0 Red WredDrops
Rate info (interval 15 seconds):
 Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate

```

**Related  
Commands**

[show hardware hg-stats](#) — displays traffic statistics from internal ports in a HiGig link bundle.

## hg-link-bundle-monitor enable

Enable the monitoring of link utilization and traffic distribution in backplane HiGig link bundles/port channels on a line-card or switch fabric module (SFM) NPU.

### C9000 Series

**Syntax**

```
hg-link-bundle-monitor {sfm npu-id hg-port-channel hg-port-channel-id |
slot slot npuUnit npu-id hg-port-channel 0} enable
```

To disable HiGig link-bundle monitoring, use the `no` version of this command.

**Parameters**

|                                                             |                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sfm npu-id hg-port-channel hg-port-channel-id</i></b> | Specify a HiGig port channel on a switch SFM (spine) NPU by entering the keyword <code>sfm</code> and SFM NPU ID, then <code>hg-port-channel</code> and a HiGig port channel ID. SFM NPU IDs are 0 to 1; SFM HiGig port-channel IDs are 0 to 10.                                                                   |
| <b><i>slot slot-id npuUnit npu-id hg-port-channel 0</i></b> | Specify a HiGig port channel on a line-card (leaf) NPU by entering the keyword <code>slot</code> and slot number, then <code>npuUnit</code> and line-card NPU ID, then <code>hg-port-channel 0</code> . Line-card slot numbers are 0 to 11; line-card NPU ID is 0. The HiGig port-channel ID range is from 0 to 2. |
| <b><i>enable</i></b>                                        | Enable HiGig link-bundle monitoring.                                                                                                                                                                                                                                                                               |

**Command Mode** CONFIGURATION

**Command  
History**

| Version         | Description                     |
|-----------------|---------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.        |
| <b>9.2(1.0)</b> | Introduced on the Z9500.        |
| <b>9.3.0.0</b>  | Introduced on the Z9000 switch. |

**Usage  
Information**

You can configure HiGig link bundle monitoring so that a system log message or an SNMP trap is generated when traffic distribution in a bundle is uneven. The formula that determines uneven traffic distribution is predefined.

## hg-link-bundle-monitor rate-interval

Specify the interval (in seconds) for polling traffic distribution in the member links of a HiGig link bundle.

### C9000 Series

**Syntax**

```
hg-link-bundle-monitor rate-interval seconds
```

To restore the default value, use the `no` version of this command.

**Parameters**

|                       |                                                                   |
|-----------------------|-------------------------------------------------------------------|
| <b><i>seconds</i></b> | Polling interval in seconds. The valid values are from 10 to 299. |
|-----------------------|-------------------------------------------------------------------|

**Command Mode** CONFIGURATION

**Command  
History**

| Version         | Description                     |
|-----------------|---------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.        |
| <b>9.2(1.0)</b> | Introduced on the Z9500 switch. |
| <b>9.3.0.0</b>  | Introduced on the Z9000 switch. |

|                          |                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>          | The default polling interval for HiGig link bundles is 15 seconds.                                                      |
| <b>Usage Information</b> | The rate interval used to poll member links is globally configured and applied to all HiGig link bundles in the system. |

## hg-link-bundle-monitor trigger-threshold

Specify the bandwidth-percentage threshold used in HiGig link-bundle monitoring to determine uneven traffic distribution and when an alarm is generated.

### C9000 Series

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                          |

|                          | <b>9.3.0.0</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Introduced on the Z9000 platform.                                                                                        |
| <b>Defaults</b>          | The default trigger-threshold value is 60.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                          |
| <b>Usage Information</b> | The trigger-threshold of bandwidth usage, which determines when the calculation of link-bundle utilization is performed, is set at 60 percent of the link-bundle bandwidth. When the total traffic use (mean) is below the trigger-threshold percentage, unevenness in link-bundle traffic distribution is not reported. If traffic unevenness is detected in three consecutive measurements, an alarm is issued. The time interval between measurements is defined by the rate interval for HiGig link polling (default 15 seconds). |                                                                                                                          |

## show hardware hg-stats

Display the traffic statistics from internal ports in a HiGig link bundle/port channel on a line-card or switch fabric module (SFM) NPU.

#### Command History

| Version         | Description                                                               |
|-----------------|---------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                  |
| <b>9.3.0.0</b>  | Added support for the <code>hg-stats</code> option on the Z9000 platform. |
| <b>9.2.1.0</b>  | Introduced on the Z9500.                                                  |

#### Example (Line-card HiGig Port)

```
Dell#show hardware linecard 0 hg-stats unit 0 port 27
Higig Port Statistics:
HiGigabitEthernet 0/0/27,
Input Statistics:
 0 packets, 0 bytes
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 0 packets, 0 bytes 0 underruns
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts 0 Unicasts
 0 throttles, 0 discarded, 0 collisions 0 wredDrops
 0 Green WredDrops 0 Yellow WredDrops, 0 Red WredDrops
Rate info (interval 15 seconds):
 Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Dell#
Dell#show hardware sfm 0 hg-stats port 1
Higig Port Statistics:
HiGigabitEthernet 10/0/1,
Input Statistics:
 0 packets, 0 bytes
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 0 packets, 0 bytes 0 underruns
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts 0 Unicasts

 0 Green WredDrops 0 Yellow WredDrops, 0 Red WredDrops
Rate info (interval 15 seconds):
 Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
```

#### Example (SFM HiGig Port)

```
Dell# show hardware sfm 5 hg-stats port 19
Higig Port Statistics:
HiGigabitEthernet 3/5/19,
Input Statistics:
 0 packets, 0 bytes
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 63970532045 packets, 5117642582960 bytes 0 underruns
 0 64-byte pkts, 63970531981 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
```

```

 0 Multicasts, 0 Broadcasts 63970532058 Unicasts
 0 throttles, 0 discarded, 0 collisions 0 wredDrops
Rate info (interval 15 seconds):
 Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 37096.40 Mbits/sec, 57963128 packets/sec, 94.88% of line-
rate

```

### Example (SFM HiGig Port)

```

Dell# show hardware sfm 5 hg-stats port 19
HiGig Port Statistics:
HiGigabitEthernet 3/5/19,
Input Statistics:
 0 packets, 0 bytes
 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 63970532045 packets, 5117642582960 bytes 0 underruns
 0 64-byte pkts, 63970531981 over 64-byte pkts, 0 over 127-byte pkts
 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
 0 Multicasts, 0 Broadcasts 63970532058 Unicasts
 0 throttles, 0 discarded, 0 collisions 0 wredDrops
Rate info (interval 15 seconds):
 Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 37096.40 Mbits/sec, 57963128 packets/sec, 94.88% of line-
rate

```

### Related Commands

[clear hardware hg-stats](#) — clears traffic statistics from internal ports in a HiGig link bundle.

## show hg-link-bundle-distribution

Display the operational status and link utilization in a HiGig link bundle.

### C9000 Series

#### Syntax

```
show hg-link-bundle-distribution {sfm npu-id hg-port-channel hg-port-channel-id | slot slot npuUnit npu-id hg-port-channel 0} enable
```

#### Parameters

|                                                             |                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sfm npu-id hg-port-channel hg-port-channel-id</i></b> | Specify a HiGig port channel on a switch SFM (spine) NPU by entering the keyword <i>sfm</i> and SFM NPU ID, then <i>hg-port-channel</i> and a HiGig port channel ID. SFM NPU ID is 0; SFM HiGig port-channel IDs are 0 to 10.                                                    |
| <b><i>slot slot-id npuUnit npu-id hg-port-channel 0</i></b> | Specify a HiGig port channel on a line-card (leaf) NPU by entering the keyword <i>slot</i> and slot number, then <i>npuUnit</i> and NPU ID, then <i>hg-port-channel 0</i> . Line-card slot numbers are 0 to 11; line-card NPU ID is 0. The HiGig port-channel ID is from 0 to 2. |

#### Command Modes

EXEC, EXEC Privilege

#### Command History

| Version          | Description              |
|------------------|--------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010. |
| <b>9.2.(1.0)</b> | Introduced on the Z9500. |
| <b>9.3.0.0</b>   | Introduced on the Z9000. |

#### Usage Information

The following table illustrates the fields displayed in the output of this command:

**Table 4. show hg-link-bundle-distribution Command Description**

| Field                         | Description                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link-bundle trigger threshold | Percentage value of link-bundle bandwidth that serves as the threshold for marking a link bundle as being overutilized, triggering link-bundle monitoring, and generating an SNMP alarm. |
| Slot                          | Slot number of a line card.                                                                                                                                                              |
| npuUnit                       | Network processing unit (NPU) ID number of a HiGig link bundle/port-channel.                                                                                                             |
| hg-port-channel               | Port-channel number of a HiGig link bundle.                                                                                                                                              |
| Utilization (In Percent)      | Percentage of total bandwidth usage by the traffic transmitted on the HiGig link bundle.                                                                                                 |
| Alarm State                   | Indicates whether an alarm has been generated if uneven traffic distribution occurs in a HiGig link bundle. Possible values are Active and Inactive.                                     |
| Interface                     | Member interface of the specified HiGig link bundle/port channel in the format:<br><i>slot-id/npu-id:hghigig-port-number</i>                                                             |
| Utilization (In Percent)      | Percentage of total link-bundle bandwidth used on each member link.                                                                                                                      |

**Example**

```
Dell#show hg-link-bundle-distribution slot 0 npu 0 hg-port-channel 0
hg-link-bundle trigger threshold - 60
HiGigabitEthernet Link Bundle 0/0/0,
 Utilization [In Percent] - 0 Alarm State - Inactive
Interface Utilization [In Percent]
0/0:hg27 0
0/0:hg28 0
0/0:hg29 0
```

## snmp-server enable traps hg-lbm

Enable the generation of SNMP traps and notifications when HiGig link-bundle monitoring is enabled.

### C9000 Series

**Syntax** `snmp-server enable traps hg-lbm`

**Parameters** **hg-lbm** Enter the keyword `hg-lbm` to enable traps for HiGig link-bundle monitoring.

**Command Modes** CONFIGURATION mode

| Command History | Version         | Description              |
|-----------------|-----------------|--------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010. |
|                 | <b>9.2.1.0</b>  | Introduced on the Z9500. |

| Version | Description              |
|---------|--------------------------|
| 9.3.0.0 | Introduced on the Z9000. |

## Time Domain Reflectometer (TDR) Commands

TDR is useful for troubleshooting an interface that is not establishing a link; either it is flapping or not coming up at all. TDR detects open or short conditions of copper cables on 100/1000 Base-T modules.

### Important Points to Remember

- The interface and port must be enabled (configured—refer to the `interface` command) before running TDR. An error message is generated if you have not enabled the interface.
- The interface on the far-end device must be shut down before running TDR.
- Because TDR is an intrusive test on an interface that is not establishing a link, do not run TDR on an interface that is passing traffic.
- When testing between two devices, do not run the test on both ends of the cable.

### tdr-cable-test

Test the condition of copper cables on 100/1000 Base-T modules.

|                        |                                                                                                                                                               |                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tdr-cable-test interface</code>                                                                                                                         |                                                                                                                                                                       |
| <b>Parameters</b>      | <b><i>interface</i></b>                                                                                                                                       | Enter the keyword <code>TenGigabitEthernet</code> , <code>peGigE</code> or <code>peTenGigE</code> then the slot/port information for the 100/1000 Ethernet interface. |
| <b>Defaults</b>        | None                                                                                                                                                          |                                                                                                                                                                       |
| <b>Command Modes</b>   | EXEC                                                                                                                                                          |                                                                                                                                                                       |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                       |

| Version    | Description                                                       |
|------------|-------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010. |
| 9.10(0.1)  | Introduced on the S4048T-ON.                                      |
| 9.10(0.0)  | Introduced on the S3148.                                          |
| 9.9(0.0)   | Introduced on the C9010.                                          |
| 9.8(2.0)   | Introduced on the S3100 series.                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                       |
| 9.7.0.0    | Introduced on the S5000.                                          |
| 8.3.19.0   | Introduced on the S4820T.                                         |
| 8.3.11.1   | Introduced on the Z9000.                                          |
| 8.3.7.0    | Introduced on the S4810.                                          |
| 8.2.1.0    | Introduced on the E-Series.                                       |
| 7.7.1.0    | Introduced on the S Series.                                       |

| 6.1.1.0    | Introduced on the E-Series.                                       |

Usage Information

The interface must be enabled to run the test or an error message is generated:

```
DellEMC# tdr-cable-test tengigabitethernet 11/1
% Error: Interface is disabled Te 11/1.
```

Syslog messages are generated when the link flaps during TDR tests.  
In a dual homing setup, you can use this command only from the primary VLT peer.

Related Commands

- [show tdr](#) — display the results of the TDR test.

show tdr

Display the TDR test results.

| 6.1.1.0    | Introduced.                                          |

Usage Information

If the TDR test has not been run, an error message is generated:

```
%Error: Please run the TDR test first
```

The following describes the TDR test status.

| Status            | Definition                                                                           |
|-------------------|--------------------------------------------------------------------------------------|
| <i>OK Status:</i> | TDR test is complete, no fault is detected on the cable, and the test is terminated. |
| <i>Terminated</i> |                                                                                      |

| Status                                                | Definition                                                                                                                        |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Length: 92 (+/- 1) meters,<br/>Status: Shorted</b> | A short is detected on the cable. The location, in this Example is 92 meters. The short is accurate to plus or minus one meter.   |
| <b>Length: 93 (+/- 1) meters,<br/>Status: Open</b>    | An opening is detected on the cable. The location, in this Example is 93 meters. The open is accurate to plus or minus one meter. |
| <b>Status:<br/>Impedance<br/>Mismatch</b>             | There is an impedance mismatch in the cables.                                                                                     |

**Example**

```
DellEMC# show tdr tengigabitethernet 11/2
Time since last test: 00:00:11
 Pair A, Length: OK Status: Terminated
 Pair B, Length: OK Status: Terminated
 Pair C, Length: OK Status: Terminated
 Pair D, Length: OK Status: Terminated
```

**Related  
Commands**

- [tdr-cable-test](#) — run the TDR test.

# Intermediate System to Intermediate System (IS-IS)

The intermediate system to intermediate system (IS-IS) is an interior gateway protocol that uses a shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing both IP and OSI traffic.

A router is considered an intermediate system. Networks are partitioned into manageable routing domains, called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the *Dell Networking OS Configuration Guide*.

**i NOTE:** The fundamental mechanisms of IS-IS are the same between IPv4 and IPv6. Where there are differences between the two versions, they are identified and clarified in this chapter. Except where identified, the information in this chapter applies to both protocol versions.

# adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

## C9000 Series

| <b>Syntax</b>          | <code>adjacency-check</code><br><br>To disable adjacency check, use the <code>no adjacency-check</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                 |                          |                 |                                          |                 |                             |

| Version                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                                          |                 |                             |
| <b>9.9(0.0)</b>        | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                                          |                 |                             |
| <b>9.8(0.0)</b>        | Introduced on the S3048-ON and S4048-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                 |                          |                 |                                          |                 |                             |
| <b>9.7(0.0)</b>        | Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                                          |                 |                             |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.5(0.1)</b> | Introduced on the Z9500.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>7.5.1.0</b>  | Introduced on the E-Series. |

#### Usage Information

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

## advertise

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

### C9000 Series

#### Syntax

```
advertise {level1-into-level2 | level2-into-level1} prefix-list-name
```

To return to the default, use the `no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name]` command.

#### Parameters

|                           |                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level1-into-level2</b> | Enter the keywords <code>level1-into-level2</code> to advertise Level 1 routes into Level 2 LSPs. This setting is the default.                       |
| <b>level2-into-level1</b> | Enter the keywords <code>level2-into-level1</code> to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966. |
| <b>prefix-list-name</b>   | Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.                                         |

#### Defaults

**level1-into-level2** (Level 1 to Level 2 leaking enabled and Level 2 to Level 1 leaking is disabled.)

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>7.5.1.0</b>  | Added IPv6 ISIS support.  |

| Version | Description                |
|---------|----------------------------|
| 6.3.1.0 | Version 6.3.1.0 Introduced |

## Usage Information

You cannot disable leaking from one level to another; however, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all routes are leaked.

You cannot enable leaking from Level 2 to Level 1, conditional route leaking can be enabled via IP prefix-list.

You can find more information in IETF RFC 2966, *Domain-wide Prefix Distribution with Two-Level IS-IS*.

# area-password

Configure a hash message authentication code (HMAC) password for an area.

## C9000 Series

### Syntax

```
area-password [hmac-md5 | encryption-type] password
```

To delete a password, use the `no area-password` command.

### Parameters

|                        |                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hmac-md5</b>        | (OPTIONAL) Enter the keywords <code>hmac-md5</code> to encrypt the password.                                                                                                                                                            |
| <b>encryption-type</b> | (OPTIONAL) Enter 7 to encrypt the password using DES.                                                                                                                                                                                   |
| <b>password</b>        | Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security. |

### Defaults

Not configured.

### Command Modes

ROUTER ISIS

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

## Usage Information

To prevent the link state database from receiving incorrect routing information from unauthorized routers, use the `area-password` command on routers within an area.

The configured password injects into Level 1 LSPs, CSNPs, and PSNPs.

## Related Commands

- [domain-password](#) — allows you to set the authentication password for a routing domain.
- [isis password](#) — allows you to configure an authentication password for an interface.

# clear isis

Restart the IS-IS process. All IS-IS data is cleared.

For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                         |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                           |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON.           |
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |

# clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

## C9000 Series

|                 |                                                                                                                                                                |                                                                           |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Syntax          | clns host name nsap                                                                                                                                            |                                                                           |
| Parameters      | name                                                                                                                                                           | Enter an alphanumeric string to identify the name-to-NSAP mapping.        |
|                 | nsap                                                                                                                                                           | Enter a specific NSAP address that is associated with the name parameter. |
| Defaults        | Not configured.                                                                                                                                                |                                                                           |
| Command Modes   | ROUTER ISIS                                                                                                                                                    |                                                                           |
| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                           |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

**Usage Information**

To configure a shortcut name that you can use instead of entering a long string of numbers associated with an NSAP address, use this command.

**Related Commands**

[hostname dynamic](#) — enables dynamic learning of host names from routers in the domain and allows the routers to advertise the host names in LSPs.

## debug isis

Enable debugging for all IS-IS operations.

### C9000 Series

**Syntax**

```
debug isis
```

To disable debugging of IS-IS, use the `no debug isis` command.

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

**Usage Information**

Entering `debug isis` enables all debugging parameters.

To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate `no` forms of each command. To disable all debug messages for IS-IS at once, enter the `no debug isis` command.

# debug isis adj-packets

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

## C9000 Series

|                 |                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax          | <pre>debug isis adj-packets [<i>interface</i>] [<i>vrf vrf-name</i>]</pre> <p>To turn off debugging, use the <code>no debug isis adj-packets [<i>interface</i>] [<i>vrf vrf-name</i>]</code> command.</p>                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Parameters      | <b>vrf <i>vrf-name</i></b>                                                                                                                                                                                                                                      | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the debug information on IS-IS for an adjacency tied to that VRF. This command displays the IIH related debug details.                                                                                                                                                                                                                                                                                                                                                             |
|                 | <b><i>interface</i></b>                                                                                                                                                                                                                                         | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| Command Modes   | EXEC Privilege                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# debug isis graceful-restart

Enable debugging information on IS-IS GR hello, internal state, and event debugs.

## C9000 Series

|            |                                                                                                                                                                                                                 |                                                                                                                                                                    |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | <pre>debug isis graceful-retart [<i>vrf vrf-name</i>] [<i>all   events   hello   states</i>]</pre> <p>To turn off debugging, use the <code>no debug isis [<i>vrf vrf-name</i>] spf-triggers</code> command.</p> |                                                                                                                                                                    |
| Parameters | <b>vrf <i>vrf-name</i></b>                                                                                                                                                                                      | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information |

|               |                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|               | contains graceful-restart details tied to the VRF that you specify. This information includes GR Hello, Internal State, and Event Debug details. |
| <b>all</b>    | Enter the keyword <code>all</code> to enable debugging information that includes all the logs that are related to graceful-restart.              |
| <b>events</b> | Enter the keyword <code>events</code> to enable debugging information that includes logs that are related to generated events.                   |
| <b>hello</b>  | Enter the keyword <code>hello</code> to enable debugging information that includes restart TLV related information.                              |
| <b>states</b> | Enter the keyword <code>states</code> to enable debugging information that includes state machine related information.                           |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |

## debug isis local-updates

To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

### C9000 Series

**Syntax** `debug isis local-updates [interface] [vrf vrf-name]`  
To turn off debugging, use the `no debug isis [vrf vrf-name] updates [interface]` command.

|                   |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b>    | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|                   | <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the debugging information on IS-IS corresponding to that VRF. This information contains local updates tied to the VRF that you specify. This command displays the local LSP debugging details of the current unit.                                                                                                                                                                                                                                                                                                                                                                                                  |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |
| <b>6.3.1.0</b>  | Introduced.                                        |

## debug isis snp-packets

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a specific interface and provides diagnostic information.

### C9000 Series

|                        |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 6.3.1.0  | Introduced.               |

## debug isis spf-triggers

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>debug isis [vrf vrf-name] spf-triggers</code><br>To turn off debugging, use the <code>no debug isis [vrf vrf-name] spf-triggers</code> command.                                                                                                                                                                |
| <b>Parameters</b>      | <b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains spf trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed. |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                                                                                                                                                       |

## debug isis update-packets

Enable debugging on link state PDUs (LSPs) that a router detects.

### C9000 Series

|               |                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>debug isis update-packets [interface] [vrf vrf-name]</code><br>To turn off debugging, use the <code>no debug isis update-packets [interface]</code> command. |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>interface</i></b>    | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|                   | <b><i>vrf vrf-name</i></b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |
| <b>6.3.1.0</b>  | Introduced.                                        |

## default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

### C9000 Series

**Syntax** `default-information originate [always] [metric metric] [route-map map-name]`

To disable the generation of a default route into the specified IS-IS routing domain, use the `no default-information originate [always] [metric metric] [route-map map-name]` command.

|                   |                                  |                                                                                                                         |
|-------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>always</i></b>             | (OPTIONAL) Enter the keyword <code>always</code> to have the default route always advertised.                           |
|                   | <b><i>metric metric</i></b>      | (OPTIONAL) Enter the keyword <code>metric</code> then a number to assign to the route. The range is from 0 to 16777215. |
|                   | <b><i>route-map map-name</i></b> | (OPTIONAL) A default route the routing process generates if the route map is satisfied.                                 |

| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                          |                |             |

| <b>6.3.1.0</b>           | Introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                          |                |             |
| <b>Usage Information</b> | <p>When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.</p> <p>How a metric value assigned to a default route advertises depends on the <code>metric-style</code> command configuration. If the <code>metric-style</code> command is set for Narrow mode and the metric value in the <code>default-information originate</code> command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the <code>metric-style</code> command is set for Wide mode, the metric value in the <code>default-information originate</code> command is advertised.</p>                                        |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                          |                |             |
| <b>Related Commands</b>  | <ul style="list-style-type: none"> <li><a href="#">redistribute</a> — redistributes routes from one routing domain to another routing domain.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                          |                |             |

## description

Enter a description of the IS-IS routing protocol.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>6.3.1.0</b>  | Introduced.               |

**Usage Information**      The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

# distribute-list in

Filter network prefixes received in updates.

## C9000 Series

| Syntax           | <div><div>distribute-list <i>prefix-list-name</i> in [<i>interface</i>]</div><div>To return to the default values, use the no <code>distribute-list <i>prefix-list-name</i> in [<i>interface</i>]</code> command.</div></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |         |                          |         |             |

# distribute-list redistributed-override

Suppress flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

## C9000 Series

| <b>Syntax</b>            | <code>distribute-list redistributed-override in</code><br>To return to the default, use the <code>no distribute-list redistributed-override in</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |         |                          |         |             |

| <b>Usage Information</b> | When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |         |                          |         |             |

# domain-password

Set the authentication password for a routing domain.

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |
| 6.3.1.0  | Introduced.               |

**Usage Information**

The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

**Related Commands**

- [area-password](#) — configures an IS-IS area authentication password.
- [isis priority](#) — configures the authentication password for an interface.

## graceful-restart ietf

Enable graceful restart on an IS-IS router.

### C9000 Series

**Syntax**

```
graceful-restart ietf
```

To return to the default, use the `no graceful-restart ietf` command.

**Parameters**

**ietf** Enter `ietf` to enable graceful restart on the IS-IS router.

**Defaults**

Graceful restart disabled.

**Command Modes** ROUTER ISIS**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 6.3.1.0  | Introduced on the E-Series. |

**Usage Information**

Every graceful restart enabled router's HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected

network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.

The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.

## graceful-restart interval

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

### C9000 Series

## graceful-restart t1

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

### C9000 Series

| <b>Syntax</b>          | <pre>graceful-restart t1 {interval <i>seconds</i>   retry-times <i>value</i>}</pre> <p>To return to the default, use the <code>no graceful-restart t1</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                         |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                |                          |                 |                           |

|-----------------|-----------------------------|
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.1.0</b>  | Introduced on the E-Series. |

## graceful-restart t2

Configure the wait time for the graceful restart timer T2 that a restarting router uses as the wait time for each database to synchronize.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                                                                                            |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>graceful-restart t2 {level-1   level-2} seconds</code><br>To return to the default, use the <code>no graceful-restart t2</code> command.                                                                                                            |                                                                                                                                            |
| <b>Parameters</b>      | <b>level-1, level-2</b>                                                                                                                                                                                                                                   | Enter the keywords <code>level-1</code> or <code>level-2</code> to identify the database instance type to which the wait interval applies. |
|                        | <b>seconds</b>                                                                                                                                                                                                                                            | Enter the <code>graceful-restart t2</code> time in seconds. The range is from 5 to 120 seconds. The default is <b>30 seconds</b> .         |
| <b>Defaults</b>        | <b>30 seconds</b>                                                                                                                                                                                                                                         |                                                                                                                                            |

| <b>Usage Information</b> | <p>The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.</p> <p>Override the default restart-wait time by entering the <code>no graceful-restart restart-wait</code> command. When you disable <code>restart-wait</code>, the current adjacency hold time is used.</p> <p>Set the t3 timer to <code>adjacency</code> on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured <code>graceful-restart t3 adjacency</code>.</p>                                                                                                                                                         |                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                             |
| <b>Related Commands</b>  | <a href="#">graceful-restart restart-wait</a> — enables the graceful restart maximum wait time before a restarting peer comes up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                             |

## hello padding

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

### C9000 Series

|                      |                                                                                                                                                                        |                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <pre>hello padding [multi-point   point-to-point]</pre> <p>To return to the default, use the <code>no hello padding [multi-point   point-to-point]</code> command.</p> |                                                                                            |
| <b>Parameters</b>    | <b>multi-point</b>                                                                                                                                                     | (OPTIONAL) Enter the keywords <code>multi-point</code> to pad only LAN hello PDUs.         |
|                      | <b>point-to-point</b>                                                                                                                                                  | (OPTIONAL) Enter the keywords <code>point-to-point</code> to pad only point-to-point PDUs. |
| <b>Defaults</b>      | Both LAN and point-to-point hello PDUs are padded.                                                                                                                     |                                                                                            |
| <b>Command Modes</b> | ROUTER ISIS                                                                                                                                                            |                                                                                            |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IIHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

**Related Commands**

[isis hello padding](#) — turns ON or OFF hello padding on an interface basis.

## hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

### C9000 Series

**Syntax**

```
hostname dynamic
```

To disable this command, use the `no hostname dynamic` command.

**Defaults**

Enabled.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

To build name-to-systemID mapping tables through the protocol, use this command. All `show` commands that display systems also display the hostname.

**Related Commands**

[clns host](#) — defines a name-to-NSAP mapping.

# ignore-lsp-errors

Ignore LSPs with bad checksums instead of purging those LSPs.

## C9000 Series

| <b>Syntax</b>            | <code>ignore-lsp-errors</code><br><br>To return to the default values, use the <code>no ignore-lsp-errors</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|------------------------------------------|----------|-----------------------------|----------|--------------------------|---------|--------------------------|----------|---------------------------|----------|--------------------------|----------|--------------------------|
| <b>Defaults</b>          | In IS-IS, the default deletes LSPs with internal checksum errors ( <code>no ignore-lsp-errors</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |

| <b>Usage Information</b> | IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |

# ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

## C9000 Series

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>7.5.1.0</b>  | Introduced.                              |

#### Usage Information

To assign a network entity title to enable IS-IS, use the `net` command.

This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

 **NOTE:** IP address is not mandatory for forming IS-IS adjacency.

#### Related Commands

- `net` — configures an IS-IS network entity title (NET) for the routing process.
- `router isis` — enables the IS-IS routing protocol.

## ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

### C9000 Series

#### Syntax

```
ipv6 router isis [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

#### Parameters

**tag** (OPTIONAL) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

#### Defaults

Not configured.

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |

Level 1 adjacencies cannot be established on this interface. |
| <b>level-1</b>         | You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                                                                                                                                                                         |                  |                                                                                                                                                                                                                  |                     |                                                                                                                                                                                                       |
| <b>level-1-2</b>       | You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                                                                                                                                                                         |                  |                                                                                                                                                                                                                  |                     |                                                                                                                                                                                                       |
| <b>level-2-only</b>    | You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                                                                                                                                                                         |                  |                                                                                                                                                                                                                  |                     |                                                                                                                                                                                                       |

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

|                          |                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Because the default establishes Level 1 and Level 2 adjacencies, you do not need to configure this command. Routers in an IS-IS system must be configured as a Level 1-only, Level 1-2, or Level 2-only system. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Only configure interfaces as Level 1 or Level 2 on routers that are between areas (for example, a Level 1-2 router) to prevent the software from sending unused hello packets and wasting bandwidth.

## isis csnp-interval

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

### C9000 Series

| <b>Syntax</b>            | <pre>isis csnp-interval seconds [level-1   level-2]</pre> <p>To return to the default values, use the <code>no isis csnp-interval [seconds] [level-1   level-2]</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                       |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |

| <b>8.3.19.0</b>          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                       |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |
| <b>8.3.12.0</b>          | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                       |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |
| <b>8.3.11.1</b>          | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                       |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |
| <b>Usage Information</b> | <p>The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.</p> <p>You can configure Level 1 and Level 2 CSNP intervals independently.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                       |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |

## isis hello-interval

Specify the length of time between hello packets sent.

