| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.12.0 | Introduced on the S4810.  |

| Usage Information | <p>The following describes the <code>show fefd</code> command shown in the following example.</p> |                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | Field                                                                                             | Description                                                                                                                                                                                       |
|                   | Interface                                                                                         | Displays the interfaces type and number.                                                                                                                                                          |
|                   | Mode                                                                                              | Displays the mode (aggressive or normal) or NA if the interface contains <code>fefd reset</code> in its configuration.                                                                            |
|                   | Interval                                                                                          | Displays the interval between FEFD packets.                                                                                                                                                       |
|                   | State                                                                                             | Displays the state of the interface and can be one of the following: <ul style="list-style-type: none"> <li>bi-directional (interface is up, connected and hearing neighbor’s echoes).</li> </ul> |

## Field

## Description

- err-disabled (only found when FEFD mode is aggressive and when the interface has not hearing its neighbor's echoes for three times the message interval. To reset an interface in this state, use the `fefd reset` command.)
- unknown (only found when FEFD mode is normal.)
- locally disabled (interface contains the `fefd reset` command in its configuration).
- Admin Shutdown (interface is disabled with the `shutdown` command).

## Example

```
Dell#sh fefd
FEFD is globally 'ON', interval is 10 seconds, mode is 'Aggressive'.

INTERFACE MODE INTERVAL STATE
 (second)
Te 1/0 Aggressive 10 Admin Shutdown
Te 1/1 Aggressive 10 Admin Shutdown
Te 1/2 Aggressive 10 Admin Shutdown
Te 1/3 Aggressive 10 Admin Shutdown
Te 1/4 Aggressive 10 Admin Shutdown
Te 1/5 Aggressive 10 Admin Shutdown
Te 1/6 Aggressive 10 Admin Shutdown
Te 1/7 Aggressive 10 Admin Shutdown
Te 1/8 Aggressive 10 Admin Shutdown
Te 1/9 Aggressive 10 Admin Shutdown
Te 1/10 NA NA Locally disabled
Te 1/11 Aggressive 10 Err-disabled
Dell#
```

## Related Commands

- [fefd](#) — enables far-end failure detection.
- [fefd disable](#) — disables FEFD on an interface only.
- [fefd-global](#) — enables FEFD globally on the system.
- [fefd reset](#) — resets all interfaces or a single interface that was in “error-disabled” mode.

# Link Aggregation Control Protocol (LACP)

This chapter contains commands for Dell Networks's implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as “port-channels” in the Dell Networking operating software.

**NOTE:** For static LAG commands, refer to [Port Channel Commands](#) in the [Interfaces](#) chapter), based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications.

## Topics:

- [clear lacp counters](#)
- [debug lacp](#)
- [lacp long-timeout](#)
- [lacp port-priority](#)
- [lacp system-priority](#)
- [port-channel mode](#)
- [port-channel-protocol lacp](#)
- [show lacp](#)

## clear lacp counters

Clear port channel counters.

### C9000 Series

**Syntax** `clear lacp port-channel-number counters`

**Parameters** *port-channel-number* Enter a port-channel number. The range is from 1 to 128.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |

|                  | Version                                      | Description                 |
|------------------|----------------------------------------------|-----------------------------|
|                  | 6.2.1.1                                      | Introduced on the E-Series. |
| Related Commands | show lacp — displays the LACP configuration. |                             |

# debug lacp

Debug LACP (configuration, events, and so on).

## C9000 Series

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |

For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |

| Version    | Description                                                       |
|------------|-------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                                          |

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                          |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                          |
| <b>6.2.1.1</b>  | Introduced on the E-Series.                          |

## lacp long-timeout

Configure a long timeout period (30 seconds) for an LACP session.

### C9000 Series

| <b>Syntax</b>            | <pre>lacp long-timeout</pre> <p>To reset the timeout period to a short timeout (1 second), use the <code>no lacp long-timeout</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

# lacp port-priority

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## port-channel mode

Configure the LACP port channel mode.

### C9000 Series

**Syntax** `port-channel number mode [active] [passive] [off]`

|                   |                |                                                                                                                                                                                                                                       |
|-------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>number</b>  | Enter the keywords <code>number</code> then a number.                                                                                                                                                                                 |
|                   | <b>active</b>  | Enter the keyword <code>active</code> to set the mode to the active state.<br> <b>NOTE:</b> LACP modes are defined in <i>Usage Information</i> .   |
|                   | <b>passive</b> | Enter the keyword <code>passive</code> to set the mode to the passive state.<br> <b>NOTE:</b> LACP modes are defined in <i>Usage Information</i> . |
|                   | <b>off</b>     | Enter the keyword <code>off</code> to set the mode to the off state.<br> <b>NOTE:</b> LACP modes are defined in <i>Usage Information</i> .         |

**Defaults** `off`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** LACP Modes

| Mode           | Function                                                                                                                                                                                                                                                                      |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>active</b>  | An interface is in an active negotiating state in this mode. LACP runs on any link configured in the active state and also automatically initiates negotiation with other ports by initiating LACP packets.                                                                   |
| <b>passive</b> | An interface is not in an active negotiating state in this mode. LACP runs on any link configured in the passive state. Ports in a passive state respond to negotiation requests from other ports that are in active states. Ports in a passive state respond to LACP packets |
| <b>off</b>     | An interface cannot be part of a dynamic port channel in off mode. LACP does not run on a port configured in off mode.                                                                                                                                                        |

## port-channel-protocol lacp

Enable LACP on any LAN port.

### C9000 Series

| <b>Syntax</b>           | <code>port-channel-protocol lacp</code><br>To disable LACP on a LAN port, use the <code>no port-channel-protocol lacp</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |

**counters** (OPTIONAL) Enter the keyword `counters` to display the LACP counters.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Example (Port-Channel-Number)**

```
Dell#show lacp 1
Port-channel 1 admin up, oper up, mode lacp
Actor System ID:Priority 32768, Address 0001.e800.a12b
Partner System ID:Priority 32768, Address 0001.e801.45a5
 Actor Admin Key 1, Oper Key 1, Partner Oper Key 1
 LACP LAG 1 is an aggregatable link

A-Active LACP, B-Passive LACP, C-Short Timeout, D-Long Timeout
E-Aggregatable Link, F-Individual Link, G-IN_SYNC, H-OUT_OF_SYNC
I-Collection enabled, J-Collection disabled, K-Distribution-enabled L-
Distribution disabled,
M-Partner Defaulted, N-Partner Non-defaulted, O-Receiver is in expired
state,
P-Receiver is not in expired state

Port Te 1/6 is enabled, LACP is enabled and mode is lacp
 Actor Admin: State ACEHJLMP Key 1 Priority 128
 Oper: State ACEGIKNP Key 1 Priority 128
 Partner Admin: State BDFHJLMP Key 0 Priority 0
 Oper: State BCEGIKNP Key 1 Priority 128
Dell#
```

**Example (Sys-id)**

```
Dell#show lacp 1 sys-id
Actor System ID: Priority 32768, Address 0001.e800.a12b
Partner System ID: Priority 32768, Address 0001.e801.45a5

Dell#
```

**Example (Counter)**

```
Dell#show lacp 1 counters

Port LACP PDU Marker PDU Unknown Illegal
 Xmit Recv Xmit Recv Pkts Rx Pkts Rx

Te 1/6 200 200 0 0 0 0
Dell#
```

- Related Commands**
- [clear lacp counters](#) — clears the LACP counters.

- `show interfaces port-channel` — displays information on configured Port Channel groups.

# Link Layer Discovery Protocol (LLDP)

Link layer discovery protocol (LLDP) advertises connectivity and management from the local station to the adjacent stations on an IEEE 802 LAN.

This chapter contains the following sections:

- [LLPD Commands](#)
- [LLDP-MED Commands](#)

LLDP facilitates multi-vendor interoperability by using standard management tools to discover and make available a physical topology for network management. The Dell Networking operating system implementation of LLDP is based on IEEE standard 801.1ab.

The starting point for using LLDP is invoking LLDP with the `protocol lldp` command in either CONFIGURATION or INTERFACE mode.

The information LLDP distributes is stored by its recipients in a standard management information base (MIB). You can access the information by a network management system through a management protocol such as simple network management protocol (SNMP).

## Topics:

- [LLPD Commands](#)
- [snmp-notification-interval](#)
- [LLDP-MED Commands](#)

## LLPD Commands

The following are LLDP commands.

### advertise dot1-tlv

Advertise dot1 TLVs (Type, Length, Value).

|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>advertise dot1-tlv {port-protocol-vlan-id   port-vlan-id   vlan-name}</pre> <p>To remove advertised dot1-tlv, use the <code>no advertise dot1-tlv {port-protocol-vlan-id   port-vlan-id   vlan-name}</code> command.</p> |                                                                                                                                        |
| <b>Parameters</b>      | <b>port-protocol-vlan-id</b>                                                                                                                                                                                                  | Enter the keywords <code>port-protocol-vlan-id</code> to advertise the port protocol VLAN identification TLV.                          |
|                        | <b>port-vlan-id</b>                                                                                                                                                                                                           | Enter the keywords <code>port-vlan-id</code> to advertise the port VLAN identification TLV.                                            |
|                        | <b>vlan-name</b>                                                                                                                                                                                                              | Enter the keywords <code>vlan-name</code> to advertise the vlan-name TLV. This keyword is only supported on the C-Series and S-Series. |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                     |                                                                                                                                        |
| <b>Command Modes</b>   | CONFIGURATION ( <code>conf-lldp</code> ) and INTERFACE ( <code>conf-if-interface-lldp</code> )                                                                                                                                |                                                                                                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                     |                                                                                                                                        |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                             |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                             |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                             |
| <b>7.7.1.0</b>  | Introduced on the S-Series. Added the <code>vlan-name</code> option. |
| <b>7.6.1.0</b>  | Introduced on the C-Series.                                          |
| <b>7.4.1.0</b>  | Introduced on the E-Series.                                          |

**Related  
Commands**

[protocol lldp \(Configuration\)](#) — enables LLDP globally.  
[debug lldp interface](#) — debugs LLDP.  
[show lldp neighbors](#) — displays the LLDP neighbors.  
[show running-config lldp](#) — displays the LLDP running configuration.

## advertise dot3-tlv

Advertise dot3 TLVs (Type, Length, Value).

### C9000 Series

**Syntax**

```
advertise dot3-tlv {max-frame-size}
```

To remove advertised dot3-tlv, use the `no advertise dot3-tlv {max-frame-size}` command.

**Parameters**

**max-frame-size** Enter the keywords `max-frame-size` to advertise the dot3 maximum frame size.

**Defaults**

none

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-*interface*-lldp)

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.7.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series. |

## advertise interface-port-desc

Advertise port descriptor.

|                          |                                                                                                                                                                                                        |                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>advertise interface-port-desc {description   port-id}</code><br>To remove the advertised port descriptor, use the <code>no advertise interface-port-desc {description   port-id}</code> command. |                                                                                    |
| <b>Parameters</b>        | <b>description</b>                                                                                                                                                                                     | Enter the keyword <code>description</code> then the interface description.         |
|                          | <b>port-id</b>                                                                                                                                                                                         | Enter the keyword <code>port-id</code> then the port-id. The range is from 0 to 7. |
| <b>Defaults</b>          | None                                                                                                                                                                                                   |                                                                                    |
| <b>Command Modes</b>     | CONFIGURATION (conf-lldp)<br>INTERFACE (conf-if-interface-lldp)                                                                                                                                        |                                                                                    |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                              |                                                                                    |
|                          | <b>Version</b>                                                                                                                                                                                         | <b>Description</b>                                                                 |
|                          | <b>9.11(2.0P2)</b>                                                                                                                                                                                     | Introduced the <code>description</code> and <code>port-id</code> options.          |
| <b>Usage Information</b> | If you do not specify the option, by default the port-id takes higher precedence and sends the port-id in the LLDP packets.                                                                            |                                                                                    |

## advertise dot3-tlv

Configure the system or an interface to advertise IEEE 802.3at extended power-via-mdi.

### C9000 Series

|                          |                                                                                                                                                                                                                                                                                                                        |                                                                                           |

|                          | <b>9.9(0.0)</b>                                                                                                                                                                                                                                                                                                        | Introduced on the C9010.                                                                  |
| <b>Usage Information</b> | The <code>advertise dot3-tlv power-via-mdi</code> command enables the system to advertise IEEE 802.3at power-via-mdi TLV to advertise its power negotiation capabilities with the powered devices via Link Layer Discovery Protocol (LLDP). You can configure this command either on a specific interface or globally. |                                                                                           |
| <b>Example</b>           | <pre>Dell(conf)#interface peGigE 0/0/0 Dell(conf-if-pegig-0/0/0)#protocol lldp</pre>                                                                                                                                                                                                                                   |                                                                                           |

```
Dell (conf-if-peg1-0/0/0-lldp) #advertise dot3-tlv power-via-mdi
Dell (conf-if-peg1-0/0/0-lldp) #
```

## advertise management-tlv

Advertise management TLVs (Type, Length, Value).

### C9000 Series

#### Syntax

```
advertise management-tlv {management-address | system-capabilities |
system-description | system-name}
```

To remove advertised management TLVs, use the `no advertise management-tlv {management-address | system-capabilities | system-description | system-name}` command.

#### Parameters

|                            |                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>management-address</b>  | Enter the keyword <code>management-address</code> to advertise the management IP address TLVs to the LLDP peer. |
| <b>system-capabilities</b> | Enter the keywords <code>system-capabilities</code> to advertise the system capabilities TLVs to the LLDP peer. |
| <b>system-description</b>  | Enter the keywords <code>system-description</code> to advertise the system description TLVs to the LLDP peer.   |
| <b>system-name</b>         | Enter the keywords <code>system-name</code> to advertise the system name TLVs to the LLDP peer.                 |

#### Defaults

none

#### Command Modes

CONFIGURATION (conf-lldp)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                       |
|------------------|---------------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                          |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                          |
| <b>9.1.(0.0)</b> | Modified to support management-address parameter. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                         |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                          |
| <b>8.3.7.0</b>   | Introduced on the S4810.                          |
| <b>7.7.1.0</b>   | Introduced on the S-Series.                       |
| <b>7.6.1.0</b>   | Introduced on the C-Series.                       |
| <b>7.4.1.0</b>   | Introduced on the E-Series.                       |

#### Usage

#### Information

The command options `management-address`, `system-capabilities`, `system-description`, and `system-name` can be invoked individually or together, in any sequence.

# advertise management-tlv (Interface)

Advertise management type, length, values (TLVs) to the specified interface.

## C9000 Series

Syntax

```
advertise management-tlv {management-address | system-capabilities | system-description | system-name}
```

To remove advertised management TLVs, use the `no advertise management-tlv {management-address | system-capabilities | system-description | system-name}` command.

Parameters

management-address

Enter the keywords `management-address` to advertise the management IP address TLVs to the specified interface.

system-capabilities

Enter the keywords `system-capabilities` to advertise the system capabilities TLVs to the specified interface.

system-description

Enter the keywords `system-description` to advertise the system description TLVs to the specified interface.

system-name

Enter the keywords `system-name` to advertise the system name TLVs to the specified interface.

Defaults

none

Command Modes

INTERFACE (conf-*interface*-lldp)

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.           |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the Z9000 and S4810. |
| 8.3.19.0  | Introduced on the S4820T.          |

# clear lldp counters

Clear LLDP transmitting and receiving counters for all physical interfaces or a specific physical interface.

## C9000 Series

|            |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax     | <pre>clear lldp counters interface</pre> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Parameters | <b>interface</b>                         | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the <i>slot/port</i> information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the <i>slot/port</i> information.</li><li>For a Management Ethernet interface, enter the keyword <code>managementethernet</code> then the <i>slot/port</i> information.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>tenGigabitEthernet</code> then the <i>slot/port</i> information.</li></ul> |

- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards on ExaScale.              |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                          |
| <b>7.7.1.0</b>    | Introduced on the S-Series.                                       |
| <b>7.6.1.0</b>    | Introduced on the C-Series.                                       |
| <b>7.4.1.0</b>    | Introduced on the E-Series.                                       |

## clear lldp neighbors

Clear LLDP neighbor information for all interfaces or a specific interface.

### C9000 Series

**Syntax** `clear lldp neighbors {interface}`

**Parameters** ***interface*** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `gigabitethernet` then the slot/ port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `tenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Management Ethernet interface, enter the keyword `managementethernet` then the slot/port information.
- For a port extender (PE) Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range

is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.13.0.1P1 | Introduced peTenGigE interface support on the C9010. |
| 9.9(0.0)   | Introduced on the C9010.                             |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0    | Introduced on the S4810.                             |
| 7.7.1.0    | Introduced on the S-Series.                          |
| 7.6.1.0    | Introduced on the C-Series.                          |
| 7.4.1.0    | Introduced on the E-Series.                          |

## debug lldp interface

To display timer events, neighbor additions or deletions, and other information about incoming and outgoing packets, enable LLDP debugging.

**Syntax** `debug lldp interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}`

To disable debugging, use the `no debug lldp [interface {interface | all}{events} {packet {brief | detail} {tx | rx | both}}]` command.

|                   |                                      |                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b><br><i>interface</i> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |
|                   | <b>all</b>                           | Enter the keyword <code>all</code> to display information on all interfaces.                                                                                                                                                                                                                                                                                   |
|                   | <b>events</b>                        | Enter the keyword <code>events</code> to display major events such as timer events.                                                                                                                                                                                                                                                                            |
|                   | <b>packet</b>                        | Enter the keyword <code>packet</code> to display information regarding packets coming in or going out.                                                                                                                                                                                                                                                         |
|                   | <b>brief</b>                         | Enter the keyword <code>brief</code> to display brief packet information.                                                                                                                                                                                                                                                                                      |
|                   | <b>detail</b>                        | Enter the keyword <code>detail</code> to display detailed packet information.                                                                                                                                                                                                                                                                                  |
|                   | <b>tx</b>                            | Enter the keyword <code>tx</code> to display transmit-only packet information.                                                                                                                                                                                                                                                                                 |
|                   | <b>rx</b>                            | Enter the keyword <code>rx</code> to display receive-only packet information.                                                                                                                                                                                                                                                                                  |
|                   | <b>both</b>                          | Enter the keyword <code>both</code> to display both receive and transmit packet information.                                                                                                                                                                                                                                                                   |
|                   |                                      |                                                                                                                                                                                                                                                                                                                                                                |

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.13.0.0   | Enhanced to display organizational specific unrecognized LLDP TLVs. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                           |
| 9.10(0.0)  | Introduced on the S3148.                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                            |
| 9.0.2.0    | Introduced on the S6000.                                            |
| 8.3.19.0   | Introduced on the S4820T.                                           |
| 8.3.11.1   | Introduced on the Z9000.                                            |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series.            |
| 8.3.7.0    | Introduced on the S4810.                                            |
| 7.7.1.0    | Introduced on the S-Series.                                         |
| 7.6.1.0    | Introduced on the C-Series.                                         |
| 7.4.1.0    | Introduced on the E-Series.                                         |

```

## disable

Enable or disable LLDP.

## C9000 Series

**Syntax** disable

To enable LLDP, use the `no disable` command.

**Defaults**

Enabled, that is no disable.

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

**Related Commands**

[protocol lldp \(Configuration\)](#) — enables LLDP globally.

[debug lldp interface](#) — debugs LLDP.

[show lldp neighbors](#) — displays the LLDP neighbors.

[show running-config lldp](#) — displays the LLDP running configuration.

## hello

Configure the rate at which the LLDP control packets are sent to its peer.

## C9000 Series

**Syntax**

`hello seconds`

To revert to the default, use the `no hello seconds` command.

**Parameters**

***seconds***

Enter the rate, in seconds, at which the control packets are sent to its peer. The rate is from 5 to 180 seconds. The default is **30 seconds**.

**Defaults**

**30 seconds**

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

| Version | Description                 |
|---------|-----------------------------|
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

## management-interface

Enable and configure LLDP protocol parameters on the management interface.

### C9000 Series

| <b>Syntax</b>            | <code>management-interface</code><br><br>To remove LLDP configuration on a management interface, use the <code>no management-interface</code> command.                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                          |          |                          |          |                                    |

## pe-lldp-multiplier

Configure the port extender (PE) LLDP multiplier value.

**Syntax**     `pe-lldp-multiplier number`

To return to the default multiplier value, use the `no pe-lldp-multiplier` command.

|                                                     |                                                                                                                                                                                                                                                |                                                                                      |

|                                                     | <b>Version</b>                                                                                                                                                                                                                                 | <b>Description</b>                                                                   |
|                                                     | <b>9.14(1.6)</b>                                                                                                                                                                                                                               | Introduced on the C9010.                                                             |
| <b>Usage Information</b>                            | PE LLDP timeout is based on the hello interval and multiplier value (for example: Default Hello interval: 3 seconds * multiplier: 3 seconds). This command allows you to change the multiplier value only.                                     |                                                                                      |
| <b>Example (configure the PE LLDP multiplier)</b>   | <pre>DellEMC(conf)#pe-lldp-multiplier ? &lt;3-10&gt;                Multiplier value (default = 3) DellEMC(conf)#pe-lldp-multiplier 5 DellEMC(conf)# DellEMC(conf)#do show running-config   grep pe- pe-lldp-multiplier 5 DellEMC(conf)#</pre> |                                                                                      |
| <b>Example (unconfigure the PE LLDP multiplier)</b> | <pre>DellEMC(conf)#no pe-lldp-multiplier DellEMC(conf)# DellEMC(conf)#do show running-config   grep pe- DellEMC(conf)#</pre>                                                                                                                   |                                                                                      |

## protocol lldp (Configuration)

Enable the LLDP globally on the switch.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                    |                  |                                                            |                 |                          |                 |                          |

| <b>9.10(0.0)</b>       | Introduced the Configuration Terminal Batch mode on C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                    |                  |                                                            |                 |                          |                 |                          |
| <b>9.9(0.0)</b>        | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                    |                  |                                                            |                 |                          |                 |                          |
| <b>9.2(1.0)</b>        | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                    |                  |                                                            |                 |                          |                 |                          |

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.7.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series. |

## protocol lldp (Interface)

Enter the LLDP protocol in INTERFACE mode.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>[no] protocol lldp</code><br><br>To return to the global LLDP configuration mode, use the <code>no protocol lldp</code> command from Interface mode.                                                                                                |
| <b>Defaults</b>        | LLDP is not enabled on the interface.                                                                                                                                                                                                                     |
| <b>Command Modes</b>   | INTERFACE ( <i>conf-if-interface-lldp</i> )                                                                                                                                                                                                               |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Before LLDP can be configured on an interface, it must be enabled globally from CONFIGURATION mode. This command places you in LLDP mode on the interface; it does not enable the protocol.<br><br>When you enter the LLDP protocol in the Interface context, it overrides global configurations. When you execute the <code>no protocol lldp</code> from INTERFACE mode, interfaces begin to inherit the configuration from global LLDP CONFIGURATION mode. |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## show lldp neighbors

Display LLDP neighbor information for all interfaces or a specified interface.

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <b>Syntax</b> | <code>show lldp neighbors [interface <i>interface</i>] [detail]</code> |
|---------------|------------------------------------------------------------------------|

|                          |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>        | <b>interface</b><br><b>interface</b>                                                                                                                          | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port extender Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is from 1 to 48.</li> <li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the stack-unit <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li> </ul> |

## show lldp statistics

Display the LLDP statistical information.

### C9000 Series

**Syntax** show lldp statistics

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.7.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series. |

### Example