### C9000 Series

|               |                                                            |
|---------------|------------------------------------------------------------|
| <b>Syntax</b> | <pre>isis hello-interval seconds [level-1   level-2]</pre> |
|---------------|------------------------------------------------------------|

To return to the default values, use the `no isis hello-interval [seconds] [level-1 | level-2]` command.

|                   |                       |                                                                                                                                   |
|-------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>seconds</i></b> | Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is <b>10</b> . |
|                   | <b>level-1</b>        | (OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.                              |
|                   | <b>level-2</b>        | (OPTIONAL) Select this value to configure the hello interval for Level 2.                                                         |

**Defaults** seconds = **10**; **level-1** (if not otherwise specified)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

**Usage Information** Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

**Related Commands** [isis hello-multiplier](#) — specifies the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

## isis hello-multiplier

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

### C9000 Series

**Syntax** `isis hello-multiplier multiplier [level-1 | level-2]`  
To return to the default values, use the `no isis hello-multiplier [multiplier] [level-1 | level-2]` command.

|                   |                          |                                                                                                                                                                                                 |
|-------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>multiplier</i></b> | Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is <b>3</b> . |
|                   | <b>level-1</b>           | (OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.                                                                |
|                   | <b>level-2</b>           | (OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.                                                                                           |

**Defaults** multiplier = **3**; **level-1** (if not otherwise specified)

**Command Modes** INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.

**Related Commands**

[isis hello-interval](#) — specifies the length of time between hello packets.

## isis hello padding

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

### C9000 Series

**Syntax**

```
isis hello padding
```

To return to the default, use the `no isis hello padding` command.

**Defaults**

Padding of hello PDUs is enabled (ON).

**Command Modes** INTERFACE**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

**Related Commands**

[hello padding](#) — turns ON or OFF padding for LAN and point-to-point hello PDUs.

# isis ipv6 metric

Assign metric to an interface for use with IPv6 information.

## C9000 Series

| Syntax            | <pre>isis ipv6 metric default-metric [level-1   level-2]</pre> <p>To return to the default values, use the <code>no ipv6 isis metric [default-metric] [level-1   level-2]</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                             |

| <b>7.5.1.0</b>    | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                             |
| Usage Information | Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                             |

# isis metric

Assign a metric to an interface.

## C9000 Series

|            |                                                                                                                                                                                     |                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | <pre>isis metric default-metric [level-1   level-2]</pre> <p>To return to the default values, use the <code>no isis metric [default-metric] [level-1   level-2]</code> command.</p> |                                                                                                                                                                         |
| Parameters | <b>default-metric</b>                                                                                                                                                               | Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for |

Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is **10**.

If metric value is configured to more than 63, system throughs the following warning:Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.

If the metric style is WIDE, the metric values that are greater than 63 are only effective.

- level-1** (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.
- level-2** (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

**Defaults** default-metric = **10**; **level-1** (if not otherwise specified)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |

**Usage Information** Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

## isis network point-to-point

Enable the software to treat a broadcast interface as a point-to-point interface.

### C9000 Series

**Syntax** `isis network point-to-point`

To disable the feature, use the `no isis network point-to-point` command.

**Defaults** Not enabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>To protect your network from unauthorized access, use this command to prevent unauthorized routers from forming adjacencies.</p> <p>You can assign different passwords for different routing levels by using the keywords <code>level-1</code> and <code>level-2</code>.</p> <p>The <code>no</code> form of this command disables the password for Level 1 or Level 2 routing, using the respective keywords <code>level-1</code> or <code>level-2</code>.</p> |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This password provides limited security as it is processed as plain text.

## isis priority

Set the priority of the designated router you select.

### C9000 Series

|                          |                                                                                                                                                                                                                                                                          |                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>isis priority value [level-1   level-2]</code><br>To return to the default values, use the <code>no isis priority [value] [level-1   level-2]</code> command.                                                                                                      |                                                                                                                                            |
| <b>Parameters</b>        | <b>value</b>                                                                                                                                                                                                                                                             | This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is <b>64</b> . |
|                          | <b>level-1</b>                                                                                                                                                                                                                                                           | (OPTIONAL) Specify the priority for Level 1. This setting is the default.                                                                  |
|                          | <b>level-2</b>                                                                                                                                                                                                                                                           | (OPTIONAL) Specify the priority for Level 2.                                                                                               |

|                          | <b>8.3.11.1</b>                                                                                                                                                                                                                                                          | Introduced on the Z9000.                                                                                                                   |
| <b>Usage Information</b> | You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS). |                                                                                                                                            |

 **NOTE:** Routers with a priority of 0 cannot be a designated router.

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.

## is-type

Configure IS-IS operating level for a router.

### C9000 Series

|               |                                                                                                                                        |

| 8.3.11.1          | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                           |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |
| Usage Information | <p>The IS-IS protocol automatically determines area boundaries and are able to keep Level 1 and Level 2 routing separate. Poorly planned use of this feature may cause configuration errors, such as accidental area partitioning.</p> <p>If you are configuring only one area in your network, you do not need to run both Level 1 and Level 2 routing algorithms. You can configure the IS type as Level 1.</p>                                                                                                                                                                                                                                                                              |                                                                                           |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |

## log-adjacency-changes

Generate a log messages for adjacency state changes.

### C9000 Series

| <b>Syntax</b>          | <pre>log-adjacency-changes</pre> <p>To disable this function, use the <code>no log-adjacency-changes</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |

| <b>8.3.11.1</b>        | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |

Usage Information

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system's error message facility.

# lsp-gen-interval

Set the minimum interval between successive generations of link-state packets (LSPs).

## C9000 Series

Syntax

```
lsp-gen-interval [level-1 | level-2] interval seconds
[initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

Parameters

level-1

level-2

interval seconds

initial\_wait\_inter  
val seconds

second\_wait\_inte  
rval seconds

(OPTIONAL) Enter the keywords `level-1` to apply the configuration to generation of Level-1 LSPs.

(OPTIONAL) Enter the keywords `level-2` to apply the configuration to generation of Level-2 LSPs.

Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is **5 seconds**.

(OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is **1 second**.

(OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is **5 seconds**.

Defaults

Refer to *Parameters*.

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                      |
| 9.5(0.1) | Introduced on the Z9500.                      |
| 9.0.2.0  | Introduced on the S6000.                      |
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.12.0 | Introduced on the S4810.                      |
| 8.3.11.1 | Introduced on the Z9000.                      |
| 7.5.1.0  | Added support for LSP Throttling Enhancement. |

Usage Information

LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though throttling LSP generations slows down network convergence, no throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

# lsp-mtu

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router generates.

## C9000 Series

| <b>Syntax</b>            | <code>lsp-mtu size</code><br>To return to the default values, use the <code>no lsp-mtu</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |         |                                               |

| 7.5.1.0                  | Added support for LSP Throttling Enhancement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |         |                                               |
| <b>Usage Information</b> | <p>The link MTU and the LSP MTU size must be the same.</p> <p>Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the <code>lsp-mtu</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                          |          |                                          |          |                             |          |                          |         |                          |          |                           |          |                          |          |                          |         |                                               |

# lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their `max-lsp-lifetime` reaches zero and then LSPs is purged.

## C9000 Series

| Usage Information | <p>The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.</p> <p>The refresh interval must be less than the LSP lifetime specified with the <code>max-lsp-lifetime</code> command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                    |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |                |                                               |

| Version         | Description                                   |
|-----------------|-----------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                      |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                      |
| <b>9.0.2.0</b>  | Introduced on the S6000.                      |
| <b>8.3.19.0</b> | Introduced on the S4820T.                     |
| <b>8.3.12.0</b> | Introduced on the S4810.                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                      |
| <b>7.5.1.0</b>  | Added support for LSP Throttling Enhancement. |

#### Usage Information

To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

## max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

### C9000 Series

#### Syntax

`max-lsp-lifetime seconds`

To restore the default time, use the `no max-lsp-lifetime` command.

#### Parameters

**seconds**

The maximum lifetime of LSP in seconds. This value must be greater than the `lsp-refresh-interval` command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is **1200**.

#### Defaults

**1200** seconds

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

#### Usage Information

Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The `seconds` parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

#### Related Commands

[lsp-refresh-interval](#) — sets the link-state packet (LSP) refresh interval.

# maximum-paths

Configure the maximum number of equal cost paths allowed in a routing table.

## C9000 Series

**NOTE:** You can use the `maximum-paths` command to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>maximum-paths number</code><br>To return to the default values, use the <code>no maximum-paths</code> command.                                                                                                                                            |
| <b>Parameters</b>      | <b>number</b> Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is <b>4</b> .                                                                                            |

| <b>Usage Information</b> | <p>If you enter the <code>metric-style wide</code> command, the Dell Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.</p> <p>The new-style TLVs have wider metric fields than old-style TLVs.</p> <p>When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.</p>                                                                                                                                                                                                                                                                                                                                                               |                                                                                                |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                |                          |                 |                           |                 |                          |                 |                          |

## multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

### C9000 Series

| <b>7.8.1.0</b>  | Introduced.               |

## net

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

### C9000 Series

**Syntax** `net network-entity-title`

To remove a net, use the `no net network-entity-title` command.

**Parameters** ***network-entity-title*** Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

# passive-interface

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

## C9000 Series

| Syntax            | <code>passive-interface interface</code><br>To delete a passive interface configuration, use the <code>no passive-interface interface</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |

| Usage Information | Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                          |          |                          |         |                          |          |                           |          |                          |          |                          |

# redistribute

Redistribute routes from one routing domain to another routing domain.

## C9000 Series

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax | <code>redistribute {static   connected   rip} [level-1   level-1-2   level-2] [metric metric-value] [metric-type {external   internal}] [route-map map-name]</code><br><br>To end redistribution or disable any of the specified keywords, use the <code>no redistribute {static   connected   rip} [metric metric-value] [metric-type {external   internal}] [level-1   level-1-2   level-2] [route-map map-name]</code> command. |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

|                                                        |                                                                                                                                                                                                                                             |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                                       | Enter the keyword <code>connected</code> to redistribute active routes into IS-IS.                                                                                                                                                          |
| <b>rip</b>                                             | Enter the keyword <code>rip</code> to redistribute RIP routes into IS-IS.                                                                                                                                                                   |
| <b>static</b>                                          | Enter the keyword <code>static</code> to redistribute user-configured routes into IS-IS.                                                                                                                                                    |
| <b>metric <i>metric-value</i></b>                      | (OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is <b>0</b> . Use a value that is consistent with the destination protocol.                                                              |
| <b>metric-type {<i>external</i>   <i>internal</i>}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following: <ul style="list-style-type: none"><li>• <code>external</code></li><li>• <code>internal</code></li></ul> |
| <b>level-1</b>                                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                                                             |
| <b>level-1-2</b>                                       | (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.                                                                                                                                                           |
| <b>level-2</b>                                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.                                                                                                                                |
| <b>route-map <i>map-name</i></b>                       | (OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.                                                                                          |

## Defaults

- `metric metric-value = 0`
- `metric-type= internal`; **level-2**

## Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                  |
|-----------------|------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.     |
| <b>9.0.2.0</b>  | Introduced on the S6000.     |
| <b>8.3.19.0</b> | Introduced on the S4820T.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.     |
| <b>8.3.12.0</b> | Introduced on the S4810.     |
| <b>7.5.1.0</b>  | Added support for IPv6 ISIS. |
| <b>6.3.1.0</b>  | Introduced.                  |

## Usage Information

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the `redistribute` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `redistribute` command is advertised.

Related  
Commands

- [default-information originate](#) — generates a default route for the IS-IS domain.
- [distribute-list out](#) — suppresses networks from being advertised in updates. This command filters redistributed routing information.

# redistribute bgp

Redistribute routing information from a BGP process.

## C9000 Series

Syntax

```
redistribute bgp AS number [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

Parameters

|                                          |                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AS number</b>                         | Enter a number that corresponds to the autonomous system number. The range is from 1 to 65355.                                                                                                                                                                                                                          |
| <b>level-1</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.                                                                                                                                                                                                                                       |
| <b>level-1-2</b>                         | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.                                                                                                                                                                                                                                |
| <b>level-2</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.                                                                                                                                                                                                       |
| <b>metric metric-value</b>               | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                                                                                                                                  |
| <b>metric-type {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"><li>• external</li><li>• internal</li></ul>                                                                                                                |
| <b>route-map map-name</b>                | map-name is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol.<br><br>If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported. |

Defaults

**IS-IS Level 2** routes only

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command  
History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.  
  
The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.12.0</b> | Introduced on the S4810.  |

| Version | Description                  |
|---------|------------------------------|
| 7.5.1.0 | Added support for IPv6 ISIS. |
| 6.3.1.0 | Introduced.                  |

#### Usage Information

BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

#### Example

```
Dell(conf)# router is
Dell(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-type
external route-map rmap-isis-to-bgp
Dell(conf-router_bgp)#show running-config isis
!
router isis
redistribute bgp 1 level-1 metric 32 metric-type external route-map
rmap-isis-to-bgp
```

## redistribute ospf

Redistribute routing information from an OSPF process.

### C9000 Series

#### Syntax

```
redistribute ospf process-id [level-1 | level-1-2 | level-2] [match
{internal | external}] [metric metric-value] [metric-type {external |
internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

#### Parameters

|                                                               |                                                                                                                                                                                                         |
|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>                                      | Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65355.                                                                                               |
| <b><i>metric metric-value</i></b>                             | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                  |
| <b><i>metric-type</i> {<i>external</i>   <i>internal</i>}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> <li>external</li> <li>internal</li> </ul> |
| <b><i>level-1</i></b>                                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                         |
| <b><i>level-1-2</i></b>                                       | (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.                                                                                                                       |
| <b><i>level-2</i></b>                                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.                                                                                            |
| <b><i>match</i> {<i>external</i>   <i>internal</i>}</b>       | (OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are <ul style="list-style-type: none"> <li>internal</li> <li>external</li> </ul>                  |
| <b><i>route-map map-name</i></b>                              | <i>map-name</i> is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol.                              |

If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

**Defaults** Refer to Parameters.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                  |
|----------|------------------------------|
| 9.9(0.0) | Introduced on the C9010.     |
| 9.5(0.1) | Introduced on the Z9500.     |
| 9.0.2.0  | Introduced on the S6000.     |
| 8.3.19.0 | Introduced on the S4820T.    |
| 8.3.11.1 | Introduced on the Z9000.     |
| 8.3.12.0 | Introduced on the S4810.     |
| 7.5.1.0  | Added support for IPv6 ISIS. |
| 6.3.1.0  | Introduced.                  |

**Usage Information** How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

## router isis

Enable the IS-IS routing protocol and specify an IP IS-IS process.

### C9000 Series

**Syntax** `router isis [tag] [vrf vrf-name]`

To disable IS-IS routing, use the `no router isis [tag]` command.

**Parameters**

|                     |                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.                                                    |
| <b>tag</b>          | (OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the <code>tag</code> option is not specified. The tag name must be unique for all IP router processes for a given router. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |

#### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

#### Related Commands

- [ip router isis](#) — configures IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- [net](#) — configures an IS-IS network entity title (NET) for a routing process.
- [is-type](#) — assigns a type for a given area.

## set-overload-bit

Set the overload bit in zeroth fragment of non-pseudonode LSPs on the router.. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

## C9000 Series

#### Syntax

`set-overload-bit`

To return to the default values, use the `no set-overload-bit` command.

#### Defaults

Not set.

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |

| Version         | Description                            |
|-----------------|----------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.               |
| <b>7.8.1.0</b>  | Added support for multi-topology ISIS. |
| <b>6.3.1.0</b>  | Introduced.                            |

#### Usage Information

Configure the router to set the overload bit when a router experiences problems, such as a memory shortage because of an incomplete link state database. This can result in an incomplete or inaccurate routing table. If you set the overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovere

d.

 **NOTE:** You can configure a single system wide value that is common for both IPv4 and IPv6 address.

## show config

Display the changes you made to the IS-IS configuration. Default values are not shown.

### C9000 Series

**Syntax** `show config`

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.1</b>  | Introduced on the S4810.  |

**Example (Router-Isis)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
Dell(conf-router_isis)# show config
!
router isis
 clns host ISIS 49.0000.0001.F100.E120.0013.00
 log-adjacency-changes
 net 49.0000.0001.F100.E120.0013.00
!
 address-family ipv6 unicast
 maximum-paths 16
 multi-topology transition
 set-overload-bit
 spf-interval level-1 100 15 20
 spf-interval level-2 120 20 25
 exit-address-family
```

**Example  
(Address-  
Family\_IPv6)**

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
Dell(conf-router_isis-af_ipv6)# show conf
!
address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family
```

# show isis database

Display the IS-IS link state database.

## C9000 Series

**Syntax**

`show isis database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid] [vrf vrf-name]`

**Parameters**

|                     |                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1</b>      | (OPTIONAL) Displays the Level 1 IS-IS link-state database.                                                                                    |
| <b>level-2</b>      | (OPTIONAL) Displays the Level 2 IS-IS link-state database.                                                                                    |
| <b>local</b>        | (OPTIONAL) Displays local link-state database information.                                                                                    |
| <b>detail</b>       | (OPTIONAL) Detailed link-state database information of each LSP displays when specified. If not specified, a summary displays.                |
| <b>summary</b>      | (OPTIONAL) Summary of link-state database information displays when specified.                                                                |
| <b>system-id</b>    | (OPTIONAL) Display link-state database for system-id.                                                                                         |
| <b>lspid</b>        | (OPTIONAL) Display only the specified LSP.                                                                                                    |
| <b>vrf vrf-name</b> | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to display IS-IS link state database corresponding to that VRF. |

 **NOTE:** If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                             |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON.             |
| 9.7(0.0) | Added supported for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Inroduced on the Z9500.                              |
| 9.2(0.2) | Introduced on the Z9000.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.7.1  | Introduced on the S4810.                             |

**Usage  
Information**

The following describes the `show isis database` command shown in the following example.

| Field                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IS-IS Level-1/<br/>Level-2 Link<br/>State Database</b> | Displays the IS-IS link state database for Level 1 or Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LSPID</b>                                              | <p>Displays the LSP identifier.</p> <p>The first six octets are the System ID of the originating router.</p> <p>The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.</p> <p>The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.</p> <p>The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.</p> <p>An * after the LSPID indicates that the system originates an LSP where this command was issued.</p> |
| <b>LSP Seq Num</b>                                        | This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LSP Checksum</b>                                       | This is the checksum of the entire LSP packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LSP Holdtime</b>                                       | This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ATT</b>                                                | This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>P</b>                                                  | This value represents the P bit. This bit is always set to zero as Dell Networking does not support area partition repair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>OL</b>                                                 | This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Example**

The bold sections identify that MultiTopology IS-IS is enabled.

|                        | The following is a list of the Dell Networking OS version history for this command.                                                                            |                                                                                                                                                                                                                                   |  |
|                        | <b>Version</b>                                                                                                                                                 | <b>Description</b>                                                                                                                                                                                                                |  |
|                        | <b>9.9(0.0)</b>                                                                                                                                                | Introduced on the C9010.                                                                                                                                                                                                          |  |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |
| <b>8.3.1.0</b>  | Introduced on the E-Series.                        |

### Example

```
Dell#show isis graceful-restart detail
Configured Timer Value
=====
Graceful Restart : Enabled
T3 Timer : Manual
T3 Timeout Value : 30
T2 Timeout Value : 30 (level-1), 30 (level-2)
T1 Timeout Value : 5, retry count: 1
Adjacency wait time : 30

Operational Timer Value
=====
Current Mode/State : Normal/RUNNING
T3 Time left : 0
T2 Time left : 0 (level-1), 0 (level-2)
Restart ACK rcv count : 0 (level-1), 0 (level-2)
Restart Req rcv count : 0 (level-1), 0 (level-2)
Suppress Adj rcv count : 0 (level-1), 0 (level-2)
Restart CSNP rcv count : 0 (level-1), 0 (level-2)
Database Sync count : 0 (level-1), 0 (level-2)
```

| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                              |         |             |                 |                          |                 |                                          |                 |                                                    |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

#### Example

```
Dell#show isis hostname
System Id Dynamic Name Static Name
*F100.E120.0013 Force10 ISIS
Dell#
```

## show isis interface

Display detailed IS-IS interface status and configuration information.

### C9000 Series

**Syntax** `show isis interface [interface] [vrf vrf-name]`

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |

| Version         | Description               |
|-----------------|---------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |

### Example

```
Dell>show isis int
GigabitEthernet 1/7 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 37847070, Local circuit ID 1
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-2 adjacencies: 1
 Next IS-IS LAN Level-1 Hello in 2 seconds
 Next IS-IS LAN Level-2 Hello in 1 seconds
 LSP Interval: 33
GigabitEthernet 1/8 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 38371358, Local circuit ID 2
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
--More--
```

```
Dell>show isis int
TenGigabitEthernet 1/7 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 37847070, Local circuit ID 1
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-2 adjacencies: 1
 Next IS-IS LAN Level-1 Hello in 2 seconds
 Next IS-IS LAN Level-2 Hello in 1 seconds
 LSP Interval: 33
TenGigabitEthernet 1/8 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 38371358, Local circuit ID 2
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10

```

## show isis neighbors

Display information about neighboring (adjacent) routers.

### C9000 Series

|                      |                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show isis neighbors [level-1   level-2] [detail] [interface] [vrf vrf-name]</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b>    | <b>level-1</b>                                                                           | (OPTIONAL) Displays information about Level 1 IS-IS neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                      | <b>level-2</b>                                                                           | (OPTIONAL) Displays information about Level 2 IS-IS neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                      | <b>detail</b>                                                                            | (OPTIONAL) Displays detailed information about neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                      | <b>interface</b>                                                                         | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|                      | <b>vrf vrf-name</b>                                                                      | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display adjacent router information corresponding to that VRF                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Command Modes</b> | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.12.0</b> | Introduced on the S4810.  |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

## Usage Information

Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

| Field             | Description                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>System Id</b>  | The value that identifies a system in an area.                                                                              |
| <b>Interface</b>  | The interface, slot, and port in which the router was discovered.                                                           |
| <b>State</b>      | The value providing status about the adjacency state. The range is Up and Init.                                             |
| <b>Type</b>       | This value displays the adjacency type (Layer 2, Layer 2 or both).                                                          |
| <b>Priority</b>   | IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface. |
| <b>Uptime</b>     | Displays the interfaces uptime.                                                                                             |
| <b>Circuit Id</b> | The neighbor's interpretation of the designated router for the interface.                                                   |

## Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
Dell#show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Gi 7/1 Up L1L2(M) 127 09:28:01 TEST.02
!
Dell#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Gi 7/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
 IP Address(es): 25.1.1.3*
 MAC Address: 0000.0000.0000
 Hold Time: 28
 Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6 , Common (IPv4 IPv6)
Adjacency being used for MTs: IPv4 IPv6
Dell#
```

```
Dell#show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:01 TEST.02
!
Dell#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
 IP Address(es): 25.1.1.3*
 MAC Address: 0000.0000.0000
 Hold Time: 28
 Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6 , Common (IPv4 IPv6)
```

#### Adjacency being used for MTs: IPv4 IPv6

Dell#

```
Dell#show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1/1 Up L1L2(M) 127 09:28:01 TEST.02
!

## show isis protocol

Display IS-IS routing information.

### C9000 Series

|                        |                                                                                                                                                           |                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show isis protocol [vrf <i>vrf-name</i> ]                                                                                                                 |                                                                                                                                               |
| <b>Parameters</b>      | <b>vrf <i>vrf-name</i></b>                                                                                                                                | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display IS-IS routing information corresponding to that VRF. |
| <b>Command Modes</b>   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                               |                                                                                                                                               |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                               |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |

**Example** The bold section identifies that Multi-Topology IS-IS is enabled.

```
Dell#show isis protocol
IS-IS Router: <Null Tag>
System Id: F100.E120.0013 IS-Type: level-1-2
Manual area address(es):
 49.0000.0001
Routing for area address(es):
```

```

49.0000.0001
Interfaces supported by IS-IS:
GigabitEthernet 1/1 - IP - IPv6
GigabitEthernet 1/2 - IP - IPv6
GigabitEthernet 1/10 - IP - IPv6
Loopback 0 - IP - IPv6
Redistributing:
Distance: 115
Generate narrow metrics: level-1-2
Accept narrow metrics: level-1-2
Generate wide metrics: none
Accept wide metrics: none
Multi Topology Routing is enabled in transition mode.
Dell#

```

```

Dell#show isis protocol
IS-IS Router: <Null Tag>
System Id: F100.E120.0013 IS-Type: level-1-2
Manual area address(es):

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |

|                          |                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The following describes the <code>show isis traffic</code> command shown in the following example. |
|--------------------------|----------------------------------------------------------------------------------------------------|

| Item                                              | Description                                                     |
|---------------------------------------------------|-----------------------------------------------------------------|
| <b>Level-1/Level-2 Hellos (sent/rcvd)</b>         | Displays the number of Hello packets sent and received.         |
| <b>PTP Hellos (sent/rcvd)</b>                     | Displays the number of point-to-point Hellos sent and received. |
| <b>Level-1/Level-2 LSPs sourced (new/refresh)</b> | Displays the number of new and refreshed LSPs.                  |
| <b>Level-1/Level-2 LSPs flooded (sent/rcvd)</b>   | Displays the number of flooded LSPs sent and received.          |
| <b>Level-1/Level-2 LSPs CSNPs (sent/rcvd)</b>     | Displays the number of CSNP LSPs sent and received.             |
| <b>Level-1/Level-2 LSPs PSNPs (sent/rcvd)</b>     | Displays the number of PSNP LSPs sent and received.             |
| <b>Level-1/Level-2 DR Elections</b>               | Displays the number of times designated router elections ran.   |

| Item                                    | Description                                              |
|-----------------------------------------|----------------------------------------------------------|
| <b>Level-1/Level-2 SPF Calculations</b> | Displays the number of shortest path first calculations. |
| <b>LSP checksum errors received</b>     | Displays the number of checksum errors LSPs received.    |
| <b>LSP authentication failures</b>      | Displays the number of LSP authentication failures.      |

### Example

```
Dell#show is traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337
IS-IS: Level-1 DR Elections : 4
IS-IS: Level-2 DR Elections : 4
IS-IS: Level-1 SPF Calculations : 0
IS-IS: Level-2 SPF Calculations : 389
IS-IS: LSP checksum errors received : 0
IS-IS: LSP authentication failures : 0
Dell#
```

## spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

### C9000 Series

#### Syntax

```
spf-interval [level-1 | level-2] interval seconds [initial_wait_interval
seconds [second_wait_interval seconds]]
```

To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

#### Parameters

|                                      |                                                                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1</b>                       | (OPTIONAL) Enter the keyword <code>level-1</code> to apply the configuration to Level-1 SPF calculations.                                                            |
| <b>level-2</b>                       | (OPTIONAL) Enter the keyword <code>level-2</code> to apply the configuration to Level-2 SPF calculations.                                                            |
| <b>interval seconds</b>              | Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is <b>10 seconds</b> .                                 |
| <b>initial_wait_interval seconds</b> | (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |
| <b>second_wait_interval seconds</b>  | (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |

#### Defaults

Refer to *Parameters*.

#### Command Modes

- ROUTER ISIS (*for IPv4*)

- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                   |
|-----------------|-----------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                      |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                      |
| <b>9.0.2.0</b>  | Introduced on the S6000.                      |
| <b>8.3.19.0</b> | Introduced on the S4820T.                     |
| <b>8.3.11.1</b> | Introduced on the Z9000.                      |
| <b>8.3.12.0</b> | Introduced on the S4810.                      |
| <b>7.8.1.0</b>  | Added support for multi-topology ISIS.        |
| <b>7.5.1.0</b>  | Added support for SPF Throttling Enhancement. |

## Usage Information

This command `spf-interval` in CONFIG-ROUTER-ISIS-AF-IPV6 mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in CONFIG-ROUTER-ISIS mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

# Internet Group Management Protocol (IGMP)

IGMP and IGMP snooping commands are supported by the Dell Networking OS on the switch.

This chapter contains the following sections:

- [IGMP Commands](#)
- [IGMP Snooping Commands](#)

## Topics:

- [IGMP Commands](#)
- [IGMP Snooping Commands](#)

## IGMP Commands

The system supports IGMPv1/v2/v3 and is compliant with RFC-3376.

## Important Points to Remember

- The system supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The switch supports up to 95 interfaces.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (`ip igmp version`) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

## clear ip igmp groups

Clear entries from the group cache table.

## C9000 Series

**Syntax** `clear ip igmp groups [group-address | interface]`

### Parameters

**group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

**interface** Enter the following keywords and slot/port or number information:

**interface**

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                 |
|--------------------------------|-----------------------------|
| 9.9(0.0)                       | Introduced on the C9010.    |
| 9.0.2.0                        | Introduced on the S6000.    |
| 8.3.19.0                       | Introduced on the S4820T.   |
| 8.3.11.1                       | Introduced on the Z9000.    |
| 8.3.7.0                        | Introduced on the S4810.    |
| 7.6.1.0                        | Introduced on the S-Series. |
| 7.5.1.0                        | Introduced on the C-Series. |
| <b>E-Series legacy command</b> |                             |

## debug ip igmp

Enable debugging of IGMP packets.

### C9000 Series

#### Syntax

```
debug ip igmp [group address | interface]
```

- To disable IGMP debugging, use the `no debug ip igmp [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

#### Parameters

|                                                    |                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>group-address</i></b>                        | (OPTIONAL) Enter the IP multicast group address in dotted decimal format.                                                                                                                                                                                                                                                                      |
| <b><i>interface</i></b><br><b><i>interface</i></b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul> |

#### Defaults

Disabled.

#### Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version                        | Description |
|--------------------------------|-------------|
| <b>E-Series legacy command</b> |             |

**Usage Information** IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

## ip igmp access-group

Specify access control list for packets in access-group.

### C9000 Series

| <b>Syntax</b>            | <pre>ip igmp access-group <i>access-list</i></pre> <p>To remove the feature, use the <code>no ip igmp access-group <i>access-list</i></code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|---------------------------|-----------------|--------------------------|----------------|--------------------------|----------------|------------------------------------------|----------------|-----------------------------|
| <b>Parameters</b>        | <b><i>access-list</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Enter the name of the extended ACL (16 characters maximum). |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
| <b>Defaults</b>          | Not configured                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
| <b>Command Modes</b>     | INTERFACE (conf-if- <i>interface-slot/port</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |

| <b>8.3.7.0</b>           | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
| <b>7.8.1.0</b>           | Introduced on the C-Series and S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
| <b>7.6.1.0</b>           | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |
| <b>Usage Information</b> | <p>The access list accepted is an extended ACL. The <code>ip igmp access-group</code> command allows you to block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                             |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                          |                |                             |

## ip igmp group-join-limit

Set a limit to the number of IGMP groups that can be joined in a second,

### C9000 Series

|                   |                                                   |                                                                                              |
|-------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>ip igmp group-join-limit <i>number</i></pre> |                                                                                              |
| <b>Parameters</b> | <b><i>number</i></b>                              | Enter the number of IGMP groups permitted to join in a second. The range is from 1 to 10000. |
| <b>Defaults</b>   | none                                              |                                                                                              |

**Command Modes** CONFIGURATION (*conf-if-interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                            |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.8.1.0  | Introduced on the C-Series and S-Series.                                                            |
| 7.6.1.0  | Introduced on the E-Series.                                                                         |

## ip igmp immediate-leave

Enable IGMP immediate leave.

### C9000 Series

**Syntax** `ip igmp immediate-leave [group-list prefix-list-name]`

To disable `ip igmp immediate leave`, use the `no ip igmp immediate-leave` command.

**Parameters** **group-list *prefix-list-name*** Enter the keywords `group-list` then a string up to 16 characters long of the *prefix-list-name*.

**Defaults** Not configured.

**Command Modes** INTERFACE  
INTERFACE (BATCH Mode)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010. |
| 9.9(0.0)  | Introduced on the C9010.                                   |
| 9.5(0.1)  | Introduced on the Z9500.                                   |
| 8.3.19.0  | Introduced on the S4820T.                                  |
| 8.3.11.1  | Introduced on the Z9000.                                   |
| 8.3.7.0   | Introduced on the S4810.                                   |
| 7.8.1.0   | Introduced on the S-Series.                                |
| 7.7.1.0   | Introduced on the C-Series.                                |

**Usage Information** Querier normally sends some group-specific queries when a `leave` message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable `immediate-leave` processing for specified groups.

## ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip igmp last-member-query-interval milliseconds</code><br>To return to the default value, use the <code>no ip igmp last-member-query-interval</code> command.                                                                                   |
| <b>Parameters</b>      | <b>milliseconds</b> Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is <b>1000 milliseconds</b> .                         |
| <b>Defaults</b>        | <b>1000 milliseconds</b>                                                                                                                                                                                                                              |
| <b>Command Modes</b>   | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.0)                      | Introduced the Configuration Terminal Batch mode on C9010.                                          |
| 9.9(0.0)                       | Introduced on the C9010.                                                                            |
| 9.7(0.1)                       | Introduced on the S3048-ON and S4048-ON.                                                            |
| 9.7(0.0)                       | Introduced on the S6000-ON. For IGMP version 2, the Interval range is modified.                     |
| 9.5(0.1)                       | Introduced on the Z9500.                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.8.1.0                        | Introduced on the S-Series.                                                                         |
| 7.7.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

## ip igmp querier-timeout

Change the interval that must pass before a multicast router decides that there is no longer another multicast router that should be the querier.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip igmp querier-timeout seconds</code><br>To return to the default value, use the <code>no ip igmp querier-timeout</code> command.                       |                                                                                                                                              |
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                 | Enter the number of seconds the router must wait to become the new querier. The range is from 60 to 300. The default is <b>125 seconds</b> . |
| <b>Defaults</b>        | <b>125 seconds</b>                                                                                                                                             |                                                                                                                                              |

| <b>7.5.1.0</b>           | Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                  |                                                            |                 |                          |                 |                                          |                 |                                                                                            |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                                                                                                              |                |                                                                                                              |
| <b>Usage Information</b> | <p>If you have configured the hello interval value to be greater than 18000, you must first reset that value to be less than or equal to 18000 before upload. Otherwise, the command execution fails during bootup and the hello interval value is set to the default value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                  |                                                            |                 |                          |                 |                                          |                 |                                                                                            |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                                                                                                              |                |                                                                                                              |

## ip igmp query-max-resp-time

Set the maximum query response time advertised in general queries.

### C9000 Series

|                      |                                                                                                                                                   |                                                                                                                          |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ip igmp query-max-resp-time seconds</code><br>To return to the default values, use the <code>no ip igmp query-max-resp-time</code> command. |                                                                                                                          |
| <b>Parameters</b>    | <b>seconds</b>                                                                                                                                    | Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is <b>10 seconds</b> . |
| <b>Defaults</b>      | <b>10 seconds</b>                                                                                                                                 |                                                                                                                          |
| <b>Command Modes</b> | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                               |                                                                                                                          |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010.                                                   |
| 9.9(0.0)  | Introduced on the C9010.                                                                                     |
| 9.5(0.1)  | Introduced on the Z9500.                                                                                     |
| 9.2(0.0)  | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.          |
| 9.0.2.0   | Introduced on the S6000.                                                                                     |
| 8.3.19.0  | Introduced on the S4820T.                                                                                    |
| 8.3.11.1  | Introduced on the Z9000.                                                                                     |
| 8.3.7.0   | Introduced on the S4810.                                                                                     |
| 7.6.1.0   | Introduced on the S-Series.                                                                                  |
| 7.5.1.0   | Introduced on the C-Series.                                                                                  |
| 7.6.1.0   | Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier. |
| 7.5.1.0   | Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier. |

## ip igmp ssm-map

To translate (\*,G) memberships to (S,G) memberships, use a statically configured list.

### C9000 Series

#### Syntax

```
ip igmp ssm-map std-access-list source-address
```

Undo this configuration, that is, remove SSM map (S,G) states and replace them with (\*,G) state, use the `ip igmp ssm-map std-access-list source-address` command.

#### Parameters

|                               |                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------|
| <b><i>std-access-list</i></b> | Specify the standard IP access list that contains the mapping rules for multicast groups. |
| <b><i>source-address</i></b>  | Specify the multicast source address to which the groups are mapped.                      |

#### Command Modes

CONFIGURATION

## Command History

| Version                | Description                              |
|------------------------|------------------------------------------|
| <b>Version 7.8.1.0</b> | Introduced on the C-Series and S-Series. |
| <b>Version 7.7.1.0</b> | Introduced on the E-Series.              |

**Usage Information** Mapping applies to both v1 and v2 IGMP joins; any updates to the ACL are reflected in the IGMP groups. You may not use extended access lists with this command. When you configure a static SSM map and the router cannot find any matching access lists, the router continues to accept (\*,G) groups.

**Related Commands** [ip access-list standard](#) — creates a standard access list to filter based on IP address.

## ip igmp static-group

Configure an IGMP static group.

### C9000 Series

**Syntax** `ip igmp static-group {group address [exclude [source address]] | [include {source address}]}`

To delete a static address, use the `no ip igmp static-group {group address [exclude [source address]] | [include {source address}]}` command.

**Parameters**

|                               |                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group address</b>          | Enter the group address in dotted decimal format (A.B.C.D).                                                                                       |
| <b>exclude source address</b> | (OPTIONAL) Enter the keyword <code>exclude</code> then the source address, in dotted decimal format (A.B.C.D), for which a static entry is added. |
| <b>include source address</b> | (OPTIONAL) Enter the keyword <code>include</code> then the source address, in dotted decimal format (A.B.C.D), for which a static entry is added. |

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                    |
|-----------------|--------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                       |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                       |
| <b>7.8.1.0</b>  | Introduced on the S-Series.                                                    |
| <b>7.7.1.0</b>  | Introduced on the C-Series.                                                    |
| <b>7.5.1.0</b>  | Expanded to support the <code>exclude</code> and <code>include</code> options. |

**Usage Information** A group in `include` mode must have at least one source address defined. In `exclude` mode, if you do not specify a source address, The system implicitly assumes all sources are included. If you do not specify either `include` or `exclude`, the system implicitly assumes a IGMPv2 static join.

#### Command Limitations

- Only one mode (`include` or `exclude`) is permitted per multicast group per interface. To configure another mode, all sources belonging to the original mode must be unconfigured.
- If a static configuration is present and a packet for the same group arrives on an interface, the dynamic entry completely overwrites all the static configuration for the group.

#### Related Commands

[show ip igmp groups](#) — displays IGMP group information.

## ip igmp version

Manually set the version of the router to IGMPv2 or IGMPv3.

### C9000 Series

**Syntax** `ip igmp version {2 | 3}`

**Parameters**

|          |                                                              |
|----------|--------------------------------------------------------------|
| <b>2</b> | Enter the number 2 to set the IGMP version number to IGMPv2. |
| <b>3</b> | Enter the number 3 to set the IGMP version number to IGMPv3. |

**Defaults** **2** (that is, IGMPv2)

**Command Modes** INTERFACE  
INTERFACE (BATCH Mode)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.                                          |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                            |
| <b>9.7(0.1)</b>  | Introduced on the S3048-ON and S4048-ON.                                                            |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON. Changed the default IGMP from version 2 to version 3.                   |
| <b>9.5(0.0)</b>  | Introduced on the Z9500.                                                                            |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                                            |
| <b>9.2(0.0)</b>  | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                                                            |
| <b>7.8.1.0</b>   | Introduced on the S-Series.                                                                         |
| <b>7.7.1.0</b>   | Introduced on the C-Series.                                                                         |
| <b>7.5.1.0</b>   | Introduced on the E-Series.                                                                         |

# show ip igmp groups

View the IGMP groups.

## C9000 Series

|            |                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | show ip igmp groups [group-address [detail]   detail   interface [group-address [detail]]] |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Parameters | <b>group-address</b>                                                                       | (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|            | <b>interface</b>                                                                           | (OPTIONAL) Enter the interface type and slot/port information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                         | Description                                         |
|---------------------------------|-----------------------------------------------------|
| 9.9(0.0)                        | Introduced on the C9010.                            |
| 9.0.2.0                         | Introduced on the S6000.                            |
| 8.3.19.0                        | Introduced on the S4820T.                           |
| 8.3.11.1                        | Introduced on the Z9000.                            |
| 8.3.7.0                         | Introduced on the S4810.                            |
| 7.6.1.0                         | Introduced on the S-Series and C-Series.            |
| 7.5.1.0                         | Expanded to support the <code>detail</code> option. |
| <b>E-Series legacy command.</b> |                                                     |

Usage Information

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

| Field                | Description                                                 |
|----------------------|-------------------------------------------------------------|
| <b>Group Address</b> | Lists the multicast address for the IGMP group.             |
| <b>Interface</b>     | Lists the interface type, slot and port number.             |
| <b>Mode</b>          | Displays the IGMP version used.                             |
| <b>Uptime</b>        | Displays the amount of time the group has been operational. |
| <b>Expires</b>       | Displays the amount of time until the entry expires.        |

| Field                | Description                                                                |
|----------------------|----------------------------------------------------------------------------|
| <b>Last Reporter</b> | Displays the IP address of the last host to be a member of the IGMP group. |

#### Example

```
Dell#show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Uptime Expires
225.0.0.0 Vlan 100 00:00:05 00:02:04
225.0.0.1 Vlan 100 00:00:05 00:02:04
225.0.0.2 Vlan 100 00:00:05 00:02:04
225.0.0.3 Vlan 100 00:00:05 00:02:04
225.0.0.4 Vlan 100 00:00:05 00:02:04
```

#### Example (VLT)

**NOTE:** The asterisk (\*) after the port channel number (Po 2) highlighted in the following example indicates that the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.

```
Dell#show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
225.0.0.0 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.1 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.2 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.3 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.4 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
```

#### Example (Details)

```
Dell#show ip igmp group details
Interface Vlan 20
Group 232.1.1.5
Uptime 00:11:22
Expires Never
Router mode INCLUDE
Last reporter 35.0.0.2
Group source list
Source address Expires
65.0.0.1 00:01:22
65.0.0.2 00:01:22
65.0.0.3 00:01:22
65.0.0.4 00:01:22
65.0.0.5 00:01:22
```

## show ip igmp interface

View information on the interfaces participating in IGMP.

### C9000 Series

**Syntax** `show ip igmp interface [interface]`

**Parameters** *interface* (OPTIONAL) Enter the interface type and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

**E-Series legacy command.**

**Usage Information** IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

### Example

```
Dell#show ip igmp interface
GigabitEthernet 0/0 is down, line protocol is down
 Internet protocol processing disabled
GigabitEthernet 0/5 is down, line protocol is down
 Internet protocol processing disabled
GigabitEthernet 0/6 is down, line protocol is down
 Internet protocol processing disabled
GigabitEthernet 0/7 is up, line protocol is down
 Internet protocol processing disabled
GigabitEthernet 7/9 is up, line protocol is up
 Internet address is 10.87.5.250/24
 IGMP is enabled on interface
 IGMP query interval is 60 seconds
 IGMP querier timeout is 120 seconds
 IGMP max query response time is 10 seconds
 IGMP last member query response interval is 1000 ms
 IGMP activity: 0 joins, 0 leaves
 IGMP querying router is 10.87.5.250 (this system)
 IGMP version is 2
```

# show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

## C9000 Series

## IGMP Snooping Commands

IGMP Snooping version 2 and 3 are supported on the switch.

### Important Points to Remember for IGMP Snooping

- The Dell Networking OS supports version 1, version 2, and version 3 hosts.
- The IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).

- The IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
- The system supports IGMP snooping on JUMBO-enabled cards.
- IGMP snooping is not enabled by default on the switch.
- A maximum of 1800 groups and 600 VLAN are supported.
- IGMP snooping is not supported on a default VLAN interface.
- IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).
- IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).
- IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.

## Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame.

If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.

If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

## clear ip igmp snooping groups

Clear snooping entries from the group cache table.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.7(0.1)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on S-Series and Z-Series.     |

**Usage Information** IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

## debug ip igmp snooping

Enable debugging of IGMP snooping packets on interfaces and groups.

### C9000 Series

| <b>Syntax</b>            | <pre>debug ip igmp snooping [<i>group address</i>   <i>interface</i>]</pre> <ul style="list-style-type: none"><li>• To disable debugging of IGMP snooping, use the <code>no debug ip igmp snooping [<i>group address</i>   <i>interface</i>]</code> command.</li><li>• To disable all debugging, use the <code>undebug all</code> command.</li></ul>                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                                          |                 |                                                                            |

| <b>Usage Information</b> | IGMP commands accept <i>only</i> non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                                          |                 |                                                                            |

## ip igmp snooping enable

Enable IGMP snooping on all or a single VLAN. This command is the master on/off switch to enable IGMP snooping.

### C9000 Series

| <b>Syntax</b>            | <code>ip igmp snooping enable</code><br>To disable IGMP snooping, use the <code>no ip igmp snooping enable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                  |                                                            |                 |                          |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.                                          |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b>  | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>  | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                                            |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                                                            |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                                                         |
| <b>7.5.1.0</b>   | Introduced on the C-Series.                                                                         |

**Usage Information**

Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.

## ip igmp snooping flood

Control the flooding behavior of unregistered multicast data packets.

### C9000 Series

**Syntax** `ip igmp snooping flood`

CONFIGURATION TERMINAL BATCH

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                |
|------------------|------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                   |
| <b>9.5(0.1)</b>  | Introduced on the Z9500.                                   |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                   |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                  |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                   |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                   |
| <b>8.2.1.0</b>   | Introduced on the C-Series and S-Series.                   |

| Version | Description                 |
|---------|-----------------------------|
| 7.7.1.0 | Introduced on the E-Series. |

### Usage Information

On the C-Series and S-Series, unregistered multicast data traffic drops when you disable flooding; they do not forward the packets to multicast router ports. On the C-Series and S-Series, in order to disable Layer 2 multicast flooding, disable Layer 3 multicast (`no ip multicast-routing`).

Use this command in Configuration Terminal Batch mode to control the flooding behavior in a dual-homing setup.

## ip igmp snooping last-member-query-interval

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

### C9000 Series

|               |                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ip igmp snooping last-member-query-interval <i>milliseconds</i></code><br>To return to the default value, use the <code>no ip igmp snooping last-member-query-interval</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>milliseconds</i></b> Enter the interval in milliseconds. The range is from 100 to 65535. The default is <b>1000 milliseconds</b> . |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                          |
|-----------------|--------------------------|
| <b>Defaults</b> | <b>1000 milliseconds</b> |
|-----------------|--------------------------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | INTERFACE<br>INTERFACE (BATCH Mode) |
|----------------------|-------------------------------------|

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.                                          |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                            |
| <b>9.5(0.1)</b>  | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>  | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                                                            |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                                                            |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                                                         |
| <b>7.5.1.0</b>   | Introduced on the C-Series.                                                                         |

### Usage Information

The last-member-query-interval is also the interval between successive Group-Specific Query messages. The `ip igmp snooping last-member-query-interval` command allows you to change the last-member-query interval.

# ip igmp snooping mrouter

Statically configure a VLAN member port as a multicast router interface.

## C9000 Series

| Syntax            | <pre>ip igmp snooping mrouter interface <i>interface</i></pre> <p>To delete a specific multicast router interface, use the <code>no igmp snooping mrouter interface <i>interface</i></code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |           |                                                            |          |                          |          |                          |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

| Usage Information | <p>Dell Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the <code>ip igmp snooping mrouter interface</code> command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |           |                                                            |          |                          |          |                          |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

## ip igmp snooping querier

Enable IGMP querier processing for the VLAN interface.

### C9000 Series

| <b>Syntax</b>            | <pre>ip igmp snooping querier</pre> <p>To disable IGMP querier processing for the VLAN interface, use the <code>no ip igmp snooping querier</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                  |                                                            |                 |                          |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

| <b>Usage Information</b> | <p>This command enables the IGMP switch to send General Queries periodically. This behavior is useful when there is no multicast router present in the VLAN because the multicast traffic is not routed. Assign an IP address to the VLAN interface for the switch to act as a querier for this VLAN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |                  |                                                            |                 |                          |                 |                          |                 |                                                                                                     |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |

## show ip igmp snooping mrouter

Display multicast router interfaces.

### C9000 Series

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>show ip igmp snooping mrouter [vlan number]</pre>                                                                                                               |
| <b>Parameters</b>      | <b>vlan <i>number</i></b> Enter the keyword <code>vlan</code> then the vlan number. The range is from 1 to 4094.                                                     |
| <b>Command Modes</b>   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                                          |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.5(0.1)</b> | Introduced on the Z9500.    |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

#### Usage Information

If the port channel is a VLT port channel, an asterisk (\*) after the port channel number (Po 100\*) indicates the port channel is locally down and that a remote VLT port is up.

#### Example

```
Dell#show ip igmp snooping mrouter
Interface Router Ports
Vlan 2 Te 1/3, Po 1
Dell#
```

#### Related Commands

- [ip igmp snooping mrouter](#) — configures a static connection to the multicast router.
- [show ip igmp groups](#) — view groups.

## show ip igmp snooping groups

Display snooping related information for all the IGMP groups and interfaces or a single group belonging to a specified interface.

### C9000 Series

#### Syntax

```
show ip igmp snooping groups [group-address [detail] | detail | interface
[group-address [detail]]]
```

#### Parameters

- |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>snooping</b>      | Enter the keyword <code>snooping</code> to display snooping related information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>group-address</b> | (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>interface</b>     | (OPTIONAL) Enter the interface type and slot/port information: <ul style="list-style-type: none"><li>• For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>• For a port extender Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is from 1 to 48.</li></ul> |

- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the `pe-id / stack-unit / port-id` information. The `pe-id` range is from 0 to 255; the stack-unit `unit-number` range is from 0 to 7; and the `port-id` range is 25 to 28 or 49 to 52 depending on the PE.

**detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.7(0.1)</b>   | Introduced on the S3048-ON and S4048-ON.                          |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500.  |

**Usage Information** This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

| Field                | Description                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Address</b> | Lists the multicast address for the IGMP group.                                                                                                                                    |
| <b>Interface</b>     | Lists the interface type, slot and port number.                                                                                                                                    |
| <b>Mode</b>          | Displays the IGMP version used.                                                                                                                                                    |
| <b>Uptime</b>        | Displays the amount of time the group has been operational.                                                                                                                        |
| <b>Expires</b>       | Displays the amount of time until the entry expires.                                                                                                                               |
| <b>Last Reporter</b> | Displays the IP address of the last host to be a member of the IGMP group.                                                                                                         |
| <b>Member Ports</b>  | Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up. |

# Internet Protocol Security (IPSec)

Internet protocol security (IPSec) is an end-to-end security scheme for securing IP communications by authenticating and encrypting all packets in a session. Use IPSec between hosts, gateways, or hosts and gateways.

IPSec uses a series of protocol functions to achieve information security:

- **Authentication Headers (AH)** — connectionless integrity and origin authentication for IP packets.
- **Encapsulating Security Payloads (ESP)** — confidentiality, authentication, and data integrity for IP packets.
- **Security Associations (SA)** — algorithm-provided parameters required for AH and ESP protocols.

IPSec capability is available on control (protocol) and management traffic; end-node support is required.

IPSec supports two operational modes: Transport and Tunnel.

- Transport is the default mode for IPSec and encrypts only the payload of the packet. Routing information is unchanged.
- Tunnel mode is used to encrypt the entire packet, including the routing information in the IP header. Tunnel mode is typically used in creating virtual private networks (VPNs).

Transport mode provides IP packet payload protection using ESP. You can use ESP alone or in combination with AH to provide additional authentication. AH protects data from modification but does not provide confidentiality.

SA is the configuration information that specifies the type of security provided to the IPSec flow. The SA is a set of algorithms and keys used to authenticate and encrypt the traffic flow. The AH and ESP use SA to provide traffic protection for the IPSec flow.

## NOTE:

Due to performance limitations on the control processor, you cannot enable IPSec on all packets in a communication session.

## crypto ipsec transform-set

Create a transform set, or combination of security algorithms and protocols, of cryptos.

## C9000 Series

### Syntax

```
crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-
authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}
```

To delete a transform set, use the `no crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}` command.

### Parameters

***name***

Enter the name for the transform set.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ah-authentication</b>  | <p>Enter the keywords <code>ah-authentication</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>md5</code> — Use Message Digest 5 (MD5) authentication.</li> <li>• <code>sha1</code> — Use Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul>  |
| <b>esp-authentication</b> | <p>Enter the keywords <code>esp-authentication</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>md5</code> — Use Message Digest 5 (MD5) authentication.</li> <li>• <code>sha1</code> — Use Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul> |
| <b>esp-encryption</b>     | <p>Enter the keywords <code>esp-encryption</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>3des</code> — Use 3DES encryption.</li> <li>• <code>cbc</code> — Use CDC encryption.</li> <li>• <code>des</code> — Use DES encryption.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul>         |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                 |
|-----------------|---------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                    |
| <b>9.2(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

**Usage Information**

- Both sides of the link must specify the same transform set.
- You can create up to 64 transform sets.

#### Example

```
Dell(conf)#int ten 0/4
Dell(conf-if-te-0/4)#ipv6 address 200:1::/64 eui64
Dell(conf)#int ten 0/6
Dell(conf-if-te-0/6)#ipv6 address 801:10::/64 eui64
```

## crypto ipsec policy

Create a crypto policy used by ipsec.

### C9000 Series

**Syntax** `crypto ipsec policy name seq-num ipsec-manual`

To delete a crypto policy entry, use the `no crypto ipsec policy name seq-num ipsec-manual` command.

**Parameters**

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <b><i>name</i></b>    | Enter the name for the crypto policy set.                      |
| <b><i>seq-num</i></b> | Enter the sequence number assigned to the crypto policy entry. |

**Defaults**

none

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                 |
|-----------------|---------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                    |
| <b>9.2(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

**Usage Information**

This command creates a crypto policy entry and enters the crypto policy configuration mode for configuring the flow parameters.

**Example**

```
Dell(conf)#crypto ipsec policy West 10 ipsec-manual
Dell(conf-crypto-policy)#
```

## management crypto-policy

Apply the crypto policy to management traffic.

### C9000 Series

**Syntax**

`management crypto-policy name`

To remove the management traffic crypto policy, use the `no management crypto-policy name` command.

**Parameters**

|                    |                                        |
|--------------------|----------------------------------------|
| <b><i>name</i></b> | Enter the name for the crypto policy.. |
|--------------------|----------------------------------------|

**Defaults**

none

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                 |
|-----------------|---------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                    |
| <b>9.2(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

# match

Apply a match filter to the crypto policy.

## C9000 Series

**Syntax** `match seq-num tcp [sourceip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]`

To remove the match filter for the crypto map, use the `no match seq-num tcp [source ip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]` command.

**Parameters**

|                                        |                                                                        |
|----------------------------------------|------------------------------------------------------------------------|
| <b>seq-num</b>                         | Enter the match command sequence number.                               |
| <b>sourceip-address / ipv6 address</b> | Enter the keyword source then the IPv4 or IPv6 address for the source. |
| <b>mask</b>                            | Enter the mask prefix length in /nn format.                            |
| <b>source-port number</b>              | Enter the source port number.                                          |
| <b>destination-port number</b>         | Enter the destination port number.                                     |

**Defaults** none

**Command Modes** CONFIG-CRYPTO-POLICY

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                    |
| 9.2(1.0) | Introduced on the Z9500.                    |
| 9.2(0.0) | Introduced on the Z9000, S4810, and S4820T. |

**Usage Information**

- IPv4 addresses support only -/32 mask types.
- IPv6 addresses support only -/128 mask types.
- Configure match for bi-directional traffic for optimal routing.
- Only TCP is supported.

**Example**

```
match 0 tcp a::1 /128 0 a::2 /128 23
match 1 tcp a::1 /128 23 a::2 /128 0
match 2 tcp a::1 /128 0 a::2 /128 21
match 3 tcp a::1 /128 21 a::2 /128 0
match 4 tcp 1.1.1.1 /32 0 1.1.1.2 /32 23
match 5 tcp 1.1.1.1 /32 23 1.1.1.2 /32 0
match 6 tcp 1.1.1.1 /32 0 1.1.1.2 /32 21
match 7 tcp 1.1.1.1 /32 21 1.1.1.2 /32 0
```

# session-key

Specify the session keys used in the crypto policy entry.

## C9000 Series

Syntax

```
session-key {inbound | outbound} {ah spi hex-key-string | esp spi encrypt hex-key-string auth hex-key-string}
```

To delete the session key information from the crypto policy, use the `no session-key {inbound | outbound} {ah | esp}` command.

Parameters

|                       |                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>           | Enter the name for the transform set.                                                                                                                                               |
| <b>inbound</b>        | Specify the inbound session key for IPSec.                                                                                                                                          |
| <b>outbound</b>       | Specify the outbound session key for IPSec.                                                                                                                                         |
| <b>ah</b>             | Use the AH protocol when you select the AH transform set in the crypto policy.                                                                                                      |
| <b>esp</b>            | Use the ESP protocol when you select the ESP transform set in the crypto policy.                                                                                                    |
| <b>spi</b>            | Enter the security parameter index number.                                                                                                                                          |
| <b>hex-key-string</b> | Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key. |
| <b>encrypt</b>        | Indicates the ESP encryption transform set key string.                                                                                                                              |
| <b>auth</b>           | Indicates the ESP authentication transform set key string.                                                                                                                          |

Dell#

```

## transform-set

Specify the transform set for crypto policy use.

### C9000 Series

**Syntax**            `transform-set transform-set-name`

To delete a transform set from the crypto policy, use the `no transform-set transform-set-name` command.

**Parameters**

***transform-set-name*** Enter the name for the crypto policy transform set.

**Defaults**

none

**Command Modes** CONFIG-CRYPTO-POLICY

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                    |
| 9.2(1.0) | Introduced on the Z9500.                    |
| 9.2(0.0) | Introduced on the Z9000, S4810, and S4820T. |

# IPv4 Routing

The basic IPv4 commands are supported by Dell Networking operating system on the switch.

# arp

To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

## C9000 Series

|                 |                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                 | 8.5.1.0                                                                                                                                           | Added support for 4-port 40G line cards on ExaScale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Version | Description                          |
|---------|--------------------------------------|
| 8.3.7.0 | Introduced on the S4810.             |
| 8.1.1.0 | Introduced on the E-Series ExaScale. |
| 7.6.1.0 | Introduced on the S-Series.          |
| 7.5.1.0 | Introduced on the C-Series.          |
| 6.2.1.0 | Introduced on the E-Series.          |

#### Usage Information

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

Use this command in Configuration Terminal Batch mode to associate an IP address with a MAC address in a dual-homing setup.

 **NOTE:** The parameters `vrf`, `mac-address`, and `interface` are not supported in the batch mode.

Although static ARP entries take precedence over dynamically-learned ARP entries, a static ARP entry that points to a wrong port is not included in the FIB or ARP entries.

#### Related Commands

`clear arp-cache` — clears dynamic ARP entries from the ARP table.

`show arp` — displays the ARP table.

## arp backoff-time

Set the exponential timer for resending unresolved ARPs.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.8.0  | Introduced on the S4810.  |

#### Usage Information

The `arp backoff` timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.

**Related  
Commands**

[show arp retries](#) — displays the configured number of ARP retries.

## arp learn-enable

Enable ARP learning using gratuitous ARP.

### C9000 Series

**Syntax** `arp learn-enable`

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>8.3.1.0</b>  | Introduced.               |

## arp retries

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

### C9000 Series

**Syntax** `arp retries number`

**Parameters** ***number*** Enter the number of retries. The range is from 5 to 20. The default is **5**.

**Defaults** **5**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Syntax     | clear arp-cache [interface   ip ip-address] [no-refresh] |                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Parameters | <b>interface</b>                                         | (OPTIONAL) Enter the following keywords and slot/port or number information:                                                                                                                                      | <ul style="list-style-type: none"><li>For the Management interface, enter the keyword <code>ManagementEthernet</code> then the slot/port information. The slot range is from 0 to 1 and the port range is 0.</li><li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 4096.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>For a port extender (PE) Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information.</li><li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li></ul> |
|            | <b>ip ip-address</b>                                     | (OPTIONAL) Enter the keyword <code>ip</code> then the IP address of the ARP entry you wish to clear.                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|            | <b>no-refresh</b>                                        | (OPTIONAL) Enter the keywords <code>no-refresh</code> to delete the ARP entry from CAM. Or use this option with <i>interface</i> or <i>ip ip-address</i> to specify which dynamic ARP entries you want to delete. | <div><div></div><div><b>NOTE:</b> Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and reinstalled in CAM. Use this option with extreme caution.</div></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010.                 |
| 9.9(0.0)   | Introduced on the C9010.                                                          |
| 9.2(1.0)   | Introduced on the Z9500.                                                          |
| 8.3.19.0   | Introduced on the S4820T.                                                         |
| 8.3.11.1   | Introduced on the Z9000.                                                          |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0    | Introduced on the S4810.                                                          |
| 8.2.1.0    | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |

| Version | Description                          |
|---------|--------------------------------------|
| 8.1.1.0 | Introduced on the E-Series ExaScale. |
| 7.9.1.0 | Introduced VRF on the E-Series.      |
| 7.6.1.0 | Introduced on the S-Series.          |
| 7.5.1.0 | Introduced on the C-Series.          |
| 6.2.1.1 | Introduced on the E-Series.          |

## clear host

Remove one or all dynamically learned host table entries.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear host <i>name</i></code>                                                                                                                                                                                                                   |
| <b>Parameters</b>      | <b><i>name</i></b> Enter the name of the host to delete. Enter * to delete all host table entries.                                                                                                                                                    |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                                                                                        |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

## clear ip fib linecard

Clear all FIB entries on a line card (use this command with caution; refer to *Usage Information*.)

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip fib linecard <i>slot-id</i></code>                                                                                                              |
| <b>Parameters</b>      | <b><i>linecard slot-id</i></b> Enter the slot ID of a line card. Valid slot IDs are from 0 to 2.                                                               |
| <b>Command Modes</b>   | EXEC                                                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.19.0 | Introduced on the S4820T. |

**Usage  
Information**

To clear Layer 3 CAM inconsistencies, use this command.

 **CAUTION: Executing this command causes traffic disruption.**

**Related  
Commands**

[show ip fib linecard](#) — shows FIB entries on a specified stack-unit.

## clear ip route

Clear one or all routes in the routing table.

### C9000 Series

**Syntax** `clear ip route { * | ip-address mask }`

**Parameters**

|                               |                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>*</b>                      | Enter an asterisk (*) to clear all learned IP routes.                                                          |
| <b><i>ip-address mask</i></b> | Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.9.1.0  | Introduced VRF on the E-Series.      |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.2.1.1  | Introduced on the E-Series.          |

**Related  
Commands**

- [ip route](#) — assigns an IP route to the switch.
- [show ip route](#) — views the routing table
- [show ip route summary](#) — views a summary of the routing table.

# clear ip traffic

Clear IP traffic statistics on the switch CPUs.

## C9000 Series

| <b>Syntax</b>           | <code>clear ip traffic {cp   rp}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                           |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|---------|--------------------------------------|---------|-----------------------------|---------|-----------------------------|---------|-----------------------------|
| <b>Parameters</b>       | <b>cp</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Clear ip traffic statistics on the Control Processor CPU. |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

#### Related Commands

[show tcp statistics](#) — displays TCP traffic statistics.

## debug arp

View information on ARP transactions.

### C9000 Series

#### Syntax