```

Dell#show lldp statistics
Total number of neighbors: 300
Last table change time : Mon Oct 02 16:00:52 2006
Number of Table Inserts : 1621
Number of Table Deletes : 200
Number of Table Drops : 0
Number of Table Age Outs : 400
Dell#

```

## show management-interface

Display LLDP management interface configuration information.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show management-interface</code>                                                                                                                         |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                        |
|------------------|------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.           |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.           |
| <b>9.2.(0.0)</b> | Introduced on the Z9000 and S4810. |

## show running-config lldp

Display the current global LLDP configuration.

### C9000 Series

|                        |                                                                                                                                                                |

| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S8420T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.7.1.0</b>  | Introduced on the S-Series. |
| <b>7.6.1.0</b>  | Introduced on the C-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series. |

#### Example

```
Dell#show running-config lldp
!
protocol lldp
 advertise dot1-tlv port-protocol-vlan-id port-vlan-id
 advertise dot3-tlv max-frame-size
 advertise management-tlv system-capabilities system-description
hello 15
multiplier 3
```

```
no disable
Dell#
```

## snmp-notification-interval

Used to configure the value for the lldp notification interval, to throttle lldp notification messages.

|                          |                                                                                                                                                                                                                                                                                                                |                                                                        |  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|--|
| <b>Syntax</b>            | [no] snmp-notification-interval [seconds]<br>To disable this feature, use the no snmp-notification-interval command.                                                                                                                                                                                           |                                                                        |  |
| <b>Parameters</b>        | <b>seconds</b>                                                                                                                                                                                                                                                                                                 | Enter a value from 5 to 3600 seconds.                                  |  |
| <b>Defaults</b>          | 5 seconds                                                                                                                                                                                                                                                                                                      |                                                                        |  |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                  |                                                                        |  |
| <b>Command History</b>   | This guide is platform-specific. |                          | <b>Version</b>                                                                                                                                                                                                                                                                                                 | <b>Description</b>                                                     |  |
|                          | <b>9.11(2.5)</b>                                                                                                                                                                                                                                                                                               | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON and Z9100-ON |  |
| <b>Usage Information</b> | SNMP notification for the changes in the lldp remote entry table is throttled by 5 seconds (default), or the configured time set using this command. If more than one notification message is generated within the configured time, only the first one will be sent and the remaining messages are suppressed. |                                                                        |  |

## LLDP-MED Commands

The following are the LLDP-MED (Media Endpoint Discovery) commands.

The Dell Networking OS LLDP-MED commands are an extension of the set of LLDP TLV advertisement commands. The C-Series and S-Series support all commands.

The E-Series generally supports the commands. However, LLDP-MED commands are more useful on the C-Series and the S50V model of the S-Series, because they support Power over Ethernet (PoE) devices.

As defined by ANSI/TIA-1057, LLDP-MED provides organizationally specific TLVs (Type Length Value), so that endpoint devices and network connectivity devices can advertise their characteristics and configuration information. The Organizational Unique Identifier (OUI) for the Telecommunications Industry Association (TIA) is 00-12-BB.

- LLDP-MED Endpoint Device — any device that is on an IEEE 802 LAN network edge, can communicate using IP, and uses the LLDP-MED framework.
- LLDP-MED Network Connectivity Device — any device that provides access to an IEEE 802 LAN to an LLDP-MED endpoint device, and supports IEEE 802.1AB (LLDP) and TIA-1057 (LLDP-MED). The Dell Networking system is an LLDP-MED network connectivity device.

Regarding connected endpoint devices, LLDP-MED provides network connectivity devices with the ability to:

- manage inventory
- manage Power over Ethernet (POE)
- identify physical location
- identify network policy

## advertise med guest-voice

To advertise a separate limited voice service for a guest user with their own IP telephony handset or other appliances that support interactive voice services, configure the system.

### C9000 Series

**Syntax** `advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                          |
|--------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                          |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                                    |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                         |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> followed the Layer 2 priority. The range is from 0 to 7. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

## advertise med guest-voice-signaling

To advertise a separate limited voice service for a guest user when the guest voice control packets use a separate network policy than the voice data, configure the system.

### C9000 Series

**Syntax** `advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

|                   |                                      |                                                                                                      |
|-------------------|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
|                   | <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                                |
|                   | <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                     |
|                   | <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

**Defaults** unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

## advertise med location-identification

To advertise a location identifier, configure the system.

### C9000 Series

**Syntax**

```
advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}
```

To return to the default, use the `no advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}` command.

|                   |                                      |                                                                                                                                                                                                |
|-------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>coordinate-based value</i></b> | Enter the keywords <code>coordinate-based</code> then the coordinated based location in hexadecimal value of 16 bytes.                                                                         |
|                   | <b><i>civic-based value</i></b>      | Enter the keywords <code>civic-based</code> then the civic based location in hexadecimal format. The range is from 6 to 255 bytes.                                                             |
|                   | <b><i>ecs-elin value</i></b>         | Enter the keywords <code>ecs-elin</code> then the Emergency Call Service (ecs) Emergency Location Identification Number (elin) numeric location string. The range is from 10 to 25 characters. |

**Defaults** unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

## Usage Information

- ECS — Emergency call service such as defined by TIA or the national emergency numbering association (NENA)
- ELIN — Emergency location identification number, a valid North America Numbering Plan format telephone number supplied for ECS purposes.

## Related Commands

[debug lldp interface](#) — debugs LLDP.

[show lldp neighbors](#) — displays the LLDP neighbors.

[show running-config lldp](#) — displays the LLDP running configuration.

# advertise med power-via-mdi

Configure the system to advertise the IEEE 802.1ab extended power via MDI TLV.

## C9000 Series

### Syntax

```
[no] advertise med power-via-mdi
```

To return to the default, use the `no advertise med power-via-mdi` command.

### Defaults

unconfigured.

### Command Modes

- LLDP CONFIGURATION (`conf-lldp`)
- INTERFACE LLDP CONFIGURATION (`conf-if-interface-lldp`)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |

## Usage Information

Advertise extended power via MDI TLVs to all ports that are connected to the 802.1ab powered endpoint devices.

When the `advertise med power-via-mdi` command is enabled in CONFIGURATION mode, advertisement is enabled for all the interfaces in a system. To enable advertisement for a specific interface, configure the command in INTERFACE configuration mode.

Port extender (PE) processes and advertises LLDP power-via-MDI TLVs when the LLDP advertisement of the TLV is enabled on the PE in class power management mode. Incoming LLDP messages are processed only when the PE is in class power management mode.

## Related Commands

[debug lldp interface](#) — debugs LLDP.

[show lldp neighbors](#) — displays the LLDP neighbors.

[show running-config lldp](#) — displays the LLDP running configuration.

# advertise med softphone-voice

To advertise softphone to enable IP telephony on a computer so that the computer can be used as a phone, configure the system.

## C9000 Series

### Syntax

```
advertise med softphone-voice {vlan-id layer2_priority DSCP_value} |
{priority-tagged number}
```

To return to the default, use the `no advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

### Parameters

|                                      |                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority (C-Series and E-Series only). The range is from 0 to 7.                   |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value (C-Series and E-Series only). The range is from 0 to 63.                        |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

### Defaults

unconfigured.

## advertise med voice-signaling

To advertise when voice control packets use a separate network policy than voice data, configure the system.

### C9000 Series

**Syntax** `advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

|                   |                                      |                                                                                                      |
|-------------------|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
|                   | <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority (C-Series and E-Series only). The range is from 0 to 7.                   |
|                   | <b><i>DSCP_value</i></b>             | Enter the DSCP value (C-Series and E-Series only). The range is from 0 to 63.                        |
|                   | <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

**Defaults** unconfigured.

# Multicast

The multicast commands are supported by Dell Networking operating system.

This chapter contains the following sections:

- [IPv4 Multicast Commands](#)

 **NOTE:** Dell Networking OS supports Multicast routing only on default VRFs .

## Topics:

- [IPv4 Multicast Commands](#)
- [IPv6 Multicast Commands](#)

## IPv4 Multicast Commands

The following section contains the IPv4 multicast commands.

### clear ip mroute

Clear learned multicast routes on the multicast forwarding table. To clear the protocol-independent multicast (PIM) tree information base, use the `clear ip pim tib` command.

### C9000 Series

**Syntax** `clear ip mroute {group-address [source-address] | * | snooping}`

**Parameters**

|                                |                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>group-address</i></b>    | Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group. |
| <b>[<i>source-address</i>]</b> |                                                                                                                                        |
| <b>*</b>                       | Enter * to clear all multicast routes.                                                                                                 |
| <b>snooping</b>                | Enter the keyword <code>snooping</code> to delete multicast snooping route table entries.                                              |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                      |
|--------------------------------|----------------------------------------------------------------------------------|
| <b>9.9(0.0)</b>                | Introduced on the C9010.                                                         |
| <b>9.2.(0.0)</b>               | Added support for keyword <code>snooping</code> on the Z9000, S4810, and S4820T. |
| <b>9.0.2.0</b>                 | Introduced on the S6000.                                                         |
| <b>8.3.19.0</b>                | Introduced on the S4820T.                                                        |
| <b>8.3.7.0</b>                 | Introduced on the S4810.                                                         |
| <b>7.8.1.0</b>                 | Introduced on the C-Series.                                                      |
| <b>E-Series legacy command</b> |                                                                                  |

## Related Commands

[show ip pim tib](#) — shows the PIM tree information base.

# mtrace

Trace a multicast route from the source to the receiver.

**Syntax** `mtrace [vrf vrf-name] {source-address/hostname} [destination-address/hostname] [group-address/hostname]`

|                   |                                     |                                                                                                                                                                                                                                                                                                |
|-------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf vrf-name</b>                 | Enter the keyword <code>vrf</code> followed by the name of the VRF. If VRF name is not mentioned, the default VRF will be used. Mtrace is not supported for management VRF.                                                                                                                    |
|                   | <b>source-address/hostname</b>      | Enter the source IP address in dotted decimal format (A.B.C.D). This is a unicast address of the beginning of the path to be traced.                                                                                                                                                           |
|                   | <b>destination-address/hostname</b> | Enter the destination (receiver) IP address in dotted decimal format (A.B.C.D). If omitted, the mtrace starts from the system at which the command is typed.                                                                                                                                   |
|                   | <b>group-address/hostname</b>       | Enter the multicast group address in dotted decimal format (A.B.C.D). If group address is not given then software shall invokes a weak mtrace. A weak mtrace is one that follows the RPF path to the source, regardless of whether any router along the path has multicast routing table state |

**Command Modes** EXEC Privilege

|                        |                 |                                                             |
|------------------------|-----------------|-------------------------------------------------------------|
| <b>Command History</b> | <b>Version</b>  | Description                                                 |
|                        | <b>9.11.0.0</b> | Re-introduced the mtrace command on the Dell Networking OS. |
|                        | <b>7.5.1.0</b>  | Expanded to support originator.                             |
|                        | <b>7.4.1.0</b>  | Expanded to support the intermediate (transit) router.      |

**Usage Information** Mtrace is an IGMP based protocol that provides a multicast trace route facility and is implemented according to the IETF draft “A *trace route* facility for IP Multicast” (draft-fenner-traceroute-ipm-01.txt). Dell Networking OS supports the Mtrace client and transit functionality.

As an Mtrace client, Dell Networking OS transmits Mtrace queries, receives, parses, and prints out the details in the response packet received.

A transit or intermediate router, forwards mtrace requests to the RPF neighbor after appending its response block to the packet. In case it is the first hop router, it sends a response.

As an Mtrace transit or intermediate router, Dell Networking OS returns the response to Mtrace queries. After receiving the Mtrace request, Dell Networking OS computes the RPF neighbor for the source, fills in the request and the forwards the request to the RPF neighbor.

## Example

```
R1>mtrace 103.103.103.3 1.1.1.1 226.0.0.3
Type Ctrl-C to abort.

Querying reverse path for source 103.103.103.3 to destination 1.1.1.1
via group 226.0.0.3
From source (?) to destination (?)

|Hop| OIF IP |Proto| Forwarding Code |Source Network/Mask|

 0 1.1.1.1 --> Destination
 -1 1.1.1.1 PIM Reached RP/Core 103.103.103.0/24
 -2 101.101.101.102 PIM - 103.103.103.0/24
 -3 2.2.2.1 PIM - 103.103.103.0/24
 -4 103.103.103.3 --> Source

```

The mtrace command traverses the path of the response data block in the reverse direction of the multicast data traffic. The mtrace command traverses the reverse path to the source from the destination. As a result, the tabular output of the mtrace command displays the destination details in the first row, followed by the RPF router details along the path in the consequent rows, and finally the source details in the last row. The tabular output contains the following columns:

- Hop — a hop number(counted negatively to indicate reverse-path)
- OIF IP — outgoing interface address
- Proto — multicast routing protocol
- Forwarding code — error code as present in the response blocks
- Source Network/Mask — source mask

## ip mroute

Assign a static mroute.

### C9000 Series

#### Syntax

```
ip mroute destination mask {ip-address | null 0| {{bgp| ospf} process-id |
isis | rip | static} {ip-address | tag | null 0}} [distance]
```

To delete a specific static mroute, use the `no ip mroute destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]` command.

To delete all mroutes matching a certain mroute, use the `no ip mroute destination mask` command.

#### Parameters

|                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>destination</i></b>                                      | Enter the IP address in dotted decimal format of the destination device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>mask</i></b>                                             | Enter the mask in slash prefix formation ( /x ) or in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>null 0</i></b>                                           | (OPTIONAL) Enter the keyword <code>null</code> then zero (0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>[protocol<br/>[process-id   tag]<br/>ip-address]</i></b> | (OPTIONAL) Enter one of the routing protocols: <ul style="list-style-type: none"> <li>• Enter the BGP as-number then the IP address in dotted decimal format of the reverse path forwarding (RPF) neighbor. The range is from 1 to 65535.</li> <li>• Enter the OSPF process identification number then the IP address in dotted decimal format of the RPF neighbor. the range is from 1 to 65535.</li> <li>• Enter the IS-IS alphanumeric tag string then the IP address in dotted decimal format of the RPF neighbor.</li> <li>• Enter the RIP IP address in dotted decimal format of the RPF neighbor.</li> </ul> |
| <b><i>static ip-address</i></b>                                | (OPTIONAL) Enter the Static IP address in dotted decimal format of the RPF neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ip-address</i></b>                                       | (OPTIONAL) Enter the IP address in dotted decimal format of the RPF neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>distance</i></b>                                         | (OPTIONAL) Enter a number as the distance metric assigned to the mroute. The range is from 0 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

| Version                        | Description               |
|--------------------------------|---------------------------|
| 9.0.2.0                        | Introduced on the S6000.  |
| 8.3.19.0                       | Introduced on the S4820T. |
| 8.3.7.0                        | Introduced on the S4810.  |
| <b>E-Series legacy command</b> |                           |

**Related Commands**      [show ip mroute](#) — displays the routing table.

## ip multicast-limit

To limit the number of multicast entries on the system, use this feature.

### C9000 Series

|                        |                                                                                                                                                           |                                                                                                    |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip multicast-limit [vrf vrf-name] limit</code>                                                                                                      |                                                                                                    |
| <b>Parameters</b>      | <b><i>limit</i></b>                                                                                                                                       | Enter the desired maximum number of multicast entries on the system. The range is from 1 to 16000. |
| <b>Defaults</b>        | The default is <b>4000</b> .                                                                                                                              |                                                                                                    |

|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>This feature allows you to limit the number of multicast entries on the system. This number is the total of all the multicast entries on all line cards in the system. On each line card, the multicast module only installs the maximum number of entries, depending on the configured CAM profile.</p> <p>To store multicast routes, use the IN-L3-McastFib CAM partition. It is a separate hardware limit that exists per port-pipe. This hardware space limitation can supersede any software-configured limit. The opposite is also true, the CAM partition might not be exhausted at the time the system-wide route limit set by the <code>ip multicast-limit</code> command is reached.</p> |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Related Commands**      [show ip igmp groups](#) — shows the IGMP groups.

## ip multicast-routing

Enable IP multicast forwarding.

### C9000 Series

| <b>Syntax</b>            | <code>ip multicast-routing</code><br>To disable multicast forwarding, use the <code>no ip multicast-routing</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                 |                          |                |                          |                 |                           |                 |                          |                |                          |

| <b>Usage Information</b> | After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the <code>ip pim sparse-mode</code> command to enable IGMP and PIM on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                          |                |                          |                 |                           |                 |                          |                |                          |

| Version                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                  |         |             |                  |                                           |                  |                          |
| <b>9.10(0.1)</b>       | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                  |         |             |                  |                                           |                  |                          |
| <b>9.10(0.0)</b>       | Introduced on the S3148.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                  |         |             |                  |                                           |                  |                          |

| Version           | Description                     |
|-------------------|---------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100–ON.     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048–ON.     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048–ON.     |
| <b>9.7(0.0)</b>   | Introduced on the S6000–ON.     |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.        |
| <b>9.0.2.0</b>    | Introduced on the S6000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.        |
| <b>8.3.7.1</b>    | Introduced on the S4810.        |

#### E-Series legacy command

#### Example

```
show ip multicast-cam stack-unit 1 port 0
Vrf Id Group Address Source Address Vlan Id IPMC index L2 Ports

0 224.1.1.1 0.0.0.0 1000 1 Te 0/3,
Te 0/10,
0 224.1.1.2 0.0.0.0 1000 1 Te 0/3,
Te 0/10,
0 224.1.1.1 165.13.34.5 2000 2 Te 0/5,
```

## show ip mroute

View the multicast routing table.

### C9000 Series

#### Syntax

```
show ip mroute [static | group-address [source-address] | count | snooping
[vlan vlan-id] [group-address [source-address]] | summary | vlt [group-
address [source-address] | count]
```

#### Parameters

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>static</b>                                                   | (OPTIONAL) Enter the keyword <code>static</code> to view static multicast routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>group-address [source-address]</b>                           | (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>count</b>                                                    | (OPTIONAL) Enter the keyword <code>count</code> to view the number of multicast routes and packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>snooping [vlan vlan-id] [group-address [source-address]]</b> | <p>Enter the keyword <code>snooping</code> to display information on the multicast routes PIM-SM snooping discovers.</p> <p>Enter a VLAN ID to limit the information displayed to the multicast routes PIM-SM snooping discovers on a specified VLAN. The VLAN ID range is from 1 to 4094.</p> <p>Enter a multicast group address and, optionally, a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes PIM-SM snooping discovers for a specified multicast group and source.</p> |
| <b>summary</b>                                                  | (OPTIONAL) Enter the keyword <code>summary</code> to view a summary of all routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**vlt** (OPTIONAL) Enter the keyword `vlt` to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword `count` to display the total number of multicast routes with the spanned IIF.

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.)                        | Introduced on the C9010.                                                                                                                                                                            |
| 9.0.2.0                        | Introduced on the S6000.                                                                                                                                                                            |
| 9.2.(0.0)                      | Added support for keyword <code>vlt</code> to the Z9000, S4810, and S4820T.                                                                                                                         |
| 8.4.1.1                        | Support for the keyword <code>snooping</code> and the optional <code>vlan vlan-id</code> , <code>group-address</code> , and <code>source-address</code> parameters were added on E-Series ExaScale. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                                                                                                                           |
| 8.3.7.0                        | Introduced on the S4810.                                                                                                                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                                                                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                                                                                                                         |
| <b>E-Series legacy command</b> |                                                                                                                                                                                                     |

**Example (Static)**

```
Dell#show ip mroute static

Mroute: 23.23.23.0/24, interface: Lo 2
Protocol: static, distance: 0, route-map: none, last change: 00:00:23
```

**Example (Snooping)**

```
Dell#show ip mroute snooping

IPv4 Multicast Snooping Table

(*, 224.0.0.0), uptime 17:46:23
 Incoming vlan: Vlan 2
 Outgoing interface list:
 GigabitEthernet 4/13

(*, 225.1.2.1), uptime 00:04:16
 Incoming vlan: Vlan 2
 Outgoing interface list:
 GigabitEthernet 4/11
 GigabitEthernet 4/13

(165.87.1.7, 225.1.2.1), uptime 00:03:17
 Incoming vlan: Vlan 2
 Outgoing interface list:
 GigabitEthernet 4/11
 GigabitEthernet 4/13
 GigabitEthernet 4/20
```

**Example (VLT)**

```
Dell#show ip mroute vlt
IP Multicast Routing Table
```

```

Flags: S - Synced
(*, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
 Vlan 20 (S)
 Vlan 30

(50.1.1.2, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
 Vlan 20 (S)

```

#### Usage Information

The following describes the `show ip mroute` command shown in the following example.

| Field                           | Description                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>(S, G)</b>                   | Displays the forwarding entry in the multicast route table.                                                                                                                                                                                              |
| <b>uptime</b>                   | Displays the amount of time the entry has been in the multicast forwarding table.                                                                                                                                                                        |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) information towards the source for (S,G) entries and the RP for (*,G) entries.                                                                                                                                |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following: <ul style="list-style-type: none"> <li>• a directly connected member of the Group</li> <li>• statically configured member of the Group</li> <li>• received a (*,G) or (S,G) Join message</li> </ul> |

#### Example

## show ip rpf

View reverse path forwarding.

## C9000 Series

#### Syntax

```
show ip rpf
```

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.)</b>  | Introduced on the C9010.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.1</b>  | Introduced on the S4810.  |

#### E-Series legacy command

#### Usage Information

Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

 **NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

## Example

```
Dell#show ip rpf
RPF information for 10.10.10.9
 RPF interface: Gi 3/4
 RPF neighbor: 165.87.31.4
 RPF route/mask: 10.10.10.9/255.255.255.255
 RPF type: unicast
```

# IPv6 Multicast Commands

The following section contains the IPv6 multicast commands.

## clear ipv6 mroute

Clear learned multicast routes on the multicast forwarding table.

**Syntax** `clear ipv6 mroute [vrf vrf-name] {group-address [source-address] | *}`

**Parameters**

|                                       |                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                   | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>group-address [source-address]</b> | Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.                                                                                                                                                            |
| <b>*</b>                              | Enter <code>*</code> to clear all multicast routes.                                                                                                                                                                                                                                               |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

**Related Commands**

- [show ip pim tib](#) — show the PIM tree information base.

## ipv6 multicast-routing

Enables IPv6 multicast forwarding.

**Syntax** `ipv6 multicast-routing [vrf vrf-name]`

To disable multicast forwarding, use the `no ipv6 multicast-routing [vrf vrf-name]` command.

**Defaults** Disabled.

**Parameters**

|                     |                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable IP multicast forwarding on that VRF. |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**9.11.3.0** Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.

**Usage Information**

After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the `ip pim sparse-mode` command to enable IGMP and PIM on the interface.

**Related Commands**

- [ip pim sparse-mode](#) — enable IGMP and PIM on an interface.

## show ipv6 mroute

View the IPv6 multicast routing table.

**Syntax**