```
debug arp [interface] [count value]
```

To stop debugging ARP transactions, use the `no debug arp` command.

#### Parameters

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                                       |
|-------------------|-----------------------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010.                 |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                          |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.                              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                          |
| <b>8.2.1.0</b>    | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                                              |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                       |
| <b>6.3.1.0</b>    | Added the <code>count</code> option.                                              |

#### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

## debug ip dhcp

Enable debug information for dynamic host configuration protocol (DHCP) relay transactions and display the information on the console.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

## Related Commands

- [ip helper-address](#) – specifies the destination broadcast or host address for the DHCP server request.
- [ip helper-address hop-count disable](#) – disables the hop-count increment for the DHCP relay agent.

# debug ip icmp

View information on the internal control message protocol (ICMP).

## C9000 Series

### Syntax

```
debug ip icmp [interface] [count value]
```

To disable debugging, use the `no debug ip icmp` command.

### Parameters

#### ***interface***

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For the Management interface, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1 and the port range is 0.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Tunnel interface, enter the keywords `tunnel` then a number. The range is from 1 to 16383.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port extender (PE) Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id*/stack-unit/port information.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**count value** (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is **Infinity**.

**Command Modes** EXEC Privilege

| <b>8.2.1.0</b>    | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                                              |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                       |
| <b>6.3.1.0</b>    | Added the <code>count</code> option.                                              |

#### Example

```
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
```

#### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

# debug ip packet

View a log of IP packets sent and received.

## C9000 Series

Syntax

debug ip packet [access-group name] [count value] [interface]

To disable debugging, use the no debug ip packet [access-group name] [count value] [interface] command.

Parameters

access-group name

Enter the keyword access-group then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL.

count value

(OPTIONAL) Enter the keyword count then the count value. The range is from 1 to 65534. The default is Infinity.

interface

(OPTIONAL) Enter the following keywords and slot/port or number information:

For the Management interface, enter the keyword ManagementEthernet then the slot/port information. The slot range is from 0 to 1 and the port range is 0.

For a Port Channel interface, enter the keywords port-channel then a number. For the C-Series and S-Series, the range is from 1 to 4096.

For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a port extender (PE) Gigabit Ethernet interface, enter the keyword peGigE then the pe-id / stack-unit / port-id information.

For a port extender 10-Gigabit Ethernet interface, enter the keyword peTenGigE then the pe-id / stack-unit / port-id information. The pe-id range is from 0 to 255; the stack-unit unit-number range is from 0 to 7; and the port-id range is 25 to 28 or 49 to 52 depending on the PE.

For a VLAN, enter the keyword vlan then a number from 1 to 4094.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

Version

Description

9.13.0.1P1

Introduced peTenGigE interface support on the C9010.

9.9(0.0)

Introduced on the C9010.

9.2(1.0)

Introduced on the Z9500.

8.3.19.0

Introduced on the S4820T.

8.3.11.1

Introduced on the Z9000.

8.5.1.0

Added support for 4-port 40G line cards on ExaScale.

8.3.7.0

Introduced on the S4810.

8.2.1.0

Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094).

8.1.1.0

Introduced on the E-Series ExaScale.

7.6.1.0

Added the access-group option.

| Version | Description                          |
|---------|--------------------------------------|
| 7.6.1.0 | Introduced on the S-Series.          |
| 7.5.1.0 | Introduced on the C-Series.          |
| 6.3.1.0 | Added the <code>count</code> option. |

## Usage Information

The following describes the `debug ip packet` command in the following example.

| Field                                                                     | Description                                                                                                                                                                                                   |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>s=</b>                                                                 | Lists the source address of the packet and the name of the interface (in parentheses) that received the packet.                                                                                               |
| <b>d=</b>                                                                 | Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.                                                         |
| <b>len</b>                                                                | Displays the packet's length.                                                                                                                                                                                 |
| <b>sending, rcvd, fragment, sending broad/multicast proto, unroutable</b> | The last part of each line lists the status of the packet.                                                                                                                                                    |
| <b>TCP src=</b>                                                           | Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.                                                           |
| <b>UDP src=</b>                                                           | Displays the source and destination ports for the UDP packets.                                                                                                                                                |
| <b>ICMP type=</b>                                                         | Displays the ICMP type and code.                                                                                                                                                                              |
| <b>IP Fragment</b>                                                        | States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram. |

## Example

```
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 54, sending
 TCP src=23, dst=40869, seq=2112994894, ack=606901739, win=8191 ACK
 PUSH
IP: s=10.1.2.206 (Ma 0/0), d=10.1.2.62, len 40, rcvd
 TCP src=0, dst=0, seq=0, ack=0, win=0
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 226, sending
 TCP src=23, dst=40869, seq=2112994896, ack=606901739, win=8192 ACK
 PUSH
IP: s=10.1.2.216 (Ma 0/0), d=10.1.2.255, len 78, rcvd
 UDP src=0, dst=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500, sending fragment
 IP Fragment, Ident = 4741, fragment offset = 0
 ICMP type=0, code=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500, sending fragment
 IP Fragment, Ident = 4741, fragment offset = 1480
IP: s=40.40.40.40 (local), d=224.0.0.5 (Te 2/11), len 64, sending broad/
multicast
proto=89
IP: s=40.40.40.40 (local), d=224.0.0.6 (Te 2/11), len 28, sending broad/
multicast
proto=2
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
 ICMP type=8, code=0
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
 ICMP type=8, code=0
```

## Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

The `access-group` option supports only the equal to (`eq`) operator in TCP ACL rules. Port operators not equal to (`neq`), greater than (`gt`), less than (`lt`), or range are not supported in `access-group` option (refer to the following example). ARP packets (`arp`) and Ether-type (`ether-type`) are also not supported in the `access-group` option. The entire rule is skipped to compose the filter.

The `access-group` option pertains to:

- IP protocol number: from 0 to 255
- Internet control message protocol (`icmp`) but not the ICMP message type (from 0 to 255)
- Any internet protocol (`ip`)
- Transmission Control Protocol (`tcp`) but not on the `rst`, `syn`, or `urg` bits
- User Datagram Protocol (`udp`)

If an ambiguous access control list rules, the `debug ip packet access-control` command is disabled. A message appears identifying the error (refer to the following Example).

#### Example (Error Messages)

```
Dell#debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug

Dell#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not
supported in access-list debug, access-list debugging is turned off
Dell#
```

## deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

### C9000 Series

#### Syntax

```
deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-
address | any | opcode code-number} [count [byte]] [order] [log [interval
minutes]] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

#### Parameters

|                                           |                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                                | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in<br/>msgs <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval <i>minutes</i></b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                   |
| <b>monitor</b>                            | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

#### Command History

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |
| <b>9.5(0.1)</b> | Introduced on the Z9500. |

| Version         | Description                                                                               |
|-----------------|-------------------------------------------------------------------------------------------|
| <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
| <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

#### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## icmp6-redirect enable

Enable ICMP and ICMP6 redirects.

**Syntax** `icmp6-redirect enable`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version               | Description    |
|-----------------------|----------------|
| <b>Legacy command</b> | Legacy command |

**Usage Information** Use this command to notify hosts on the same network that a better route is available for a specific destination.

The `icmp6-redirect enable` command is applicable for both IP and IPv6 routes.

## ip address

Assign a primary and secondary IP address to the interface.

### C9000 Series

**Syntax** `ip address {ip-address mask [secondary] | dhcp}`

To delete an IP address from an interface, use the `no ip address [ip-address]` command.

**Parameters**

|                          |                                                                             |
|--------------------------|-----------------------------------------------------------------------------|
| <b><i>ip-address</i></b> | Enter an IP address in dotted decimal format.                               |
| <b><i>mask</i></b>       | Enter the mask of the IP address in slash prefix format (for example, /24). |

|                  |                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>secondary</b> | (OPTIONAL) Enter the keyword <code>secondary</code> to designate the IP address as the secondary address.                |
| <b>dhcp</b>      | Enter the keyword <code>dhcp</code> to configure an interface to receive its IP address from the configured DHCP server. |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |

**Usage Information** You must be in INTERFACE mode before you add an IP address to an interface. Assign an IP address to an interface prior to entering ROUTER OSPF mode.

## ip directed-broadcast

Enable the interface to receive directed broadcast packets.

### C9000 Series

**Syntax** `ip directed-broadcast`

To disable the interface from receiving directed broadcast packets, use the `no ip directed-broadcast` command.

**Defaults** Disabled (that is, the interface does not receive directed broadcast packets)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |

## ip domain-list

Configure ip domain names to complete unqualified host names.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip domain-list name</code><br>To remove the name, use the <code>no ip domain-list name</code> command.                                                   |
| <b>Parameters</b>      | <b>name</b> Enter an ip domain name to complete unqualified names (that is, incomplete domain names that cannot be resolved).                                  |
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>To configure a list of possible domain names, configure the <code>ip domain-list</code> command up to six times.</p> <p>If you configure both the <code>ip domain-name</code> and <code>ip domain-list</code> commands, the software tries to resolve the name using the <code>ip domain-name</code> command. If the name is not resolved, the software goes through the list of names configured with the <code>ip domain-list</code> command to find a match.</p> <p>To enable dynamic resolution of hosts, use the following steps:</p> <ul style="list-style-type: none"> <li>• specify a domain name server with the <code>ip name-server</code> command</li> <li>• enable DNS with the <code>ip domain-lookup</code> command</li> </ul> <p>To view current bindings, use the <code>show hosts</code> command. To view a DNS-related configuration, use the <code>show running-config resolve</code> command.</p> |
| <b>Related Commands</b>  | <a href="#">ip domain-name</a> — specifies a DNS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# ip domain-lookup

Enable dynamic host-name to address resolution (that is, DNS).

## C9000 Series

| <b>Syntax</b>            | <code>ip domain-lookup</code><br>To disable DNS lookup, use the <code>no ip domain-lookup</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                             |                |                             |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |

**Usage Information**

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

**Related Commands**

[ip domain-list](#) — configures additional names.

## ip helper-address hop-count disable

Disable the hop-count increment for the DHCP relay agent.

### C9000 Series

**Syntax**

```
ip helper-address hop-count disable
```

To re-enable the hop-count increment, use the `no ip helper-address hop-count disable` command.

**Defaults**

Enabled; the hops field in the DHCP message header is incremental by default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |

| Version        | Description                  |
|----------------|------------------------------|
| <b>7.6.1.0</b> | Introduced on the S-Series.  |
| <b>7.5.1.0</b> | Introduced on the C-Series.  |
| <b>6.3.1.0</b> | Introduced for the E-Series. |

#### Usage Information

This command disables the hop field increments when boot requests are relayed to a DHCP server through the system. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

#### Related Commands

- [ip helper-address](#) — specifies the destination broadcast or host address for DHCP server requests.
- [show running-config](#) — displays the current configuration and changes from the default values.

## ip host

Assign a name and IP address for the host-to-IP address mapping table.

### C9000 Series

#### Syntax

```
ip host name ip-address
```

To remove an IP host, use the `no ip host name [ip-address]` command.

#### Parameters

|                          |                                                                          |
|--------------------------|--------------------------------------------------------------------------|
| <b><i>name</i></b>       | Enter a text string to associate with one IP address.                    |
| <b><i>ip address</i></b> | Enter an IP address, in dotted decimal format, to be mapped to the name. |

#### Defaults

Not configured.

|                          | <b>7.5.1.0</b>                                                                                                                                                                                                                                        | Introduced on the C-Series.                                                                     |
|                          | <b>6.1.1.0</b>                                                                                                                                                                                                                                        | Introduced for the E-Series.                                                                    |
| <b>Usage Information</b> | To avoid denial of service (DOS) attacks, keep the number of fragments allowed for re-assembly low.                                                                                                                                                   |                                                                                                 |

# ip name-server

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

## C9000 Series

|                      |                                                                                                                                                                 |                                                                                                                                          |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ip name-server ipv4-address [ipv4-address2...ipv4-address6]</code><br>To remove a name server, use the <code>no ip name-server ip-address</code> command. |                                                                                                                                          |
| <b>Parameters</b>    | <b>ipv4-address</b>                                                                                                                                             | Enter the IPv4 address, in dotted decimal format, of the name server to be used.                                                         |
|                      | <b>ipv4-address2...<br/>ipv4-address6</b>                                                                                                                       | (OPTIONAL) Enter up five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space. |
| <b>Defaults</b>      | No name servers are configured.                                                                                                                                 |                                                                                                                                          |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                                                   |                                                                                                                                          |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced on the E-Series.          |

**Usage Information**

The system does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port.

You can separately configure both IPv4 and IPv6 domain name servers.

**Related Commands**

[ipv6 name-server](#) — configures an IPv6 name server.

## ip proxy-arp

Enable proxy ARP on an interface.

### C9000 Series

**Syntax**

```
ip proxy-arp
```

To disable proxy ARP, use the `no ip proxy-arp` command.

**Defaults**

Enabled.

**Command Modes** INTERFACE**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.0 | Introduced on the E-Series. |

#### Related Commands

[show ip interface](#) — displays the interface routing status and configuration.

## ip route

Assign a static route to the switch.

### C9000 Series

#### Syntax

```
ip route {destination mask {ip-address | interface [slot/port] | [tunnel
tunnel-id] [distance] [name description] [permanent] | tag tag-value}}[vrf
vrf-name]
```

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

#### Parameters

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

The range is from 0 to 16383.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID. The range is from 1 to 16383.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then the slot/port information. The range is from 1 to 4094.</li> <li>For a port extender (PE) Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is 0–255; the <i>stack-unit number</i> range is 0–7; and the <i>port-id</i> range is 1–48.</li> <li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the <i>stack-unit unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li> </ul> <p>If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.</p> |
| <b><i>interface ip-address</i></b>                 | Enter the keyword <code>interface</code> then the IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>name description</i></b>                     | (OPTIONAL) Enter the keyword <code>name</code> and the description for the IPv4 static route configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                            |                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>distance</b>            | (OPTIONAL) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.                                                                                                                                                                                                                               |
| <b>permanent</b>           | (OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.                      |
| <b>tag tag-value</b>       | (OPTIONAL) Enter the keyword <code>tag</code> then a number to assign to the route. The range is from 1 to 4294967295.                                                                                                                                                                                                             |
| <b>vrf vrf-name</b>        | Enter the keyword <code>vrf</code> followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. Refer to the Route Leaking VRFs section in the Virtual Routing and Forwarding (VRF) chapter of the Configuration guide.      |
| <b>weight weight-value</b> | Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.<br> <b>NOTE:</b> Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version            | Description                                                                       |
|--------------------|-----------------------------------------------------------------------------------|
| <b>9.14(1.2)</b>   | Added the keyword <code>name</code> for static routes.                            |
| <b>9.13.0.1P1</b>  | Introduced <code>peTenGigE</code> interface support on the C9010.                 |
| <b>9.9(0.0)</b>    | Introduced on the C9010.                                                          |
| <b>9.7(0.1)</b>    | Introduced on the S3048-ON.                                                       |
| <b>9.7(0.1)</b>    | Introduced on the S4048-ON.                                                       |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                       |
| <b>9.7(0.0)</b>    | Included the <code>weighted</code> parameter to support weighted ECMP feature.    |
| <b>9.4.(0.0)</b>   | Added support for VRF.                                                            |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                          |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                          |
| <b>9.2.(0.0)</b>   | Added support for tunnel interface type.                                          |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                         |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                          |
| <b>8.5.1.0</b>     | Added support for 4-port 40G line cards on ExaScale.                              |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                          |
| <b>8.2.1.0</b>     | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| <b>8.1.1.0</b>     | Introduced on the E-Series ExaScale.                                              |
| <b>7.9.1.0</b>     | Introduced VRF on the E-Series.                                                   |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                       |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                       |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                       |

## Usage Information

Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1 172.31.5.43`

- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface's configured subnet. In the example, if tengig 1/1 has an ip address on subnet 2.2.2.0 and if 172.31.5.43 recursively resolves to 2.2.2.0, Dell Networking OS installs the static route.
- When the interface goes down, Dell Networking OS withdraws the route.
- When the interface comes up, Dell Networking OS re-installs the route.
- When recursive resolution is "broken," Dell Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each path corresponding to that route is configured with a weight.

You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

## Example

```
Dell(conf)#ip route 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)#ip route 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#do show running-config | grep route ip route 1.1.1.0/24
4.4.4.2 weight 100 ip route 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)#ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#
Dell(conf)#do show running-config | grep route ip route vrf test
1.1.1.0/24 4.4.4.2 weight 100 ip route vrf test 1.1.1.0/24 6.6.6.2
weight 200
```

## Related Commands

[show ip route](#) — views the switch routing table.

# ip source-route

Enable the system to forward IP packets with source route information in the header.

## C9000 Series

### Syntax

`ip source-route`

To drop packets with source route information, use the `no ip route-source` command.

### Defaults

Enabled.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |
| <b>6.1.1.0</b>  | Introduced on the E-Series.          |

## ip unreachable

Enable the generation of internet control message protocol (ICMP) unreachable messages.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip unreachable</code><br>To disable the generation of ICMP messages, use the <code>no ip unreachable</code> command.                                                                                                                            |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                             |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |

| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |
| <b>6.1.1.0</b>  | Introduced on the E-Series.          |

## ipv4 unicast-host-route

Enable the storage of IPv4 route prefixes in the L3 host table.

### C9000 Series

|                 |                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <code>[no] ipv4 unicast-host-route</code>                                                                        |
| <b>Defaults</b> | Disabled; by default, all IPv4 route prefixes are stored installed only in the Longest Prefix Match (LPM) table. |

**Command Modes** CONFIGURATION

| Command History | Version         | Description              |
|-----------------|-----------------|--------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010. |
|                 | <b>9.5(0.1)</b> | Introduced on the Z9500. |
|                 | <b>9.3(0.1)</b> | Introduced on the S6000. |

**Usage Information**

Route prefixes stored in the L3 host table are managed using ECMP next-hop forwarding.

A warning message is displayed after you enter the command stating that this setting takes effect for existing routes only when IPv4 route prefixes are cleared from the LPM routing table (RTM). To enable storage of IPv4 route prefixes in the LPM table, disable this setting by entering the `no ipv4 unicast-host-route` command.

**Example**

```
Dell(conf)#ipv4 unicast-host-route
Warning: Command will take effect for existing routes only when IPv4
route prefixes are cleared from RTM
Dell(conf)#no ipv4 unicast-host-route
```

## load-balance

By default, the system uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the `load-balance` command.

### C9000 Series

**Syntax**

```
load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac |
source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}
```

To return to the default setting (IP 4-tuple), use the `no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}` command.

**Parameters**

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-selection {dest-ip   source-ip}</b>            | Enter the keywords to distribute IP traffic based on the following criteria: <ul style="list-style-type: none"><li>• <code>dest-ip</code> — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-ip</code> — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li></ul>                                                                                                                                                                                                                                                                                                                                                  |
| <b>mac {dest-mac   source-dest-mac   source-mac}</b> | Enter the keywords to distribute MAC traffic based on the following criteria: <ul style="list-style-type: none"><li>• <code>dest-mac</code> — Uses the destination MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-dest-mac</code> — Uses the destination and source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li><li>• <code>source-mac</code> — Uses the source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.</li></ul> |
| <b>tcp-udp enable</b>                                | Enter the keywords to distribute traffic based on the following:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                            | <ul style="list-style-type: none"> <li><code>enable</code> — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                 |                                                              |                |                          |                |                             |                |                             |

| <b>7.5.1.0</b>             | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                 |                                                              |                |                          |                |                             |                |                             |
| <b>Usage Information</b>   | <p>By default, the system distributes incoming traffic based on a hash algorithm using the following criteria:</p> <ul style="list-style-type: none"> <li>IP source address</li> <li>IP destination address</li> <li>TCP/UDP source port</li> <li>TCP/UDP destination port</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                 |                                                              |                |                          |                |                             |                |                             |
| <b>Related Commands</b>    | <a href="#">hash-algorithm ecmp</a> — changes the hash algorithm across an ECMP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                 |                                                              |                |                          |                |                             |                |                             |

## management route

Configure a static route that points to the Management interface or a forwarding router.

### C9000 Series

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>management route {{ip-address mask   {ipv6-address prefix-length}} {forwarding-router-address   managementethernet   fortyGigE   vlan   gigabitethernet   tengigabitethernet}}</pre> <p>To remove a static route, use the <code>no management route{{ip-address mask   {ipv6-address prefix-length}}{forwarding-router-address   managementethernet   fortyGigE   vlan   gigabitethernet   tengigabitethernet}}</code> command.</p> |
| <b>Parameters</b> | <p><b><i>ip-address mask</i></b> Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.</p> <p><b><i>ipv6-address prefix-length</i></b> Enter an IPv6 address (x:x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x:x format followed by the prefix length in the /x format.</p>                                                       |

The range is from /0 to /128.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

|                                  |                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>forwarding-router-address</b> | Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x:x format) of a forwarding router. |
| <b>managementethernet</b>        | Enter the keyword <code>managementethernet</code> for the Management interface on the Primary RPM.        |
| <b>fortyGigE</b>                 | Enter the keyword <code>fortyGigE</code> to specify a forty Gigbit Ethernet interface.                    |
| <b>vlan</b>                      | Enter the keyword <code>vlan</code> to specify a vlan interface.                                          |
| <b>gigabitethernet</b>           | Enter the keyword <code>gigabitethernet</code> to specify a one Gigabit Ethernet interface.               |
| <b>tengigabitethernet</b>        | Enter the keyword <code>tengigabitethernet</code> to specify a ten Gigabit Ethernet interface.            |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version            | Description                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b>    | Introduced on the C9010.                                                                               |
| <b>9.7(0.1)</b>    | Introduced on the S3048-ON.                                                                            |
| <b>9.7(0.1)</b>    | Introduced on the S4048-ON.                                                                            |
| <b>9.7(0.0)</b>    | Added support for forty gigabit, vlan, and tengigabit ethernet interfaces. Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                               |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                               |
| <b>9.0.0.0</b>     | Introduced on the Z9000 and added support for IPv6.                                                    |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                              |
| <b>8.3.11.1</b>    | Introduced on the S4810.                                                                               |
| <b>8.1.1.0</b>     | Introduced on the E-Series ExaScale.                                                                   |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                            |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                                            |

**Usage Information** When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

**Related Commands** [interface ManagementEthernet](#) — configures the Management port on the system (either the Primary or Standby RPM).  
[speed \(Management interface\)](#) — sets the speed for the Management interface.

# show arp

Display the ARP table entries learned on a switch CPU.

## C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Version           | Description                                                                       |
|-------------------|-----------------------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced peTenGigE interface support on the C9010.                              |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                          |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.                              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                          |
| <b>8.2.1.0</b>    | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| <b>8.1.1.0</b>    | Introduced on the E-Series ExaScale.                                              |
| <b>7.9.1.0</b>    | Introduced VRF on the E-Series.                                                   |
| <b>7.8.1.0</b>    | Augmented to display local ARP entries learned from private VLANs (PVLANS).       |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                       |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                       |

## Usage Information

Use the `show arp` command to display the ARP entries learned on the Control Processor and Route Processor.

The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to [Private VLAN \(PVLAN\)](#)).

The following describes the `show arp` command shown in the following example.

| Field                   | Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Protocol</b>         | Displays the protocol type.                                                                            |
| <b>Address</b>          | Displays the IP address of the ARP entry.                                                              |
| <b>Age(min)</b>         | Displays the age (in minutes) of the ARP entry.                                                        |
| <b>Hardware Address</b> | Displays the MAC address associated with the ARP entry.                                                |
| <b>Interface</b>        | Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry. |
| <b>VLAN</b>             | Displays the VLAN ID, if any, associated with the ARP entry.                                           |
| <b>CPU</b>              | Lists which CPU the entries are stored on.                                                             |

## Example

```
Dell>show arp
```

| Protocol | Address     | Age(min) | Hardware Address  | Interface | VLAN | CPU |
|----------|-------------|----------|-------------------|-----------|------|-----|
| Internet | 192.2.1.254 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.253 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.252 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.251 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.250 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.251 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.250 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.249 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.248 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.247 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.246 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |
| Internet | 192.2.1.245 | 1        | 00:00:c0:02:01:02 | Te 0/13   | -    | CP  |

### Example (Private VLAN)

**NOTE:** In this example, Line 1 shows community VLAN 200 (in primary VLAN 10) in a PVLAN. Line 2 shows primary VLAN 10.

```
Dell#show arp
Protocol Address Age(min) Hardware Address Interface VLAN CPU

Internet 5.5.5.1 - 00:01:e8:43:96:5e - Vl 10 pv 200 CP
Internet 5.5.5.10 - 00:01:e8:44:99:55 - Vl 10 CP
Internet 10.1.2.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.10.10.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.16.127.53 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.16.134.254 20 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 133.33.33.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
```

### Usage Information

The following describes the `show arp summary` command shown in the following example.

| Field                  | Description                                                 |
|------------------------|-------------------------------------------------------------|
| <b>Total Entries</b>   | Lists the total number of ARP entries in the ARP table.     |
| <b>Static Entries</b>  | Lists the total number of configured or static ARP entries. |
| <b>Dynamic Entries</b> | Lists the total number of learned or dynamic ARP entries.   |
| <b>CPU</b>             | Lists which CPU the entries are stored on.                  |

### Example (Summary)

```
#show arp summary

TotalEntries Static Entries Dynamic Entries CPU

83 0 83 CP
Dell
```

### Related Commands

- [ip local-proxy-arp](#) — enables/disables Layer 3 communication in secondary VLANs.
- [switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

## show arp retries

Display the configured number of ARP retries.

## C9000 Series

**Syntax** `show arp retries`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.1.0</b>  | Introduced.               |

**Related  
Commands**

[arp retries](#) — sets the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

# show hosts

View the host table and DNS configuration.

## C9000 Series

**Syntax** `show hosts`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 9.0.0.0  | Added support for IPv6 addresses.    |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced on the E-Series.          |

**Usage Information**

The following describes the `show hosts` command in the following example.

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default domain...      | Displays the domain name (if configured).                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Name/address lookup... | States if DNS is enabled on the system. <ul style="list-style-type: none"><li>If DNS is enabled, the Name/Address lookup is domain service.</li><li>If DNS is not enabled, the Name/Address lookup is static mapping</li></ul>                                                                                                                                                                                                                                         |
| Name servers are...    | Lists the name servers, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Host                   | Displays the host name assigned to the IP address.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Flags                  | Classifies the entry as one of the following: <ul style="list-style-type: none"><li>perm — the entry was manually configured and will not time out</li><li>temp — the entry was learned and will time out after 72 hours of inactivity.</li></ul> Also included in the flag is an indication of the validity of the route: <ul style="list-style-type: none"><li>ok — the entry is valid.</li><li>ex — the entry expired.</li><li>?? — the entry is suspect.</li></ul> |
| TTL                    | Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only.                                                                                                                                                                                                                                                                                                                                                               |

| Field   | Description                                     |
|---------|-------------------------------------------------|
| Type    | Displays IP as the type of entry.               |
| Address | Displays the IP addresses assigned to the host. |

#### Example

```
Dell#show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host Flags TTL Type Address

ks (perm, OK) - IP 2.2.2.2
4200-1 (perm, OK) - IP 192.68.69.2
1230-3 (perm, OK) - IP 192.68.99.2
ZZr (perm, OK) - IP 192.71.18.2
Z10-3 (perm, OK) - IP 192.71.23.1
Dell#
```

## show ip cam linecard

View CAM entries for a port pipe on a line card..