```
show ipv6 mroute [vrf vrf-name] [static | group-address [source-address] | count] | summary | vlt [group-address [source-address] | count]
```

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- static** (OPTIONAL) Enter the keyword `static` to view static multicast routes.
- group-address [source-address]** (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.
- count** (OPTIONAL) Enter the keyword `count` to view the number of multicast routes and packets.
- summary** (OPTIONAL) Enter the keyword `summary` to view a summary of all routes.
- vlt** (OPTIONAL) Enter the keyword `vlt` to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword `count` to display the total number of multicast routes with the spanned IIF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**9.11.3.0** Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.

**Example**

```
Dell# show ipv6 mroute

IP Multicast Routing Table

(*, ff0e:225:0:1::1), uptime 18:01:56
 Incoming interface: Null
 Outgoing interface list:
 Vlan 401
 Vlan 1001

(2001:120:3:1::11, ff0e:225:0:1::1), uptime 18:02:03
 Incoming interface: Vlan 401
 Outgoing interface list:
 Vlan 1001
```

```
(2001:130:3:1::11, ff0e:225:0:1::1), uptime 18:01:17
 Incoming interface: Vlan 1001
 Outgoing interface list:
 Vlan 401

(2001:140:3:1::11, ff0e:225:0:1::1), uptime 18:01:13
 Incoming interface: Vlan 1001
 Outgoing interface list:
 Vlan 401

Dell#
```

## show ipv6 multicast-cam

Display the content addressable memory (CAM) size and the portions allocated for IP multicast traffic.

**Syntax** `show ipv6 multicast-cam [linecard slot-id | port-set port-pipe | stack-unit unit-id]`

**Parameters**

- linecard *slot-id*** Enter the keyword `linecard` with a slot id to select the line card for which to gather information. The range of slot IDs is from 0 to 2.
- port-set *port-pipe*** Enter the keyword `port-set` with a port-pipe number to select the port pipe for which to gather information. The range of port pipes is from 0 to 3.
- stack-unit *unit-id*** Enter the keyword `stack-unit` with a unit-id number to select the stack unit for which to gather information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**9.11.3.0** Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.

### Example

```
Dell# show ipv6 multicast-cam stack-unit 1 port-set 0

Group Address : ff0e::228:1:1
Source Address : 400::2
VRF : 1
VlanId : 4095
IPMC : 609
L2 Ports : -
L3 Ports : Te 0/10
```

## show ipv6 rpf

View reverse path forwarding.

**Syntax** `show ipv6 rpf`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

#### Usage Information

Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

 **NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

#### Example

# Multicast Listener Discovery Protocol

The Multicast Listener Discovery (MLD) protocol is used by IPv6 routers to discover multicast listeners on a directly attached link.

Similar to the Internet Group Management Protocol (IGMP), which handles multicast group memberships in IPv4 networks, MLD is used for multicast management on IPv6 networks.

## Topics:

- [clear ipv6 mld groups](#)
- [debug ipv6 mld](#)
- [ipv6 mld explicit-tracking](#)
- [ipv6 mld last-member-query-interval](#)
- [ipv6 mld query-interval](#)
- [ipv6 mld query-max-resp-time](#)
- [ipv6 mld version](#)
- [show ipv6 mld groups](#)
- [show ipv6 mld interface](#)
- [MLD Snooping](#)

## clear ipv6 mld groups

Clear entries from the group cache table.

|                        |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# debug ipv6 mld

Enable debugging on IPv6 MLD packets.

**Syntax** `debug ipv6 mld [vrf vrf-name] {group-address | interface}`  
To turn off debugging, use the `no debug ipv6 mld {group-address | interface}` command.

**Parameters**

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF.

**group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x:x` format. The `::` notation specifies successive hexadecimal fields of zero.

**interface** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |

| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

# ipv6 mld explicit-tracking

Enable MLD explicit tracking receivers.

**Syntax** `ipv6 mld explicit-tracking`  
To disable explicit tracking, use the `no ipv6 mld explicit-tracking` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

# ipv6 mld last-member-query-interval

Change the MAX Response Time inserted into the Group-Specific Queries sent in response to a Leave Group messages. This interval is also the interval between Group-Specific Query messages.

**Syntax** `ipv6 mld last-member-query-interval {milliseconds}`

To return to the default, use the `no ipv6 mld last-member-query-interval {milliseconds}` command.

|                        |                                                                                                                                                               |                                                                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>milliseconds</i></b>                                                                                                                                    | Enter the last member query interval in milliseconds. The range is from 100 to 65535.                      |
| <b>Defaults</b>        | 1000 milliseconds.                                                                                                                                            |                                                                                                            |

|                        | <b>9.11(3.0)</b>                                                                                                                                              | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld query-interval

Change the transmission frequency of the MLD host.

|                        |                                                                                                                                                               |                                                                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 mld query-interval [<i>seconds</i>]</code><br>To return to the default interval, use the <code>no ipv6 mld query-interval</code> command.          |                                                                                                            |
| <b>Parameters</b>      | <b><i>seconds</i></b>                                                                                                                                         | Enter the interval in seconds. The range is from 1 to 18000.                                               |
| <b>Defaults</b>        | 60 seconds.                                                                                                                                                   |                                                                                                            |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                            |
|                        | <b>Version</b>                                                                                                                                                | <b>Description</b>                                                                                         |
|                        | <b>9.11(3.0)</b>                                                                                                                                              | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld query-max-resp-time

Set the maximum query response time advertised in the general queries.

|                        |                                                                                                                                                               |                                                                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 mld query-max-resp-time {<i>seconds</i>}</code><br>To return to the default, use the <code>no ipv6 mld query-max-resp-time</code> command.         |                                                                                                            |
| <b>Parameters</b>      | <b><i>seconds</i></b>                                                                                                                                         | Enter the interval in seconds. The range is from 1 to 25.                                                  |
| <b>Defaults</b>        | 10 seconds.                                                                                                                                                   |                                                                                                            |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                            |
|                        | <b>Version</b>                                                                                                                                                | <b>Description</b>                                                                                         |
|                        | <b>9.11(3.0)</b>                                                                                                                                              | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

# ipv6 mld version

Configure the MLD version on the system.

**Syntax** `ipv6 mld version {1 | 2}`

**Defaults** MLD version 2

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

**Usage Information** The `ipv6 mld version` command is applicable for MLD snooping-enabled interfaces.

**Example** The following is a sample configuration wherein MLD version 1 is selected on the system.

```
interface Vlan 61
 ip vrf forwarding red
 ipv6 address 61::9/64
 ipv6 ospf 2 area 0
 untagged TenGigabitEthernet 2/18
 ipv6 pim sparse-mode
 ipv6 mld version 1
 no shutdown
```

## show ipv6 mld groups

View the configured MDL groups.

**Syntax** `show ipv6 mld [vrf vrf-name] groups [detail] [group-address] [interface interface [detail]]`

**Parameters**

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>        | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF.                                                                                                                                                                                                                                                                                                                                                          |
| <b>group-address</b>       | Enter the group address for which you want to display information.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>interface interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a VLAN, enter the keyword <code>vlan</code> followed by a number from 1 to 4094.</li></ul> |
| <b>detail</b>              | View detailed group information.                                                                                                                                                                                                                                                                                                                                                                                                        |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## Example

```
Dell#show ipv6 mld groups
Total Number of Groups: 1
MLD Connected Group Membership
Group Address Interface Mode Uptime Expires Last
Reporter
Ff08::12 Vlan 10 MLDv2 00:00:12 00:02:05 1::2
```

# show ipv6 mld interface

View the configured MLD interfaces.

## Syntax

```
show ipv6 mld [vrf vrf-name] interface [interface]
```

## Parameters

- vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF.
- interface**  
**interface** Enter the following keywords and slot/port or number information:
- For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## Example

```
Dell#show ipv6 mld interface vlan 20
Vlan 20 is up, line protocol is up
Inbound MLD access group is not set
Internet address is fe80::92b1:1cff:fef4:9b63/64
MLD is enabled on interface
MLD query interval is 60 seconds
MLD querier timeout is 125 seconds
MLD max query response time is 10 seconds
MLD last member query response interval is 1000 ms
MLD immediate-leave is enabled for all groups
MLD activity: 0 joins
MLD querying router is 35::1 (this system)
MLD version is 2
```

# MLD Snooping

MLD snooping allows the switch to examine the MLD packets and forwards the decision based on their content. You can configure MLD snooping in subnets that receive MLD queries from either MLD or the MLD snooping querier. MLD snooping limits the IPv6 multicast traffic at Layer 2 by configuring Layer 2 LAN ports and dynamically forwards the IPv6 multicast traffic to the ports that want to receive it. Hosts join IPv6 multicast groups either by sending an unsolicited MLD report or by sending an MLD report in response to a general query from an IPv6 multicast router (the switch forwards general queries from IPv6 multicast routers to all the ports in a VLAN). The switch snoops these reports and in response to a snooped MLD report, the switch creates an entry in its forwarding table for the VLAN on which the report was received. When the other hosts that are interested in this multicast traffic send MLD reports, the switch snoops their report and adds them to the existing forwarding table entry. The switch creates only one entry per VLAN in the forwarding table for each multicast group, for which it snoops an MLD report.

## clear ipv6 mld snooping groups

Clear entries from the group cache table.

|                        |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## ipv6 mld snooping

Enable MLD snooping on a VLAN.

**Syntax** `ipv6 mld snooping`

To disable MLD snooping, use the `no ipv6 mld snooping` command.

**Defaults** Enabled on all VLAN interfaces.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## ipv6 mld snooping enable

Enable MLD snooping on the switch globally.

**Syntax** `ipv6 mld snooping enable`

To disable MLD snooping, use the `no ipv6 mld snooping enable` command.

**Defaults** Enabled on all VLAN interfaces.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## ipv6 mld snooping explicit-tracking

Enable explicit MLD snooping tracking on an interface.

**Syntax** `ipv6 mld snooping explicit-tracking`

To disable MLD snooping explicit tracking, use the `no ipv6 mld snooping explicit-tracking` command.

**Defaults** Disabled.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b> | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

#### Example

```
DellEMC#show ipv6 mld snooping interface vlan 10
Vlan 10 is up, line protocol is up
 Interface address is fe80::3617:ebff:fe30:2482/64
 MLD protocol processing disabled
 Current MLD snooping version is 2
 MLD snooping is enabled on this interface
 MLD snooping querier is disabled and is currently inactive
 MLD snooping last member query response interval is 1000 ms
 MLD snooping explicit tracking is disabled
```

## show ipv6 mld snooping mrouter

Display information on the MLD snooping router.

**Syntax**                show ipv6 mld snooping mrouter [vlan]

**Parameters**            **VLAN**                    (OPTIONAL) Enter the keyword VLAN then the VLAN number to display the information on that specific VLAN. The VLAN range is from 1 to 4094.

**Defaults**                None.

**Command Modes**        EXEC  
                              EXEC Privilege

**Command History**        This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b> | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

#### Example

```
Dell#show ipv6 mld snooping mrouter
Interface Ports (* - Dynamic)
Vlan 2 Gi 1/18
Dell#
```

# Multicast Source Discovery Protocol (MSDP)

Multicast source discovery protocol (MSDP) connects multiple PIM Sparse-Mode (PIM-SM) domains together.

MSDP peers connect using TCP port 639. Peers send keepalives every 60 seconds. A peer connection is reset after 75 seconds if no MSDP packets are received. MSDP connections are parallel with MBGP connections.

## Topics:

For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |                                                                                                                                                                                                                                             |

| Version  | Description                                |
|----------|--------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                   |
| 9.5(0.1) | Introduced on the Z9500.                   |
| 8.3.19.0 | Introduced on the S4820T.                  |
| 8.3.11.1 | Introduced on the Z9000.                   |
| 8.3.7.1  | Introduced on the S4810.                   |
| 7.8.1.0  | Added the <code>local</code> option.       |
| 7.7.1.0  | Added the <code>rejected-sa</code> option. |
| 6.2.1.1  | Introduced                                 |

## clear ip msdp statistic

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

### C9000 Series

|               |                                                                           |
|---------------|---------------------------------------------------------------------------|
| <b>Syntax</b> | <code>clear ip msdp sa-cache [group-address   rejected-sa   local]</code> |
|---------------|---------------------------------------------------------------------------|

| <b>Parameters</b>      | <b><i>group-address</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enter the group IP address in dotted decimal format (A.B.C.D.).                                                                                                                                                                            |                |                    |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                      |                |                                            |                |            |

## ip msdp default-peer

Define a default peer from which to accept all source-active (SA) messages.

### C9000 Series

|               |                                                            |
|---------------|------------------------------------------------------------|
| <b>Syntax</b> | <code>ip msdp default-peer peer address [list name]</code> |
|---------------|------------------------------------------------------------|

To remove the default peer, use the `no ip msdp default-peer {peer address} list name` command.

| <b>Parameters</b>        | <b><i>peer address</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Enter the peer address in a dotted decimal format (A.B.C.D.)                                                                                                                                                                   |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                                                                     |                |            |

| 8.3.19.0          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |
| 8.3.11.1          | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |
| 8.3.7.0           | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |
| 6.2.1.1           | Introduced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |
| Usage Information | <p>An MSDP mesh group is a mechanism for reducing SA flooding, typically in an intra-domain setting. When some subset of a domain's MSDP speakers are fully meshed, they can be configured into a mesh-group. If member X of a mesh-group receives a SA message from an MSDP peer that is also a member of the mesh-group, member X accepts the SA message and forwards it to all of its peers that are not part of the mesh-group. However, member X cannot forward the SA message to other members of the mesh-group.</p>                                                                                                                                                     |  |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |            |

## ip msdp originator-id

Configure the MSDP Originator ID.

### C9000 Series

|                   |                                                                                                                                                     |  |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Syntax</b>     | <pre>ip msdp originator-id {interface}</pre> <p>To remove the originator-id, use the <code>no ip msdp originator-id {interface}</code> command.</p> |  |
| <b>Parameters</b> | <p><b>interface</b> Enter the following keywords and slot/port or number information:</p>                                                           |  |

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 4096.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                          |
|-----------------|------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                             |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                             |
| <b>8.3.19.0</b> | Introduced on the S4820T.                            |
| <b>8.3.11.1</b> | Introduced on the Z9000.                             |
| <b>8.3.7.0</b>  | Introduced on the S4810.                             |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale. |
| <b>6.2.1.1</b>  | Introduced                                           |

## ip msdp peer

Configure an MSDP peer.

### C9000 Series

**Syntax** `ip msdp peer peer address [connect-source] [description] [sa-limit number]`  
 To remove the MSDP peer, use the `no ip msdp peer peer address [connect-source interface] [description name] [sa-limit number]` command.

**Parameters**

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>peer address</i></b>             | Enter the peer address in a dotted decimal format (A.B.C.D.).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>connect-source interface</i></b> | Enter the keywords <code>connect-source</code> then one of the interfaces and slot/port or number information: <ul style="list-style-type: none"> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 4096.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

***description name*** (OPTIONAL) Enter the keyword *description* then a description name (maximum 80 characters) to designate a description for the MSDP peer.

***sa-limit number*** (OPTIONAL) Enter the maximum number of SA entries in SA-cache. The range is from 1 to 500000. The default is **500000**.

**Defaults** As described in the *Parameters* section.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                           |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                           |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale.               |
| <b>7.5.1.0</b>  | Added option for SA upper limit and the <i>description</i> option. |
| <b>6.2.1.1</b>  | Introduced                                                         |

**Usage Information** The `connect-source` option is used to supply a source IP address for the TCP connection. When an interface is specified using the `connect-source` option, the primary configured address on the interface is used.

If the total number of SA messages received from the peer is already larger than the limit when this command is applied, those SA messages continue to be accepted. To enforce the limit in such situation, use the `clear ip msdp peer` command to reset the peer.

**Related Commands**

- [ip msdp sa-limit](#) — configures the MSDP SA Limit.
- [clear ip msdp peer](#) — clears the MSDP peer.
- [show ip msdp](#) — displays the MSDP information.

## ip msdp redistribute

Filter local PIM SA entries in the SA cache. SAs which the ACL denies time out and are not refreshed. Until they time out, they continue to reside in the MSDP SA cache.

### C9000 Series

**Syntax** `ip msdp redistribute [list acl-name]`

**Parameters** ***list acl-name*** Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>7.8.1.0</b>  | Introduced                |

#### Usage Information

Modifications to the ACL do not have an immediate effect on the sa-cache.

To apply the redistribute filter to entries already present in the SA cache, use the `clear ip msdp sa-cache local` command.

## ip msdp sa-filter

Permit or deny MSDP source active (SA) messages based on multicast source and/or group from the specified peer.

### C9000 Series

| <b>Usage Information</b> | <p>The system counts the SA messages originated by itself and those messages received from the MSDP peers. When the total SA messages reach this limit, the subsequent SA messages are dropped (even if they pass RPF checking and policy checking).</p> <p>If the total number of SA messages is already larger than the limit when this command is applied, those SA messages that are already in the system continue to be accepted. To enforce the limit in such situation, use the <code>clear ip msdp sa-cache</code> command.</p>                                                                                                                                                                                                   |                                                                                   |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |

|                      |                                                     |                                                               |
|----------------------|-----------------------------------------------------|---------------------------------------------------------------|
| <b>Syntax</b>        | <code>ip msdp shutdown {<i>peer address</i>}</code> |                                                               |
| <b>Parameters</b>    | <b><i>peer address</i></b>                          | Enter the peer address in a dotted decimal format (A.B.C.D.). |
| <b>Defaults</b>      | Not configured.                                     |                                                               |
| <b>Command Modes</b> | CONFIGURATION                                       |                                                               |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |
| 6.2.1.1  | Introduced                |

# ip multicast-msdp

Enable MSDP.

## C9000 Series

### Syntax

`ip multicast-msdp`

To exit MSDP, use the `no ip multicast-msdp` command.

### Defaults

Not configured.

### Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |
| 6.2.1.1  | Introduced                |

# show ip msdp

Display the MSDP peer status, SA cache, or peer summary.

## C9000 Series

### Syntax

`show ip msdp {peer peer address | sa-cache | summary}`

### Parameters

|                                 |                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------|
| <b>peer <i>peer address</i></b> | Enter the keyword <code>peer</code> then the peer address in a dotted decimal format (A.B.C.D.). |
|---------------------------------|--------------------------------------------------------------------------------------------------|

**sa-cache** Enter the keywords `sa-cache` to display the Source-Active cache.

**summary** Enter the keyword `summary` to display an MSDP peer summary.

**Defaults** Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.5(0.1)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>6.2.1.1</b>  | Introduced                |

#### Example

```
Dell#show ip msdp peer 100.1.1.1

Peer Addr: 100.1.1.1
 Local Addr: 100.1.1.2(639) Connect Source: none
 State: Established Up/Down Time: 00:00:08
 Timers: KeepAlive 60 sec, Hold time 75 sec
 SourceActive packet count (in/out): 0/0
 SAs learned from this peer: 0
 SA Filtering:
 Input (S,G) filter: none
 Output (S,G) filter: none

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                             |
| 9.2(1.0) | Introduced on the Z9500.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.2.1.1  | Introduced on the E-Series.                          |

## Example

```
Dell#debug spanning-tree mstp bpdu tengigabitethernet 2/0 ?
in Receive (in)
out Transmit (out)
```

# disable

Globally disable the multiple spanning tree protocol on the switch.

## C9000 Series

### Syntax

`disable`

To enable MSTP, enter the `no disable` command.

### Defaults

disabled.

### Command Modes

MULTIPLE SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

## Related Commands

[protocol spanning-tree mstp](#) — enters MULTIPLE SPANNING TREE mode.

# forward-delay

The amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

## C9000 Series

| <b>Syntax</b>           | <code>forward-delay <i>seconds</i></code><br>To return to the default setting, use the <code>no forward-delay</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |             |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

## Related Commands

[forward-delay](#) — the amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

[max-age](#) — changes the wait time before MSTP refreshes protocol configuration information.

# max-age

To maintain configuration information before refreshing that information, set the time interval for the MSTB.

## C9000 Series

### Syntax

`max-age seconds`

To return to the default values, use the `no max-age` command.

### Parameters

***max-age*** Enter a number of seconds the system waits before refreshing configuration information. The range is from 6 to 40. The default is **20 seconds**.

### Defaults

**20 seconds**

### Command Modes

MULTIPLE SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

## Related Commands

[forward-delay](#) — the amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

[hello-time](#) — changes the time interval between BPDUs.

# max-hops

Configure the maximum hop count.

## C9000 Series

### Syntax

`max-hops number`

To return to the default values, use the `no max-hops` command.

### Parameters

#### range

Enter a number for the maximum hop count. The range is from 1 to 40. The default is **20**.

### Defaults

**20 hops**

### Command Modes

MULTIPLE SPANNING TREE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.1</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.5.1.0</b>  | Introduced.                 |

### Usage Information

The `max-hops` command is a configuration command that applies to both the IST and all MST instances in the MSTP region. The BPDUs sent out by the root switch set the remaining-hops parameter to the configured value of max-hops. When a switch receives the BPDU, it decrements the received value of the remaining hops and uses the resulting value as remaining-hops in the BPDUs. If the remaining-hops reach zero, the switch discards the BPDU and ages out any information that it holds for the port.

# msti

Configure multiple spanning tree instance, bridge priority, and one or multiple VLANs mapped to the MST instance.

## C9000 Series

### Syntax

`msti instance {vlan range | bridge-priority priority}`

To disable mapping or bridge priority, use the `no msti instance {vlan range | bridge-priority priority}` command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.5.1.0</b>  | Introduced.                 |

**Usage Information**

For two MSTP switches to be within the same MSTP region, the switches must share the same region name (including matching case).

**Related Commands**

[msti](#) — maps the VLAN(s) to an MST instance.  
[revision](#) — assigns the revision number to the MST configuration.

## protocol spanning-tree mstp

To enable and configure the multiple spanning tree group, enter MULTIPLE SPANNING TREE mode.

### C9000 Series

**Syntax**

`protocol spanning-tree mstp`

To disable the multiple spanning tree group, use the `no protocol spanning-tree mstp` command.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Usage Information**

MSTP is not enabled when you enter MULTIPLE SPANNING TREE mode. To enable MSTP globally on the switch, enter the `no disable` command while in MULTIPLE SPANNING TREE mode.

For more information about the multiple spanning tree protocol, refer to the *Dell Networking OS Configuration Guide*.

**Example**

```
Dell(conf)#protocol spanning-tree mstp
Dell(config-mstp)#no disable
```

**Related Commands**      [disable](#) — disables multiple spanning tree.

## revision

The revision number for the multiple spanning tree configuration.

### C9000 Series

| <b>Syntax</b>            | <code>revision range</code><br>To return to the default values, use the <code>no revision</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

| <b>6.2.1.1</b>           | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| <b>Usage Information</b> | For two MSTP switches to be within the same MST region, the switches must share the same revision number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| <b>Related Commands</b>  | <a href="#">msti</a> — maps the VLAN(s) to an MST instance.<br><a href="#">name</a> — assigns the region name to the MST region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## show config

View the current configuration for the mode. Only non-default values are shown.

### C9000 Series

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show config</code>                                                                                                                                             |
| <b>Command Modes</b>   | MULTIPLE SPANNING TREE                                                                                                                                               |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced on the E-Series. |

#### Example

```
Dell(conf-mstp)#show config
!
protocol spanning-tree mstp
 no disable
 name CustomerSvc
 revision 2
 MSTI 10 VLAN 101-105
 max-hops 5
Dell(conf-mstp)#
```

## show spanning-tree mst configuration

View the multiple spanning tree configuration.

### C9000 Series

**Syntax**                show spanning-tree mst configuration

**Command Modes**      • EXEC  
                         • EXEC Privilege

**Command History**     This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information**    Enable the multiple spanning tree protocol prior to using this command.

## Example

```
Dell#show spanning-tree mst configuration
MST region name: CustomerSvc
Revision: 2
MSTI VID
 10 101-105
Dell#
```

# show spanning-tree msti

View the multiple spanning tree instance.

## C9000 Series

### Syntax

```
show spanning-tree msti [instance-number [brief]] [guard]
```

### Parameters

- |                               |                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b><i>instance-number</i></b> | (Optional) Enter the multiple spanning tree instance number. The range is from 0 to 63.                                         |
| <b><i>brief</i></b>           | (Optional) Enter the keyword <i>brief</i> to view a synopsis of the MST instance.                                               |
| <b><i>guard</i></b>           | (Optional) Enter the keyword <i>guard</i> to display the type of guard enabled on an MSTP interface and the current port state. |

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                                   |
| 9.2(1.0) | Introduced on the Z9500.                                                                                   |
| 8.3.19.0 | Introduced on the S4820T.                                                                                  |
| 8.3.11.1 | Introduced on the Z9000.                                                                                   |
| 8.4.2.1  | Support for the optional keyword <i>guard</i> was added on the C-Series, S-Series, and E-Series TeraScale. |
| 8.3.7.0  | Introduced on the S4810.                                                                                   |
| 7.6.1.0  | Introduced on the S-Series.                                                                                |
| 7.5.1.0  | Introduced on the C-Series.                                                                                |
| 6.4.1.0  | Expanded to display the port error disable state (EDS) loopback BPDU inconsistency causes.                 |

### Usage Information

Enable the multiple spanning tree protocol prior to using this command.

### Example

```
Dell#show spanning-tree msti 10
MSTI 10 VLANs mapped 101-105

Bridge Identifier has priority 32768, Address 0001.e802.3506
Configured hello time 2, max age 20, forward delay 15, max hops 5
Current root has priority 16384, Address 0001.e800.0a5c
Number of topology changes 0, last change occurred 3058087
```

```
Port 82 (TenGigabitEthernet 2/0) is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.82
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.82, designated path cost
Number of transitions to forwarding state 1
BPDU (Mrecords): sent 1109, received 0
The port is not in the portfast mode
```

```
Port 88 (TenGigabitEthernet 2/6) is root Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.88
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.88, designated path cost
Number of transitions to forwarding state 4
BPDU (Mrecords): sent 19, received 1103
The port is not in the portfast mode
```

```
Port 89 (TenGigabitEthernet 2/7) is alternate Discarding
Port path cost 0, Port priority 128, Port Identifier 128.89
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.89, designated path cost
Number of transitions to forwarding state 3
BPDU (Mrecords): sent 7, received 1103
The port is not in the portfast mode
```

#### Example (EDS and LBK)

The bold line shows the loopback BPDU inconsistency (LBK\_INC).

```
Dell#show spanning-tree msti 0 brief
MSTI 0 VLANs mapped 1-4094
```

```
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max hops 20
Bridge ID Priority 32768, Address 0001.e801.6aa8
We are the root of MSTI 0 (CIST)
Configured hello time 2, max age 20, forward delay 15, max hops 20
CIST regional root ID Priority 32768, Address 0001.e801.6aa8
CIST external path cost 0
```

| Interface Name | PortID  | Prio | Cost  | Sts | Cost | Designated Bridge ID | PortID  |
|----------------|---------|------|-------|-----|------|----------------------|---------|
| Te 0/0         | 128.257 | 128  | 20000 | EDS | 0    | 32768 0001.e801.6aa8 | 128.257 |

| Interface Name | Role   | PortID  | Prio | Cost  | Sts | Cost | Link-type | Edge | Boundary |
|----------------|--------|---------|------|-------|-----|------|-----------|------|----------|
| Te 0/0         | ErrDis | 128.257 | 128  | 20000 | EDS | 0    | P2P       | No   | No       |

```
Dell#show spanning-tree msti 0
MSTI 0 VLANs mapped 1-4094
```

```
Root Identifier has priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max hops 20
Bridge Identifier has priority 32768, Address 0001.e801.6aa8
Configured hello time 2, max age 20, forward delay 15, max hops 20
We are the root of MSTI 0 (CIST)
Current root has priority 32768, Address 0001.e801.6aa8
CIST regional root ID Priority 32768, Address 0001.e801.6aa8
CIST external path cost 0
Number of topology changes 1, last change occurred 00:00:15 ago on Te 0/0
```

#### **Port 257 (TenGigabitEthernet 0/0) is LBK\_INC Discarding**

```
Port path cost 20000, Port priority 128, Port Identifier 128.257
Designated root has priority 32768, address 0001.e801.6aa8
Designated bridge has priority 32768, address 0001.e801.6aa8
Designated port id is 128.257, designated path cost 0
Number of transitions to forwarding state 1
```

```
BPDU (MRecords): sent 21, received 9
The port is not in the Edge port mode
```

#### Usage Information

The following describes the `show spanning-tree msti 5 guard` command shown in the following example.

| Field          | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| Interface Name | MSTP interface.                                                                                                         |
| Instance       | MSTP instance.                                                                                                          |
| Sts            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| Guard Type     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

#### Example (Guard)

```
Dell#show spanning-tree msti 5 guard
Interface
Name Instance Sts Guard type

Te 0/1 5 INCON (Root) Rootguard
Te 0/2 5 FWD Loopguard
Te 0/3 5 EDS (Shut) Bpduguard
```

## spanning-tree

Enable the multiple spanning tree protocol on the interface.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |

| <b>6.2.1.0</b>  | Introduced on the E-Series. |

# spanning-tree msti

Configure multiple spanning tree instance cost and priority for an interface.

## C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>spanning-tree msti <i>instance</i> {cost <i>cost</i>   priority <i>priority</i>}</code>                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>      | <b>msti <i>instance</i></b>                                                                                                                                                                                                                               | Enter the keyword <code>msti</code> and the MST instance number. The range is from zero (0) to 63.                                                                                                                                                                                                                                                              |
|                        | <b>cost <i>cost</i></b>                                                                                                                                                                                                                                   | (OPTIONAL) Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000. The defaults are: <ul style="list-style-type: none"><li>10-Gigabit Ethernet interface = <b>2000</b></li><li>Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b></li><li>Port Channel with two 10 Gigabit Ethernet = <b>1800</b></li></ul> |
|                        | <b>priority <i>priority</i></b>                                                                                                                                                                                                                           | Enter keyword <code>priority</code> then a value in increments of 16 as the priority. The range is from 0 to 240. The default is <b>128</b> .                                                                                                                                                                                                                   |
|                        |                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Defaults</b>        | <ul style="list-style-type: none"><li>cost = depends on the interface type</li><li>priority = <b>128</b></li></ul>                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                 |

# spanning-tree mstp edge-port

Configures the interface as an MST edge port and optionally a Bridge Protocol Data Unit (BPDU) guard.

## C9000 Series

|                   |                                                                               |                                                                                                                                                |
|-------------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>spanning-tree mstp edge-port [bpduguard [shutdown-on-violation]]</code> |                                                                                                                                                |
| <b>Parameters</b> | <b>mstp edge-port</b>                                                         | Enter the keyword <code>mstp</code> then the keywords <code>edge-port</code> to configure the interface as a Multiple Spanning Tree edge port. |

|                             |                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bpduguard</b>            | (OPTIONAL) Enter the keyword <code>portfast</code> to enable Portfast to move the interface into forwarding mode immediately after the root fails. Enter the keyword <code>bpduguard</code> to disable the port when it receives a BPDU. |
| <b>shutdown-onviolation</b> | (OPTIONAL) Enter the keywords <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                                      |

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                           |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                           |
| <b>8.3.7.1</b>  | Introduced on the S4810.                                           |
| <b>8.2.1.0</b>  | Introduced the hardware <code>shutdown-on-violation</code> option. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                        |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                        |
| <b>6.5.1.0</b>  | Introduced on the E-Series.                                        |

**Usage Information** On an MSTP switch, a port configured as an edge port immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with spanning-tree portfast enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

## tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

### C9000 Series

**Syntax** `tc-flush-standard`  
To disable, use the `no tc-flush-standard` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |

| Version        | Description                 |
|----------------|-----------------------------|
| <b>8.3.7.0</b> | Introduced on the S4810.    |
| <b>7.6.1.0</b> | Introduced on the S-Series. |
| <b>7.5.1.0</b> | Introduced on the C-Series. |
| <b>6.5.1.0</b> | Introduced                  |

**Usage  
Information**

By default, the system implements an optimized flush mechanism for MSTP. This mechanism helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, this `knob` command can be turned on to enable flushing MAC addresses after receiving every topology change notification.

# Neighbor Discovery Protocol (NDP)

The neighbor discovery protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. NDP defines mechanisms for solving the following problems:

- Router discovery: Hosts can locate routers residing on a link
- Prefix discovery: Hosts can discover address prefixes for the link
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination
- Neighbor unreachability detection (NUD): Determine that a neighbor is no longer reachable on the link.
- Duplicate address detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

NDP uses the following five ICMPv6 packet types in its implementation:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

## Topics:

- `debug ipv6 nd ra-guard`
- `device-role`
- `hop-limit`
- `ipv6 nd ra-guard attach-policy`
- `ipv6 nd ra-guard enable`
- `ipv6 nd ra-guard policy`
- `managed-config-flag`
- `match ra`
- `mtu`
- `other-config-flag`
- `reachable-time`
- `retrans-time`
- `router-lifetime`
- `router-preference maximum`
- `show config`
- `show ipv6 nd ra-guard policy`
- `trusted-port`

## debug ipv6 nd ra-guard

Enable debugging for IPv6 RA guard snooping information.

**Syntax** `debug ipv6 nd ra-guard [interface_type slot/port | count value]`

**Parameters**

|                                                         |                                                                                                                                                                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface_type</i></b><br><b><i>slot/port</i></b> | Enter the one of the following interfaces and slot/port information: <ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul> |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**count value** Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534. The default is infinity.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version           | Description                                                                  |
|-------------------|------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>  | Introduced on the C9010.                                                     |
| <b>9.9(0.0)</b>   | Introduced on the Z9500.                                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

## device-role

Specify the role of the device attached to the port.

**Syntax** `device-role {host | router}`  
To reset the device role, use the `no device-role {host | router}` command.

**Parameters**

|               |                                                                         |
|---------------|-------------------------------------------------------------------------|
| <b>host</b>   | Enter the keyword <code>host</code> to set the device-role as host.     |
| <b>router</b> | Enter the keyword <code>router</code> to set the device-role as router. |

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version           | Description                                                                  |
|-------------------|------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>  | Introduced on the C9010.                                                     |
| <b>9.9(0.0)</b>   | Introduced on the Z9500.                                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.
- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.

# hop-limit

Enable the verification of the advertised hop count limit. If this command is not configured, the verification process is bypassed.

**Syntax** `hop-limit {maximum | minimum limit}`

To reset the hop count limit, use the `no hop-limit {maximum | minimum limit}` command.

**Parameters**

|                             |                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------|
| <b>maximum <i>limit</i></b> | Enter the keyword <code>maximum</code> then the hop limit value. The range is from 0 to 254. |
| <b>minimum <i>limit</i></b> | Enter the keyword <code>minimum</code> then the hop limit value. The range is from 0 to 254. |

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.

# ipv6 nd ra-guard attach-policy

Apply the IPv6 RA guard to a specific interface.

**Syntax** `ipv6 nd ra-guard attach-policy policy-name [vlan [vlan 1, vlan 2, vlan 3.....]]`

**Parameters**

|                                           |                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>policy <i>policy-name</i></b>          | Enter the keyword <code>policy</code> then the policy name. The policy-name allows a maximum of <b>140</b> characters. |
| <b>vlan [vlan 1, vlan 2, vlan 3.....]</b> | Enter the keyword <code>vlan</code> then the VLAN range. The VLAN range is from 1 to 4094.                             |

**Defaults** None

**Command Modes** INTERFACE

## mtu

Enable the verification of the configured maximum transmission unit (MTU) value in the received RA packets.

**Syntax** `mtu value`

To reset the MTU value, use the `no mtu value` command.

**Parameters**

***value*** Enter the maximum transmission unit value in bytes. The range is from 1,280 to 11,982 bytes.

**Defaults** 0

## router-preference maximum

Enable the verification of the advertised default router preference (DRP) value. The preference value is lower than or equal to the specified limit. If this command is not configured, the verification process is bypassed.

# show config

Display the RA guard policy mode configurations.

**Syntax** `show config`

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

## Example

```
Dell(conf)# ipv6 nd ra-guard policy test
Dell(conf-ra_guard_policy_list)#show config
!
ipv6 nd ra-guard policy test
device-role router
hop-limit maximum 251
mtu 1350
other-config-flag on
reachable-time 540
retrans-timer 101
router-preference maximum medium
trusted-port
Dell(conf-ra_guard_policy_list)#
```

## Related Commands

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) — define the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) — specify the role of the device attached to the port.
- [hop-limit](#) — enable the verification of the advertised hop count limit.
- [mtu](#) — set the maximum transmission unit (MTU) value.
- [other-config-flag](#) — enable the verification of the advertised other configuration parameter.
- [reachable-time](#) — set the advertised reachability time.
- [retrans-timer](#) — set the advertised retransmission time.
- [router-preference maximum](#) — enable the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) — apply the policy to trusted ports.

# show ipv6 nd ra-guard policy

Display the configurations applied on all the RA guard policies or a specific RA guard policy.

**Syntax** `show ipv6 nd ra-guard policy policy-name`

|                        | <b>9.8(0.0P2)</b>                                                                                                                                         | Introduced on the S3048-ON.                                                                                            |
|                        | <b>9.7(0.0)</b>                                                                                                                                           | Introduced on the S4810, S4820T, S5000, S6000, Introduced on the S6000-ON, and Z9000 switches.                         |

#### Example

```
Dell# show ipv6 nd ra-guard policy test

ipv6 nd ra-guard policy test
 device-role router
 hop-limit maximum 1
 match ra ipv6-access-list access
 other-config-flag on
 router-preference maximum medium
 trusted-port
 Interfaces :
 Te 6/1
Dell#
```

#### Related Commands

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) — define the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) — specify the role of the device attached to the port.
- [hop-limit](#) — enable the verification of the advertised hop count limit.
- [mtu](#) — set the maximum transmission unit (MTU) value.
- [other-config-flag](#) — enable the verification of the advertised other configuration parameter.
- [reachable-time](#) — set the advertised reachability time.
- [retrans-timer](#) — set the advertised retransmission time.
- [router-preference maximum](#) — enable the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) — apply the policy to trusted ports.
- [ipv6 nd raguard attach-policy](#) — apply the IPv6 RA guard to a specific interface.

## trusted-port

Allow bypassing the configured RA guard validation and forwards the RA packets received on the interface, which has the trusted port policy attached.

#### Syntax

`trusted-port`

To reset the policy applied to the trusted port, use the `no trusted-port` command.

| <b>Defaults</b>          | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                  |                          |                 |                          |                 |                             |                   |                             |                   |                             |                 |                                                                              |

# Object Tracking

Object Tracking supports IPv4 and IPv6 protocols.

Object tracking allows you to define objects of interest, monitor their state, and report to a client when a change in an object's state occurs. The following tracked objects are supported:

- Link status of Layer 2 interfaces
- Routing status of Layer 3 interfaces (IPv4 and IPv6)
- Reachability of IPv4 and IPv6 routes
- Metric thresholds of IPv4 and IPv6 routes

You can configure client applications, such virtual router redundancy protocol (VRRP), to receive a notification when the state of a tracked object changes.

This chapter contains the following sections:

- [IPv4 Object Tracking Commands](#)
- [IPv6 Object Tracking Commands](#)

## Topics:

- [IPv4 Object Tracking Commands](#)
- [IPv6 Object Tracking Commands](#)

## IPv4 Object Tracking Commands

The following section describes the IPv4 object tracking commands.

### debug track

Enable debugging for tracked objects.

### C9000 Series

| <b>Syntax</b>          | <code>debug track [all   notifications   <i>object-id</i>]</code>                                                                                                                                                                                                                                                                                                                         |                                                                                                               |         |             |                 |                          |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|
| <b>Parameters</b>      | <b>all</b>                                                                                                                                                                                                                                                                                                                                                                                | Enables debugging on the state and notifications of all tracked objects.                                      |         |             |                 |                          |

| <b>9.9(0.0)</b>        | Introduced on the C9010.                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                               |         |             |                 |                          |

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

#### Example

```
Dell#debug track all

04:35:04: %RPM0-P:RP2 %OTM-5-STATE: track 6 - Interface
TenGigabitEthernet 1/2/1
line-protocol DOWN

04:35:04: %RPM0-P:RP2 %OTM-5-NOTIF: VRRP notification: resource ID 6 DOWN
```

## delay

Configure the time delay used before communicating a change in the status of a tracked object to clients.

### C9000 Series

**Syntax** `delay {[up seconds] [down seconds]}`

To return to the default setting, use the `no delay` command.

**Parameters** **seconds** Enter the number of seconds the object tracker waits before sending a notification about the change in the UP and/or DOWN state of a tracked object to clients. The range is 0 to 180. The default is **0 seconds**.

**Defaults** **0 seconds**

**Command Modes** OBJECT TRACKING (*conf\_track\_object-id*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

#### Usage Information

To set the time delay before a change in the state of a tracked object is communicated to clients configure an UP and/or DOWN timer for each tracked object. The configured time delay starts when the state changes from UP to DOWN or vice-versa.

If the state of an object changes back to its former UP/DOWN state before the timer expires, the timer is cancelled and the client is not notified. For example, if the DOWN timer is running when an interface goes down and comes back up, the DOWN timer is cancelled and the client is not notified of the event.

If the timer expires and an object's state has changed, a notification is sent to the client. If you do not configure a delay timer, a notification is sent immediately after a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

**Related Commands**

- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

description

Enter a description of a tracked object.

C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>description {text}</code><br>To remove the description, use the <code>no description {text}</code> command.                                              |
| <b>Parameters</b>      | <b>text</b> Enter a description to identify a tracked object (80 characters maximum).                                                                          |
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | OBJECT TRACKING ( <i>conf_track_object-id</i> )                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

show running-config track

Display the current configuration of tracked objects.

C9000 Series

|                      |                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show running-config track [object-id]</code>                                                      |
| <b>Parameters</b>    | <b>object-id</b> (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500. |
| <b>Command Modes</b> | EXEC Privilege                                                                                          |

## Command History

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 8.3.12.0 | Introduced on the S4810.                 |
| 8.4.1.0  | Introduced.                              |

## Example

```
Dell#show running-config track

track 1 ip route 23.0.0.0/8 reachability

track 2 ipv6 route 2040::/64 metric threshold
delay down 3
delay up 5
threshold metric up 200

track 3 ipv6 route 2050::/64 reachability

track 4 interface TenGigabitEthernet 1/2/1 ip routing

track 5 ip route 192.168.0.0/24 reachability vrf red

track resolution ip route isis 20
track resolution ip route ospf 10
```

## Example (Object-id)

```
Dell#show running-config track 300

track 300 ip route 10.0.0.0/8 metric threshold
delay down 3
delay up 5
threshold metric up 100
```

## Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

# show track

Display information about tracked objects, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

## C9000 Series

### Syntax

```
show track [object-id [brief] | interface [brief] [vrf vrf-name] | ip route [brief] [vrf vrf-name] | resolution | vrf vrf-name [brief] | brief]
```

### Parameters

|                         |                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------|
| <b><i>object-id</i></b> | (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500. |
| <b><i>interface</i></b> | (OPTIONAL) Display information on all tracked interfaces (Layer 2 and IPv4 Layer 3).   |

|                            |                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip route</b>            | (OPTIONAL) Display information on all tracked IPv4 routes.                                                                                                                                                                                         |
| <b>resolution</b>          | (OPTIONAL) Display information on the configured resolution values used to scale protocol-specific route metrics. The range is 0 to 255.                                                                                                           |
| <b>brief</b>               | (OPTIONAL) Display a single line summary of the tracking information for a specified object, object type, or all tracked objects.                                                                                                                  |
| <b>vrf <i>vrf-name</i></b> | (OPTIONAL) E-Series only: Display information on only the tracked objects that are members of the specified VRF instance. The maximum is 32 characters. If you do not enter a VRF name, information on the tracked objects from all VRFs displays. |

**Command Modes** EXEC Privilege

| Command History | Version         | Description                              |
|-----------------|-----------------|------------------------------------------|
|                 | <b>9.9(0.0)</b> | Introduced on the C9010.                 |
|                 | <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
|                 | <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
|                 | <b>8.3.12.0</b> | Introduced on the S4810.                 |
|                 | <b>8.4.1.0</b>  | Introduced.                              |

**Usage Information** The following describes the `show track` command shown in the Example below.

| Output                                                                                                                  | Description                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Track <i>object-id</i></b>                                                                                           | Displays the number of the tracked object.                                                                                            |
| <b>Interface <i>type slot/port</i>, IP <i>slot/port</i>, IP route <i>ip-address</i>, IPv6 route <i>ipv6-address</i></b> | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.                             |
| <b><i>object</i> is Up/Down</b>                                                                                         | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.                        |
| <b><i>number</i> changes, last change <i>time</i></b>                                                                   | Number of times that the state of the tracked object has changed and the time since the last change in <i>hours:minutes:seconds</i> . |
| <b>First hop interface</b>                                                                                              | Displays the type and slot/port number of the first-hop interface of the tracked route.                                               |
| <b>Tracked by</b>                                                                                                       | Client that is tracking an object's state; for example, VRRP.                                                                         |

The following describes the `show track brief` command shown in the Example below.

| Output             | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <b>ResID</b>       | Number of the tracked object.                                  |
| <b>Resource</b>    | Type of tracked object.                                        |
| <b>Parameter</b>   | Detailed description of the tracked object.                    |
| <b>State</b>       | Up or Down state of the tracked object.                        |
| <b>Last Change</b> | Time since the last change in the state of the tracked object. |

## Example

```
Dell#show track

Track 1
 IP route 23.0.0.0/8 reachability
 Reachability is Down (route not in route table)
 2 changes, last change 00:16:08
 Tracked by:

Track 2
```

```

IPv6 route 2040::/64 metric threshold
Metric threshold is Up (STATIC/0/0)
 5 changes, last change 00:02:16
Metric threshold down 255 up 254
First-hop interface is TenGigabitEthernet 1/2/1
Tracked by:
 VRRP TenGigabitEthernet 2/3/4 IPv6 VRID 1

Track 3
IPv6 route 2050::/64 reachability
Reachability is Up (STATIC)
 5 changes, last change 00:02:16
First-hop interface is TenGigabitEthernet 1/2/1
Tracked by:
 VRRP TenGigabitEthernet 2/3/4 IPv6 VRID 1

```

### Example (Brief)

```

Dell>show track brief
ResId Resource Parameter State LastChange
1 IP route reachability 10.16.0.0/16 Up 00:01:08
2 Interface line-protocol Ethernet0/2 Down 00:05:00
3 Interface ip routing VLAN100 Up 01:10:05

```

### Related Commands

- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.
- 

## threshold metric

Configure the metric threshold used to determine the UP and/or DOWN state of a tracked IPv4 or IPv6 route.