### C9000 Series

#### Syntax

```
show ip cam linecard number port-set pipe-number [ip-address mask [longer-
prefixes] | index index-number | summary | vrf vrf instance]
```

#### Parameters

|                                               |                                                                                                                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>number</i></b>                          | Enter the number of the line card.                                                                                                                                          |
| <b><i>pipe-number</i></b>                     | Enter the number of the line card's port-pipe. The range is from 0 to 1.                                                                                                    |
| <b><i>ip-address mask [longer-prefix]</i></b> | (OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. Enter the keyword <code>longer-prefixes</code> to view routes with a common prefix. |
| <b><i>index index-number</i></b>              | (OPTIONAL) Enter the keyword <code>index</code> then the CAM index number. The range depends on CAM size.                                                                   |
| <b><i>summary</i></b>                         | (OPTIONAL) Enter the keyword <code>summary</code> to view a table listing route prefixes and the total number of routes that can be entered into the CAM.                   |
| <b><i>vrf instance</i></b>                    | (OPTIONAL) E-Series Only: Enter the keyword <code>vrf</code> then the VRF instance name to show CAM information as it applies to that VRF instance.                         |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |

| Version | Description                                |
|---------|--------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                   |
| 8.1.1.2 | Introduced on the E-Series ExaScale E600i. |
| 8.1.1.0 | Introduced on the E-Series ExaScale.       |
| 7.9.1.0 | Introduced VRF on the E-Series.            |
| 7.5.1.0 | Introduced on the C-Series.                |
| 6.1.1.0 | Introduced on the E-Series.                |

#### Usage Information

The following describes the `show ip cam` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>       | Displays the CAM index number of the entry.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Destination</b> | Displays the destination route of the index.                                                                                                                                                                                                                                                                                                                                                           |
| <b>EC</b>          | Displays the number of equal cost multipaths (ECMP) available for the default route for non-Jumbo line cards. For Jumbo line cards, displays 0,1 when ECMP is more than eight.                                                                                                                                                                                                                         |
| <b>CG</b>          | Displays 0.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>V</b>           | Displays a 1 if the entry is valid and a 0 if the entry is for a line card with Catalog number beginning with LC-EF.                                                                                                                                                                                                                                                                                   |
| <b>C</b>           | Displays the CPU bit. 1 indicates that a packet hitting this entry is forwarded to the CP or RP2, depending on Egress port.                                                                                                                                                                                                                                                                            |
| <b>Next-Hop</b>    | Displays the next hop IP address of the entry.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Vld</b>         | Displays the VLAN ID. If the entry is 0, the entry is not part of a VLAN.                                                                                                                                                                                                                                                                                                                              |
| <b>Mac Addr</b>    | Displays the next-hop router's MAC address.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Port</b>        | Displays the egress interface. Use the second half of the entry to determine the interface. For example, in the entry 17cl CP, the CP is the pertinent portion. <ul style="list-style-type: none"> <li>• CP = control processor</li> <li>• RP2 = route processor 2</li> <li>• Gi = Gigabit Ethernet interface</li> <li>• So = SONET interface</li> <li>• Te = 10-Gigabit Ethernet interface</li> </ul> |

#### Example

```
Dell#show ip cam linecard 0 port-set 0
Destination EC C Vld Mac-Addr Port

1.1.32.140/32 0 0 200 00:00:00:00:1f:8a PeGigE <PE-ID>/<Slot>/<Port>
```

## show ip fib linecard

View all forwarding information base (FIB) entries.

### C9000 Series

|                   |                                                                                                   |                                                         |
|-------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Syntax</b>     | <code>show ip fib linecard <i>linecard id</i> {vrf &lt;vrf-id&gt;/&lt;A.B.C.D&gt;/summary}</code> |                                                         |
| <b>Parameters</b> | <b>linecard</b>                                                                                   | Displays the fib entries for the mentioned linecard id. |

|                 |                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b>      | Displays the fib entries for the mentioned <i>vrf-id</i> . Otherwise, <i>vrf</i> displays the default <i>vrf</i> entries. |
| <b>A.B.C.D.</b> | Displays the fib entry for the mentioned prefix.                                                                          |
| <b>summary</b>  | Displays the fib summary.                                                                                                 |

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.9.1.0</b>  | Introduced VRF on the E-Series.      |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |
| <b>6.1.1.0</b>  | Introduced on the E-Series.          |

#### Example

```
Dell>show ip fib linecard 2
Destination Gateway First-Hop Mac-
Addr Port Vid EC

1.1.32.140/32 via 1.1.32.140, PeGigE PE-ID/Slot/Port 1.1.32.140
00:00:00:00:1f:8a PeGigE PE-ID/Slot/Port 200 0
```

## show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

### C9000 Series

**Syntax** `show ip flow interface interface {source-ip address destination-ip address} {protocol number [tcp | udp]} {src-port number destination-port number}`

|                   |                                                     |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b><br><b><i>interface</i></b>         | Enter the keyword <i>interface</i> then one of the following interface keywords. <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|                   | <b>source-ip</b><br><b><i>address</i></b>           | Enter the keywords <i>source-ip</i> then the IP source address in IP address format.                                                                                                                                                                                                                                                                                             |
|                   | <b>destination-ip</b><br><b><i>address</i></b>      | Enter the keywords <i>destination-ip</i> then the IP destination address in IP address format.                                                                                                                                                                                                                                                                                   |
|                   | <b>protocol <i>number</i></b><br><b>[tcp   udp]</b> | Enter the keyword <i>protocol</i> then one of the protocol type keywords: <code>tcp</code> , <code>udp</code> , or <i>protocol number</i> . The protocol number range is from 0 to 255. .                                                                                                                                                                                        |

**src-port *number*** Enter the keywords *src-port* then the source port number.

**destination-port *number*** Enter the keywords *destination-port* then the destination port number.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.3.10.0</b> | Introduced on the S4810.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.                 |
| <b>7.9.1.0</b>  | Introduced VRF on the E-Series.                      |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                          |
| <b>6.1.1.0</b>  | Introduced on the E-Series.                          |

**Usage Information** This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use this command for routed packets only. For switched packets, use the `show port-channel-flow` command.

The `show ip flow` command does not compute the egress port information when `load-balance mac hashing` is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: `%Error: Unable to read IP route table.`

#### Example

```
Dell#show ip flow interface Te 1/8 189.1.1.1 63.0.0.1 protocol tcp
source-port 7898 destination-port 8
```

**flow: 189.1.1.1 63.0.0.1 protocol 6 7868 8976**

Ingress interface:Te 1/20

Egress interface:Te 1/14 to 1.7.1.2[CAM hit 103710] unfragmented packet  
Te 1/10 to 1.2.1.2[CAM hit 103710] fragmented packet

## show ip interface

View IP-related information on all interfaces.

### C9000 Series

**Syntax** `show ip interface [interface | brief] [linecard slot-id] [configured]`

**Parameters** ***interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a Loopback interface, enter the keyword `Loopback` then a number from 0 to 16383.
- For the Management interface, enter the keyword `ManagementEthernet` then zero (0).
- For the Null interface, enter the keyword `null` then zero (0).
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

|                                |                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard <i>slot-id</i></b> | Enter the <code>linecard slot-id</code> parameters to specify the switch ports on a line card. The range of slot IDs is from 0 to 2. |
| <b>brief</b>                   | (OPTIONAL) Enter the keyword <code>brief</code> to view a brief summary of the interfaces and whether an IP address is assigned.     |
| <b>configured</b>              | (OPTIONAL) Enter the keyword <code>configured</code> to display the physical interfaces with non-default configurations only.        |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Updated the command output to include the unicast reverse path forwarding (uRPF) status. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                 |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                                                                 |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                 |
| <b>8.5.1.0</b>   | Added support for 4-port 40G line cards on ExaScale.                                     |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                                                 |
| <b>8.1.1.2</b>   | Supported on the E-Series ExaScale E600i.                                                |
| <b>8.1.1.0</b>   | Introduced on the E-Series ExaScale.                                                     |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                                              |
| <b>7.5.1.0</b>   | Introduced on the C-Series.                                                              |
| <b>6.1.1.0</b>   | Introduced on the E-Series.                                                              |

**Usage Information** The following describes the `show ip interface` command shown in the following example.

| Lines                            | Description                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>TenGigabitEthernet 0/0...</b> | Displays the interface's type, slot/port, and physical and line protocol status.                                    |
| <b>Internet address...</b>       | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed. |

| Lines                      | Description                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>IP MTU is...</b>        | Displays IP MTU value.                                                                                              |
| <b>Inbound access...</b>   | Displays the name of the configured incoming access list. If none is configured, the phrase "not set" is displayed. |
| <b>Proxy ARP...</b>        | States whether proxy ARP is enabled on the interface.                                                               |
| <b>Split horizon...</b>    | States whether split horizon for RIP is enabled on the interface.                                                   |
| <b>Poison Reverse...</b>   | States whether poison for RIP is enabled on the interface.                                                          |
| <b>ICMP redirects...</b>   | States if ICMP redirects are sent.                                                                                  |
| <b>ICMP unreachable...</b> | States if ICMP unreachable messages are sent.                                                                       |

### Example

```
Dell# show ip interface tengigabitethernet 2
TenGigabitEthernet 2/0 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
```

```
TenGigabitEthernet 2/1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
```

```
TenGigabitEthernet 2/2 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
```

```
TenGigabitEthernet 2/3 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
--More--
```

```
Dell# show ip interface brief
Interface IP-Address OK Method
Status Protocol
TenGigabitEthernet 0/0 unassigned NO Manual administratively
down down
TenGigabitEthernet 0/1 10.10.10.1 NO Manual administratively
down down
```

```
TenGigabitEthernet 0/2 unassigned NO Manual administratively
down down
TenGigabitEthernet 0/3 unassigned NO Manual administratively
down down
fortyGigE 0/4 unassigned NO Manual administratively
down down
fortyGigE 0/8 unassigned NO Manual administratively
down down
--More--
```

```
Dell# show ip interface configured
TenGigabitEthernet 0/0 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
```

```
TenGigabitEthernet 0/1 is down, line protocol is down
Internet address is 10.10.10.1/24
Broadcast address is 10.10.10.255
Address determined by config file
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
--More--
```

## Usage Information

The following describes the `show ip interface brief` command shown in the following example.

| Fields            | Description                                                                       |
|-------------------|-----------------------------------------------------------------------------------|
| <b>Interface</b>  | Displays type of interface and the associated slot and port number.               |
| <b>IP-Address</b> | Displays the IP address for the interface, if configured.                         |
| <b>Ok?</b>        | Indicates if the hardware is functioning properly.                                |
| <b>Method</b>     | Displays "Manual" if the configuration is read from the saved configuration.      |
| <b>Status</b>     | States whether the interface is enabled (up) or disabled (administratively down). |
| <b>Protocol</b>   | States whether IP is enabled (up) or disabled (down) on the interface.            |

## Example (Brief)

```
Dell#show ip int brief
Interface IP-Address OK? Method Status
Protocol
TenGigabitEthernet 1/0 unassigned NO Manual administratively down
down
TenGigabitEthernet 1/1 unassigned NO Manual administratively down
down
TenGigabitEthernet 1/2 unassigned YES Manual up
TenGigabitEthernet 1/3 unassigned YES Manual up
TenGigabitEthernet 1/4 unassigned YES Manual up
TenGigabitEthernet 1/5 10.10.10.1 YES Manual up
TenGigabitEthernet 1/6 unassigned NO Manual administratively down
down
```

# show ip management-route

View the IP addresses assigned to the Management interface.

## C9000 Series

|                 |                                                                                                                                                                |                                                                                                                                         |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Syntax          | show ip management-route [all   connected   summary   static]                                                                                                  |                                                                                                                                         |
| Parameters      | all                                                                                                                                                            | (OPTIONAL) Enter the keyword <code>all</code> to view all IP addresses assigned to all Management interfaces on the switch.             |
|                 | connected                                                                                                                                                      | (OPTIONAL) Enter the keyword <code>connected</code> to view only routes directly connected to the Management interface.                 |
|                 | summary                                                                                                                                                        | (OPTIONAL) Enter the keyword <code>summary</code> to view a table listing the number of active and non-active routes and their sources. |
|                 | static                                                                                                                                                         | (OPTIONAL) Enter the keyword <code>static</code> to view non-active routes also.                                                        |
| Command Modes   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                                    |                                                                                                                                         |
| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                         |

|         |                               |                        |           |
|---------|-------------------------------|------------------------|-----------|
| Example | Dell#show ip management-route |                        |           |
|         | Destination                   | Gateway                | State     |
|         | -----                         | -----                  | -----     |
|         | 10.1.2.0/24                   | ManagementEthernet 0/0 | Connected |
|         | 172.16.1.0/24                 | 10.1.2.4               | Active    |
|         | Dell#                         |                        |           |

# show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

## C9000 Series

|        |                                                                 |
|--------|-----------------------------------------------------------------|
| Syntax | show ipv6 management-route [all   connected   summary   static] |
|--------|-----------------------------------------------------------------|

|                   |                  |                                                                                                                                         |
|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>all</b>       | (OPTIONAL) Enter the keyword <code>all</code> to view all IP addresses assigned to all Management interfaces on the switch.             |
|                   | <b>connected</b> | (OPTIONAL) Enter the keyword <code>connected</code> to view only routes directly connected to the Management interface.                 |
|                   | <b>summary</b>   | (OPTIONAL) Enter the keyword <code>summary</code> to view a table listing the number of active and non-active routes and their sources. |
|                   | <b>static</b>    | (OPTIONAL) Enter the keyword <code>static</code> to view non-active routes also.                                                        |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                        |
|-----------------|------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.           |
| <b>9.7(0.1)</b> | Introduced on the S3048-ON.        |
| <b>9.7(0.1)</b> | Introduced on the S4048-ON.        |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.        |
| <b>9.2(1.0)</b> | Introduced on the Z9500.           |
| <b>9.0.2.0</b>  | Introduced on the S6000.           |
| <b>9.0.0.0</b>  | Introduced on the Z9000.           |
| <b>8.3.19.0</b> | Introduced on the S4820T.          |
| <b>8.4.1.0</b>  | Introduced on the C- and E-Series. |
| <b>8.3.7.0</b>  | Introduced on the S4810.           |

#### Example

```
Dell#show ipv6 management-route
IPv6 Destination Gateway State

2001:34::0/64 ManagementEthernet 0/0 Connected
2001:68::0/64 2001:34::16 Active
Dell#
```

## show ip protocols

View information on all routing protocols enabled and active on the switch.

### C9000 Series

**Syntax** `show ip protocols`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                               |
|-----------------|---------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                  |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                  |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.                                      |
| <b>7.6.1.0</b>  | Regular evaluation optimization enabled/disabled added to display output. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                               |
| <b>6.1.1.0</b>  | Introduced on the E-Series.                                               |

### Example

```
Dell#show ip protocols
Routing Protocol is "bgp 1"
 Cluster Id is set to 20.20.20.3
 Router Id is set to 20.20.20.3
 Fast-external-fallover enabled
 Regular expression evaluation optimization enabled
 Capable of ROUTE_REFRESH
 For Address Family IPv4 Unicast
 BGP table version is 0, main routing table version 0
 Distance: external 20 internal 200 local 200
 Neighbor(s):
 Address : 20.20.20.2
 Filter-list in : foo
 Route-map in : foo
 Weight : 0
 Address : 5::6
 Weight : 0
Dell#
```

## show ip route

View information, including how they were learned, about the IP routes on the switch.

## C9000 Series

### Syntax

```
show ip route hostname | ip-address [mask] [longer-prefixes] | list prefix-list | protocol [process-id | routing-tag] | all | connected | static | summary] [vrf vrf-name]
```

### Parameters

|                                |                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf vrf-name</i></b>     | (OPTIONAL) Enter the keyword <code>vrf</code> and then the VRF name to list the routes in the route table of a specific VRF.                                            |
| <b><i>ip-address</i></b>       | (OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.                                                |
| <b><i>mask</i></b>             | (OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.                                                                     |
| <b><i>longer-prefixes</i></b>  | (OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.                                                                     |
| <b>list <i>prefix-list</i></b> | (OPTIONAL) Enter the keyword <code>list</code> and the name of a configured prefix list. For more information, refer to the <a href="#">show ip route list</a> command. |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>protocol</i></b>    | (OPTIONAL) Enter the name of a routing protocol ( <code>bgp</code> , <code>isis</code> , <code>ospf</code> , <code>rip</code> ) or the keywords <code>connected</code> or <code>static</code> .<br> <b>NOTE:</b> <code>bgp</code> , <code>isis</code> , <code>ospf</code> , and <code>rip</code> . <ul style="list-style-type: none"><li>• If you enter <code>bgp</code>, you can include the BGP <i>as-number</i>.</li><li>• If you enter <code>isis</code>, you can include the ISIS <i>routing-tag</i>.</li><li>• If you enter <code>ospf</code>, you can include the OSPF <i>process-id</i>.</li></ul> |
| <b><i>process-id</i></b>  | (OPTIONAL) Specify that only OSPF routes with a certain process ID must be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>routing-tag</i></b> | (OPTIONAL) Specify that only ISIS routes with a certain routing tag must be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>connected</i></b>   | (OPTIONAL) Enter the keyword <code>connected</code> to view only the directly connected routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>all</i></b>         | (OPTIONAL) Enter the keyword <code>all</code> to view both active and non-active routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>static</i></b>      | (OPTIONAL) Enter the keyword <code>static</code> to view only routes the <code>ip route</code> command configures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>summary</i></b>     | (OPTIONAL) Enter the keyword <code>summary</code> . For more information, refer to the <a href="#">show ip route summary</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>     | <b>Description</b>                   |
|--------------------|--------------------------------------|
| <b>9.9(0.0)</b>    | Introduced on the C9010.             |
| <b>9.7(0.1)</b>    | Introduced on the S3048-ON.          |
| <b>9.7(0.1)</b>    | Introduced on the S4048-ON.          |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.          |
| <b>9.4.(0.0)</b>   | Added support for VRF.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.             |
| <b>9.0.2.0</b>     | Introduced on the S6000.             |
| <b>8.3.19.0</b>    | Introduced on the S4820T.            |
| <b>8.3.11.1</b>    | Introduced on the Z9000.             |
| <b>8.3.7.0</b>     | Introduced on the S4810.             |
| <b>8.1.1.0</b>     | Introduced on the E-Series ExaScale. |
| <b>7.9.1.0</b>     | Introduced VRF on the E-Series.      |
| <b>7.6.1.0</b>     | Introduced on the S-Series.          |
| <b>7.5.1.0</b>     | Introduced on the C-Series.          |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.          |

#### Example

```
Dell#show ip route all

Codes:C- connected, S - static, R - RIP
 B- BGP, IN - internal BGP, EX - external BGP, LO - Locally
 Originated
 O- OSPF, IA - OSPF inter area N1 - OSPF NSSA external type 1
```

```

N2- OSPF NSSA external type 2, E1 - OSPF external type 1
E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1
L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default
>- non-active route + - summary route

Gateway of last resort is not set

 Destination Gateway Dist/Metric Last Change

R 3.0.0.0/8 via 100.10.10.10, So 2/8 120/1 00:07:12
 100.10.10.0/24 via 101.10.10.10, So 2/9
 Direct, Te 2/8 0/0 00:08:54
> R 100.10.10.0/24 Direct, Te 2/8 120/0 00:08:54
C 101.10.10.0/24 Direct, Te 2/9 0/0 00:09:15
> R 101.10.10.0/24 Direct, Te 2/9 120/0 00:09:15
Dell#

```

### Example (Summary)

```

Dell#show ip route summary

Route Source Active Routes Non-active Routes
connected 2 0
static 1 0
Total 3 0
Total 3 active route(s) using 612 bytes

Dell#show ip route static
Destination Gateway Dist/Metric Last Change

*S 0.0.0.0/0 via 10.10.91.9, Te 1/2 1/0 3d2h

```

## show ip route list

Display IP routes in an IP prefix list.

### C9000 Series

**Syntax** `show ip route list prefix-list`

**Parameters** *prefix-list* Enter the name of a configured prefix list.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.0 | Introduced on the E-Series. |

#### Example

```
Dell#show ip route list test

Codes:C- connected, S - static, R - RIP,
 B- BGP, IN - internal BGP, EX - external BGP, LO - Locally
 Originated,
 O- OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
 N2- OSPF NSSA external type 2, E1 - OSPF external type 1,
 E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
 L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default,
 >- non-active route, + - summary route

Gateway of last resort is not set

 Destination Gateway Dist/Metric Last Change

R 2.1.0.0/24 via 2.1.4.1, Te 2/43 120/2 3d0h
R 2.1.1.0/24 via 2.1.4.1, Te 2/43 120/2 3d1h
R 2.1.2.0/24 via 2.1.4.1, Te 2/43 120/1 3d0h
R 2.1.3.0/24 via 2.1.4.1, Te 2/43 120/1 3d1h
C 2.1.4.0/24 Direct, Te 2/43 0/0 3d1h
```

#### Related Commands

- [ip prefix-list](#) — enters CONFIGURATION-IP PREFIX-LIST mode and configures a prefix list.
- [show ip prefix-list summary](#) — displays a summary of the configured prefix lists.

## show ip route summary

View a table summarizing the IP routes in the switch.

### C9000 Series

**Syntax** `show ip route summary`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced on the E-Series.          |

Usage Information

The following describes the `show ip route summary` shown in the following example.

| Column Heading       | Description                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Source         | Identifies how the route is configured in the system.                                                                                                                       |
| Active Routes        | Identifies the best route if a route is learned from two protocol sources.                                                                                                  |
| Non-active Routes    | Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route. |
| ospf 100             | If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.                                                   |
| Total 1388 active... | Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the system, this line does not appear.       |

Example

```
Dell>show ip route summary

Route Source Active Routes Non-active Routes
connected 17 0
static 3 0
ospf 100 1368 2
Intra-area: 762 Inter-area: 1 External-1: 600 External-2: 5
Total 1388 2
Total 1388 active route(s) using 222440 bytes
Total 2 non-active route(s) using 128 bytes
Dell>
```

Related Commands

[show ip route](#) — displays information about the routes found in the switch.

# show ip traffic

View IP traffic statistics related to switch CPUs, including ICMP, UDP, TCP and ARP counters.

## C9000 Series

Syntax

show ip traffic {all | cp | rp}

Parameters

all

(OPTIONAL) Enter the keyword `all` to view IP traffic statistics from all processors.

cp

(OPTIONAL) Enter the keyword `cp` to view only IP traffic statistics from the Control Processor.

rp

(OPTIONAL) Enter the keyword `rp` to view only IP traffic statistics from the Route Processor.

Default

View IP traffic statistics from all processors.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.          |
| <b>6.1.1.0</b>  | Introduced on the E-Series.          |

## Usage Information

The following describes the `show ip traffic` summary shown in the following example.

| Keyword                        | Definition                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unknown protocol...</b>     | No receiver for these packets. Counts packets whose protocol type field is not recognized by the system.                                                                                                                                                                                                                                               |
| <b>not a gateway...</b>        | Packets can not be routed; the host/network is unreachable.                                                                                                                                                                                                                                                                                            |
| <b>security failures...</b>    | Counts the number of received unicast/multicast packets that could not be forwarded due to: <ul style="list-style-type: none"> <li>route not found for unicast/multicast; ingress interfaces do not belong to the destination multicast group</li> <li>destination IP address belongs to reserved prefixes; the host/network is unreachable</li> </ul> |
| <b>bad options...</b>          | Unrecognized IP option on a received packet.                                                                                                                                                                                                                                                                                                           |
| <b>Fragments:</b>              | IP fragments received.                                                                                                                                                                                                                                                                                                                                 |
| <b>...reassembled</b>          | Number of IP fragments that were reassembled.                                                                                                                                                                                                                                                                                                          |
| <b>...timeouts</b>             | Number of times a timer expired on a reassembled queue.                                                                                                                                                                                                                                                                                                |
| <b>...too big</b>              | Number of invalid IP fragments received.                                                                                                                                                                                                                                                                                                               |
| <b>...couldn't fragment</b>    | Number of packets that could not be fragmented and forwarded.                                                                                                                                                                                                                                                                                          |
| <b>...encapsulation failed</b> | Counts packets which could not be forwarded due to ARP resolution failure. The system sends an ARP request prior to forwarding an IP packet. If a reply is not received, the system repeats the request three times. These packets are counted in encapsulation failed.                                                                                |
| <b>Rcvd:</b>                   | Total number of packets received from specified protocol.                                                                                                                                                                                                                                                                                              |
| <b>...short packets</b>        | The number of bytes in the packet are too small.                                                                                                                                                                                                                                                                                                       |
| <b>...bad length</b>           | The length of the packet was not correct.                                                                                                                                                                                                                                                                                                              |
| <b>...no port broadcasts</b>   | The incoming broadcast/multicast packet did not have any listener.                                                                                                                                                                                                                                                                                     |
| <b>...socket full</b>          | The applications buffer is full and the incoming packet are dropped.                                                                                                                                                                                                                                                                                   |

The F10 Monitoring MIB provides access to the following statistics.

- **IP Statistics: Bcast: Received:** Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent:** Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received:** Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent:** Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request:** Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies:** Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3

- **ARP Statistics: Sent: Request:** Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Replies:** Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy:** Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5

### Example

```
Dell#show ip traffic
Control Processor IP Traffic:

IP statistics:
 Rcvd: 23857 total, 23829 local destination
 0 format errors, 0 checksum errors, 0 bad hop count
 0 unknown protocol, 0 not a gateway
 0 security failures, 0 bad options
 Frags: 0 reassembled, 0 timeouts, 0 too big
 0 fragmented, 0 couldn't fragment
 Bcast: 28 received, 0 sent; Mcast: 0 received, 0 sent
 Sent: 16048 generated, 0 forwarded
 21 encapsulation failed, 0 no route
ICMP statistics:
 Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0 unreachable
 0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0 quench
 0 parameter, 0 timestamp, 0 info request, 0 other
 Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
 0 mask requests, 0 mask replies, 0 quench, 0 timestamp
 0 info reply, 0 time exceeded, 0 parameter problem
UDP statistics:
 Rcvd: 0 total, 0 checksum errors, 0 no port
 0 short packets, 0 bad length, 0 no port broadcasts, 0 socket full
 Sent: 0 total, 0 forwarded broadcasts
TCP statistics:
 Rcvd: 23829 total, 0 checksum errors, 0 no port
 Sent: 16048 total
ARP statistics:
 Rcvd: 156 requests, 11 replies
 Sent: 21 requests, 10 replies (0 proxy)
```

### Related Commands

[clear ip traffic](#) — clears IP traffic statistics.

## show tcp statistics

Display statistical information about TCP traffic transmitted on Z9500 CPUs.

### C9000 Series

**Syntax** `show tcp statistics {all | cp | rp}`

**Parameters**

|            |                                                                                           |
|------------|-------------------------------------------------------------------------------------------|
| <b>all</b> | Enter the keyword <code>all</code> to view all TCP statistics on the switch CPUs.         |
| <b>cp</b>  | Enter the keyword <code>cp</code> to view TCP statistics only from the Control Processor. |
| <b>rp</b>  | Enter the keyword <code>rp1</code> to view TCP statistics only from the Route Processor.  |

**Command Modes** EXEC Privilege

**Default** Display TCP information from all processors.

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 6.4.1.0  | Introduced                           |

## Usage Information

The following describes the `show tcp statistics cp` command shown in the following example.

| Field                                   | Description                                                                                                                                                                                                                     |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rcvd:</b>                            | Displays the number and types of TCP packets received by the switch. <ul style="list-style-type: none"> <li>• Total = total packets received</li> <li>• no port = number of packets received with no designated port</li> </ul> |
| <b>0 checksum error...</b>              | Displays the number of packets received with the following: <ul style="list-style-type: none"> <li>• checksum errors</li> <li>• bad offset to data</li> <li>• too short</li> </ul>                                              |
| <b>329 packets...</b>                   | Displays the number of packets and bytes received in sequence.                                                                                                                                                                  |
| <b>17 dup...</b>                        | Displays the number of duplicate packets and bytes received.                                                                                                                                                                    |
| <b>0 partially...</b>                   | Displays the number of partially duplicated packets and bytes received.                                                                                                                                                         |
| <b>7 out-of-order...</b>                | Displays the number of packets and bytes received out of order.                                                                                                                                                                 |
| <b>0 packets with data after window</b> | Displays the number of packets and bytes received that exceed the switch's window size.                                                                                                                                         |
| <b>0 packets after close</b>            | Displays the number of packet received after the TCP connection was closed.                                                                                                                                                     |
| <b>0 window probe packets...</b>        | Displays the number of window probe and update packets received.                                                                                                                                                                |
| <b>41 dup ack...</b>                    | Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.                                                                                                                        |
| <b>10184 ack...</b>                     | Displays the number of acknowledgement packets and bytes received.                                                                                                                                                              |
| <b>Sent:</b>                            | Displays the total number of TCP packets sent and the number of urgent packets sent.                                                                                                                                            |
| <b>25 control packets...</b>            | Displays the number of control packets sent and the number retransmitted.                                                                                                                                                       |
| <b>11603 data packets...</b>            | Displays the number of data packets sent.                                                                                                                                                                                       |
| <b>24 data packets retransmitted</b>    | Displays the number of data packets resent.                                                                                                                                                                                     |
| <b>355 ack..</b>                        | Displays the number of acknowledgement packets sent and the number of packet delayed.                                                                                                                                           |
| <b>0 window probe...</b>                | Displays the number of window probe and update packets sent.                                                                                                                                                                    |
| <b>7 Connections initiated...</b>       | Displays the number of TCP connections initiated, accepted, and established.                                                                                                                                                    |

| Field                           | Description                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14 Connections closed...</b> | Displays the number of TCP connections closed, dropped.                                                                                       |
| <b>20 Total rxmt...</b>         | Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period. |
| <b>0 Keepalive....</b>          | Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.     |

### Example

```
Dell#show tcp statistics cp

Control Processor TCP:
Rcvd: 10585 Total, 0 no port
 0 checksum error, 0 bad offset, 0 too short
 329 packets (1263 bytes) in sequence
 17 dup packets (6 bytes)
 0 partially dup packets (0 bytes)
 7 out-of-order packets (0 bytes)
 0 packets (0 bytes) with data after window
 0 packets after close
 0 window probe packets, 41 window update packets
 41 dup ack packets, 0 ack packets with unsend data
 10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
 25 control packets (including 24 retransmitted)
 11603 data packets (12439677 bytes)
 24 data packets (7638 bytes) retransmitted
 355 ack only packets (41 delayed)
 0 window probe packets, 0 window update packets
 7 Connections initiated, 8 connections accepted, 15 connections
established
 14 Connections closed (including 0 dropped, 0 embryonic dropped)
 20 Total rxmt timeout, 0 connections dropped in rxmt timeout
 0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in
keepalive
Dell#
```

### Related Commands

[clear tcp statistics](#) — clears TCP traffic statistics.

# IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell Networking operating system.

**NOTE:** For IPv4 ACL commands, refer to the [Access Control Lists \(ACL\)](#) chapter.

## Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, see the [cam-acl](#) command.
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

## cam-acl

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

## C9000 Series

### Syntax

```
cam-acl {default | l2acl number { ipv4acl number ipv6acl number ipv4qos
number l2qos number l2pt number ipmacacl number vman-qos | vman-dual-qos
number ecfmact number [openflow number fcoeact number | fedgovact number]
```

```
nlbclusteracl number | ipv4pbr number | iscsiopaclnumber | openflow number
| vrfv4ac number1]}}
```

## Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>          | <p>Use the default CAM profile settings and set the CAM as follows:</p> <ul style="list-style-type: none"> <li>• L3 ACL (ipv4acl): 4</li> <li>• L2 ACL(l2acl): 5</li> <li>• IPv6 L3 ACL (ipv6acl): 0</li> <li>• L3 QoS (ipv4qos): 2</li> <li>• L2 QoS (l2qos): 1</li> <li>• OpenFlow: 0 (disabled)</li> <li>• FCoE (fcoeacl): 0 (disabled)</li> <li>• iSCSI Optimization (iscsiopacl): 0 (disabled)</li> <li>• L2 PT : 0</li> <li>• IP-MAC ACL : 0</li> <li>• Vman QoS : 0</li> <li>• ECFM ACL: 0</li> <li>• IPv4 PBR : 0</li> <li>• VRFv4 ACL : 0</li> <li>• FedGov ACL : 0</li> <li>• NLB Cluster ACL : 0</li> </ul>                                                     |
| <b>l2acl number</b>     | <p>Allocate space to each CAM region.</p> <p>Enter the CAM profile name then the amount for CAM space allocation. The total space allocated must be equal to 12. The IPv6 ACL range must be a factor of 2.</p> <p>Enter <i>l2acl</i> and the FP block <i>number</i> for L2 ACL. The FP block number range is from 1 to 8.</p> <ul style="list-style-type: none"> <li>• 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)</li> <li>• 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)</li> </ul> |
| <b>ipv4acl number</b>   | <p>Enter <i>ipv4acl</i> and the FP block <i>number</i> for IPv4. The FP block number range is from 0 to 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ipv6acl number</b>   | <p>Enter <i>ipv6acl</i> and the FP block <i>number</i> for IPv6. The FP block number range is from 0 to 4 (multiples of 2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ipv4qos number</b>   | <p>Enter <i>ipv4qos</i> and the FP block <i>number</i> for IPv4–QoS. The FP block number range is from 0 to 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>l2qos number</b>     | <p>Enter <i>l2qos</i> and the FP block <i>number</i> for L2–QoS. The FP block number range is from 1 to 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>l2pt number</b>      | <p>Enter <i>l2pt</i> and the FP block <i>number</i> for L2–Protocol tunneling. The FP block number range is from 0 to 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ipmacacl number</b>  | <p>Enter <i>ipmacacl</i> and the FP block <i>number</i> for IP-MAC ACL. The FP block number range is from 0 to 6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>vman-qos number</b>  | <p>Enter <i>vman-qos</i> and the FP block <i>number</i> for Vman QoS. The FP block number range is from 0 to 6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ecfmacacl number</b> | <p>Enter <i>ecfmacacl</i> and the FP block <i>number</i> for ECFM ACL. The FP block number range is from 0 to 5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>fcoeacl number</b>   | <p>Enter <i>fcoeacl</i> and the FP block <i>number</i> for FCoE ACL. The FP block number range is 0 to 6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                                 |                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>fedgovacl<br/>number</b>     | Enter <code>fedgovacl</code> and the FP block <i>number</i> for Fed Gov ACL. The FP block number range is 0 to .              |
| <b>nlbclusteracl<br/>number</b> | Enter <code>nlbclusteracl</code> and the FP block <i>number</i> for NLB Cluster ACL. The FP block number range is 0 to 6.     |
| <b>ipv4pbr number</b>           | Enter <code>ipv4pbr</code> and the FP block <i>number</i> for IPv4 PBR ACL. The FP block number range is 0 to 6.              |
| <b>iscsiopacl<br/>number</b>    | Enter <code>iscsiopacl</code> and the FP block <i>number</i> for iSCSI optimization ACL. The FP block number range is 0 to 6. |
| <b>openflow number</b>          | Enter <code>openflow</code> and the FP block <i>number</i> for OpenFlow ACL. The FP block number range is 0 to 6.             |
| <b>vrfv4acl number</b>          | Enter <code>vrfv4acl</code> and the FP block <i>number</i> for VRF ACL. The FP block number range is 0 to 6.                  |

**Command Modes** CONFIGURATION

CONFIGURATION TERMINAL BATCH

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.                                         |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                                                           |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                                                                           |
| <b>9.2(0.0)</b>  | Added support for the <code>fcoe</code> parameter on the S4810 and S4820T.                         |
| <b>9.1.(0.0)</b> | Added support for OpenFlow on the Z9000.                                                           |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                                                          |
| <b>8.3.12.0</b>  | Added the keywords <code>fcoeacl</code> and <code>iscsiopacl</code> on the S4810.                  |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                                                           |
| <b>8.3.1.0</b>   | Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> . |
| <b>8.2.1.0</b>   | Introduced on the S-Series.                                                                        |
| <b>7.8.1.0</b>   | Introduced on the C-Series.                                                                        |

## Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires four blocks and these blocks cannot be reallocated. The total number of blocks must be equal to 12. The `ipv4acl` profile range is from 0 to 8.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 12.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of 2 (2, 4, 6, 8, 10).

If you enabled BMP 3.0, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the `reload conditional nvram-cfg-change` command.

You can use the `cam-acl default` command in Configuration Terminal Batch mode to reset ACL CAM entries to default settings in a dual-homing setup.

# cam-acl-egress

Allocate space for IPv6 egress ACLs.

## C9000 Series

|            |                                                              |                                                                                                                                                                                                                      |
|------------|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | cam-acl-egress {default   l2acl 1-3 ipv4acl 1-3 ipv6acl 0-2} |                                                                                                                                                                                                                      |
| Parameters | default                                                      | Use the default CAM profile settings, and set the CAM as follows: <ul style="list-style-type: none"><li>L2 ACL(l2acl): <b>1</b></li><li>L3 ACL (ipv4acl): <b>1</b></li><li>IPv6 L3 ACL (ipv6acl): <b>2</b></li></ul> |
|            | l2acl 1-3 ipv4acl 1-3 ipv6acl 0-2                            | Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the allocation amount. The ipv6acl range must be a factor of 2.                                          |

|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>deny {ipv6-protocol-number   icmp   ipv6   tcp   udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]]</code>                                                                 |                                                                                                                                                                                                                                                                                                                                    |
|                   | To remove this filter, you have two choices:                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                    |
|                   | <ul style="list-style-type: none"><li>Use the <code>no seq sequence-number</code> command syntax if you know the filter's sequence number</li><li>Use the <code>no deny {ipv6-protocol-number   icmp   ipv6   tcp   udp}</code> command</li></ul> |                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b> | <b>log</b>                                                                                                                                                                                                                                        | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
|                   | <b>threshold-in-msgs <i>count</i></b>                                                                                                                                                                                                             | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval <i>minutes</i></b>                                                                                                                                                                                                                    | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                    |

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

| Command History | Version         | Description                                                                               |
|-----------------|-----------------|-------------------------------------------------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                                                                  |
|                 | <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                  |
|                 | <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
|                 | <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

### C9000 Series

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**

```
deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

|                   |                                       |                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                            | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                                   |
|                   | <b>threshold-in-msgs <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100. |
|                   | <b>interval <i>minutes</i></b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.                                                                                                                                                        |
|                   | <b>monitor</b>                        | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                                      |

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

| <b>Command History</b> | <b>Version</b>  | <b>Description</b>                                                                        |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

### C9000 Series

**Syntax**

```
deny tcp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [bit] [operator
port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs
[count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

|                   |                                           |                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                                | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                         |
|                   | <b>threshold-in<br/>msgs <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.. |
|                   | <b>interval <i>minutes</i></b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.                                                                                                                                                     |
|                   | <b>monitor</b>                            | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                            |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

|                            |                 |                                                                                           |
|----------------------------|-----------------|-------------------------------------------------------------------------------------------|
| <b>Command<br/>History</b> | <b>Version</b>  | <b>Description</b>                                                                        |
|                            | <b>9.9(0.0)</b> | Introduced on the C9010.                                                                  |
|                            | <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                  |
|                            | <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
|                            | <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

## C9000 Series

### Syntax

```
deny udp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [operator port
[port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]
[monitor]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

### Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                        |
| <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.                                                                                                                                                        |
| <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

### Command Modes

### Command History

| Version         | Description                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                 |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                                                 |
| <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms. |
| <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.              |

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing

packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

### C9000 Series

| <b>Syntax</b>            | <pre>ipv6 access-list access-list-name</pre> <p>To delete an access list, use the <code>no ipv6 access-list access-list-name</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                |                          |                |                             |                |                                      |                |                                                                                                                                                     |                |                                       |

|                   | <b>threshold-in-msgs <i>count</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval <i>minutes</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
|                   | <b>monitor</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |
| <b>Defaults</b>   | By default, 10 ACL logs are generated if you do not specify the threshold explicitly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                   |

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

| Command History | Version         | Description                                                                               |
|-----------------|-----------------|-------------------------------------------------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                                                                  |
|                 | <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                  |
|                 | <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
|                 | <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit icmp (for IPv6 ACLs)

Allow filtering of all or specific internet control message protocol (ICMP) messages

### C9000 Series

**Syntax** `permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

| Parameters                     |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                     | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
| <b>threshold-in-msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval minutes</b>        | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                          |

| <b>Usage Information</b> | <p>When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.</p> <p>If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.</p> <p>You can activate flow-based monitoring for a monitoring session by entering the <code>flow-based enable</code> command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is very useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).</p> |                                                                                                                                                                                                          |

| <b>Parameters</b> | <p><b>log</b> (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                           |                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>threshold-in<br/>msgs <i>count</i></b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
| <b>interval <i>minutes</i></b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                         |
| <b>monitor</b>                            | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                           |

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

| Command History | Version         | Description                                                                               |
|-----------------|-----------------|-------------------------------------------------------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                                                                  |
|                 | <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                  |
|                 | <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
|                 | <b>9.3(0.0)</b> | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands** [permit \(for Standard IPv6 ACLs\)](#) – configures a filter to forward IPv6 packets.

## permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

### C9000 Series

**Syntax**

```
permit udp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [operator port
[port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

|                   |                                    |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>log</b>                         | (OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.                                                                                                                                                                                                                                       |
|                   | <b>threshold-in<br/>msgs count</b> | (OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100. |
|                   | <b>interval minutes</b>            | (OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.                                                                                                                                                        |
|                   | <b>monitor</b>                     | (OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.                                                                                                                          |

|                        | <b>9.9(0.0)</b> | Introduced on the C9010.                                                                  |
|                        | <b>9.5(0.1)</b> | Introduced on the Z9500.                                                                  |
|                        | <b>9.4(0.0)</b> | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms. |
|                        | <b>9.3.0.0</b>  | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.              |

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

[permit \(for Standard IPv6 ACLs\)](#) – configures a filter to forward IPv6 packets.

# seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

## C9000 Series

**Syntax** `seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To delete a filter, use the `no seq sequence-number` command.

|                   |                                |                                                                                                                                                                                                                                                                                                                                  |

| Command History | Version   | Description                                                                                 |
|-----------------|-----------|---------------------------------------------------------------------------------------------|
|                 | 9.11.0.0  | The <code>show cam-usage</code> command is updated to display ECMP group count information. |
|                 | 9.5.(0.0) | Introduced on the Z9500.                                                                    |
|                 | 9.3.(0.0) | Introduced on the S4810, S4820T, Z9000 and MXL.                                             |

**Usage Information**

The following regions must be provided in the `show cam-usage` output:

- L3AclCam
- L2AclCam
- V6AclCam

The following table describes the output fields of the `show cam-usage` command.

Table 5. Output fields of the show cam-usage command

| Field           | Description                                                                 |
|-----------------|-----------------------------------------------------------------------------|
| LineCard        | Number of the line card that contains information on ACL VLAN groups        |
| Portpipe        | The hardware path that packets follow through a system for ACL optimization |
| CAM-Region      | Type of area in the CAM block that is used for ACL VLAN groups              |
| Total CAM space | Total amount of space in the CAM block                                      |
| Used CAM        | Amount of CAM space that is currently in use                                |
| Available CAM   | Amount of CAM space that is free and remaining to be allocated for ACLs     |

Example 1:

|                          | The following is a list of the Dell Networking OS version history for this command.                                                                                              |                                                                                                                    |
|                          | <b>Version</b>                                                                                                                                                                   | <b>Description</b>                                                                                                 |
|                          | <b>9.9(0.0)</b>                                                                                                                                                                  | Introduced on the C9010.                                                                                           |
| <b>Usage Information</b> | No output displays If you do not attach an ingress or egress access-list to an interface and you return to the <code>DELL#</code> prompt.                                        |                                                                                                                    |
| <b>Example</b>           | <pre>Dell#show ipv6 access-list V6-ACL in Ingress IPV6 access list V6-ACL   seq 5 permit tcp any any count (0 packets)   seq 10 permit udp any any count (0 packets) Dell#</pre> |                                                                                                                    |

# show ipv6 accounting access-list

View the IPv6 access-list and the sequence of filters.

## C9000 Series

|                   |                                                                                                  |                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show ipv6 accounting {access-list access-list-name   cam_count} interface interface</code> |                                                                                                      |
| <b>Parameters</b> | <b>access-list-name</b>                                                                          | Enter the name of the ACL that you want to display. The ACL name size is limited to 140 characters.  |
|                   | <b>cam_count</b>                                                                                 | List the count of the CAM rules for this ACL.                                                        |
|                   | <b>interface interface</b>                                                                       | Enter the keyword <code>interface</code> and the interface type and slot/port or number information: |

- For a Port Channel interface, enter the keywords `port-channel` a port channel number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` and the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` and the slot/port information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                                            |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                                                                            |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale.                                                                                                |
| <b>8.4.2.1</b>  | Introduced on the S-Series.                                                                                                                         |
| <b>8.2.1.0</b>  | Introduced on the E-Series ExaScale.                                                                                                                |
| <b>7.8.1.0</b>  | Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long. |
| <b>7.4.1.0</b>  | Introduced on the E-Series TeraScale.                                                                                                               |

| Usage Information | Field                    | Description                                                                                                                                                                                             |
|-------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>“Ingress IPv6...”</b> | Displays the name of the IPv6 ACL, in this Example “Acclist1”.                                                                                                                                          |
|                   | <b>“seq 10...”</b>       | Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes processed by the filter is displayed at the end of the line. |

#### Example

```
Dell#show ipv6 accounting access-list
!
Ingress IPv6 access list V6-ACL on TenGigabitEthernet 10/1
Total cam count 2
 seq 5 permit tcp any any count (0 packets)
 seq 10 permit udp any any count (0 packets)
```

## show running-config

Display the ACL running configurations.

### C9000 Series

**Syntax** `show running-config {acl [ip | mac | ipv6]}`

| Parameters  |                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>acl</b>  | Enter the keyword <code>acl</code> to display all access-lists and <code>acl</code> sub commands.                     |
| <b>ip</b>   | Enter the keyword <code>ip</code> to display all <code>ip</code> access-list and the <code>ip</code> sub commands.    |
| <b>ipv6</b> | Enter the keyword <code>ipv6</code> to display all <code>ipv6</code> access-lists and <code>ipv6</code> sub commands. |
| <b>mac</b>  | Enter the keyword <code>mac</code> to display all L2 access-lists and sub commands.                                   |

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

**Example**

```
Dell# show running-config acl
ip

ip access-list standard five
seq 5 permit any
!
ip access-list standard four
seq 5 permit any count bytes
seq 10 deny any count

seq 20 deny host 2.2.2.2 log threshold-in-msgs 10 interval 5
!
show running-config acl mac

mac access-list standard mac
seq 5 permit 11:22:33:44:55:66 count
seq 10 deny any log threshold-in-msgs 10 interval 5 order 1
seq 15 permit any order 2 monitor
!
```

## IPv6 Basics

IPv6 basic commands are supported on the Dell Networking operating system.

**NOTE:** For information about the Dell Networking operating software version and platform that supports IPv6 in each software feature, refer to the *IPv6 Addressing* chapter of the *Dell Networking OS Configuration Guide*.

- `show ipv6 neighbors`
- `show ipv6 route`

## cam-ipv6 extended-prefix

Enable LPM CAM partitioning to support the storage of extended IPv6 (/65 to /128) route prefixes in LPM partition 1.

### C9000 Series

#### Syntax

```
cam-ipv6 extended-prefix max-ipv6-prefixes
```

To remove LPM partitioning configuration, use `no cam-ipv6 extended-prefix`.

#### Parameters

***max-ipv6-prefixes***

Maximum number of extended IPv6 prefixes with the mask length of /65 to /128 that are supported in the LPM partition. The possible values are 1024, 2048, and 3072.

| <b>Defaults</b>          | LPM CAM is not partitioned with Partition 1. IPv6 /65 to /128 prefixes are not converted to /64 prefixes and saved in the LPM table. All the packets for extended IPv6 route prefixes are transmitted using the default route path.                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                          |                 |                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|--------------------------|
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                 |                          |

| <b>Parameters</b> | <b>ipv6-address</b>                                                                    | <p>Enter the IPv6 address of the neighbor in the x:x:x:x::x format to remove a specific IPv6 neighbor.</p> <p> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zero.</p>                                                                                                                                                                                                                                     |
|                   | <b>vrf vrf-name</b>                                                                    | <p>(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to clear the neighbor corresponding to that VRF.</p> <p> <b>NOTE:</b> If you do not specify this option, the neighbors in the default VRF are cleared.</p>                                                                                                                                                                                          |
|                   | <b>interface interface</b>                                                             | <p>To remove all neighbor entries learned on a specific interface, enter the keyword <code>interface</code> then the interface type and slot/port or number information of the interface:</p> <p>Enter one of the following keywords with slot/port or number to clear information about the IPv6 neighbors learned on the specified interface:</p> <ul style="list-style-type: none"> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information</li> </ul> |

- For a 10-Gigabit Ethernet interface, enter the keyword `tengigabitethernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port-channel interface, enter the keyword `port-channel` with a port-channel number. The range of port-channel numbers is from 1 to 4096.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Command Modes** • EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>9.7(0.0)</b> | Added support for VRF.                   |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.3.7.1</b>  | Introduced on the S4810.                 |

## ipv6 address

Configure an IPv6 address to an interface.

### C9000 Series

**Syntax** `ipv6 address {ipv6-address prefix-length}`  
 To remove the IPv6 address, use the `no ipv6 address {ipv6-address prefix-length}` command.

**Parameters** ***ipv6-address***  
***prefix-length*** Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.  
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                |
|-----------------|----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.   |
| <b>9.2(1.0)</b> | Introduced on the Z9500.   |
| <b>9.1(0.0)</b> | Updated Usage Information. |

| Version         | Description                                    |
|-----------------|------------------------------------------------|
| <b>9.0.0.0</b>  | Introduced on the Z9000.                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                      |
| <b>8.3.7.0</b>  | Introduced on the S4810.                       |
| <b>8.4.1.0</b>  | Added support on the management Ethernet port. |
| <b>8.2.1.0</b>  | Introduced on the E-Series ExaScale.           |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series.       |
| <b>7.4.1.0</b>  | Introduced on the E-Series TeraScale.          |

#### Usage Information

- If two addresses are configured, delete an existing address before configuring a new address.
- If the last manually-configured global IPv6 address is removed using the “no” form of the command, the link-local IPv6 address is removed automatically.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

 **NOTE:** Do not use the /128 prefix length on physical or port channel interfaces. You can use the /128 prefix length on loopback interfaces.

#### Example

```
Dell(conf)#interface tengigabitethernet 1/0
Dell(conf-if-te-1/0)#ipv6 address ?
X:X:X:X::X IPv6 address
Dell(conf-if-te-1/0)#ipv6 address 2002:1:2::3 ?
<0-128> Prefix length in bits
Dell(conf-if-te-1/0)#ipv6 address 2002:1:2::3 /96 ?
<cr>
Dell(conf-if-te-1/0)#ipv6 address 2002:1:2::3 /96
Dell(conf-if-te-1/0)#show config
!
interface TenGigabitEthernet 1/0
 no ip address
 ipv6 address 2002:1:2::3 /96
 no shutdown
Dell(conf-if-te-1/0)#
```

## ipv6 address autoconfig

Configure IPv6 address auto-configuration for the management interface.

### C9000 Series

|                        |                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>ipv6 address autoconfig</pre> <p>To disable the address autoconfig operation on the management interface, use the <code>no ipv6 address autoconfig</code> command.</p> |
| <b>Default</b>         | Disabled                                                                                                                                                                    |
| <b>Command Modes</b>   | INTERFACE (management interface only)                                                                                                                                       |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .              |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.           |
| 9.7(0.1)  | Introduced on the S3048-ON.        |
| 9.7(0.1)  | Introduced on the S4048-ON.        |
| 9.1.(0.0) | Updated Usage Information section. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 8.3.12.0  | Introduced on the S4810.           |

- Usage Information**
- SAA can configure up to two addresses. If any preferred prefix or valid timers time out, the corresponding address are deprecated or removed. If an address is removed due to a time-out, an address from the current unused prefix is used to create a new address. If there are no remaining prefixes, the software waits to receive a new prefix from the RA.
  - If auto-configuration is enabled, all IPv6 addresses on that management interface are auto-configured. Manual and auto-configurations are not supported on a single management interface.
  - Removing auto-configuration removes all auto-configured IPv6 addresses and the link-local IPv6 address from that management interface.
  - IPv6 addresses on a single management interface cannot be members of the same subnet.
  - IPv6 secondary addresses on management interfaces across a platform must be members of the same subnet.
  - IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

## ipv6 address eui64

Configure IPv6 EUI64 address configuration on the interface.

### C9000 Series

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.2(1.0) | Introduced on the Z9500. |

| Version  | Description |
|----------|-------------|
| 9.2(0.0) | Introduced. |

#### Usage Information

This command allows you to create an EUI64 address based on the specified prefix and MAC address only. Prefixes may be configured on the interface using the `ipv6 nd prefix` command without creating an EUI64 address.

#### Example

```
Dell(conf)#int ten 0/4
Dell(conf-if-te-0/4)#ipv6 address 200:1::/64 eui64
Dell(conf)#int ten 0/6
Dell(conf-if-te-0/6)#ipv6 address 801:10::/64 eui64
```

## ipv6 control-plane icmp error-rate-limit

Configure the maximum number of ICMP error packets generated and sent in one second.

### C9000 Series

#### Syntax

```
ipv6 control-plane icmp error-rate-limit {1-200}
```

To restore the default value, use the `no ipv6 control-plane icmp error-rate-limit` command.

#### Parameters

**pps** Enter the maximum number of error packets generated per second. The range is from 1 to 200.

#### Default

100 pps

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

## ipv6 flowlabel-zero

Configure system to set the flow label field in the packets to zero.

### C9000 Series

#### Syntax

```
ipv6 flowlabel-zero
```

To remove 0 from the flow label field and allow the protocol operations to fill the field, use the `no ipv6 flowlabel-zero` command.

|                        |                                                                                                                                                                |

| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |

|                          |                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If the flowlabel value is already set for BGP or SSH, the system defaults to the already configured value. All packets on the same connection are considered part of the same flow by the system. For new connections, set the new flowlabel to zero. |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ipv6 host

Assign a name and IPv6 address for the host-to-IPv6 address mapping table.

### C9000 Series

|                            |                                                                                                                                                                                                                                          |                    |                                                       |                            |                                                               |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------|----------------------------|---------------------------------------------------------------|
| <b>Syntax</b>              | <code>ipv6 host name ipv6-address</code><br>To remove an IP host, use the <code>no ipv6 host name {ipv6-address}</code> .                                                                                                                |                    |                                                       |                            |                                                               |

| <b>Command History</b>     | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                           |                    |                                                       |                            |                                                               |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                 |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>8.4.2.1</b>  | Introduced on the C-Series and S-Series. |
| <b>8.4.1.0</b>  | Introduced on the E-Series TeraScale.    |

# ipv6 name-server

Enter up to six IPv6 addresses of name servers. The order you enter the addresses determines the order of their use.

## C9000 Series

| Syntax            | <pre>ipv6 name-server ipv6-address [ipv6-address2... ipv6-address6]</pre> <p>To remove a name server, use the <code>no ipv6 name-server ipv6-address</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|---------|--------------------------|----------|---------------------------|---------|--------------------------|---------|------------------------------------------|---------|---------------------------------------|
| Parameters        | <b>ipv6-address</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Enter the IPv6 address (X:X:X:X) of the name server to be used.<br><br>Note: The :: notation specifies successive hexadecimal fields of zeros. |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |
|                   | <b>ipv6-address2...<br/>ipv6-address6</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | (OPTIONAL) Enter up to five more IPv6 addresses, in the x:x:x:x format, of name servers to be used. Separate the IPv6 addresses with a space.  |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |

| 8.3.7.0           | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |
| 8.4.2.1           | Introduced on the C-Series and S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |
| 8.4.1.0           | Introduced on the E-Series TeraScale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |
| Usage Information | You can separately configure both IPv4 and IPv6 domain name servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                |         |             |          |                          |          |                          |         |                          |          |                           |         |                          |         |                                          |         |                                       |

# ipv6 nd dad attempts

Configure the number of neighbor solicitation messages that are sent to perform duplicate address detection (DAD) on the interface.

## C9000 Series

|               |                                                                                                                                                 |                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax        | <pre>ipv6 nd dad attempts {number of attempts}</pre> <p>To restore the default value, use the <code>no ipv6 nd dad attempts</code> command.</p> |                                                                                                                                                         |
| Parameters    | <b>number of attempts</b>                                                                                                                       | Enter the number of attempts to be made to detect a duplicate address. The range is from 0 to 15. Setting the value to 0 disables DAD on the interface. |
| Default       | 3 attempts                                                                                                                                      |                                                                                                                                                         |
| Command Modes | INTERFACE                                                                                                                                       |                                                                                                                                                         |

## INTERFACE (BATCH MODE)

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010. |
| 9.9(0.0)  | Introduced on the C9010.                                   |
| 9.2(1.0)  | Introduced on the Z9500.                                   |
| 8.3.19.0  | Introduced on the S4820T.                                  |
| 8.3.11.1  | Introduced on the Z9000.                                   |
| 8.3.7.0   | Introduced on the S4810.                                   |

## ipv6 nd disable-reachable-timer

Keep the learnt neighbor discovery entries stateless so that the entries do not time out.

**Syntax** `ipv6 nd disable-reachable-timer`  
To restore to default, use the `no ipv6 nd disable-reachable-timer` command.

**Default** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.11.0.1 | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S4810, S4820, S5000, S6000, S6010-ON, S6000-ON, S6100-ON, Z9100-ON, C9010, Z9500, MXL, and FN IOM. |

## ipv6 nd dns-server

Configure Recursive DNS Server (RDNSS) addresses for distribution via IPv6 router advertisements to an IPv6 device.

### C9000 Series

**Syntax** `ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`  
To remove the IPv6 RDSS configuration, use `no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`

**Parameters**

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ipv6-RDNSS-address</i></b> | Enter the IPv6 Recursive DNS Server's (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.                                                                                                                                                                                                                                                                                                                              |
| <b><i>lifetime</i></b>           | Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or <i>infinite</i> , the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the <i>lifetime</i> or <i>infinite</i> parameter. |

|                          | <b>infinite</b>                                                                                                                                                                                                                                                                                                                                                                                 | Enter the keyword <i>infinite</i> to specify that the RDNSS lifetime does not expire. |             |                  |                                                            |                 |                          |                 |                                                         |

| <b>Usage Information</b> | Use the <code>ipv6 nd dns-server</code> command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the <code>lifetime</code> or <code>infinite</code> parameter. In the Configuration Terminal Batch mode, you can use this command to configure the IPv6 addresses in a dual-homing setup. |                                                                                       |             |                  |                                                            |                 |                          |                 |                                                         |
| <b>Example</b>           | <code>Dell(conf-if-te-0/1)#ipv6 nd dns-server 1000::1 1</code>                                                                                                                                                                                                                                                                                                                                  |                                                                                       |             |                  |                                                            |                 |                          |                 |                                                         |

## ipv6 nd prefix

Specify which IPv6 prefixes are included in Neighbor Advertisements.

### C9000 Series

|                   |                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ipv6 nd prefix {<i>ipv6-prefix</i>   <i>prefix-length</i>   default} [no-advertise]   [no-autoconfig] [no-rtr-address] [off-link] [lifetime {<i>valid</i>   infinite} {<i>preferred</i>   infinite}]</code> |                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b> | <b><i>ipv6-prefix</i></b>                                                                                                                                                                                         | Enter an IPv6 prefix.                                                                                                                                                                                                                                                                             |
|                   | <b><i>prefix-length</i></b>                                                                                                                                                                                       | Enter the prefix then the prefix length. The length range is from 0 to 128.                                                                                                                                                                                                                       |
|                   | <b>default</b>                                                                                                                                                                                                    | Enter the keyword <code>default</code> to set default parameters for all prefixes.                                                                                                                                                                                                                |
|                   | <b>no-advertise</b>                                                                                                                                                                                               | Enter the keyword <code>no-advertise</code> to prevent the specified prefix from being advertised.                                                                                                                                                                                                |
|                   | <b>no-autoconfig</b>                                                                                                                                                                                              | Enter the keywords <code>no-autoconfig</code> to disable Stateless Address Autoconfiguration.                                                                                                                                                                                                     |
|                   | <b>no-rtr-address</b>                                                                                                                                                                                             | Enter the keyword <code>no-rtr-address</code> to exclude the full router address from router advertisements (the R bit is not set).                                                                                                                                                               |
|                   | <b>off-link</b>                                                                                                                                                                                                   | Enter the keywords <code>off-link</code> to advertise the prefix without stating to recipients that the prefix is either on-link or off-link.                                                                                                                                                     |
|                   | <b><i>valid-lifetime</i>   infinite</b>                                                                                                                                                                           | Enter the amount of time that the prefix is advertised, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is <b>2592000</b> . The maximum value means that the preferred lifetime does not expire for the valid-life time parameter. |
|                   | <b><i>preferred-lifetime</i>   infinite</b>                                                                                                                                                                       | Enter the amount of time that the prefix is preferred, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is <b>604800</b> . The maximum value means that the preferred lifetime and does not expire.                                 |

| <b>8.3.2.0</b>           | Introduced on the E-Series TeraScale, C-Series, and S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                                               |
| <b>Usage Information</b> | By default, all prefixes configured as addresses on the interface are advertised. This command allows control over the individual parameters per prefix; you can use the <code>default</code> keyword to use the default parameters for all prefixes. If a prefix has been configured with lifetime parameter values, the default values cannot be applied using the <code>ipv6 nd prefix default no-autoconfig</code> command. Use this command in the Configuration Terminal Batch mode to advertise in a dual-homing setup.                                                                                                                                                                                                                                                                                                                                                                     |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                                               |

## ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

| <b>Syntax</b>     | <pre>ipv6 neighbor{ipv6-address} {interface interface} {hardware_address}[vrf vrf-name]</pre> <p>To remove a static IPv6 entry from the IPv6 neighbor discovery, use the <code>no ipv6 neighboripv6-address{interface interface</code></p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b> | <p><b>ipv6-address</b></p> <p><b>interface</b></p> <p><b>intehardware_rfa</b></p> <p><b>ce</b></p>                                                                                                                                         | <p>Enter the IPv6 address of the neighbor in the x:x:x:x:x format.</p> <p> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zero.</p> <p>Enter the keyword <code>interface</code> then the interface type and slot/port or number information:</p> <ul style="list-style-type: none"><li>• For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**hardware\_addresses** Enter a 48-bit hardware MAC address in nn:nn:nn:nn:nn:nn format.