### C9000 Series

#### Syntax

```
threshold metric {up number | down number}
```

To return to the default setting, use the `no threshold metric {up number | down number}` command.

#### Parameters

- |                           |                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>up <i>number</i></b>   | Enter a number for the UP threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default UP threshold is <b>254</b> . The routing state is UP if the scaled route metric is less than or equal to the UP threshold.            |
| <b>down <i>number</i></b> | Enter a number for the DOWN threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default DOWN threshold is <b>255</b> . The routing state is DOWN if the scaled route metric is greater than or equal to the DOWN threshold. |

#### Defaults

none

#### Command Modes

OBJECT TRACKING (conf\_track\_object-id)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

## Usage Information

Determine the UP/DOWN state of a tracked route by the threshold for the current value of the route metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value.

The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

Configure the UP and DOWN thresholds for each tracked route with the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

The tracking process uses a protocol-specific resolution value to convert the actual metric in the routing table to a scaled metric in the range 0 to 255. You can configure the resolution value used to scale route metrics for supported protocols with the `track resolution ip route` and `track resolution ipv6 route` commands.

## Related Commands

- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track resolution ip route](#) – configures the protocol-specific resolution value used to scale an IPv4 route metric.

# track interface ip routing

Configure object tracking on the routing status of an IPv4 Layer 3 interface.

## C9000 Series

### Syntax

```
track object-id interface interface ip routing
```

To return to the default setting, use the `no track object-id` command.

### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b> | Enter the ID number of the tracked object. The range is from 1 to 500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>interface</i></b> | Enter one of the following values: <ul style="list-style-type: none"> <li>• For a 1-Gigabit Ethernet interface, enter <code>gigabitethernet</code> and the slot-number/ port-number.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a 10-Gigabit Ethernet interface, enter <code>tengigabitethernet</code> and the slot-number/ port-number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 8.3.12.0 | Introduced on the S4810.                 |
| 8.4.1.0  | Introduced.                              |

## Usage Information

Use this command to create an object that tracks the routing state of an IPv4 Layer 3 interface:

- The status of the IPv4 interface is UP only if the Layer 3 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv4 interface goes DOWN when its Layer 3 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

## Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.

# track interface line-protocol

Configure object tracking on the line-protocol state of a Layer 2 interface.

## C9000 Series

### Syntax

```
track object-id interface interface line-protocol
```

To return to the default setting, use the `no track object-id` command.

### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b> | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>interface</i></b> | Enter one of the following values: <ul style="list-style-type: none"><li>• For a 1-Gigabit Ethernet interface, enter <code>gigabitethernet</code> and the slot-number/ port-number.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter <code>tengigabitethernet</code> and the slot-number/ port-number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

#### Usage Information

Use this command to create an object that tracks the line-protocol state of a Layer 2 interface by monitoring its operational status (UP or DOWN).

When the link-level status goes down, the tracked object status is considered to be DOWN; if the link-level status is up, the tracked object status is considered to be UP.

#### Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.

## track ip route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

### C9000 Series

#### Syntax

```
track object-id ip route ip-address/prefix-len metric threshold
```

To return to the default setting, use the `no track object-id` command.

#### Parameters

|                                   |                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------|
| <b>object-id</b>                  | Enter the ID number of the tracked object. The range is 1 to 500.                                 |
| <b>ip-address/<br/>prefix-len</b> | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32. |

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

#### Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv4 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv4 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

#### Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track resolution ip route](#) – configures the protocol-specific resolution value used to scale an IPv4 route metric.

## track ip route reachability

Configure object tracking on the reachability of an IPv4 route.

### C9000 Series

#### Syntax

```
track object-id ip route ip-address/prefix-len reachability
```

To return to the default setting, use the `no track object-id` command.

#### Parameters

|                                   |                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------|
| <b>object-id</b>                  | Enter the ID number of the tracked object. The range is from 1 to 500.                            |
| <b>ip-address/<br/>prefix-len</b> | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32. |

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

#### Usage Information

Use this command to create an object that tracks the reachability of an IPv4 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure IPv4 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the address resolution protocol (ARP) cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry if the next-hop address appears before considering the route DOWN.

#### Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.

## track reachability refresh

Change the refresh interval for tracking the reachability of the next-hop. If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to check if the next-hop address is reachable after a certain refresh interval before considering the route DOWN.

**Syntax** `track reachability refresh interval`

**Parameters** *interval* Enter the refresh interval, in seconds, for object tracking reachability. The range is from 0 to 60 seconds. The default is 60.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.4.1.0</b>    | Introduced.                               |

**Usage Information** To disable the attempt to track the reachability of next-hop after the configured refresh interval, set the refresh interval as 0.

#### Related Commands

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.

# track resolution ip route

Configure the protocol-specific resolution value used to scale an IPv4 route metric.

## C9000 Series

**Syntax** `track resolution ip route {isis resolution-value | ospf resolution-value}`  
To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                     |                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>             | Enter the ID number of the tracked object. The range is from 1 to 500.                                   |
| <b><i>isis resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
| <b><i>ospf resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 8.3.12.0 | Introduced on the S4810.                 |
| 8.4.1.0  | Introduced.                              |

**Usage Information** Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv4 route in the routing table to a scaled metric in the range from 0 to 255.

The UP/DOWN state of a tracked IPv4 route is determined by a user-configurable threshold (the `threshold metric` command) for the route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range of 0-255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range of 1-1000, where the default is **10**.
- For OSPF, you can set the resolution in the range of 1-1592, where the default is **1**.
- You cannot configure the resolution value used to map static routes. By default, Dell Networking OS assigns a metric of **0** to static routes.
- You cannot configure the resolution value used to map RIP routes. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

**Related Commands**

- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.

# IPv6 Object Tracking Commands

The following section describes the IPv6 object tracking commands.

The following object tracking commands apply to IPv4 and IPv6:

- [debug track](#)
- [delay](#)
- [description](#)
- [show running-config track](#)
- [threshold metric](#)
- [track interface line-protocol](#)

## show track ipv6 route

Display information about all tracked IPv6 routes, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |                                                                                  |

| <b>Last Change</b>                                                                                       | Time since the last change in the state of the tracked object. |

#### Example

```
Dell#show track ipv6 route

Track 2
 IPv6 route 2040::/64 metric threshold
 Metric threshold is Up (STATIC/0/0)
 5 changes, last change 00:02:30
 Metric threshold down 255 up 254
 First-hop interface is TenGigabitEthernet 1/2/1
 Tracked by:
 VRRP TenGigabitEthernet 2/4/1 IPv6 VRID 1

Track 3
 IPv6 route 2050::/64 reachability
 Reachability is Up (STATIC)
 5 changes, last change 00:02:30
 First-hop interface is TenGigabitEthernet 1/2/1
 Tracked by:
 VRRP TenGigabitEthernet 2/4/1 IPv6 VRID
```

#### Example (Brief)

```
Dell#show track ipv6 route brief

ResId Resource Parameter State LastChange
2 IPv6 route metric threshold 2040::/64 Up 00:02:36
3 IPv6 route reachability 2050::/64 Up 00:02:36
```

## track interface ipv6 routing

Configure object tracking on the routing status of an IPv6 Layer 3 interface.

### C9000 Series

#### Syntax

```
track object-id interface interface ipv6 routing
```

To return to the default setting, use the `no track object-id` command.

## track ipv6 route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

### C9000 Series

**Syntax** `track object-id ipv6 route ipv6-address/prefix-len metric threshold`  
 To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                       |                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>               | Enter the ID number of the tracked object. The range is from 1 to 500.                      |
| <b><i>ipv6-address/prefix-len</i></b> | Enter an IPv6 address in X:X:X:X format. The valid IPv6 prefix lengths are from /0 to /128. |

| <b>Defaults</b>          | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                |             |

| <b>Usage Information</b> | <p>Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv6 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.</p> <p>A tracked IPv6 route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the status of the tracked route is considered to be DOWN.</p> <p>When you configure the threshold of an IPv6 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.</p> <p>To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. To determine the state of a tracked route, the resulting scaled value is compared against the configured threshold values as follows:</p> <ul style="list-style-type: none"> <li>• If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.</li> <li>• If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.</li> </ul> <p>Configure the UP and DOWN thresholds for each tracked IPv6 route using the <code>threshold metric</code> command. The default UP threshold is <b>254</b>; the default DOWN threshold is <b>255</b>. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.</p> |         |             |                 |                          |                 |                                          |                 |                             |                 |                          |                |             |

## track ipv6 route reachability

Configure object tracking on the reachability of an IPv6 route.

|                   |                                                                                                                                                                                         |                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>track <i>object-id</i> ipv6 route <i>ip-address/prefix-len</i> reachability</pre> <p>To return to the default setting, use the <code>no track <i>object-id</i></code> command.</p> |                                                                                                                                                                                   |
| <b>Parameters</b> | <p><b><i>object-id</i></b></p> <p><b><i>ipv6-address/prefix-len</i></b></p>                                                                                                             | <p>Enter the ID number of the tracked object. The range is from 1 to 500.</p> <p>Enter an IPv6 address in X:X:X:X format. The valid IPv6 prefix lengths are from /0 to / 128.</p> |
| <b>Defaults</b>   | none                                                                                                                                                                                    |                                                                                                                                                                                   |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                 |
| 9.8(0.0) | Introduced on the S3048-ON and S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 8.3.12.0 | Introduced on the S4810.                 |
| 8.4.1.0  | Introduced.                              |

**Usage Information** Use this command to create an object that tracks the reachability of an IPv6 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the tracked route is considered to be DOWN.

When you configure IPv6 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

**Related Commands**

- [show track ipv6 route](#) – displays information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- [track ipv6 route reachability](#) – configures object tracking on the reachability of an IPv4 route.

## track reachability refresh

Change the refresh interval for tracking the reachability of the next-hop. If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to check if the next-hop address is reachable after a certain refresh interval before considering the route DOWN.

**Syntax** `track reachability refresh interval`

**Parameters** *interval* Enter the refresh interval, in seconds, for object tracking reachability. The range is from 0 to 60 seconds. The default is 60.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>8.3.12.0</b>   | Introduced on the S4810.    |
| <b>8.4.1.0</b>    | Introduced.                 |

**Usage Information** To disable the attempt to track the reachability of next-hop after the configured refresh interval, set the refresh interval as 0.

**Related Commands**

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.

## track resolution ipv6 route

Configure the protocol-specific resolution value used to scale an IPv6 route metric.

### C9000 Series

**Syntax** `track resolution ipv6 route {isis resolution-value | ospf resolution-value}`  
To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                     |                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>             | Enter the ID number of the tracked object. The range is from 1 to 500.                                   |
| <b><i>isis resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
| <b><i>ospf resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.              |
| <b>8.3.12.0</b> | Introduced on the S4810.                 |
| <b>8.4.1.0</b>  | Introduced.                              |

**Usage Information** Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv6 route in the routing table to a scaled metric in the range of 0 to 255.

The UP/DOWN state of a tracked IPv6 route is determined by the user-configurable threshold (the `threshold metric` command) for a route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range of 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range of 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range of 1 to 1592, where the default is 1.
- You cannot configure the resolution value used to map static routes. By default, Dell Networking OS assigns a metric of 0 to static routes.
- You cannot configure the resolution value used to map RIP routes. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

#### **Related Commands**

- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ipv6 route metric threshold](#) – configures object tracking on the threshold of an IPv6 route metric.

# Open Shortest Path First (OSPFv2 and OSPFv3)

Open Shortest Path First (OSPF) is an Interior Gateway Protocol (IGP), which means that it distributes routing information between routers in a single Autonomous System (AS). OSPF is also a link-state protocol in which all routers contain forwarding tables derived from information about their links to their neighbors.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) are the same for OSPFv2 and OSPFv3. OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis.

On Tunnel interfaces, OSPFv2 is supported on IPv6 tunnels only and OSPFv3 is supported on IPv4 tunnels only.

This chapter is divided into two sections. There is no overlap between the two sets of commands. You cannot use an OSPFv2 command in the IPv6 OSPFv3 mode.

- [OSPFv2 Commands](#)
- [OSPFv3 Commands](#)

OSPF on Tunnel Interfaces:

**NOTE:** The Dell Networking OS versions 9.4(0.0) and 9.7(0.0) introduce support for VRF on OSPFv2 and OSPFv3, respectively.

The multi-process OSPF feature supported on Dell Networking OS version 7.8.1.0 is modified. In earlier versions, multiple OSPF processes were created without VRF (prior to 9.4 release). In Dell Networking OS version 9.4 and version 9.7 (for OSPFv3), multiple OSPF processes can be created on a router, but with only one OSPF process per VRF. However, there can be one OSPFv2 and one OSPFv3 on the same VRF.

## Topics:

- [OSPFv2 Commands](#)
- [OSPFv3 Commands](#)

## OSPFv2 Commands

The Dell Networking implementation of OSPFv2 is based on IETF RFC 2328. .

### area default-cost

Set the metric for the summary default route the area border router (ABR) generates into the stub area. Use this command on the border routers at the edge of a stub area.

### C9000 Series

|                   |                                                                                      |                                                                                                     |
|-------------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>area area-id default-cost cost</code>                                          |                                                                                                     |
|                   | To return default values, use the <code>no area area-id default-cost</code> command. |                                                                                                     |
| <b>Parameters</b> | <b><i>area-id</i></b>                                                                | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535. |
|                   | <b><i>cost</i></b>                                                                   | Specifies the stub area's advertised external route metric. The range is from zero (0) to 65535.    |
| <b>Defaults</b>   | <code>cost = 1</code> ; no areas are configured.                                     |                                                                                                     |

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                  |
| 9.2(1.0) | Introduced on the Z9500.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 7.8.1.0  | Added support for the Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.               |
| 7.5.1.0  | Introduced on the C-Series.               |
| 6.1.1.1  | Introduced on the E-Series.               |

**Usage Information** In the Dell Networking operating software, `cost` is defined as reference bandwidth/bandwidth.

**Related Commands** [area stub](#) — creates a stub area.

## area nssa

Specify an area as a not so stubby area (NSSA).

## C9000 Series

**Syntax** `area area-id nssa [default-information-originate] [no-redistribution] [no-summary]`

To delete an NSSA, use the `no area area-id nssa` command.

|                   |                                      |                                                                                                                                                                    |
|-------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>area-id</b>                       | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.                                                                |
|                   | <b>no-redistribution</b>             | (OPTIONAL) Specify that the <code>redistribute</code> command does not distribute routes into the NSSA. Only use this command in an NSSA area border router (ABR). |
|                   | <b>default-information-originate</b> | (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.                                                               |
|                   | <b>no-summary</b>                    | (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.                                                                                              |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.9(0.0) | Introduced on the C9010. |

| Version         | Description                               |
|-----------------|-------------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.                  |
| <b>8.3.19.0</b> | Introduced on the S4820T.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                  |
| <b>7.8.1.0</b>  | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.               |
| <b>6.1.1.1</b>  | Introduced on the E-Series.               |

## area range

Summarize routes matching an address/mask at an area border router (ABR).

### C9000 Series

|                        |                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>area area-id range ip-address mask [not-advertise]</pre> <p>To disable route summarization, use the <code>no area area-id range ip-address mask</code> command.</p>                                                                                        |                                                                                                                                                                                                         |
| <b>Parameters</b>      | <b><i>area-id</i></b>                                                                                                                                                                                                                                           | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.                                                                                                     |
|                        | <b><i>ip-address</i></b>                                                                                                                                                                                                                                        | Specify an IP address in dotted decimal format.                                                                                                                                                         |
|                        | <b><i>mask</i></b>                                                                                                                                                                                                                                              | Specify a mask for the destination prefix. Enter the full mask (for example, 255.255.255.0).                                                                                                            |
|                        | <b><i>not-advertise</i></b>                                                                                                                                                                                                                                     | (OPTIONAL) Enter the keywords <code>not-advertise</code> to set the status to DoNotAdvertise (that is, the Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas.) |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                 |                                                                                                                                                                                                         |

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                  |
| 9.2(1.0) | Introduced on the Z9500.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 7.8.1.0  | Added support for the Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.               |
| 7.5.1.0  | Introduced on the C-Series.               |
| 6.1.1.1  | Introduced on the E-Series.               |

|                          |                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To configure all routers and access servers within a stub, use this command.         |
| <b>Related Commands</b>  | <a href="#">router ospf</a> — enters ROUTER OSPF mode to configure an OSPF instance. |

## auto-cost

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

### C9000 Series

| <b>Syntax</b>          | <code>auto-cost [reference-bandwidth <i>ref-bw</i>]</code><br><br>To return to the default bandwidth or to assign cost based on the interface type, use the <code>no auto-cost [reference-bandwidth]</code> command.                                                                                                                                                                |                                                                                                                                                  |         |             |                 |                          |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|
| <b>Parameters</b>      | <b><i>ref-bw</i></b>                                                                                                                                                                                                                                                                                                                                                                | (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is <b>100 megabits per second</b> . |         |             |                 |                          |
| <b>Defaults</b>        | <b>100 megabits per second.</b>                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                  |         |             |                 |                          |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

| Version | Description                               |
|---------|-------------------------------------------|
| 7.8.1.0 | Added support for the Multi-Process OSPF. |
| 7.6.1.0 | Introduced on the S-Series.               |
| 7.5.1.0 | Introduced on the C-Series.               |
| 6.1.1.1 | Introduced on the E-Series.               |

**Related Commands** [show ip ospf statistics](#) — displays the OSPF statistics.

## debug ip ospf

Display debug information on OSPF. Entering the `debug ip ospf` commands enables OSPF debugging for the first OSPF process.

### C9000 Series

**Syntax** `debug ip ospf process-id [vrf vrf name][bfd | event | packet | spf | database-timers]`

To cancel the debug command, use the `no debug ip ospf` command.

|                   |                        |                                                                                                                     |
|-------------------|------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>process-id</b>      | Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared. |
|                   | <b>vrf name</b>        | Enter the keyword <code>vrf</code> to view debugging information on OSPF corresponding to that VRF.                 |
|                   | <b>bfd</b>             | (OPTIONAL) Enter the keyword <code>bfd</code> to debug only OSPF BFD information.                                   |
|                   | <b>event</b>           | (OPTIONAL) Enter the keyword <code>event</code> to debug only OSPF event information.                               |
|                   | <b>packet</b>          | (OPTIONAL) Enter the keyword <code>packet</code> to debug only OSPF packet information.                             |
|                   | <b>spf</b>             | (OPTIONAL) Enter the keyword <code>spf</code> to display the Shortest Path First information.                       |
|                   | <b>database-timers</b> | (OPTIONAL) Enter the keywords <code>database-timers</code> to display the LSA throttling timer information.         |

| <b>pri:</b>        | Displays the OSPF priority                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>N, MC, E, T</b> | Displays information available in the Options field of the HELLO packet: <ul style="list-style-type: none"> <li>• N + (N-bit is set)</li> <li>• N - (N-bit is not set)</li> <li>• MC+ (bit used by MOSPF is set and router is able to forward IP multicast packets)</li> <li>• MC- (bit used by MOSPF is not set and router cannot forward IP multicast packets)</li> <li>• E + (router is able to accept AS External LSAs)</li> <li>• E - (router cannot accept AS External LSAs)</li> <li>• T + (router can support TOS)</li> <li>• T - (router cannot support TOS)</li> </ul> |
| <b>hi:</b>         | Displays the amount of time configured for the HELLO interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>di:</b>         | Displays the amount of time configured for the DEAD interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field       | Description                                        |
|-------------|----------------------------------------------------|
| <b>dr:</b>  | Displays the IP address of the designated router.  |
| <b>bdr:</b> | Displays the IP address of the Border Area Router. |

#### Example

```
Dell#debug ip ospf 1 packet
OSPF process 90, packet debugging is on

Dell#
08:14:24 : OSPF(100:00):
Xmt. v:2 t:1(HELLO) l:44 rid:192.1.1.1
aid:0.0.0.1 chk:0xa098 aut:0 auk: keyid:0 to:Te 1/3 dst:224.0.0.5
netmask:255.255.255.0 pri:1 N-, MC-, E+, T-,
hi:10 di:40 dr:90.1.1.1 bdr:0.0.0.0
```

## default-information originate

To generate a default external route into an OSPF routing domain, configure the system.

### C9000 Series

#### Syntax

```
default-information originate [always] [metric metric-value] [metric-type
type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.

#### Parameters

|                                      |                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                        | (OPTIONAL) Enter the keyword <code>always</code> to specify that default route information must always be advertised.                                                                                                                            |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number to configure a metric value for the route. The range is from 1 to 16777214.                                                                                                       |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then an OSPF link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>1 = Type 1 external route</li> <li>2 = Type 2 external route</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map.                                                                                                                                                  |

#### Defaults

Disabled.

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                               |
|-----------------|-------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                  |
| <b>8.3.19.0</b> | Introduced on the S4820T.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                  |
| <b>7.8.1.0</b>  | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.               |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.1 | Introduced on the E-Series. |

**Related Commands**     [redistribute](#) — redistributes routes from other routing protocols into OSPF.

## default-metric

Change the metrics of redistributed routes to a value useful to OSPF. Use this command with the `redistribute` command.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>default-metric number</code><br>To return to the default values, use the <code>no default-metric [number]</code> command.                                                                                                                           |
| <b>Parameters</b>      | <b><i>number</i></b> Enter a number as the metric. The range is from 1 to 16777214.                                                                                                                                                                       |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                                 |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                                                                                                               |

**Related Commands**     [redistribute](#) — redistributes routes from other routing protocols into OSPF.

## description

Add a description about the selected OSPF configuration.

### C9000 Series

|               |                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>description description</code><br>To remove the OSPF description, use the <code>no description</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------|

**Parameters** *description* Enter a text string description to identify the OSPF configuration (80 characters maximum).

**Defaults** none

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                  |
| 9.2(1.0) | Introduced on the Z9500.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 7.8.1.0  | Added support for the Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.               |
| 7.5.1.0  | Introduced on the C-Series.               |
| 6.1.1.1  | Introduced on the E-Series.               |

## distance

Define an administrative distance for particular routes to a specific IP address.

### C9000 Series

**Syntax** `distance weight [ip-address mask prefix-list-name]`  
To delete the settings, use the `no distance weight [ip-address mask prefix-list-name]` command.

**Parameters**

|                         |                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>weight</i>           | Specify an administrative distance. The range is from 1 to 255. The default is <b>110</b> .                                    |
| <i>ip-address</i>       | (OPTIONAL) Enter a router ID in the dotted decimal format. If you enter a router ID, include the mask for that router address. |
| <i>mask</i>             | (OPTIONAL) Enter a mask in dotted decimal format or /n format.                                                                 |
| <i>prefix-list-name</i> | (OPTIONAL) Enter the name of an IP standard prefix list, up to 140 characters.                                                 |

**Defaults** 110

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |

| Version         | Description                               |
|-----------------|-------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                  |
| <b>7.8.1.0</b>  | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.               |
| <b>6.1.1.1</b>  | Introduced on the E-Series.               |

## distance ospf

Configure an OSPF distance metric for different types of routes.

For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |

| Version         | Description                               |
|-----------------|-------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                  |
| <b>8.3.19.0</b> | Introduced on the S4820T.                 |
| <b>8.3.11.1</b> | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>  | Introduced on the S4810.                  |
| <b>7.8.1.0</b>  | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.               |
| <b>7.5.1.0</b>  | Introduced on the C-Series.               |
| <b>6.1.1.1</b>  | Introduced on the E-Series.               |

|                          |                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To specify a distance for routes learned from other routing domains, use the <code>redistribute</code> command. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------|

# distribute-list in

Apply a filter to incoming routing updates from OSPF to the routing table.

## C9000 Series

| <b>Syntax</b>                  | <code>distribute-list <i>prefix-list-name</i> in [<i>interface</i>]</code><br><br>To delete a filter, use the <code>no distribute-list <i>prefix-list-name</i> in [<i>interface</i>]</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                |                                             |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                 |                          |                 |                           |                 |                          |                |                          |                |                                           |                |                             |                |                             |                |                             |

| Usage Information | <p>The <code>distribute-list out</code> command applies to routes autonomous system boundary routers (ASBRs) redistributes into OSPF. It can be applied to external type 2 and external type 1 routes, but not to intra-area and inter-area routes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                    |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                                           |                |                             |                |                             |                |                             |

## enable inverse-mask

By default, the system allows you to input the OSPF `network` command with a net-mask. This command provides a choice between inverse-mask or net-mask (the default).

### C9000 Series

|                 |                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <pre>enable inverse mask</pre> <p>To return to the default net-mask, use the <code>no enable inverse mask</code> command.</p> |
| <b>Defaults</b> | <b>net-mask</b>                                                                                                               |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.1  | Introduced on the E-Series. |

## fast-convergence

This command sets the minimum LSA origination and arrival times to zero (0), allowing more rapid route computation so that convergence takes less time.

### C9000 Series

**Syntax** `fast-convergence {number}`

To cancel fast-convergence, use the `no fast convergence` command.

**Parameters** **number** Enter the convergence level desired. The higher this parameter is set, the faster OSPF converge takes place. The range is from 1 to 4.

**Defaults** none.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                  |
|----------|------------------------------|
| 9.9(0.0) | Introduced on the C9010.     |
| 9.2(1.0) | Introduced on the Z9500.     |
| 8.3.19.0 | Introduced on the S4820T.    |
| 8.3.11.1 | Introduced on the Z9000.     |
| 8.3.7.0  | Introduced on the S4810.     |
| 7.8.1.0  | Introduced on all platforms. |

**Usage Information**

The higher this parameter is set, the faster OSPF converge takes place.

 **NOTE:** The faster the convergence, the more frequent the route calculations and updates. This behavior impacts CPU utilization and may impact adjacency stability in larger topologies.

Generally, convergence level 1 meets most convergence requirements. Higher convergence levels should only be selected following consultation with Dell Networking technical support.

## graceful-restart grace-period

Specifies the time duration, in seconds, that the router's neighbors continue to advertise the router as fully adjacent regardless of the synchronization state during a graceful restart.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                                         |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>graceful-restart grace-period seconds</code><br>To disable the grace period, use the <code>no graceful-restart grace-period</code> command.              |                                                                                                                                                         |
| <b>Parameters</b>      | <b><i>seconds</i></b>                                                                                                                                          | Time duration, in seconds, that specifies the duration of the restart process before OSPF terminates the process. The range is from 40 to 1800 seconds. |
| <b>Defaults</b>        | Not Configured                                                                                                                                                 |                                                                                                                                                         |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |                                                                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                         |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                       |
|-----------------|-------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                          |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                          |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                          |
| <b>7.8.1.0</b>  | Introduced on the S-Series. Added support for Multi-Process OSPF. |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                       |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                                       |

## graceful-restart helper-reject

Specify the OSPF router to not act as a helper during graceful restart.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                     |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>graceful-restart helper-reject ip-address</code><br>To return to default value, use the <code>no graceful-restart helper-reject</code> command.          |                                                                                                                                     |
| <b>Parameters</b>      | <b><i>ip-address</i></b>                                                                                                                                       | Enter the OSPF router-id, in IP address format, of the restart router that <i>will not</i> act as a helper during graceful restart. |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |                                                                                                                                     |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                   |
|----------|-----------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                      |
| 9.2(1.0) | Introduced on the Z9500.                                                                      |
| 8.3.19.0 | Introduced on the S4820T.                                                                     |
| 8.3.11.1 | Introduced on the Z9000.                                                                      |
| 8.3.12.0 | Introduced on the S4810.                                                                      |
| 7.8.1.0  | Added support for Multi-Process OSPF. Added Restart and Helper roles support on the S-Series. |
| 7.7.1.0  | Added Helper-Role support on the S-Series.                                                    |
| 7.5.1.0  | Introduced on the C-Series.                                                                   |
| 6.1.1.1  | Introduced on the E-Series.                                                                   |

# ip ospf auth-change-wait-time

OSPF provides a grace period while OSPF changes its interface authentication type. During the grace period, OSPF sends out packets with new and old authentication scheme until the grace period expires.

## C9000 Series

|                 |                                                                                                                                                                |                |                                                |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.1</b>  | Introduced on the E-Series. |

## ip ospf authentication-key

Enable authentication and set an authentication key on OSPF traffic on an interface.

### C9000 Series

|                          |                                                                                                                                                                                                                                                           |                                                                                      |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>ip ospf authentication-key [encryption-type] key</code><br>To delete an authentication key, use the <code>no ip ospf authentication-key</code> command.                                                                                             |                                                                                      |
| <b>Parameters</b>        | <b>encryption-type</b>                                                                                                                                                                                                                                    | (OPTIONAL) Enter 7 to encrypt the key.                                               |
|                          | <b>key</b>                                                                                                                                                                                                                                                | Enter an eight-character string. Strings longer than eight characters are truncated. |
| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                           |                                                                                      |

# ip ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

## C9000 Series

| Parameters    | <b>seconds</b>                                                                                                                        | Enter the number of seconds for the interval. The range is from 1 to 65535. The default is <b>40 seconds</b> . |
| Defaults      | <b>40 seconds</b>                                                                                                                     |                                                                                                                |
| Command Modes | INTERFACE                                                                                                                             |                                                                                                                |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.1  | Introduced on the E-Series. |

## Usage Information

By default, the dead interval is four times the default hello-interval.

## Related Commands

[ip ospf hello-interval](#) — sets the time interval between the hello packets.

# ip ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

## C9000 Series

### Syntax

```
ip ospf hello-interval seconds
```

To return to the default value, use the `no ip ospf hello-interval` command.

### Parameters

**seconds** Enter the number of seconds for the interval. The range is from 1 to 65535. The default is **10 seconds**.

### Defaults

**10 seconds**

### Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>You can configure a maximum of six digest keys on an interface. Of the available six digest keys, the switches select the MD5 key that is common. The remaining MD5 keys are unused.</p> <p>To change to a different key on the interface, enable the new key while the old key is still enabled. The system sends two packets: the first packet authenticated with the old key and the second packet authenticated with the new key. This process ensures that the neighbors learn the new key and communication is not disrupted by keeping the old key enabled.</p> <p>After the reply is received and the new key is authenticated, delete the old key. Dell recommends keeping only one key per interface.</p> <div> <div></div> <div><b>NOTE:</b> The MD5 secret is stored as plain text in the configuration file with service password encryption. Write down or otherwise record the key. You cannot learn the key once it is configured. Use caution when changing the key.</div> </div> |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ip ospf mtu-ignore

Disable OSPF MTU mismatch detection upon receipt of database description (DBD) packets.

### C9000 Series

|                        |                                                                                                                                                                |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                              |                  |                                                                                                     |                       |                                                                                                                |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description              |
|-----------------|--------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010. |

| Version         | Description                           |
|-----------------|---------------------------------------|
| <b>9.2(1.0)</b> | Introduced on the Z9500.              |
| <b>8.3.19.0</b> | Introduced on the S4820T.             |
| <b>8.3.11.1</b> | Introduced on the Z9000.              |
| <b>8.3.7.0</b>  | Introduced on the S4810.              |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.           |
| <b>6.1.1.1</b>  | Introduced on the E-Series.           |

## ip ospf priority

To determine the designated router for the OSPF network, set the priority of the interface.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                       |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ospf priority number</code><br>To return to the default setting, use the <code>no ip ospf priority</code> command.                                    |                                                                                       |
| <b>Parameters</b>      | <b><i>number</i></b>                                                                                                                                           | Enter a number as the priority. The range is from 0 to 255. The default is <b>1</b> . |
| <b>Defaults</b>        | <b>1</b>                                                                                                                                                       |                                                                                       |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |                                                                                       |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                       |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |

| <b>6.1.1.1</b>           | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |
| <b>Usage Information</b> | Set the time interval to a number large enough to prevent unnecessary retransmissions. For example, the interval must be larger for interfaces connected to virtual links.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## ip ospf transmit-delay

To send a link state update packet on the interface, set the estimated time elapsed.

|                      |                                                                                                                                        |                                                                                                                                                                                                                                     |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ip ospf transmit-delay seconds</code><br>To return to the default value, use the <code>no ip ospf transmit-delay</code> command. |                                                                                                                                                                                                                                     |
| <b>Parameters</b>    | <b>seconds</b>                                                                                                                         | Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is <b>1 second</b> .<br><br>This value must be greater than the transmission and propagation delays for the interface. |
| <b>Defaults</b>      | <b>1 second</b>                                                                                                                        |                                                                                                                                                                                                                                     |
| <b>Command Modes</b> | INTERFACE                                                                                                                              |                                                                                                                                                                                                                                     |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.9(0.0) | Introduced on the C9010.    |
| 9.2(1.0) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.1  | Introduced on the E-Series. |

## log-adjacency-changes

To send a Syslog message about changes in the OSPF adjacency state, set the system.

### C9000 Series

**Syntax**

log-adjacency-changes

To disable the Syslog messages, use the `no log-adjacency-changes` command.

**Defaults**

Disabled.

**Command Modes** ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.9(0.0) | Introduced on the C9010.              |
| 9.2(1.0) | Introduced on the Z9500.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.7.0  | Introduced on the S4810.              |
| 7.8.1.0  | Added support for Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.           |
| 7.5.1.0  | Introduced on the C-Series.           |
| 6.1.1.1  | Introduced on the E-Series.           |

## maximum-paths

Enable the software to forward packets over multiple paths.

### C9000 Series

|                      |                                                                                                                                       |                                                                                                                                                                                                |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>maximum-paths number</code><br>To disable packet forwarding over multiple paths, use the <code>no maximum-paths</code> command. |                                                                                                                                                                                                |
| <b>Parameters</b>    | <b><i>number</i></b>                                                                                                                  | Specify the number of paths. The range for OSPFv2 is from 1 to 64. The default for OSPFv2 is <b>4 paths</b> . The range for OSPFv3 is from 1 to 64. The default for OSPFv3 is <b>8 paths</b> . |
| <b>Defaults</b>      | <b>4</b>                                                                                                                              |                                                                                                                                                                                                |
| <b>Command Modes</b> | ROUTER OSPF for OSPFv2<br>ROUTER OSPFv3 for OSPFv3                                                                                    |                                                                                                                                                                                                |

**Command History** This guide is platform-specific. For command information about other platforms, see relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                           |
|-----------------|-------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                              |
| <b>9.1(0.0)</b> | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b> | Introduced on the S4820T.                             |
| <b>8.3.11.1</b> | Introduced on the Z9000.                              |
| <b>8.3.7.0</b>  | Introduced on the S4810.                              |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                 |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                           |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                           |

## network area

Define which interfaces run OSPF and the OSPF area for those interfaces.

### C9000 Series

|                   |                                                                                                                                                     |                                                                                                                                                                        |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>network ip-address mask area area-id</code><br>To disable an OSPF area, use the <code>no network ip-address mask area area-id</code> command. |                                                                                                                                                                        |
| <b>Parameters</b> | <b><i>ip-address</i></b>                                                                                                                            | Specify a primary or secondary address in dotted decimal format. The primary address is required before adding the secondary address.                                  |
|                   | <b><i>mask</i></b>                                                                                                                                  | Enter a network mask in /prefix format. (/x)                                                                                                                           |
|                   | <b><i>area-id</i></b>                                                                                                                               | Enter the OSPF area ID as either a decimal value or in a valid IP address. Decimal value range is from 0 to 65535. IP address format is dotted decimal format A.B.C.D. |

 **NOTE:** If the area ID is smaller than 65535, it is converted to a decimal value. For example, if you use an area ID of 0.0.0.1, it is converted to 1.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                  |
|----------|------------------------------|
| 9.9(0.0) | Introduced on the C9010.     |
| 9.2(1.0) | Introduced on the Z9500.     |
| 8.3.19.0 | Introduced on the S4820T.    |
| 8.3.11.1 | Introduced on the Z9000.     |
| 8.3.7.0  | Introduced on the S4810.     |
| 7.8.1.0  | Introduced to all platforms. |
| 7.6.1.0  | Introduced on the S-Series.  |
| 7.5.1.0  | Introduced on the C-Series.  |
| 6.1.1.1  | Introduced on the E-Series.  |

**Usage Information** To enable OSPF on an interface, the `network area` command must include, in its range of addresses, the primary IP address of an interface.

 **NOTE:** An interface can be attached only to a single OSPF area.

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

## passive-interface

Suppress both receiving and sending routing updates on an interface.

### C9000 Series

**Syntax** `passive-interface {default | interface}`

To enable both the receiving and sending routing, use the `no passive-interface interface` command.

To return all OSPF interfaces (current and future) to active, use the `no passive-interface default` command.

**Parameters**

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>   | Enter the keyword <code>default</code> to make all OSPF interfaces (current and future) passive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For Port Channel groups, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                            |
|----------|--------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                               |
| 9.2(1.0) | Introduced on the Z9500.                               |
| 8.3.19.0 | Introduced on the S4820T.                              |
| 8.3.11.1 | Introduced on the Z9000.                               |
| 8.3.7.0  | Introduced on the S4810.                               |
| 7.8.1.0  | Added support for Multi-Process OSPF.                  |
| 7.6.1.0  | Introduced on the S-Series.                            |
| 7.5.1.0  | Introduced on the C-Series.                            |
| 7.4.1.0  | Modified to include the keyword <code>default</code> . |
| 6.1.1.1  | Introduced on the E-Series.                            |

**Usage Information**

Although the passive interface does not send or receive routing updates, the network on that interface is still included in OSPF updates sent using other interfaces.

The `default` keyword sets all interfaces as passive. You can then configure individual interfaces, where adjacencies are desired, using the `no passive-interface interface` command. The `no` form of this command is inserted into the configuration for individual interfaces when the `no passive-interface interface` command is issued while `passive-interface default` is configured.

This command behavior has changed as follows:

`passive-interface interface`

- The previous `no passive-interface interface` is removed from the running configuration.
- The ABR status for the router is updated.
- Save `passive-interface interface` into the running configuration.

`passive-interface default`

- All present and future OSPF interfaces are marked as *passive*.
- Any adjacency is explicitly terminated from all OSPF interfaces.
- All previous `passive-interface interface` commands are removed from the running configuration.
- All previous `no passive-interface interface` commands are removed from the running configuration.

`no passive-interface interface`

- Remove the interface from the passive list.
- The ABR status for the router is updated.
- If `passive-interface default` is specified, then save `no passive-interface interface` into the running configuration.

`No passive-interface default`

- Clear everything and revert to the default behavior.
- All previously marked passive interfaces are removed.
- May update ABR status.

# redistribute

Redistribute information from another routing protocol throughout the OSPF process.

## C9000 Series

| <b>Syntax</b>            | <pre>redistribute {connected   rip   static} [metric <i>metric-value</i>   metric-type <i>type-value</i>] [route-map <i>map-name</i>] [tag <i>tag-value</i>]</pre> <p>To disable redistribution, use the <code>no redistribute {connected   isis   rip   static}</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                 |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                       |         |                             |         |                             |         |                             |

| <b>Related Commands</b>  | <a href="#">default-information originate</a> — generates a default route into the OSPF routing domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                 |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                                       |         |                             |         |                             |         |                             |

# redistribute bgp

Redistribute BGP routing information throughout the OSPF instance.

## C9000 Series

**Syntax** `redistribute bgp as number [metric metric-value] | [metric-type type-value] | [tag tag-value]`

To disable redistribution, use the `no redistribute bgp as number [metric metric-value] | [metric-type type-value] [route-map map-name] [tag tag-value]` command.

|                   |                                      |                                                                                                                                                                                                     |
|-------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>as number</i></b>              | Enter the autonomous system number. The range is from 1 to 65535.                                                                                                                                   |
|                   | <b><i>metric metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then the metric-value number. The range is from 0 to 16777214.                                                                                     |
|                   | <b><i>metric-type type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"><li>1 = for OSPF External type 1</li><li>2 = for OSPF External type 2</li></ul> |
|                   | <b><i>route-map map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                                |
|                   | <b><i>tag tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.                                                                 |

**Defaults** none

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                     |
|----------|-------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                        |
| 9.2(1.0) | Introduced on the Z9500.                        |
| 8.3.19.0 | Introduced on the S4820T.                       |
| 8.3.11.1 | Introduced on the Z9000.                        |
| 8.3.7.0  | Introduced on the S4810.                        |
| 7.8.1.3  | Added Route Map for BGP Redistribution to OSPF. |
| 7.8.1.0  | Added support for Multi-Process OSPF.           |
| 7.6.1.0  | Introduced on the S-Series.                     |
| 7.5.1.0  | Introduced on the C-Series.                     |
| 7.4.1.0  | Added the keyword <code>default</code> .        |
| 6.1.1.1  | Introduced on the E-Series.                     |

# redistribute isis

Redistribute IS-IS routing information throughout the OSPF instance.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.9(0.0) | Introduced on the C9010.              |
| 9.2(1.0) | Introduced on the Z9500.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.7.0  | Introduced on the S4810.              |
| 7.8.1.0  | Added support for Multi-Process OSPF. |
| 7.5.1.0  | Introduced on the C-Series.           |
| 6.1.1.1  | Introduced on the E-Series.           |

# router-id

To configure a fixed router ID, use this command.

## C9000 Series

|                 |                                                                                                                                                                |                                               |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Syntax          | <code>router-id ip-address</code><br>To remove the fixed router ID, use the <code>no router-id ip-address</code> command.                                      |                                               |
| Parameters      | <b><i>ip-address</i></b>                                                                                                                                       | Enter the router ID in the IP address format. |
| Defaults        | none.                                                                                                                                                          |                                               |
| Command Modes   | ROUTER OSPF                                                                                                                                                    |                                               |
| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                               |

| 8.3.7.0  | Introduced on the S4810.              |
| 7.8.1.0  | Added support for Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.           |
| 7.5.1.0  | Introduced on the C-Series.           |
| 6.1.1.1  | Introduced on the E-Series.           |

|                   |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Information | You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique. If you use this command on an OSPF router process, which is already active (that is, has neighbors), a prompt reminding you that changing the router-id brings down the existing OSPF adjacency. The new router ID is effective at the next reload. |

| Usage Information | <p>You must have an IP address assigned to an interface to enter ROUTER OSPF mode and configure OSPF.</p> <p>After the OSPF process and the VRF are tied together, you cannot use the OSPF Process ID again in the system. You can only create one process per VRF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                        |         |             |          |                          |          |                                                                |          |                          |          |                                                  |          |                           |          |                          |         |                          |         |                                    |         |                                       |         |                             |         |                             |         |                             |
| Example           | <pre>To create an OSPF instance in default vrf Dell(conf)#router ospf 1 Dell(conf-router_ospf-1)#  To create an OSPF instance in a non-default vrf, for example, "vrf1" Dell(conf)#router ospf 2 vrf vrf1 Dell(conf-router_ospf-2)#</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                        |         |             |          |                          |          |                                                                |          |                          |          |                                                  |          |                           |          |                          |         |                          |         |                                    |         |                                       |         |                             |         |                             |         |                             |

## show config

Display the non-default values in the current OSPF configuration.

### C9000 Series

**Syntax** `show config`

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.1</b>  | Introduced on the E-Series. |

**Example**

```
Dell(conf-router_ospf)#show config
!
router ospf 3
passive-interface FastEthernet 0/1
Dell(conf-router_ospf)#
```

## show ip ospf

Display information on the OSPF process configured on the switch.

### C9000 Series

**Syntax** `show ip ospf process-id [vrf vrf name]`

**Parameters**

|                     |                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>process-id</b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> and the name of the VRF to view only the OSPF information tied to the VRF process.              |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                           |
|-----------------|-----------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                              |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP).        |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                              |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                             |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                              |
| <b>8.3.8.0</b>  | Added output for LSA throttling timers.                               |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                              |
| <b>7.9.1.0</b>  | Added support for VRF on E-Series.                                    |
| <b>7.8.1.0</b>  | Added support of Multi-Process OSPF.                                  |
| <b>7.8.1.0</b>  | Added the <i>process-id</i> option, in support of Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                           |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                                           |

#### Usage Information

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

The following describes the `show ip ospf` command shown in the following example.

| Line Beginning with         | Description                                                                     |
|-----------------------------|---------------------------------------------------------------------------------|
| <b>“Routing Process...”</b> | Displays the OSPF process ID and the IP address associated with the process ID. |
| <b>“Supports only...”</b>   | Displays the number of Type of Service (TOS) routes supported.                  |
| <b>“SPF schedule...”</b>    | Displays the delay and hold time configured for this process ID.                |
| <b>“Convergence Level”</b>  |                                                                                 |
| <b>“Min LSA....”</b>        | Displays the intervals set for LSA transmission and acceptance.                 |
| <b>“Number of...”</b>       | Displays the number and type of areas configured for this process ID.           |

#### Example