**vrf vrf-name** (Optional) Enter the keyword `vrf` and the name of the VRF to install IPv6 routes in that VRF.

**Defaults** none

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.10(0.0)</b>  | Introduced the Configuration Terminal Batch mode on C9010.        |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.8(0.0)</b>   | Introduced on the S3048-ON and S4048-ON.                          |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON.                |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.3.7.1</b>    | Introduced on the S4810.                                          |

**Usage Information** Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link
- Prefix discovery: Hosts can discover address prefixes for the link.
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination· Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link
- Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

Use the `ipv6 neighbor` command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

 **NOTE:** The parameters `vrf`, `mac-address`, `interface` are not supported in the batch mode.

# ipv6 route

Establish a static IPv6 route.

## C9000 Series

### Syntax

```
ipv6 route ipv6-address prefix-length {ipv6-address | interface | interface
ipv6-address} [distance] [tag value] [permanent][weight weight-value [vrf
vrf-name]
```

To remove the IPv6 route, use the `no ipv6 route ipv6-address prefix-length {ipv6-address | interface | interface ipv6-address} [distance] [tag value] [permanent][weight weight-value [vrf vrf-name]` command.

### Parameters

***ipv6-address***  
***prefix-length***

Enter the IPv6 address in the x:x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

***interface***

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `VLAN` then the vlan number. The range is from 1 to 4094.

If you configure a static IPv6 route using an egress interface and enter the `ping` command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the `ping` command to detect the destination address.

***ipv6-address***

Enter the forwarding router IPv6 address in the x:x:x:x:x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

***distance***

(OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.

***tag value***

(OPTIONAL) Enter the keyword `tag` then a tag value number. The range is from 1 to 4294967295.

***permanent***

(OPTIONAL) Enter the keyword `permanent` to specify that the route is not to be removed, even if the interface assigned to that route goes down.

 **NOTE:** If you disable the interface with an IPv6 address associated with the keyword `permanent`, the route disappears from the routing table.

***weight weight-value***

Enter the keyword `weight` followed by a weight value. The range is from 0 to 255.

 **NOTE:** Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

***vrf vrf-name***

(Optional) Enter the keyword `vrf` followed by the name of the VRF to install IPv6 routes in that VRF.

### Defaults

none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                                                             |
| 9.7(0.1) | Introduced on the S3048-ON.                                                                                                          |
| 9.7(0.1) | Introduced on the S4048-ON.                                                                                                          |
| 9.7(0.0) | Added support for VRF. Also included the <code>weight</code> parameter to support weighted ECMP feature. Introduced on the S6000-ON. |
| 9.0.0.0  | Introduced on the Z9000.                                                                                                             |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                                                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                                                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.                                                                                                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series.                                                                                             |
| 7.4.1.0  | Introduced on the E-Series TeraScale.                                                                                                |

**Usage Information** When the interface goes down, Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the interface comes back up. When a recursive resolution is “broken,” Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

#### Example

```
Dell(conf)#ipv6 route 44::/64 33::1 weight 100
Dell(conf)#ipv6 route 44::/64 33::2 weight 200
Dell(conf)#do show running-config | grep ipv6 route
Dell(conf)#ipv6 route vrf vrf_test 44::/64 33::1 weight 100
Dell(conf)#ipv6 route vrf vrf_test 44::/64 33::2 weight 200
Dell(conf)#do show running-config | grep ipv6 route vrf
```

**Related Commands** [show ipv6 route](#) — views the IPv6 configured routes.

## ipv6 unicast-host-route

Enable the storage of extended IPv6 route prefixes (/65 to /128) in the L3 host table.

### C9000 Series

**Syntax** `[no] ipv6 unicast-host-route`

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>Defaults</b>          | Enabled; by default, extended IPv6 route prefixes are stored only in the L3 host table.                                                                                                                                                                                                                                                                                                                                                                                |                          |

|                          | <b>9.5(0.1)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Introduced on the Z9500. |
|                          | <b>9.3(0.1)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Introduced on the S6000. |
| <b>Usage Information</b> | Use this command to enable programming of extended IPv6 (/65 to /128) route prefixes in the L3 host table. A warning message is displayed after you enter the command stating that this setting takes effect for existing routes only when IPv6 route prefixes are cleared from the LPM routing table (RTM). To enable storage of extended IPv6 route prefixes in the LPM table, disable this setting by entering the <code>no ipv6 unicast-host-route</code> command. |                          |

#### Example

```
Dell(conf)# ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
Dell(conf)#no ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
Dell(conf)#
```

## ipv6 unicast-routing

Enable IPv6 Unicast routing.

|                          | <b>8.2.1.0</b>                                                                                                                                                                                                                                        | Introduced on the E-Series ExaScale.  |
|                          | <b>7.8.1.0</b>                                                                                                                                                                                                                                        | Introduced on the C-Series.           |
|                          | <b>7.4.1.0</b>                                                                                                                                                                                                                                        | Introduced on the E-Series TeraScale. |
| <b>Usage Information</b> | Because this command is enabled by default, it does not appear in the running configuration. When you disable unicast routing, the <code>no ipv6 unicast-routing</code> command is included in the running                                            |                                       |

configuration. Whenever unicast routing is disabled or re-enabled, the system generates a syslog message indicating the action.

Disabling unicast routing on an E-Series chassis causes the following behavior:

- static and protocol learned routes are removed from RTM and from the CAM; packet forwarding to these routes is terminated
- connected routes and resolved neighbors remain in the CAM and new IPv6 neighbors are still discoverable
- additional protocol adjacencies (OSPFv3 and BGP4) are brought down and no new adjacencies are formed
- the IPv6 address family configuration (under router bgp) is deleted
- IPv6 Multicast traffic continues to flow unhindered

## show cam-ipv6 extended-prefix

Display the currently configured and next-boot settings for extended IPv6 prefixes (/65 to /128) in LPM CAM.

### C9000 Series

| <b>Syntax</b>            | <code>show cam-ipv6 extended-prefix</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                          |                 |                          |

| <b>9.3(0.1)</b>          | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                 |                          |                 |                          |                 |                          |
| <b>Usage Information</b> | You can use this command to view the maximum number of extended IPv6 prefix entries supported in LPM CAM. The output displays the current value and the new value applicable after a switch reload.                                                                                                                                                                                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                 |                          |
| <b>Example</b>           | <pre>Dell#show cam-ipv6 extended-prefix Cam-Ipv6-LPM Extended Prefix ----- Current Settings cam-ipv6-max-/65-to-/128-Prefix : 2048 Dell(conf)#</pre>                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                 |                          |                 |                          |                 |                          |

## show ipv6 cam linecard

Display the IPv6 CAM entries for the specified line card.

|---------------|---------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>show ipv6 cam linecard slot id port-set number [vrf vrf-name] [X:X:X:X::X   summary]</code> |
|---------------|---------------------------------------------------------------------------------------------------|

|                   |                     |                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>slot-id</b>      | Displays the cam entries for the mentioned linecard id.                                                                                                                                                                                                                                                                                     |
|                   | <b>port-set</b>     | Enter the keyword <code>port-set</code> and specify the port-set number. The port-set number value is 0.                                                                                                                                                                                                                                    |
|                   | <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed and the name of the VRF to display IPv6 CAM entries corresponding to that VRF.<br> <b>NOTE:</b> If you do not specify this option, IPv6 CAM entries corresponding to the default VRF are displayed. |
|                   | <b>X:X:X:X::X</b>   | (OPTIONAL) Enter the network address or host name.                                                                                                                                                                                                                                                                                          |
|                   | <b>summary</b>      | (OPTIONAL) Enter the keyword <code>summary</code> to display a table listing network prefixes and the total number prefixes which can be entered into the IPv6 CAM.                                                                                                                                                                         |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>9.0.0.0</b>  | Introduced on the Z9000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.7.1</b>  | Introduced on the S4810.    |
| <b>8.4.2.1</b>  | Introduced on the S-Series. |

#### Example

```
Dell#show ipv6 cam linecard 10 port-set 0
```

| Neighbor              | Mac-Addr          | Port | Vid | EC |
|-----------------------|-------------------|------|-----|----|
| fe80::2ff:eff:fe3f:a1 | 00:00:00:00:00:00 | CP   | 0   | 0  |
| 2::3                  | 00:00:00:00:00:00 | CP   | 0   | 0  |
| refix                 | Mac-Addr          | Port | Vid | EC |
| 2::/64                | 00:00:00:00:00:00 | CP   | 0   | 0  |
| fe80::/10             | 00:00:00:00:00:00 | NuP  | 0   | 0  |
| ::/0                  | 00:00:00:00:00:00 | CP   | 0   |    |

## show ipv6 control-plane icmp

Displays the status of the icmp control-plane setting for the error eate limit setting.

### C9000 Series

**Syntax** `show ipv6 control-plane icmp`

**Default** 100

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

#### Example

## show ipv6 fib linecard

Display all forwarding information base (FIB) entries for a line card.

### C9000 Series

**Syntax** `show ipv6 fib linecard slot-id port-set number [vrf vrf-name] [summary | ipv6-address]`

|                   |                        |                                                                                                                                     |
|-------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>slot-id</b>         | Enter the linecard <i>slot-id</i> . The range is from 0 to 11.                                                                      |
|                   | <b>port-set number</b> | Enter the keyword <i>port-set</i> and the port-set number value. The number value is 0.                                             |
|                   | <b>vrf vrf-name</b>    | (Optional) Enter the keyword <i>vrf</i> followed by the name of the VRF to display neighbors corresponding to that VRF.             |
|                   | <b>summary</b>         | (OPTIONAL) Enter the keyword <i>summary</i> to view a summary of entries in IPv6 cam.                                               |
|                   | <b>ipv6-address</b>    | Enter the IPv6 address in the x:x:x::x/n format to display networks that have more specific prefixes. The range is from /0 to /128. |

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.4.2.1  | Introduced on the S-Series. |

#### Example

```
Dell#show ipv6 fib linecard 10
```

| Prefix | Next-Hop | Mac-Addr | Port | VID |
|--------|----------|----------|------|-----|
| EC     |          |          |      |     |

|                           |             |                   |          |   |   |
|---------------------------|-------------|-------------------|----------|---|---|
| ::/0                      | -           | 00:00:00:00:00:00 | CP       | 0 | 0 |
| 2::/64                    | ::, Te 10/1 | 00:00:00:00:00:00 | CP       | 0 | 0 |
| 2::3/128                  | :::1        | 00:00:00:00:00:00 | CP       | 0 | 0 |
| fe80::/10                 | ::, Nu 0    | 00:00:00:00:00:00 | BLK HOLE | 0 | 0 |
| fe80::2ff:eff:fe3f:a1/128 | :::1        | 00:00:00:00:00:00 | CP       | 0 | 0 |

## show ipv6 flowlabel-zero

Display the flow label zero setting.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show ipv6 flowlabel-zero</code>                                                                                                                          |
| <b>Default</b>         | Disabled                                                                                                                                                       |
| <b>Command Modes</b>   | EXEC                                                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |

## show ipv6 interface

Display the status of interfaces configured for IPv6.

### C9000 Series

|               |                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>show ipv6 interface <i>interface</i> [<i>linecard slot-id</i>] [<i>brief</i>] [<i>configured</i>] [<i>loopback interface-number</i>] [<i>managementethernet slot/port</i>] [<i>port-channel number</i>] [<i>tengigabitethernet slot   slot/port</i>] [<i>fortyGigE slot   slot/port</i>] [<i>tunnel tunnel-id</i>] [<i>vlan vlan-id</i>]</code> |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b><i>interface</i></b> (OPTIONAL) Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>For a Loopback interface, enter the keyword <code>Loopback</code> then a number from 0 to 16383.</li> <li>For the Null interface, enter the keyword <code>null</code> then zero (0).</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID.
- For a VLAN interface, enter the keyword `VLAN`.
- For a port channel interface, enter the keywords `port-channel`.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

|                                            |                                                                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard <i>slot-id</i></b>             | Enter the <code>linecard slot-id</code> parameters to specify the switch ports on a line card. The range of slot IDs is from 0 to 2. |
| <b>brief</b>                               | (OPTIONAL) View a summary of IPv6 interfaces.                                                                                        |
| <b>configured</b>                          | (OPTIONAL) View information on all IPv6 configured interfaces.                                                                       |
| <b>managementethernet <i>slot/port</i></b> | (OPTIONAL) View information on an IPv6 Management port. Enter the slot number (0-1) and port number zero (0).                        |
| <b>loopback</b>                            | (OPTIONAL) View information for IPv6 Loopback interfaces.                                                                            |
| <b>port-channel</b>                        | (OPTIONAL) View information for IPv6 port channels.                                                                                  |
| <b>tengigabitethernet</b>                  | (OPTIONAL) View information for an IPv6 tengigabitethernet interface.                                                                |
| <b>fortyGigE</b>                           | (OPTIONAL) View information for an IPv6 fortygigabitethernet interface.                                                              |
| <b>tunnel <i>tunnel-id</i></b>             | (OPTIONAL) View information for a tunnel interface.                                                                                  |
| <b>vlan</b>                                | (OPTIONAL) View information for IPv6 VLANs.                                                                                          |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010.                                               |
| <b>9.11(0.0)</b>  | Updated the command output to include the unicast reverse path forwarding (uRPF) status.                        |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                                                                        |
| <b>9.5(0.1)</b>   | Added support for IPv6 recursive DNS addresses.                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                        |
| <b>9.2.(0.0)</b>  | Added support for tunnel interface.                                                                             |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                       |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                        |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.                                                            |
| <b>8.4.2.1</b>    | Introduced on the S-Series.                                                                                     |
| <b>8.2.1.0</b>    | Introduced on the E-Series ExaScale. Added support for the <code>managementethernet slot/port</code> parameter. |

| Version | Description                           |
|---------|---------------------------------------|
| 7.8.1.0 | Introduced on the C-Series.           |
| 7.4.1.0 | Introduced on the E-Series TeraScale. |

## Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the `ipv6 address` command to assign an IPv6 address to the Management port.

## Example

```
Dell# show ipv6 interface linecard 0
TenGigabitEthernet 0/2 is down, line protocol is down
 IPV6 is enabled
 Link Local address: fe80::7686:7aff:feff:6f08
 Global Unicast address(es):
 10:10:10:1::8, subnet is 10:10:10::/48 (MANUAL)
 Remaining lifetime: infinite
 Global Anycast address(es):
 Joined Group address(es):
 ff02::1
 ff02::2
 ff02::1:ff00:8
 ff02::1:ffff:6f08
 ND MTU is 0
 ICMP redirects are not sent
 DAD is enabled, number of DAD attempts: 3
 ND reachable time is 27000 milliseconds
 ND base reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
 ND advertised retransmit interval is 0 milliseconds
 ND router advertisements are sent every 200 to 600 seconds
 ND router advertisements live for 1800 seconds
 ND advertised hop limit is 64
 IPv6 hop limit for originated packets is 64
 IPv6 unicast RPF check is not supported
```

```
Dell# show ipv6 interface linecard 0 configured
TenGigabitEthernet 0/2 is down, line protocol is down
 IPV6 is enabled
 Link Local address: fe80::7686:7aff:feff:6f08
 Global Unicast address(es):
 10:10:10:1::8, subnet is 10:10:10::/48 (MANUAL)
 Remaining lifetime: infinite
 Global Anycast address(es):
 Joined Group address(es):
 ff02::1
 ff02::2
 ff02::1:ff00:8
 ff02::1:ffff:6f08
 ND MTU is 0
 ICMP redirects are not sent
 DAD is enabled, number of DAD attempts: 3
 ND reachable time is 27000 milliseconds
 ND base reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
 ND advertised retransmit interval is 0 milliseconds
 ND router advertisements are sent every 200 to 600 seconds
 ND router advertisements live for 1800 seconds
 ND advertised hop limit is 64
 IPv6 hop limit for originated packets is 64
 IPv6 unicast RPF check is not supported
```

```
Dell# show ipv6 interface linecard 0 configured
TenGigabitEthernet 0/2 is down, line protocol is down
 IPV6 is enabled
 Link Local address: fe80::7686:7aff:feff:6f08
 Global Unicast address(es):
 10:10:10:1::8, subnet is 10:10:10::/48 (MANUAL)
 Remaining lifetime: infinite
```

```
Global Anycast address(es):
Joined Group address(es):
 ff02::1
 ff02::2
 ff02::1:ff00:8
 ff02::1:ffff:6f08

 ff02::1
 ff02::2
 ff02::1:ff00:6
 ff02::1:ffff:6f08
 ff02::1
 ff02::2
 ff02::1:ff00:4
 ff02::1:ffff:6f08
```

## show ipv6 mld\_host

Display the IPv6 MLD host counters.

### C9000 Series

**Syntax** `show ipv6 mld_host`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |

**Usage Information** The following describes the `show ipv6 mld-host` command shown in the following example.

| Field                    | Description                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Valid MLD Packets</b> | The total number of packets received and sent from the last time the elapsed time was cleared.                                |
| <b>Reports</b>           | The total number of reports (queries and unsolicited reports generated from joins or leaves) that have been received or sent. |

| Field                    | Description                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------|
| <b>Leaves</b>            | The number of Multicast leaves that have been sent.                                             |
| <b>MLDv1 queries</b>     | The number of MLDv1 queries that have been received.                                            |
| <b>MLDv2 queries</b>     | The number of MLDv2 queries that have been received.                                            |
| <b>Malformed Packets</b> | The number of MLDv1 and MLDv2 packets that do not match the requirement for a valid MLD packet. |

#### Example

```
MLD Host Traffic Counters
Elapsed time since counters cleared: 0028:33:52
Received Sent
Valid MLD Packets 97962 18036
Reports 79962 18034
Leaves ---- 0
MLDv2 Queries 18000 ----
MLDv1 Queries 0 ----
Errors:
Malformed Packets: 4510
```

## show ipv6 neighbors

Display information about the IPv6 neighbors discovered on the switch CPUs.

### C9000 Series

#### Syntax

```
show ipv6 neighbors [cpu rp] [ipv6-address] {ipv6-address} [interface
interface [vrf vrf-name]
```

#### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>        | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display the neighbors corresponding to that VRF.<br> <b>NOTE:</b> If you do not specify this option, neighbors corresponding to the default VRF are displayed. |
| <b>cpu rp</b>              | Enter the keywords <code>cpu rp</code> to display information about IPv6 neighbors learned only on the Route Processor.                                                                                                                                                                                                            |
| <b>ipv6-address</b>        | Enter the IPv6 address of a neighbor to display information about the specified device.                                                                                                                                                                                                                                            |
| <b>ipv6-address</b>        | Enter the IPv6 address of the neighbor in the x:x:x::x format.<br> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                   |
| <b>interface interface</b> | Enter the keyword <code>interface</code> then the interface type and slot/port or number information:                                                                                                                                                                                                                              |

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                           |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |
| <b>8.3.7.1</b>  | Introduced on the S4810.                           |

## Usage Information

When you issue the `show ipv6 neighbors` without specifying any options, it will display all IPv6 neighbor addresses stored on the control processor (CP).

## Example

```
Dell#show ipv6 neighbors
```

```
* - Active session role
Ad Dn - Admin Down
B - BGP
C - CLI
I - ISIS
O - OSPF
R - Static Route (RTM)
```

|   | LocalAddr | RemoteAddr | Interface | State | Rx-int | Tx-int | Mult | Clients |
|---|-----------|------------|-----------|-------|--------|--------|------|---------|
| * | 10.1.3.2  | 10.1.3.1   | Te 1/3    | Up    | 300    | 250    | 3    | C       |

```
Dell#show ipv6 neighbors detail
```

```
Session Discriminator: 1
Neighbor Discriminator: 1
Local Addr: 10.1.3.2
Local MAC Addr: 00:01:e8:02:15:0e
Remote Addr: 10.1.3.1
Remote MAC Addr: 00:01:e8:27:2b:f1
Int: TenGigabitEthernet 1/3
State: Up
Configured parameters:
 TX: 100ms, RX: 100ms, Multiplier: 3
Neighbor parameters:
 TX: 250ms, RX: 300ms, Multiplier: 4
Actual parameters:
 TX: 300ms, RX: 250ms, Multiplier: 3
Role: Active
Delete session on Down: False
Client Registered: CLI
Uptime: 00:02:04
Statistics:
 Number of packets received from neighbor: 376
 Number of packets sent to neighbor: 314
 Number of state changes: 2
 Number of messages from IFA about port state change: 0
 Number of messages communicated b/w Manager and Agent: 6
Dell#
```

# show ipv6 route

Displays the IPv6 routes.

## C9000 Series

|                 |                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                      |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax          | <code>show ipv6 route [ipv6-address prefix-length] [hostname] [all] [bgp as number] [connected] [isis tag] [list prefix-list name] [ospf process-id] [vrf vrf-name] [rip] [static] [summary]</code>                                                             |                                                                                                                                                                                                                      |
| Parameters      | <b>ipv6-address</b><br><b>prefix-length</b>                                                                                                                                                                                                                     | (OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.<br><b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.     |
|                 | <b>hostname</b>                                                                                                                                                                                                                                                 | (OPTIONAL) View information for this IPv6 routes with Host Name.                                                                                                                                                     |

| Command History | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |                                                                                                                                                                                                                      |

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                      |
| 9.7(0.1) | Introduced on the S3048-ON.                   |
| 9.7(0.1) | Introduced on the S4048-ON.                   |
| 9.7(0.0) | Added support for VRF. Introduced on S6000-ON |
| 9.2(1.0) | Introduced on the Z9500.                      |
| 9.0.0.0  | Introduced on the Z9000.                      |
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.7.0  | Introduced on the S4810.                      |
| 8.2.1.0  | Introduced on the E-Series ExaScale.          |

| Version | Description                              |
|---------|------------------------------------------|
| 7.8.1.0 | Introduced on the C-Series and S-Series. |
| 7.4.1.0 | Introduced on the E-Series TeraScale.    |

Usage Information

The following describes the `show ipv6 route` command shown in the following examples.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (undefined) | Identifies the type of route: <ul style="list-style-type: none"><li>• L = Local</li><li>• C = connected</li><li>• S = static</li><li>• R = RIP</li><li>• B = BGP</li><li>• IN = internal BGP</li><li>• EX = external BGP</li><li>• LO = Locally Originated</li><li>• O = OSPF</li><li>• IA = OSPF inter-area</li><li>• N1 = OSPF NSSA external type 1</li><li>• N2 = OSPF NSSA external type 2</li><li>• E1 = OSPF external type 1</li><li>• E2 = OSPF external type 2</li><li>• i = IS-IS</li><li>• L1 = IS-IS level-1</li><li>• L2 = IS-IS level-2</li><li>• IA = IS-IS inter-area</li><li>• * = candidate default</li><li>• &gt; = non-active route</li><li>• + = summary routes</li></ul> |
| Destination | Identifies the route's destination IPv6 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Gateway     | Identifies whether the route is directly connected and on which interface the route is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Dist/Metric | Identifies if the route has a specified distance or metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Last Change | Identifies when the route was last changed or configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Example

```
Dell#show ipv6 route

Codes: C - connected, L - local, S - static, R - RIP,
 B - BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated,
 O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
 N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
 E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
 L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default,
Gateway of last resort is not set

 Destination Dist/Metric, Gateway, Last Change

C 2::/64 [0/0]
 Direct, Te 10/1, 00:01:53
L fe80::/10 [0/0]
 Direct, Nu 0, 00:01:53
```

Example (Summary)

```
Dell#show ipv6 route summary

Route Source Active Routes Non-active Routes
```

```
connected 5 0
static 0 0
Total 5 0
Total 5 active route(s) using 952 bytes
```

# iSCSI Optimization

Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on a switch.

To configure and verify the iSCSI optimization feature, use the following Dell Networking OS commands.

# iscsi cos

Set the QoS policy that is applied to the iSCSI flows.

## C9000 Series

|                      |                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>iscsi cos {enable   disable   dot1p vlan-priority-value [remark]   dscp dscp-value [remark]}</code><br>To disable the QoS policy, use the <code>no iscsi cos</code> command. |                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>    | <b>enable</b>                                                                                                                                                                      | Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default is: the iSCSI packets are handled with dotp1 priority 4 without remark.   |
|                      | <b>disable</b>                                                                                                                                                                     | Enter the keyword <code>disable</code> to disable the application of preferential QoS treatment to iSCSI frames.                                                                                                                                                                                                                     |
|                      | <b>dot1p vlan-priority-value</b>                                                                                                                                                   | Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the <code>iscsi priority-bits</code> command. |
|                      | <b>dscp dscp-value</b>                                                                                                                                                             | Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed.                                                                                                                                                        |
|                      | <b>remark</b>                                                                                                                                                                      | Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1and DSCP values in egress packets are not changed.                                                                                                                                                  |
| <b>Defaults</b>      | Disabled.                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                      |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                      |

## iscsi target port

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

### C9000 Series

| Syntax          | <code>iscsi target port [tcp-port-2...tcp-port-16]ip-address [ip-address]</code><br><br>To remove the configured iSCSI target ports or IP addresses, use the <code>no iscsi target port</code> command.                                                                                                                                                                              |                                                                                                                                                                                                                                                            |         |             |                 |                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|
| Parameters      | <b><i>tcp-port-2...tcpport-16</i></b>                                                                                                                                                                                                                                                                                                                                                | Enter the tcp-port number of the iSCSI target ports. The <code>tcp-port-n</code> is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is <b>860, 3260</b> . |         |             |                 |                          |
|                 | <b>ip-address (Optional)</b>                                                                                                                                                                                                                                                                                                                                                         | Enter the ip-address that the iSCSI monitors. The ip-address specifies the IP address of the iSCSI target.                                                                                                                                                 |         |             |                 |                          |
| Defaults        | <b>860, 3260</b>                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                            |         |             |                 |                          |

| Version  | Description              |
|----------|--------------------------|
| 9.6(0.0) | Introduced on the Z9500. |

#### Usage Information

You can configure up to 16 target TCP ports on the switch in one command or multiple commands.

When you use the `no iscsi target port` command and the TCP port you want to delete is one bound to a specific IP address, the IP address value must be included in the command.

## show iscsi

Display the currently configured iSCSI settings.

### C9000 Series

**Syntax** `show iscsi`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.6(0.0) | Introduced on the Z9500. |

#### Example

```
Dell#show iscsi
iSCSI is enabled
iSCSI session monitoring is disabled
iSCSI COS : dot1p is 4 no-remark
Session aging time: 10
Maximum number of connections is 256

iSCSI Targets and TCP Ports:

TCP Port Target IP Address
3260
860
```

#### Related Commands

- [show iscsi session](#)— displays information about active iSCSI sessions on the switch.
- [show iscsi session detailed](#)— displays detailed information about active iSCSI sessions on the switch.
- [show run iscsi](#)— shows `run iscsi`.

## show iscsi session

Display information about active iSCSI sessions on the switch.

### C9000 Series

**Syntax** `show iscsi session`

**Command Modes**

- EXEC

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |
| <b>9.6(0.0)</b> | Introduced on the Z9500. |

## Example

```
Dell# show iscsi session
Session 0:

Target: iqn.2001-05.com.equallogic:0-8a0906-0e70c2002-10a0018426a48c94-
iom010
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000

Session 1:

Target: iqn.2001-05.com.equallogic:0-8a0906-0f60c2002-0360018428d48c94-
iom011
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000.
```

## Usage Information

The switch learns only the active sessions which it observes; sessions flowing through an adjacent switch are not learned.

After you reload the switch, session information exchanged during the initial handshake is not available. If the switch picks up session communication after reloading, it detects iSCSI sessions in progress but sometimes cannot obtain complete session information. Incomplete information about active iSCSI sessions is not displayed in `show iscsi session` command output.

In a VLT configuration, `show iscsi session` output is not accurate unless there are iSCSI traffic flows on VLT LAGs on both the target and the initiator side of the VLT domain.

## Related Commands

- [show iscsi](#) — displays the currently configured iSCSI settings.
- [show iscsi session detailed](#) — displays detailed information about active iSCSI sessions on the switch.
- [show run iscsi](#) — shows `run iscsi`.

# show iscsi session detailed

Display detailed information on active iSCSI sessions on the switch.