```
Dell#show ip ospf 10
Routing Process ospf 10 with ID 1.1.1.1 Virtual router default
Supports only single TOS (TOS0) routes
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
 Area BACKBONE (0)
 Number of interface in this area is 1
 SPF algorithm executed 205 times
 Area ranges are
Dell#
```

#### Related Commands

[show ip ospf database](#) — displays information about the OSPF routes configured.

[show ip ospf interface](#) — displays the OSPF interfaces configured.

[show ip ospf neighbor](#) — displays the OSPF neighbors configured.

# show ip ospf asbr

Display all autonomous system boundary router (ASBR) routers visible to OSPF.

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                           |
|----------|-----------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                              |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP).        |
| 9.2(1.0) | Introduced on the Z9500.                                              |
| 8.3.19.0 | Introduced on the S4820T.                                             |
| 8.3.11.1 | Introduced on the Z9000.                                              |
| 8.3.7.0  | Introduced on the S4810.                                              |
| 7.8.1.0  | Added support of Multi-Process OSPF.                                  |
| 7.8.1.0  | Added the <i>process-id</i> option, in support of Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.                                           |
| 7.5.1.0  | Introduced on the C-Series and E-Series.                              |

**Usage Information** To isolate problems with external routes, use this command. In OSPF, external routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, use this command to determine if the path to the originating router is correct. The display output is not sorted in any order.

 **NOTE:** ASBRs that are not in directly connected areas are also displayed.

You can determine if an ASBR is in a directly connected area (or not) by the flags. For ASBRs in a directly connected area, E flags are set. In the following example, router 1.1.1.1 is in a directly connected area since the Flag is E/-/-/. For remote ASBRs, the E flag is clear (-/-/-/).

### Example

```
Dell#show ip ospf lasbr

RouterID Flags Cost Nexthop Interface Area
3.3.3.3 -/-/-/ 2 10.0.0.2 Te 0/1 1
1.1.1.1 E/-/-/ 0 0.0.0.0 - 0
Dell#
```

# show ip ospf database

Display all LSA information. If you do not enable OSPF on the switch, no output is generated.

|               |                                                                                            |                                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Syntax        | show ip ospf <i>process-id</i> [vrf <i>vrf-name</i> ] database [ <i>database-summary</i> ] |                                                                                                                                         |
| Parameters    | <b><i>process-id</i></b>                                                                   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.      |
|               | <b>vrf <i>vrf-name</i></b>                                                                 | Enter the keyword <i>vrf</i> and then the name of the VRF to view LSA information on OSPF processes corresponding to that VRF.          |
|               | <b>database-summary</b>                                                                    | (OPTIONAL) Enter the keywords <i>database-summary</i> to the display the number of LSA types in each area and the total number of LSAs. |
| Command Modes | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                |                                                                                                                                         |

|                 |                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command History | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support of Multi-Process OSPF.                           |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

| Usage Information | <p>The following describes the <code>show ip ospf <i>process-id</i> database</code> command shown in the following example.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |             |         |                           |            |                                         |     |                              |      |                                                                                                                           |          |                                                               |            |                                                    |

#### Related Commands

[show ip ospf database asbr-summary](#) — displays only ASBR summary LSA information.

## show ip ospf database asbr-summary

Display information about autonomous system (AS) boundary LSAs.

### C9000 Series

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] database asbr-summary [link-state-id] [adv-router ip-address]
```

#### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword *vrf* and the name of the VRF to view information about AS boundary LSAs corresponding to a specific VRF.
- link-state-id*** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network's IP address for Type 3 LSAs or Type 5 LSAs
  - the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- adv-router ip-address*** (OPTIONAL) Enter the keywords *adv-router* and the *ip-address* to display only the LSA information about that router.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                    |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                                    |

#### Usage Information

The following describes the `show ip ospf database asbr-summary` command shown in the following example.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the advertising router's ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>TOS</b>                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metric</b>             | Displays the LSA metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### Example

```
Dell#show ip ospf 100 database asbr-summary

 OSPF Router with ID (1.1.1.10) (Process ID 100)

 Summary Asbr (Area 0.0.0.0)

LS age: 1437
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 103.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000000f
Checksum: 0x8221
Length: 28
Network Mask: /0
 TOS: 0 Metric: 2
```

```

LS age: 473
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 104.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000010
Checksum: 0x4198
Length: 28
--More--

```

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

# show ip ospf database external

Display information on the AS external (type 5) LSAs.

## C9000 Series

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database external [link-state-id]
[adv-router ip-address]
```

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                         |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> and the name of the VRF to view information on AS external LSAs corresponding to the OSPF processes that are tied to a specific VRF.                                                                                                                                                                                                    |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the <code>ip-address</code> to display only the LSA information about that router.                                                                                                                                                                                                                               |

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                    |

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.1 | Introduced on the E-Series. |

## Usage Information

The following describes the `show ip ospf process-id database external` command shown in the following example.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LS Seq Number</b>      | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Metrics Type</b>       | Displays the external type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>TOS</b>                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metric</b>             | Displays the LSA metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Forward Address</b>    | Identifies the address of the forwarding router. Data traffic is forwarded to this router. If the forwarding address is 0.0.0.0, data traffic is forwarded to the originating router.                                                                                                                                                                                                                                                                                                              |
| <b>External Route Tag</b> | Displays the 32-bit field attached to each external route. The OSPF protocol does not use this field, but you can use the field for external route management.                                                                                                                                                                                                                                                                                                                                     |

## Example

```
Dell#show ip ospf 1 database external

 OSPF Router with ID (20.20.20.5) (Process ID 1)

 Type-5 AS External

LS age: 612
Options: (No TOS-capability, No DC, E)
LS type: Type-5 AS External
Link State ID: 12.12.12.2
Advertising Router: 20.31.3.1
LS Seq Number: 0x80000007
Checksum: 0x4cde
Length: 36
Network Mask: /32
 Metrics Type: 2
 TOS: 0
 Metrics: 25
 Forward Address: 0.0.0.0
 External Route Tag: 43
```

```

LS age: 1868
Options: (No TOS-capability, DC)
LS type: Type-5 AS External
Link State ID: 24.216.12.0
Advertising Router: 20.20.20.8
LS Seq Number: 0x80000005
Checksum: 0xa00e
Length: 36
Network Mask: /24
 Metrics Type: 2
 TOS: 0
 Metrics: 1
 Forward Address: 0.0.0.0
 External Route Tag: 701
Dell#

```

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

# show ip ospf database network

Display the network (type 2) LSA information.

## C9000 Series

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database network [link-state-id]
[adv-router ip-address]
```

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                         |
| <b>vrf <i>vrf-name</i></b>          | Enter the keyword <code>vrf</code> and the name of the VRF to view the network LSA information corresponding to an OSPF process that is tied to a specific VRF                                                                                                                                                                                                             |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b>adv-router <i>ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                            |

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |

| Version | Description                           |
|---------|---------------------------------------|
| 7.8.1.0 | Added support for Multi-Process OSPF. |
| 7.6.1.0 | Introduced on the S-Series.           |
| 7.5.1.0 | Introduced on the C-Series.           |
| 6.1.1.1 | Introduced on the E-Series.           |

## Usage Information

The following describes the `show ip ospf process-id database network` command shown in the following example.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Checksum</b>           | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Length</b>             | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Network Mask</b>       | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Attached Router</b>    | Identifies the IP address of routers attached to the network.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example

```
Dell#show ip ospf 1 data network

 OSPF Router with ID (20.20.20.5) (Process ID 1)

 Network (Area 0.0.0.0)
 LS age: 1372
 Options: (No TOS-capability, DC, E)
 LS type: Network
 Link State ID: 202.10.10.2
 Advertising Router: 20.20.20.8
 LS Seq Number: 0x80000006
 Checksum: 0xa35
 Length: 36
 Network Mask: /24
 Attached Router: 20.20.20.8
 Attached Router: 20.20.20.9
 Attached Router: 20.20.20.7

 Network (Area 0.0.0.1)

 LS age: 252
 Options: (TOS-capability, No DC, E)
 LS type: Network
 Link State ID: 192.10.10.2
 Advertising Router: 192.10.10.2
 LS Seq Number: 0x80000007
 Checksum: 0x4309
 Length: 36
```

```
Network Mask: /24
 Attached Router: 192.10.10.2
 Attached Router: 20.20.20.1
 Attached Router: 20.20.20.5
Dell#
```

**Related Commands** [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database nssa-external

Display NSSA-External (type 7) LSA information.

### C9000 Series

|                        |                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show ip ospf [process-id { vrf vrf-name] database nssa-external [link-state-id] [adv-router ip-address]</code>                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>      | <b><i>process-id</i></b>                                                                                                                                                                                                                                   | Enter the OSPF Process ID to view a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                     |
|                        | <b><i>vrf vrf-name</i></b>                                                                                                                                                                                                                                 | Enter the keyword <code>vrf</code> followed by the name of the VRF to view NSSA-External LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                             |
|                        | <b><i>link-state-id</i></b>                                                                                                                                                                                                                                | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
|                        | <b><i>adv-router ip-address</i></b>                                                                                                                                                                                                                        | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                        |
| <b>Command Modes</b>   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |                                                                                                                                                                                                                                                                                                                                                                        |

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

**Related Commands** [show ip ospf database](#) — displays OSPF database information.

# show ip ospf database opaque-area

Display the opaque-area (type 10) LSA information.

## C9000 Series

|               |                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                        |

|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

|                   |                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Information | <p>The following describes the <code>show ip ospf <i>process-id</i> database opaque-area</code> command shown in the following example.</p>                                                                                                                                   |
| Item              | Description                                                                                                                                                                                                                                                                   |
| LS Age            | Displays the LSA's age.                                                                                                                                                                                                                                                       |
| Options           | <p>Displays the optional capabilities available on router. The following options can be found in this item:</p> <ul style="list-style-type: none"><li>TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li></ul> |

| Item                      | Description                                                                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | <ul style="list-style-type: none"> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                         |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                      |
| <b>Advertising Router</b> | Identifies the advertising router's ID.                                                                                                                                                                                                                          |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                   |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                         |
| <b>Opaque Type</b>        | Displays the Opaque type field (the first 8 bits of the Link State ID).                                                                                                                                                                                          |
| <b>Opaque ID</b>          | Displays the Opaque type-specific ID (the remaining 24 bits of the Link State ID).                                                                                                                                                                               |

### Example

```
Dell1>show ip ospf 1 database opaque-area

 OSPF Router with ID (3.3.3.3) (Process ID 1)
 Type-10 Opaque Link Area (Area 0)

LS age: 1133
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.1
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000416
Checksum: 0x376
Length: 28
Opaque Type: 1
Opaque ID: 1
Unable to display opaque data

LS age: 833
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.2
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000002
Checksum: 0x19c2
--More--
```

### Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database opaque-as

Display the opaque-as (type 11) LSA information.

### C9000 Series

|                   |                                                                                                                                              |                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show ip ospf [<i>process-id</i>   vrf <i>vrf-name</i>] database opaque-as [<i>link-state-id</i>] [<i>adv-router ip-address</i>]</code> |                                                                                                                                    |
| <b>Parameters</b> | <b><i>process-id</i></b>                                                                                                                     | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
|                   | <b><i>vrf vrf-name</i></b>                                                                                                                   | Enter the keyword <code>vrf</code> and the name of the VRF to view LSA information tied to the specific VRF.                       |

|                                     |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                            |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                    |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                                    |

**Related Commands**

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database opaque-link

Display the opaque-link (type 9) LSA information.

### C9000 Series

**Syntax**

```
show ip ospf [process-id] vrf vrf-name] database opaque-link [link-state-id] [adv-router ip-address]
```

|                   |                             |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>process-id</i></b>    | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                         |
|                   | <b><i>vrf vrf-name</i></b>  | Enter the keyword <code>vrf</code> and the name of the VRF to view opaque-link LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                           |
|                   | <b><i>link-state-id</i></b> | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |

**adv-router ip-address** (OPTIONAL) Enter the keywords `adv-router` then the IP address of an Advertising Router to display only the LSA information about that router.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

**Related Commands** [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database router

Display the router (type 1) LSA information.

### C9000 Series

**Syntax** `show ip ospf [process-id| vrf vrf-name]database router [link-state-id] [adv-router ip-address]`

**Parameters**

**process-id** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

**vrf vrf-name** Enter the keyword `vrf` and the name of the VRF to view the router LSA information corresponding to the OSPF process that is tied to a specific VRF.

**link-state-id** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:

- the network's IP address for Type 3 LSAs or Type 5 LSAs
- the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

**adv-router ip-address** (OPTIONAL) Enter the keywords `adv-router` followed by the IP address of an Advertising Router to display only the LSA information about that router.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

#### Usage Information

The following describes the `show ip ospf process-id database router` command shown in the following example.

| Item                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age               | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options              | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"><li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li><li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li><li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li></ul> |
| LS Type              | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Link State ID        | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Advertising Router   | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LS Seq Number        | Displays the link state sequence number. This number detects duplicate or old LSAs.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Checksum             | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Length               | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Number of Links      | Displays the number of active links to the type of router (Area Border Router or AS Boundary Router) listed in the previous line.                                                                                                                                                                                                                                                                                                                                                              |
| Link connected to:   | Identifies the type of network to which the router is connected.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| (Link ID)            | Identifies the link type and address.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| (Link Data)          | Identifies the router interface address.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Number of TOS Metric | Lists the number of TOS metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TOS 0 Metric         | Lists the number of TOS 0 metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### Example

```
Dell#show ip ospf 100 database router
 OSPF Router with ID (1.1.1.10) (Process ID 100)
```

```

Router (Area 0)

LS age: 967
Options: (No TOS-capability, No DC, E)
LS type: Router
Link State ID: 1.1.1.10
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000012f
Checksum: 0x3357
Length: 144
AS Boundary Router
Area Border Router
 Number of Links: 10

 Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.129.1
 (Link Data) Router Interface address: 192.68.129.1
 Number of TOS metric: 0
 TOS 0 Metric: 1

 Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.130.1
 (Link Data) Router Interface address: 192.68.130.1
 Number of TOS metric: 0
 TOS 0 Metric: 1

 Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.142.2
 (Link Data) Router Interface address: 192.68.142.2
 Number of TOS metric: 0
 TOS 0 Metric: 1

 Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.141.2
 (Link Data) Router Interface address: 192.68.141.2
 Number of TOS metric: 0
 TOS 0 Metric: 1

 Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.140.2
 (Link Data) Router Interface address: 192.68.140.2
 Number of TOS metric: 0
 TOS 0 Metric: 1

 Link connected to: a Stub Network
 (Link ID) Network/subnet number: 11.1.5.0

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database summary

Display the network summary (type 3) LSA routing information.

## C9000 Series

### Syntax

```
show ip ospf [process-id|vrf vrf-name]database summary [link-state-id]
[adv-router ip-address]
```

### Parameters

- |                            |                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                           |
| <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> and the name of the VRF to view LSA routing information corresponding to the OSPF process that is tied to a specific VRF. |

|                                     |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> then the IP address of an Advertising Router to display only the LSA information about that router.                                                                                                                                                                                                                  |

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                    |
| <b>6.1.1.1</b>  | Introduced on the E-Series.                                    |

**Usage Information**

The following describes the `show ip ospf process-id database summary` command shown in the following example.

| Item                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>LS Seq Number</b>      | Displays the link state sequence number. This number allows you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Checksum</b>           | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Item          | Description                                            |
|---------------|--------------------------------------------------------|
| <b>TOS</b>    | Displays the TOS options. Option 0 is the only option. |
| <b>Metric</b> | Displays the LSA metrics.                              |

#### Example

```
Dell#show ip ospf 100 database summary

 OSPF Router with ID (1.1.1.10) (Process ID 100)

 Summary Network (Area 0.0.0.0)

LS age: 1551
Options: (No TOS-capability, DC, E)
LS type: Summary Network
Link State ID: 192.68.16.0
Advertising Router: 192.168.17.1
LS Seq Number: 0x80000054
Checksum: 0xb5a2
Length: 28
Network Mask: /24
 TOS: 0 Metric: 1

LS age: 9
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.32.0
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000016
Checksum: 0x987c
Length: 28
Network Mask: /24
 TOS: 0 Metric: 1

LS age: 7
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.33.0
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000016
Checksum: 0x1241
Length: 28
Network Mask: /26
 TOS: 0 Metric: 1
```

#### Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf interface

Display the OSPF interfaces configured. If OSPF is not enabled on the switch, no output is generated.

### C9000 Series

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] interface [interface]
```

#### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword *vrf* and the name of the VRF to view the OSPF processes that are tied to a specific VRF.
- interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:
  - For the null interface, enter the keyword *null* then zero (0).

- For loopback interfaces, enter the keyword `loopback` then a number from 0 to 16383.
- For tunnel interfaces, enter the keyword `tunnel` then a number from 0 to 16383.
- For Port Channel groups, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then the VLAN ID. The range is from 1 to 4094.
- For a port extender (PE) Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id* / *stack-unit* / *port-id* information.
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id* / *stack-unit* / *port-id* information. The *pe-id* range is from 0 to 255; the *stack-unit unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.4(0.0)</b>   | Added support for VRF on all platforms (Except MXL and STOMP).    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                          |
| <b>7.8.1.0</b>    | Added support for Multi-Process OSPF.                             |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                       |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                       |
| <b>6.1.1.1</b>    | Introduced on the E-Series.                                       |

**Usage Information** The following describes the `show ip ospf process-id interface` command shown in the following example.

| Item                         | Description                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TenGigabitEthernet...</b> | This line identifies the interface type slot/port and the status of the OSPF protocol on that interface.                                    |
| <b>Internet Address...</b>   | This line displays the IP address, network mask and area assigned to this interface.                                                        |
| <b>Process ID...</b>         | This line displays the OSPF Process ID, Router ID, Network type and cost metric for this interface.                                         |
| <b>Transmit Delay...</b>     | This line displays the interface's settings for Transmit Delay, State, and Priority. In the State setting, BDR is Backup Designated Router. |

| Item                        | Description                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Designated Router...</b> | This line displays the ID of the Designated Router and its interface address.                                                           |
| <b>Backup Designated...</b> | This line displays the ID of the Backup Designated Router and its interface address.                                                    |
| <b>Timer intervals...</b>   | This line displays the interface's timer settings for Hello interval, Dead interval, Transmit Delay (Wait), and Retransmit Interval.    |
| <b>Hello due...</b>         | This line displays the amount time until the next Hello packet is sent out this interface.                                              |
| <b>Neighbor Count...</b>    | This line displays the number of neighbors and adjacent neighbors. Listed below this line are the details about each adjacent neighbor. |

### Example

```
Dell>show ip ospf int

TenGigabitEthernet 1/17 is up, line protocol is up
 Internet Address 192.168.1.2/30, Area 0.0.0.1
 Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
 Transmit Delay is 1 sec, State DR, Priority 1
 Designated Router (ID) 192.168.253.2, Interface address 192.168.1.2
 Backup Designated Router (ID) 192.168.253.1, Interface address
192.168.1.1
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Neighbor Count is 1, Adjacent neighbor count is 1
 Adjacent with neighbor 192.168.253.1 (Backup Designated Router)

TenGigabitEthernet 1/23 is up, line protocol is up
 Internet Address 192.168.0.1/24, Area 0.0.0.1
 Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
 Transmit Delay is 1 sec, State DROTHER, Priority 1
 Designated Router (ID) 192.168.253.5, Interface address 192.168.0.4
 Backup Designated Router (ID) 192.168.253.3, Interface address
192.168.0.2
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:08
 Neighbor Count is 3, Adjacent neighbor count is 2
 Adjacent with neighbor 192.168.253.5 (Designated Router)
 Adjacent with neighbor 192.168.253.3 (Backup Designated Router)

Loopback 0 is up, line protocol is up
 Internet Address 192.168.253.2/32, Area 0.0.0.1
 Process ID 1, Router ID 192.168.253.2, Network Type LOOPBACK, Cost: 1
 Loopback interface is treated as a stub Host.
Dell>
```

## show ip ospf neighbor

Display the OSPF neighbors connected to the local router.

### C9000 Series

|                      |                                                                  |                                                                                                                                               |
|----------------------|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | show ip ospf [ <i>process-id</i>  vrf <i>vrf-name</i> ] neighbor |                                                                                                                                               |
| <b>Parameters</b>    | <b><i>process-id</i></b>                                         | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.            |
|                      | <b><i>vrf vrf-name</i></b>                                       | Enter the keyword <i>vrf</i> and the name of the VRF to view information corresponding to the OSPF neighbors that are tied to a specific VRF. |
| <b>Command Modes</b> | EXEC Privilege                                                   |                                                                                                                                               |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 6.1.1.1  | Introduced on the E-Series.                                    |

## Usage Information

The following describes the `show ip ospf process-id neighbor` command shown in the following example.

| Item        | Description                                                             |
|-------------|-------------------------------------------------------------------------|
| Neighbor ID | Displays the neighbor router ID.                                        |
| Pri         | Displays the priority assigned neighbor.                                |
| State       | Displays the OSPF state of the neighbor.                                |
| Dead Time   | Displays the expected time until the system declares the neighbor dead. |
| Address     | Displays the IP address of the neighbor.                                |
| Interface   | Displays the interface type slot/port information.                      |
| Area        | Displays the neighbor's area (process ID).                              |

## Example

```
Dell#show ip ospf 34 neighbor

Neighbor ID Pri State Dead Time Address Interface Area
20.20.20.7 1 FULL/DR 00:00:32 182.10.10.3 Te 0/0 0.0.0.2
192.10.10.2 1 FULL/DR 00:00:37 192.10.10.2 Te 0/1 0.0.0.1
20.20.20.1 1 FULL/DROTHER 00:00:36 192.10.10.4 Te 0/1 0.0.0.1
Dell#
```

# show ip ospf routes

Display routes OSPF calculates and stores in OSPF RIB.

## C9000 Series

### Syntax

```
show ip ospf [process-id|vrf vrf-name] routes
```

### Parameters

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>process-id</b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                               |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> and the name of the VRF to view the OSPF RIB information corresponding to the OSPF processes that are tied to a specific VRF. |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series and E-Series.                       |

**Usage Information** This command is useful in isolating routing problems between the OSPF and the RTM. For example, if a route is missing from the RTM/FIB but is visible from the display output of this command, the problem is with downloading the route to the RTM.

This command has the following limitations:

- The display output is sorted by prefixes; intra-area ECMP routes are not displayed together.
- For Type 2 external routes, Type 1 cost is not displayed.

#### Example

```
Dell#show ip ospf 100 route

Prefix Cost Nexthop Interface Area Type
1.1.1.1 1 0.0.0.0 Lo 0 0 Intra-Area
3.3.3.3 2 13.0.0.3 Te 0/47 1 Intra-Area
13.0.0.0 1 0.0.0.0 Te 0/47 0 Intra-Area
150.150.150.0 2 13.0.0.3 Te 0/47 - External
172.30.1.0 2 13.0.0.3 Te 0/47 1 Intra-Area
Dell#
```

## show ip ospf statistics

Display OSPF statistics.

### C9000 Series

**Syntax** `show ip ospf [process-id | vrf vrf-name] statistics global | [interface name {neighbor router-id}]`

**Parameters**

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword `vrf` and the name of the VRF to display statistics corresponding to the OSPF process that is tied to a specific VRF.
- global*** Enter the keyword `global` to display the packet counts received on all running OSPF interfaces and packet counts OSPF neighbors receive and transmit.

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface <i>name</i></b>     | (OPTIONAL) Enter the keyword <code>interface</code> then one of the following interface keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>For a Null interface, enter the keywords <code>null 0</code>.</li><li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID. The range is from 1 to 16383.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>neighbor <i>router-id</i></b> | (OPTIONAL) Enter the keyword <code>neighbor</code> then the neighbor's router-id in dotted decimal format (A.B.C.D.).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                    |
|----------|----------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                       |
| 9.4(0.0) | Added support for VRF on all platforms (Except MXL and STOMP). |
| 9.2(1.0) | Introduced on the Z9500.                                       |
| 8.3.19.0 | Introduced on the S4820T.                                      |
| 8.3.11.1 | Introduced on the Z9000.                                       |
| 8.3.7.0  | Introduced on the S4810.                                       |
| 7.9.1.0  | Added support for VRF on E-Series.                             |
| 7.8.1.0  | Added support for Multi-Process OSPF.                          |
| 7.6.1.0  | Introduced on the S-Series.                                    |
| 7.5.1.0  | Introduced on the C-Series.                                    |
| 7.4.1.0  | Introduced on the E-Series.                                    |

**Usage Information**

The following describes the `show ip ospf statistics process-id` global command shown in the following example.

| Row Heading | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| Total       | Displays the total number of packets the OSPF process receives/transmits.              |
| Error       | Displays the error count while receiving and transmitting packets by the OSPF process. |
| Hello       | Number of OSPF Hello packets.                                                          |
| DDiscr      | Number of database description packets.                                                |
| LSReq       | Number of link state request packets.                                                  |

| Row Heading    | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>LSUpd</b>   | Number of link state update packets.                                                                                    |
| <b>LSAck</b>   | Number of link state acknowledgement packets.                                                                           |
| <b>TxQ-Len</b> | The transmission queue length.                                                                                          |
| <b>RxQ-Len</b> | The reception queue length.                                                                                             |
| <b>Tx-Mark</b> | The highest number mark in the transmission queue.                                                                      |
| <b>Rx-Mark</b> | The highest number mark in the reception queue.                                                                         |
| <b>Hello-Q</b> | The queue, for transmission or reception, for the hello packets.                                                        |
| <b>LSR-Q</b>   | The queue, for transmission or reception, for the link state request packets.                                           |
| <b>Other-Q</b> | The queue, for transmission or reception, for the link state acknowledgement, database description, and update packets. |

The following describes the error definitions for the `show ip ospf statistics process-id global` command.

| Error Type          | Description                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <b>Intf_Down</b>    | Received packets on an interface that is either down or OSPF is not enabled.                        |
| <b>Non-Dr</b>       | Received packets with a destination address of ALL_DRS even though SELF is not a designated router. |
| <b>Self-Org</b>     | Receive the self originated packet.                                                                 |
| <b>Wrong_Len</b>    | The received packet length is different to what was indicated in the OSPF header.                   |
| <b>Invld-Nbr</b>    | LSA, LSR, LSU, and DDB are received from a peer which is not a neighbor peer.                       |
| <b>Nbr-State</b>    | LSA, LSR, and LSU are received from a neighbor with stats less than the loading state.              |
| <b>Auth-Error</b>   | Simple authentication error.                                                                        |
| <b>MD5-Error</b>    | MD5 error                                                                                           |
| <b>Cksum-Err</b>    | Checksum Error                                                                                      |
| <b>Version</b>      | Version mismatch                                                                                    |
| <b>AreaMismatch</b> | Area mismatch                                                                                       |
| <b>Conf-Issue</b>   | The received hello packet has a different hello or dead interval than the configuration.            |
| <b>No-Buffer</b>    | Buffer allocation failure.                                                                          |
| <b>Seq-no</b>       | A sequence no errors occurred during the database exchange process.                                 |
| <b>Socket</b>       | Socket Read/Write operation error.                                                                  |
| <b>Q-overflow</b>   | Packets dropped due to queue overflow.                                                              |
| <b>Unknown-Pkt</b>  | Received packet is not an OSPF packet.                                                              |
| <b>RtidZero</b>     | Received router-ID (0.0.0.0) from peer.                                                             |

#### Example

```

ell#show ip ospf 1 statistics
Interface TenGigabitEthernet 0/0
 Error packets (Receive statistics)
 Intf-Down 0 Non-Dr 0 Self-Org 0
 Wrong-Len 0 Invld-Nbr 0 Nbr-State 0
 Auth-Error 0 MD5-Error 0 Cksum-Err 0
 Version 0 AreaMisMatch 0 Conf-Issue 0
 SeqNo-Err 0 Unknown-Pkt 0 Bad-LsReq 0
 RtidZero 0
 Neighbor ID 1.2.1.1
 Packet Statistics
 Hello DDiscr LSReq LSUpd LSAck

```

```

 RX 130 2 1 3 3
 TX 144 2 1 3 2
 Timers
 Hello 6 Wait 0 Grace 0
 Dead 38 Transmit 0
 Queue Statistics

```

## Usage Information

The `show ip ospf process-id statistics` command displays the error packet count received on each interface as:

- The hello-timer remaining value for each interface
- The wait-timer remaining value for each interface
- The grace-timer remaining value for each interface
- The packet count received and transmitted for each neighbor
- Dead timer remaining value for each neighbor
- Transmit timer remaining value for each neighbor
- The LSU Q length and its highest mark for each neighbor
- The LSR Q length and its highest mark for each neighbor

## Example (Statistics)

```

Dell#show ip ospf 100 statistics

Interface TenGigabitEthernet 0/8

 Hello-Timer 9, Wait-Timer 0, Grace-Timer 0
 Error packets (Only for RX)

 Intf-Down 0 Non-Dr 0 Self-Org 0
 Wrong-Len 0 Invld-Nbr 0 Nbr-State 0
 Auth-Error 0 MD5-Error 0 Cksum-Err 0
 Version 0 AreaMisMatch 0 Conf-Issue 0
 SeqNo-Err 0 Unkown-Pkt 0

 Neighbor ID 9.1.1.2

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                    |
|-----------------|----------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                       |
| <b>9.4(0.0)</b> | Added support for VRF on all platforms (Except MXL and STOMP). |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                       |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                       |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF.                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>  | Introduced on the C-Series and E-Series.                       |

## Usage Information

To isolate problems with inter-area and external routes, use this command. In OSPF inter-area and external routes are calculated by adding LSA cost to the cost of reaching the router. If an inter-area or external route is not of correct cost, the display can determine if the path to the originating router is correct or not.

## Example

```
Dell#show ip ospf 1 topology

Router ID Flags Cost Nexthop Interface Area
3.3.3.3 E/B/-/ 1 20.0.0.3 Te 13/1 0
1.1.1.1 E/-/-/ 1 10.0.0.1 Te 7/1 1
Dell#
```

# summary-address

To advertise one external route, set the OSPF ASBR.

## C9000 Series

### Syntax

`summary-address ip-address mask [not-advertise] [tag tag-value]`

To disable summary address, use the `no summary-address ip-address mask` command.

### Parameters

|                             |                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>    | Specify the IP address in dotted decimal format of the address to summarize.                                                                        |
| <b><i>mask</i></b>          | Specify the mask in dotted decimal format of the address to summarize.                                                                              |
| <b><i>not-advertise</i></b> | (OPTIONAL) Enter the keywords <code>not-advertise</code> to suppress that match the network prefix/mask pair.                                       |
| <b><i>tag tag-value</i></b> | (OPTIONAL) Enter the keyword <code>tag</code> then a value to match on routes redistributed through a route map. The range is from 0 to 4294967295. |

### Defaults

Not configured.

### Command Modes

ROUTER OSPF

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                           |
|-----------------|---------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.              |
| <b>8.3.19.0</b> | Introduced on the S4820T.             |
| <b>8.3.11.1</b> | Introduced on the Z9000.              |
| <b>8.3.7.0</b>  | Introduced on the S4810.              |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.           |
| <b>6.1.1.1</b>  | Introduced on the E-Series.           |

#### Usage Information

The `area range` command summarizes routes for the different areas.

With the `not-advertise` parameter configured, you can use this command to filter out some external routes. For example, if you want to redistribute static routes to OSPF, but you don't want OSPF to advertise routes with prefix 1.1.0.0, you can configure the `summary-address 1.1.0.0 255.255.0.0 not-advertise` to filter out all the routes fall in range 1.1.0.0/16.

#### Related Commands

[area range](#) — summarizes routes within an area.

## timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

#### Syntax

```
timers spf delay holdtime msec
```

To return to the default, use the `no timers spf` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>delay</i></b>    | Enter a number as the delay. The range is from 0 to 2147483647. The default is <b>5 seconds</b> .                                                                                                                                                                                            |
| <b><i>holdtime</i></b> | Enter a number as the hold time. The range is from 0 to 2147483647. The default is <b>10 seconds</b> .                                                                                                                                                                                       |
| <b><i>msec</i></b>     | Enter the keyword <code>msec</code> to specify the time interval value in milli seconds.<br> <b>NOTE:</b> If you do not specify the <code>msec</code> option, the timer values are considered as seconds. |

#### Defaults

- delay = 5 seconds
- holdtime = 10 seconds

**Command Modes** ROUTER OSPFv2

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                |
|------------------|--------------------------------------------|
| <b>9.11.0.0</b>  | Introduced the keyword <code>msec</code> . |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.  |
| <b>9.10(0.0)</b> | Introduced on the S3148.                   |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.            |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.                |

| Version            | Description                           |
|--------------------|---------------------------------------|
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.           |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.           |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.           |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.              |
| <b>9.0.2.0</b>     | Introduced on the S6000.              |
| <b>8.3.19.0</b>    | Introduced on the S4820T.             |
| <b>8.3.11.1</b>    | Introduced on the Z9000.              |
| <b>8.3.7.0</b>     | Introduced on the S4810.              |
| <b>7.8.1.0</b>     | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>     | Introduced on the S-Series.           |
| <b>7.5.1.0</b>     | Introduced on the C-Series.           |
| <b>pre-6.1.1.1</b> | Introduced on the E-Series.           |

#### Usage Information

Setting the *delay* and *holdtime* parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

#### Example

```
DellEMC# conf
DellEMC(conf)# router ospf 1
DellEMC(conf-router_ospf-1)# timer spf 2 5 msec
DellEMC(conf-router_ospf-1)# show config
!
router ospf 1
timers spf 2 5 msec
DellEMC(conf-router_ospf-1)# end
```

## timers throttle lsa all

Configure LSA transmit intervals.

### C9000 Series

#### Syntax

`timers throttle lsa all {start-interval | hold-interval | max-interval}`

To return to the default, use the `no timers throttle lsa` command.

#### Parameters

|                       |                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>start-interval</b> | Set the minimum interval between initial sending and resending the same LSA. The range is from 0 to 600,000 milliseconds.                                                                    |
| <b>hold-interval</b>  | Set the next interval to send the same LSA. This interval is the time between sending the same LSA after the start-interval has been attempted. The range is from 1 to 600,000 milliseconds. |
| <b>max-interval</b>   | Set the maximum amount of time the system waits before sending the LSA. The range is from 1 to 600,000 milliseconds.                                                                         |

#### Defaults

- start-interval: **0 msec**
- hold-interval: **5000 msec**
- max-interval: **5000 msec**

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.8.0  | Introduced on the S4810.  |

**Usage  
Information**

LSAs are sent after the start-interval and then after hold-interval until the maximum interval is reached. In throttling, exponential backoff is used when sending same LSA, so that the interval is multiplied until the maximum time is reached. For example, if the *start-interval 5000* and *hold-interval 1000* and *max-interval 100,000*, the LSA is sent at 5000 msec, then 1000 msec, then 2000 msec, then 4000 until 100,000 msec is reached.

## timers throttle lsa arrival

Configure the LSA acceptance intervals.

### C9000 Series

**Syntax**

```
timers throttle lsa arrival arrival-time
```

To return to the default, use the `no timers throttle lsa` command.

**Parameters**

***arrival-time***

Set the interval between receiving the same LSA repeatedly, to allow sufficient time for the system to accept the LSA. The range is from 0 to 600,000 milliseconds.

**Defaults**

**1000 msec**

**Command Modes**

ROUTER OSPF

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.2(1.0) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.8.0  | Introduced on the S4810.  |

## OSPFv3 Commands

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) remain unchanged. However, OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis. Most changes were necessary to handle the increased address size of IPv6.

The Dell Networking implementation of OSPFv3 is based on IETF RFC 2740.

# area authentication

Configure an IPsec authentication policy for OSPFv3 packets in an OFSPFv3 area.

## C9000 Series

| Syntax            | <code>area <i>area-id</i> authentication ipsec spi <i>number</i> {MD5   SHA1} [<i>key-encryption-type</i>] <i>key</i></code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                             |         |             |          |                          |          |                          |           |                                    |          |                           |         |                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|--------------------------|----------|--------------------------|-----------|------------------------------------|----------|---------------------------|---------|---------------------------------------|
| Parameters        | <b>area <i>area-id</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Area for which OSPFv3 traffic is to be authenticated. For <i>area-id</i> , you can enter a number.<br><br>The range is from 0 to 4294967295.                                                                                                                |         |             |          |                          |          |                          |           |                                    |          |                           |         |                                       |

| 8.3.19.0          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                             |         |             |          |                          |          |                          |           |                                    |          |                           |         |                                       |
| 8.4.2.0           | Introduced on the E-Series TeraScale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                             |         |             |          |                          |          |                          |           |                                    |          |                           |         |                                       |
| Usage Information | <p>Before you enable IPsec authentication on an OSPFv3 area, you must first enable OSPFv3 globally on the router. Configure the same authentication policy (same SPI and key) on each interface in an OSPFv3 link.</p> <p>An SPI number must be unique to one IPsec security policy (authentication or encryption) on the router.</p> <p>If you have enabled IPsec encryption in an OSPFv3 area with the <code>area encryption</code> command, you cannot use the <code>area authentication</code> command in the area at the same time.</p> <p>The configuration of IPsec authentication on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area authentication policy that has been configured is applied to the interface.</p> <p>To remove an IPsec authentication policy from an OSPFv3 area, enter the <code>no area <i>area-id</i> authentication spi <i>number</i></code> command.</p> |                                                                                                                                                                                                                                                             |         |             |          |                          |          |                          |           |                                    |          |                           |         |                                       |

**Related  
Commands**

[ipv6 ospf authentication](#) – configures an IPsec authentication policy on an OSPFv3 interface.  
[show crypto ipsec policy](#) – displays the configuration of IPsec authentication policies.

## area encryption

Configure an IPsec encryption policy for OSPFv3 packets in an OSPFv3 area.

### C9000 Series

**Syntax**

```
area area-id encryption ipsec spi number esp encryption-algorithm [key-encryption-type] key authentication-algorithm [key-encryption-type] key
```

**Parameters**

|                                 |                                                                                                                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>area <i>area-id</i></b>      | Area for which OSPFv3 traffic is to be encrypted. For <i>area-id</i> , enter a number.<br>The range is from 0 to 4294967295.                                                                                                                        |
| <b>ipsec spi <i>number</i></b>  | Security Policy index (SPI) value that identifies an IPsec security policy.<br>The range is from 256 to 4294967295.                                                                                                                                 |
| <b>esp encryption-algorithm</b> | Encryption algorithm used with ESP.<br>Valid values are: 3DES, DES, AES-CBC, and NULL.<br>For AES-CBC, only the AES-128 and AES-192 ciphers are supported.                                                                                          |
| <b>key-encryption-algorithm</b> | (OPTIONAL) Specifies if the key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                                    |
| <b>key</b>                      | Text string used in encryption.<br>The required lengths of a non-encrypted or encrypted key are:<br>3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.            |
| <b>authentication-algorithm</b> | Specifies the authentication algorithm to use for encryption.<br>Valid values are MD5 or SHA1.                                                                                                                                                      |
| <b>key-encryption-type</b>      | (OPTIONAL) Specifies if the authentication key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                     |
| <b>key</b>                      | Text string used in authentication.<br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).<br>For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted). |
| <b>null</b>                     | Causes an encryption policy configured for the area to not be inherited on the interface.                                                                                                                                                           |

**Defaults**

Not configured.

**Command Modes**

ROUTER OSPFv3

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.              |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.              |
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.    |
| <b>8.4.2.0</b>   | Introduced on the E-Series TeraScale. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |

## Usage Information

Before you enable IPsec encryption on an OSPFv3 interface, first enable OSPFv3 globally on the router. Configure the same encryption policy (same SPI and keys) on each interface in an OSPFv3 link.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router.

When you configure encryption for an OSPFv3 area with the `area encryption` command, you enable both IPsec encryption and authentication. However, when you enable authentication on an area with the `area authentication` command, you do not enable encryption at the same time.

If you have enabled IPsec authentication in an OSPFv3 area with the `area authentication` command, you cannot use the `area encryption` command in the area at the same time.

The configuration of IPsec encryption on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area encryption policy that has been configured is applied to the interface.

To remove an IPsec encryption policy from an interface, enter the `no area area-id encryption spi number` command.

## Related Commands

[ipv6 ospf encryption](#) – configures an IPsec encryption policy on an OSPFv3 interface.

[show crypto ipsec policy](#) – display the configuration of IPsec encryption policies.

# area nssa

Specify an area as a not so stubby area (NSSA).

**Syntax** `area area-id nssa [default-information-originate] [no-redistribution] [no-summary]`

To delete an NSSA, use the `no area area-id nssa` command.

## Parameters

|                                      |                                                                                                                                                                                                                              |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>area-id</b>                       | Specify the OSPF area by entering a number from zero (0) to 65535.                                                                                                                                                           |
| <b>no-redistribution</b>             | (OPTIONAL) Specify that the <code>redistribute</code> command does not distribute routes into the NSSA. This command can be used when the router is an autonomous system boundary router (ASBR) or area border router (ABR). |
| <b>default-information-originate</b> | (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.                                                                                                                         |
| <b>no-summary</b>                    | (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.                                                                                                                                                        |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                 |
|------------------|---------------------------------------------|
| <b>9.13(0.0)</b> | Introduced on the remaining DNOS platforms. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.   |
| <b>9.10(0.0)</b> | Introduced on the S3148.                    |

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.               |

## area range

Summarize routes matching an address or mask at an area border router (ABR).

|                   |                                                                                                                                                                            |                                                                                                                                                                                                         |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax            | <code>area area-id range ip-address mask [not-advertise]</code><br><br>To disable route summarization, use the <code>no area area-id range ip-address mask</code> command. |                                                                                                                                                                                                         |
| Parameters        | <b>area-id</b>                                                                                                                                                             | For area-id, you can enter a number. The range is from 0 to 4294967295.                                                                                                                                 |
|                   | <b>ip-address</b>                                                                                                                                                          | Specify an IPv6 address.                                                                                                                                                                                |
|                   | <b>mask</b>                                                                                                                                                                | Specify a mask for the destination prefix.                                                                                                                                                              |
|                   | <b>not-advertise</b>                                                                                                                                                       | (OPTIONAL) Enter the keywords <code>not-advertise</code> to set the status to DoNotAdvertise (that is, the Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas). |
| Defaults          | Not configured                                                                                                                                                             |                                                                                                                                                                                                         |
| Command Modes     | ROUTER OSPFv3                                                                                                                                                              |                                                                                                                                                                                                         |
| Command History   | This guide is platform-specific. | <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                                                                            |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.7(0.1)</b> | Introduced on the S3048-ON.              |
| <b>9.7(0.1)</b> | Introduced on the S4048-ON.              |
| <b>9.7(0.0)</b> | Added support for VRF.                   |
| <b>9.0.0.0</b>  | Introduced on the Z9000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>8.2.1.0</b>  | Introduced on the E-Series ExaScale.     |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series. |
| <b>7.4.1.0</b>  | Introduced on the E-Series TeraScale.    |

## debug ipv6 ospf bfd

Display debug information and interface types for bidirectional forwarding detection (BFD) on OSPF IPv6 packets.

### C9000 Series

|                   |                                                   |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>[no] debug ipv6 ospf bfd [interface]</code> |                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b> | <b>interface</b>                                  | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a tunnel interface, enter the keyword `tunnel` then a number. The range is from 1 to 16383.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                 |
|------------------|---------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                    |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                    |
| <b>9.2.(0.0)</b> | Introduced on the S4820T, S4810, and Z9000. |

**Usage Information** The following section describes the command fields.

| Lines Beginning With or Including | Description                                                |
|-----------------------------------|------------------------------------------------------------|
| <b>OSPFv3...</b>                  | Debugging is on for all OSPFv3 packets and all interfaces. |
| <b>05:21:01</b>                   | Displays the time stamp.                                   |
| <b>Sending Ver:3</b>              | Sending OSPF3 version..                                    |

## debug ipv6 ospf packet

Display debug information and interface types on OSPF IPv6 packets.

**Syntax** `debug ipv6 ospf packet [interface] [vrf vrf-name] [detail]`

|                   |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>interface</i></b>    | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|                   | <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> to view debugging information on OSPF corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | <b><i>detail</i></b>       | Enter the keyword <code>detail</code> to view detailed debugging information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.13(0.0)</b>  | Added support for detailed debugging.     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.1.(0.0)</b>  | Introduced on the S4810 and Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version | Description                 |
|---------|-----------------------------|
| 7.8.1.0 | Added support for C-Series. |
| 7.4.1.0 | Introduced on E-Series.     |

## debug ipv6 ospf spf

Display debug information for SPF timers on OSPF IPv6 packets.

**Syntax** [no] debug ipv6 ospf spf

**Parameters** *interface* (OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following section describes the command fields.

| Lines<br>Beginning<br>With or<br>Including | Description                                                |
|--------------------------------------------|------------------------------------------------------------|
| OSPFv3...                                  | Debugging is on for all OSPFv3 packets and