## C9000 Series

### Syntax

```
show iscsi session detailed [session isid]
```

### Parameters

**isid** Enter the session's iSCSi ID to display detailed information about the specified iSCSi session.

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.6(0.0) | Introduced on the Z9500. |

Example

```
Dell# show iscsi session detailed

| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |
| 9.6(0.0) | Introduced on the Z9500. |

Related Commands

- [show iscsi](#)— displays the currently configured iSCSI settings.
- [show iscsi session](#)— displays detailed information about active iSCSI sessions on the switch.
- [show iscsi session detailed](#)— displays detailed information on active iSCSI sessions on the switch.

## Layer 2

This chapter describes commands to configure Layer 2 features.

This chapter contains the following sections:

- [MAC Addressing Commands](#)
- [Virtual LAN \(VLAN\) Commands](#)
- [Far-End Failure Detection \(FEFD\)](#)

### Topics:

- [MAC Addressing Commands](#)
- [Virtual LAN \(VLAN\) Commands](#)
- [Far-End Failure Detection \(FEFD\)](#)

## MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

### clear mac-address-table

Clear the MAC address table of all MAC address learned dynamically.

### C9000 Series

|                   |                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Parameters</b> | <b>dynamic</b>                                                                                                                                | Enter the keyword <code>dynamic</code> to specify dynamically-learned MAC addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b>sticky</b>                                                                                                                                 | Enter the keyword <code>sticky</code> to specify sticky MAC addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>address <i>mac-address</i></b>                                                                                                             | Enter the keyword <code>address</code> then a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>all</b>                                                                                                                                    | Enter the keyword <code>all</code> to delete all MAC address entries in the MAC address table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>interface <i>interface</i></b>                                                                                                             | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port extender Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is from 1 to 48.</li> <li>• For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li> </ul> |

**vlan *vlan-id*** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                                       |
|------------|-------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                                          |
| 9.2(1.0)   | Introduced on the Z9500.                                          |
| 8.3.19.0   | Introduced on the S4820T.                                         |
| 8.3.12.0   | Added support for sticky MAC addresses.                           |
| 8.3.11.1   | Introduced on the Z9000.                                          |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.              |
| 8.3.7.0    | Introduced on the S4810.                                          |
| 7.6.1.0    | Introduced on the S-Series.                                       |
| 7.5.1.0    | Introduced on the C-Series.                                       |
| 6.1.1.1    | Introduced on the E-Series.                                       |

## mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

### C9000 Series

**Syntax** `mac-address-table aging-time seconds`

**Parameters** ***seconds*** Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is **1800 seconds**.

**Defaults** **1800 seconds**

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010. |
| 9.9(0.0)  | Introduced on the C9010.                                   |
| 9.2(1.0)  | Introduced on the Z9500.                                   |
| 8.3.19.0  | Introduced on the S4820T.                                  |
| 8.3.11.1  | Introduced on the Z9000.                                   |
| 8.3.7.0   | Introduced on the S4810.                                   |

| Version | Description                                                                                                                                     |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.3.1.0 | On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second. |
| 7.6.1.0 | Introduced on the S-Series.                                                                                                                     |
| 7.5.1.0 | Introduced on the C-Series.                                                                                                                     |
| 6.2.1.1 | Introduced on the E-Series.                                                                                                                     |

**Related Commands** [mac learning-limit](#) — sets the MAC address learning limits for a selected interface.  
[show mac-address-table aging-time](#) — displays the MAC aging time.

## mac-address-table disable-learning

Disable MAC address learning from LACP or LLDP BPDUs.

**Syntax** `mac-address-table disable-learning [lacp | lldp]`

**Parameters**

|             |                                                             |
|-------------|-------------------------------------------------------------|
| <b>lacp</b> | Enter lacp to disable MAC address learning from LACP BPDUs. |
| <b>lldp</b> | Enter LLDP to disable MAC address learning from LLDP BPDUs. |

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| 9.10(0.0) | Introduced on the S3048-ON, S3100 series, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, Z9100-ON, and Z9500. |

**Usage Information** If you use the `mac-address-table disable-learning` command without specifying any option, the system does not learn source MAC addresses from LACP or LLDP BPDUs.

## mac-address-table static

Associate specific MAC or hardware addresses to an interface and VLANs.

### C9000 Series

**Syntax** `mac-address-table static mac-address {multicast vlan vlan-id output-range interface}{output interface vlan vlan-id}`

To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.

**Parameters**

|                         |                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-address</b>      | Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                            |
| <b>multicast</b>        | Enter a vlan port to where L2 multicast MAC traffic is forwarded.<br><div>  <b>NOTE:</b> Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols. </div> |
| <b>output interface</b> | For a unicast MAC address, enter the keyword <code>output</code> then one of the following interfaces for which traffic is forwarded:                                                                                                                                        |

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**output-range interface** For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**vlan *vlan-id*** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                   |
|------------------|---------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.    |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                      |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                                      |
| <b>9.1(0.0)</b>  | Added support for output range parameter for S4810 and Z9000. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                     |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                      |
| <b>8.5.1.0</b>   | Added support for 4-port 40G line cards on ExaScale.          |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                      |
| <b>7.6.1.0</b>   | Introduced on the S-Series.                                   |
| <b>7.5.1.0</b>   | Introduced on the C-Series.                                   |
| <b>6.2.1.1</b>   | Introduced on the E-Series.                                   |

**Example (Unicast)** `mac-address-table static 00:01:00:00:00:01 {output Te 0/2 vlan 2}`

**Example (Multicast)** `mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-range Te 0/2,Te 0/3}`

**Related Commands** [show mac-address-table](#) — displays the MAC address table.

## mac-address-table station-move refresh-arp

Ensure that address resolution protocol (ARP) refreshes the egress interface when a station move occurs due to a topology change.

### C9000 Series

| <b>Syntax</b>            | <code>[no] mac-address-table station-move refresh-arp</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## mac-address-table station-move threshold

Specify the threshold and time interval for the maximum number of station moves on PE ports. When the number of station moves for a specified MAC address exceeds the configured threshold in the configured time, a loop is detected on PE ports. The loop is prevented by bringing down the line protocol on all active ports in the learned path, except for the port with the lowest interface index (ifIndex).

### C9000 Series

|                   |                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>[no] mac-address-table station-move threshold <i>number</i> interval <i>seconds</i></code>                                                                                                                  |
| <b>Parameters</b> | <p><b>threshold <i>number</i></b> Enter the keyword <code>threshold</code> with the maximum number of times a MAC-address station move is detected within the configured interval. The range is from 5 to 50.</p> |

**interval *seconds*** Enter the keyword *interval* with the interval (in seconds). The range is from 1 to 60.

**Defaults** Not configured.

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                |
|-----------|------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010. |
| 9.9(0.0)  | Introduced on the C1048P.                                  |

**Usage Information** As xSTP protocols are not supported on PEs, use this command to detect possible loops on PE ports. Use this command in Configuration Terminal Batch mode to detect the possible loops in a dual-homing setup.

If a station move for a MAC address is detected above the configured threshold and within the specified time, a syslog message is triggered with the port information. All ports on which the station move was detected are shut down, except for the port with the lowest interface index. Only the port with the lowest ifIndex remains active. For example:

```
Jun 18 09:55:35: %RPM0-P:RP %MACMGR-1-PE LOOP DETECTION: Loop occurred
on PE interfaces:oldInterface: peGigE 0/2/47, newInterface: peGigE
0/1/20,vlanId: 3902, macAddr: 00:aa:00:00:00:
```

To display the PE ports that are shut down due to loop detection, enter the `show mac learning-limit violate-action` command.

```
Dell# show mac learning-limit violate-action
Interface Violation-Type Violate-Action Status
PeGi 0/2/47 Pe-Loop Shutdown PEl loop-disable
PeGi 100/0/20 Pe-Loop Shutdown PEl loop-disable
PeGi 255/0/47 Pe-Loop Shutdown PEl loop-disable
Po 1 Pe-Loop Shutdown PEl loop-disable
Po 100 Pe-Loop Shutdown PEl loop-disable
```

To display the reason why the line protocol is down on a PE port or port channel, enter the `show interface` command.

```
Dell(conf-if-po-1)#do show interface port-channel 1
Port-channel 1 is up, line protocol is down(Pe Loop Detection)
```

When a PE interface is shut down due to a PE loop violation, you must manually reset it. To reset the interface, shut it down by entering the `shutdown` command and then re-enable it by entering the `no shutdown` command.

## mac learning-limit

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

### C9000 Series

**Syntax** `mac learning-limit address_limit [vlan vlan-id] [station-move-violation [dynamic]] [dynamic [no-station-move] station-move]`

**Parameters** ***address\_limit*** Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000.

|                               |                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-id</i></b>    | E-Series only: Enter the keyword then the VLAN ID. The range is from 1 to 4094.                                      |
| <b>dynamic</b>                | (OPTIONAL) Enter the keyword <code>dynamic</code> to allow aging of MACs even though a learning limit is configured. |
| <b>station-move-violation</b> | (OPTIONAL) Enter the keywords <code>station-move</code> to allow a station move on learned MAC addresses.            |

## Defaults

- On S-Series, the default behavior is `dynamic`.

 **NOTE:** “Static” means manually entered addresses, which do not age.

## Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                          |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                                                          |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                         |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                          |
| <b>8.3.12.0</b> | Deprecated the <code>no-station-move</code> command (replaced by the <code>mac-learning-limit mac-address-sticky</code> command). |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                          |
| <b>8.3.1.0</b>  | Added the <code>vlan</code> option on the E-Series.                                                                               |
| <b>8.2.1.0</b>  | Introduced on the S-Series.                                                                                                       |
| <b>7.7.1.0</b>  | Introduced on the C-Series. Added the <code>station-move</code> option.                                                           |
| <b>6.5.1.0</b>  | Added support for MAC Learning-Limit on the LAG.                                                                                  |

## Usage Information

This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the `vlan` option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword `no-station-move` option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the `dynamic` option. To clear statistics on MAC address learning, use the `clear counters` command with the learning-limit parameter.

 **NOTE:** If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the `mac learning-limit` command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

## Related Commands

- [clear counters](#) — Clear counters used in the `show interface` command.
- [clear mac-address-table](#) — clears the MAC address table of all MAC address learned dynamically.
- [mac learning-limit mac-address-sticky](#) — Replaces deprecated `no-station-move` parameter.
- [show mac learning-limit](#) — displays MAC learning-limit configuration.

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.12.0 | Introduced on the S4810.  |

## Usage Information

If you configure `mac-learning-limit` and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port.

## Related Commands

[show mac learning-limit](#) — displays the details of the mac learning-limit.

# mac learning-limit station-move-violation

Specify the actions for a station move violation.

## C9000 Series

### Syntax

```
mac learning-limit station-move-violation {log | shutdown-both | shutdown-offending | shutdown-original}
```

To disable a configuration, use the `no mac learning-limit station-move-violation` command, then the configured keyword.

### Parameters

|                           |                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                | Enter the keyword <code>log</code> to generate a syslog message on a station move violation.                                  |
| <b>shutdown-both</b>      | Enter the keyword <code>shutdown</code> to shut down both the original and offending interface and generate a syslog message. |
| <b>shutdown-offending</b> | Enter the keywords <code>shutdown-offending</code> to shut down the offending interface and generate a syslog message.        |
| <b>shutdown-original</b>  | Enter the keywords <code>shutdown-original</code> to shut down the original interface and generate a syslog message.          |

### Defaults

none

| 8.2.1.0  | Introduced on the S-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 7.8.1.0 | Introduced on the C-Series. |
| 7.5.1.0 | Introduced on the E-Series. |

**Usage Information** This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands** [show mac learning-limit](#) — displays details of the mac learning-limit.

## mac learning-limit reset

Reset the MAC address learning-limit error-disabled state.

### C9000 Series

**Syntax** `mac learning-limit reset`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| 8.2.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |
| 7.5.1.0  | Introduced on the E-Series. |

## mac port-security

Enable or disable the port security feature globally in the system.

**Syntax** `mac port-security`

To disable the port security, use the `no mac port-security` command.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the C9010, MXL, FN IOM, S3100 series, S4810, S4820T, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, and Z9500. |

#### Usage Information

Only if you enable the port security, you will be able to configure MAC address learning limit configurations on the interface level.

When you disable the port security, all the interface level configurations are reset. Also, all dynamically learnt MAC addresses on the interfaces configured with MAC address learning limit are cleared.

## show cam mac linecard (dynamic or static)

Display the CAM size and the portions allocated for MAC addresses and for MAC ACLs.

### C9000 Series

#### Syntax

```
show cam mac linecard slot-id port-set port-pipe [address mac_addr |
dynamic | interface interface | static | vlan vlan-id]
```

#### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard slot-id</b>    | (REQUIRED) Enter the keyword <code>linecard</code> then a slot number to select the linecard for which to gather information. The range of C9000 slot IDs are from 0 to 11.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>port-set port-pipe</b>  | (REQUIRED) Enter the keywords <code>port-set</code> then a port-pipe number to specify the port pipe for which to gather information. The range of port pipe numbers is from 0 to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>address mac-addr</b>    | (OPTIONAL) Enter the keyword <code>address</code> then a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>dynamic</b>             | (OPTIONAL) Enter the keyword <code>dynamic</code> to display only those MAC addresses the switch dynamically learns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>interface interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> then the interface type, slot and port information: <ul style="list-style-type: none"> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port extender Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the <i>stack-unit unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is from 1 to 48.</li> <li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the <i>stack-unit unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li> </ul> |
| <b>static</b>              | (OPTIONAL) Enter the keyword <code>static</code> to display only those MAC addresses specifically configured on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>vlan vlan-id</b>        | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

#### Command Modes

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.13.0.1P1 | Introduced peTenGigE interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                             |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0    | Introduced on the S4810.                             |
| 7.5.1.0    | Introduced on the C-Series.                          |
| 6.2.1.1    | Introduced on the E-Series.                          |

## Example

```
Dell# show cam mac linecard 1 port-set 0
PVlanId Mac Address Region Interface
1 00:01:02:03:04:09 DYNAMIC Fo 2/0
0 74:86:7a:ff:6f:1c LOCAL_DA 00001
1 00:11:22:33:44:55 STATIC Fo 2/8
1 00:01:02:03:04:07 DYNAMIC Fo 2/0
1 00:01:02:03:04:08 DYNAMIC Fo 2/0
0 ff:ff:ff:ff:ff:ff STATIC 00001
1 00:01:02:03:04:05 DYNAMIC Fo 2/0
1 00:01:02:03:04:06 DYNAMIC Fo 2/0
```

# show mac-address-table

Display the MAC address table.

## C9000 Series

### Syntax

```
show mac-address-table [address mac-address | interface interface | vlan vlan-id] [aging-time] [dynamic | static] [count [vlan vlan-id] [interface interface-type [slot [/port]]]]
```

### Parameters

|                                   |                                                                                                                                                                                                                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address <i>mac-address</i></b> | (OPTIONAL) Enter the keyword <i>address</i> then a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.                                                                                                                        |
| <b>dynamic</b>                    | (OPTIONAL) Enter the keyword <i>dynamic</i> to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: <i>address/mac-address</i> , <i>interface/interface</i> , or <i>vlan vlan-id</i> .         |
| <b>static</b>                     | (OPTIONAL) Enter the keyword <i>static</i> to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: <i>address/mac-address</i> , <i>interface/interface</i> , or <i>vlan vlan-id</i> .  |
| <b>aging-time</b>                 | Enter the keyword <i>aging-time</i> to display only aging-time information.                                                                                                                                                                                       |
| <b>interface <i>interface</i></b> | (OPTIONAL) Enter the keyword <i>interface</i> then the interface type, slot and port information: <ul style="list-style-type: none"><li>For a Port Channel interface, enter the keywords <i>port-channel</i> then a number. The range is from 1 to 128.</li></ul> |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

|                                           |                                                                                                                                                                                                      |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><b>interface-type</b> | (OPTIONAL) Instead of entering the keyword <code>interface</code> then the interface type, slot and port information, as above, you can enter the interface type, then just a slot number.           |
| <b>vlan</b> <b>vlan-id</b>                | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.                                                             |
| <b>count</b>                              | (OPTIONAL) Enter the keyword <code>count</code> , then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.3.12.0</b>   | Updated the output.                                               |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                          |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                       |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                       |

**Usage Information** The following describes the `show mac-address-table` command shown in the following example.

| Column Heading     | Description                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VlanId</b>      | Displays the VLAN ID number.                                                                                                                |
| <b>Mac Address</b> | Displays the MAC address in nn:nn:nn:nn:nn:nn format.                                                                                       |
| <b>Type</b>        | Lists whether the MAC address was manually configured (Static), learned dynamically (Dynamic), or associated with a specific port (Sticky). |

| Column Heading   | Description                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Displays the interface type and slot/port information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>po — Port Channel then a number. The range is from 1 to 255 for TeraScale.</li> <li>te — 10-Gigabit Ethernet then a slot/port.</li> <li>fo — 40-Gigabit Ethernet then a slot/port.</li> </ul> |
| <b>State</b>     | Lists if the MAC address is in use (Active) or not in use (Inactive).                                                                                                                                                                                                                                                                                 |

#### Example

```
Dell(conf)#do show mac-address-table
Codes: *N - VLT Peer Synced MAC
VlanId Mac Address Type Interface State
2 00:00:00:00:00:01 Dynamic (N) Po 128 Active
2 00:00:00:00:00:02 Dynamic (N) Po 10 Active
2 00:00:00:00:00:03 Dynamic Po 100 Active
2 00:00:00:00:00:04 Dynamic Po 10 Active
```

#### Usage Information

The following describes the `show mac-address-table` command shown in the following example.

| Column Heading     | Description                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VlanId</b>      | Displays the VLAN ID number.                                                                                                                                                                                                                                                                                                                                    |
| <b>Mac Address</b> | Displays the MAC address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                                                                                                           |
| <b>Type</b>        | Lists whether the MAC address was manually configured (Static), learned (Dynamic), or associated with a specific port (Sticky). An (N) indicates that the specified MAC address has been learnt by a neighbor and is synced to the node.                                                                                                                        |
| <b>Interface</b>   | Displays the interface type and slot/port information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>po — Port Channel followed by a number. Range for Terascale is from 1 to 255.</li> <li>te — 10-Gigabit Ethernet followed by a slot/port.</li> <li>fo — 40-Gigabit Ethernet then a slot/port.</li> </ul> |
| <b>State</b>       | Lists if the MAC address is in use (Active) or not in use (Inactive).                                                                                                                                                                                                                                                                                           |

The following describes the `show mac-address-table count` command shown in the following example.

| Line Beginning With       | Description                                              |
|---------------------------|----------------------------------------------------------|
| <b>MAC Entries...</b>     | Displays the number of MAC entries learned per VLAN.     |
| <b>Dynamic Address...</b> | Lists the number of dynamically learned MAC addresses.   |
| <b>Static Address...</b>  | Lists the number of user-defined MAC addresses.          |
| <b>Total MAC...</b>       | Lists the total number of MAC addresses the switch uses. |

#### Example (Count)

```
Dell# show mac-address-table count
MAC Entries for all vlans :
Dynamic Address Count : 110
Static Address (User-defined) Count : 0
Sticky Address Count : 0
Total Synced Mac from Peer(N): 100
```

```
Total MAC Addresses in Use: 110
Dell#
```

#### Related Commands

[show mac-address-table aging-time](#) — displays MAC aging time.

## show mac-address-table aging-time

Display the aging times assigned to the MAC addresses on the switch.

### C9000 Series

#### Syntax

```
show mac-address-table aging-time [vlan vlan-id]
```

#### Parameters

**vlan *vlan-id*** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                         |
|-----------------|-----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                            |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                            |
| <b>8.3.19.0</b> | Introduced on the S4820T.                           |
| <b>8.3.11.1</b> | Introduced on the Z9000.                            |
| <b>8.3.7.0</b>  | Introduced on the S4810.                            |
| <b>8.3.1.0</b>  | Added the <code>vlan</code> option on the E-Series. |
| <b>7.7.1.0</b>  | Introduced on the C-Series and S-Series.            |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                         |

#### Example

```
Dell#show mac-address-table aging-time
Mac-address-table aging time : 1800
Dell#
```

#### Related Commands

[show mac-address-table](#) — displays the current MAC address configuration.

## show mac learning-limit

Display MAC address learning limits set for various interfaces.

### C9000 Series

#### Syntax

```
show mac learning-limit [violate-action] [detail] [interface interface]
```

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>violate-action</b>          | (OPTIONAL) Enter the keywords <code>violate-action</code> to display the MAC learning limit violation status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>detail</b>                  | (OPTIONAL) Enter the keyword <code>detail</code> to display the MAC learning limit in detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>interface<br/>interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> with the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the <i>slot/port</i> information.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>For a port extender Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id / stack-unit / port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is from 1 to 48.</li><li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id / stack-unit / port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li></ul> |

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                                        |
|-------------------|------------------------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010.                  |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                                           |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                           |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.                               |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                           |
| <b>8.3.1.0</b>    | Added the <code>vlan</code> option on the E-Series.                                |
| <b>7.7.1.0</b>    | Introduced on the C-Series.                                                        |
| <b>7.5.1.0</b>    | Added support for the <code>violate-action</code> and <code>detail</code> options. |
| <b>6.5.1.0</b>    | Added support for Port Channel.                                                    |

## Example

```
Dell#show mac learning-limit
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/0 10 0 0 0
Te 1/1 5 0 0 0

Dell#show mac learning-limit interface gigabitethernet 1/0
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/0 10 0 0 0
```

# Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

**NOTE:** For more information, refer to [VLAN Stacking](#) and VLAN-related commands, such as `portmode hybrid` in the [Interfaces](#) chapter.

## default vlan-id

Specify a VLAN as the Default VLAN.

### C9000 Series

| Syntax            | default vlan-id <i>vlan-id</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                             |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------|-------------|------------------|------------------------------------------------------------|-----------------|--------------------------|-----------------|--------------------------|-----------------|---------------------------|-----------------|--------------------------|----------------|--------------------------|----------------|-----------------------------|----------------|-----------------------------|----------------|-----------------------------|
|                   | To remove the default VLAN status from a VLAN and VLAN 1 does not exist, use the no default vlan-id <i>vlan-id</i> syntax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                             |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| Parameters        | <i>vlan-id</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is <b>1</b> . |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| Defaults          | The Default VLAN is VLAN <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                             |         |             |                  |                                                            |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## default-vlan disable

Disable the default VLAN so that all switchports are placed in the Null VLAN until they are explicitly configured as a member of another VLAN.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Usage Information**

To display information about a named VLAN, enter the `show vlan` command with the name parameter or the `show interfaces description` command.

**Related Commands**

- [interface vlan](#) — configures a VLAN.
- [show vlan](#) — displays the current VLAN configurations on the switch.

## show config

Display the current configuration of the selected VLAN.

### C9000 Series

**Syntax** `show config`

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Example**

```
Dell(conf-if-vl-100)#show config
!
interface Vlan 100
 no ip address
 no shutdown
Dell(conf-if-vl-100)#
```

# show vlan

Display the current VLAN configurations on the switch.

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.                                                                                                                                          |
| 9.2(1.0)  | Introduced on the Z9500.                                                                                                                                          |
| 9.1.(0.0) | Updated to support OpenFlow.                                                                                                                                      |
| 8.3.19.0  | Introduced on the S4820T.                                                                                                                                         |
| 8.3.11.1  | Introduced on the Z9000.                                                                                                                                          |
| 8.3.7.0   | Introduced on the S4810.                                                                                                                                          |
| 7.8.1.0   | Augmented to display PVLAN data for the C-Series and S-Series and revised the output to include the Description field to display a user-entered VLAN description. |
| 7.6.1.0   | Introduced on the S-Series and revised the output to display Native VLAN.                                                                                         |
| 7.5.1.0   | Introduced on the C-Series.                                                                                                                                       |
| 6.2.1.1   | Introduced on the E-Series.                                                                                                                                       |

**Usage Information** The following describes the `show vlan` command shown in the following example.

| Column Heading          | Description                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Column 1 — no heading) | <ul style="list-style-type: none"><li>• asterisk symbol (*) = Default VLAN</li><li>• G = GVRP VLAN</li><li>• P = primary VLAN</li><li>• C = community VLAN</li><li>• I = isolated VLAN</li><li>• O = OpenFlow</li></ul> |
| NUM                     | Displays existing VLAN IDs.                                                                                                                                                                                             |

| Column Heading | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>  | Displays the word <i>Inactive</i> for inactive VLANs and the word <i>Active</i> for active VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Q</b>       | <ul style="list-style-type: none"> <li>• Displays G for GVRP tagged</li> <li>• M for member of a VLAN-Stack VLAN</li> <li>• T for tagged interface</li> <li>• U for untagged interface</li> <li>• x (not capitalized x) for Dot1x untagged</li> <li>• X (capitalized X) for Dot1x tagged</li> <li>• o (not capitalized o) for OpenFlow untagged</li> <li>• O (capitalized O) for OpenFlow tagged</li> <li>• H for VSN tagged</li> <li>• i (not capitalized i) for Internal untagged</li> <li>• I (capitalized I) for Internal tagged</li> <li>• v (not capitalized v) for VLT untagged</li> <li>• V (capitalized V) for VLT tagged</li> </ul> |
| <b>Ports</b>   | Displays the type, slot, and port information. <ul style="list-style-type: none"> <li>• Po = port channel</li> <li>• Te = 10-Gigabit Ethernet</li> <li>• Fo = 40-Gigabit Ethernet</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Example

```
Dell#show vlan

Codes: * - Default VLAN, G - GVRP VLANs, R - Remote Port Mirroring
VLANs, P - Primary, C - Community, I - Isolated
 O - Openflow
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 o - OpenFlow untagged, O - OpenFlow tagged
 G - GVRP tagged, M - Vlan-stack
 i - Internal untagged, I - Internal tagged, v - VLT untagged, V - VLT
tagged

 NUM Status Description Q Ports
* 1 Active
 10 Active T Po10 (Te 0/140,Te
1/80)
 20 Active T Po20 (Te 1/81)
1/80) T Po10 (Te 0/140,Te
 30 Active T Po20 (Te 1/81)
 T Fo 2/0
```

### Example (VLAN ID)

```
Dell# show vlan id 20

Codes: * - Default VLAN, G - GVRP VLANs, R - Remote Port Mirroring
VLANs, P - Primary, C - Community, I - Isolated
 O - Openflow
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 o - OpenFlow untagged, O - OpenFlow tagged
 G - GVRP tagged, M - Vlan-stack
 i - Internal untagged, I - Internal tagged, v - VLT untagged, V - VLT
tagged

 NUM Status Description Q Ports
 20 Active T Po10 (Te 0/140,Te
1/80)
```

```
T Po20 (Te 1/81)
T Fo 2/0
```

#### Example (Brief)

```
Dell#show vlan brief
VLAN Name STG MAC Aging IP Address

1 0 1800 unassigned
10 0 1800 unassigned
20 0 1800 2.3.3.3/24
30 0 1800 2.1.1.1/24
```

#### Example (Name)

```
Dellconf)#interface vlan 20
Dell(conf-if-vl-20)#name test
Dell(conf-if-vl-20)#do show vlan name test

Codes: * - Default VLAN, G - GVRP VLANs, R - Remote Port Mirroring
VLANs, P - Primary, C - Community, I - Isolated
O - Openflow
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 o - OpenFlow untagged, O - OpenFlow tagged
 G - GVRP tagged, M - Vlan-stack
 i - Internal untagged, I - Internal tagged, v - VLT untagged, V - VLT
tagged

 NUM Status Description Q Ports
 20 Active
1/80)

T Po20 (Te 1/81)
T Fo 2/0
```

#### Related Commands

[interface vlan](#) — configures a VLAN.

## tagged

Add a Layer 2 interface to a VLAN as a tagged interface.

## C9000 Series

#### Syntax

`tagged interface`

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

#### Parameters

***interface***

Enter the following keywords and slot/port or number information:

- For a Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the *slot/port* information.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range

is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Defaults** All interfaces in Layer 2 mode are untagged.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.13.0.1P1 | Introduced peTenGigE interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                             |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0    | Introduced on the S4810.                             |
| 7.6.1.0    | Introduced on the S-Series.                          |
| 7.5.1.0    | Introduced on the C-Series.                          |
| 6.2.1.1    | Introduced on the E-Series.                          |

**Usage Information** When you use the `no tagged` command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

**Related Commands** [interface vlan](#) — configures a VLAN.  
[untagged](#) — specifies which interfaces in a VLAN are untagged.

## track ip

Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

### C9000 Series

**Syntax** `track ip interface`

To remove the tracking feature from the VLAN, use the `no track ip interface` command.

**Parameters** *interface* Enter the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** Not configured.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                             |
| 9.2(1.0) | Introduced on the Z9500.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.2.1.1  | Introduced on the E-Series.                          |

**Usage Information** When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and hence the Layer 2 traffic, is not affected by the `track ip` command configuration.

**Related Commands** [interface vlan](#) — configures a VLAN.  
[tagged](#) — specifies which interfaces in a VLAN are tagged.

## untagged

Add a Layer 2 interface to a VLAN as an untagged interface.

## C9000 Series

**Syntax** `untagged interface`

To remove an untagged interface from a VLAN, use the `no untagged interface` command.

**Parameters** ***interface*** Enter the following keywords and slot/port or number information:

- For a Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the *slot/port* information.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.

- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Defaults** All interfaces in Layer 2 mode are untagged.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                          |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                       |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                       |

**Usage Information** Untagged interfaces can only belong to one VLAN.  
In the Default VLAN, you cannot use the `no untagged interface` command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the `no switchport` command.

**Related Commands**

- [interface vlan](#) — configures a VLAN.
- [tagged](#) — specifies which interfaces in a VLAN are tagged.

## Far-End Failure Detection (FEFD)

The Dell Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces.

The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

### debug fefd

Enable debugging of FEFD.

### C9000 Series

**Syntax** `debug fefd {events | packets} [interface]`

To disable debugging of FEFD, use the `no debug fefd {events | packets} [interface]` command.

|                   |                  |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>events</b>    | Enter the keyword <code>events</code> to enable debugging of FEFD state changes.                                                                                                                                                                                                                                                                                           |
|                   | <b>packets</b>   | Enter the keyword <code>packets</code> to enable debugging of FEFD to view information on packets sent and received.                                                                                                                                                                                                                                                       |
|                   | <b>interface</b> | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/ port information.</li></ul> |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.12.0</b> | Introduced on the S4810.  |

**Related Commands**

- `fe fd` — enables far-end failure detection on an interface.
- `fe fd reset` — enables FEFD globally on the system.

## fe fd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

### C9000 Series

**Syntax** `fe fd {disable|interval|mode {aggressive|normal}}`

|                   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Parameters</b> | <b>disable</b>  | Enter the keyword <b>disable</b> to disable FEFD for the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>interval</b> | Enter the keyword <b>interval</b> , followed by a value to specify the FEFD interval in seconds. Range is from 3 to 300. Default is 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>mode</b>     | Enter the keyword <b>mode</b> followed by the mode type to specify the FEFD mode. <ul style="list-style-type: none"><li><b>normal</b>: Change the link state to “unknown” when a far-end failure is detected by the software on that interface. When the interface is placed in an “unknown” state, the software brings down the line protocol.</li><li><b>aggressive</b>: Change the link state to “error-disabled” when a far-end failure is detected by the software on that interface. When an interface is placed in an “error-disabled” state, you must enter the <code>fe fd reset</code> command to reset the interface state. Range is normal or aggressive. Default is normal.</li></ul> |

**Defaults** Disabled.

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.12.0 | Introduced on the S4810.  |

## Usage Information

When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

## Related Commands

- [fefd disable](#) — disables far-end failure detection on an interface.
- [fefd reset](#) — enables FEFD globally on the system.
- [fefd mode](#) — changes FEFD mode on an interface.

# fefd disable

Disable FEFD on an interface only. This command overrides the `fefd reset` command for the interface.

## C9000 Series

### Syntax

`fefd disable`

To re-enable FEFD on an interface, use the `no fefd disable` command.

### Defaults

Not configured.

### Command Modes

INTERFACE

## Command History

| <b>8.3.7.0</b>  | Introduced on the S4810.  |

#### Related Commands

- [fefd](#) — enables far-end failure detection.

## fefd reset

Reset all interfaces or a single interface that was in “error-disabled” mode.

### C9000 Series

**Syntax** `fefd reset [interface]`

**Parameters** ***interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/ port information.

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| <b>8.3.12.0</b> | Introduced on the S4810.  |

#### Related Commands

- [fefd](#) — enables far-end failure detection.

## fefd-global interval

Configure an interval between FEFD control packets.

### C9000 Series

**Syntax** `fefd-global interval seconds`

To return to the default value, use the `no fefd-global interval` command.

| Parameters       | <b><i>seconds</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Enter a number as the time between FEFD control packets. The range is from 3 to 300 seconds. The default is <b>15 seconds</b> . |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |
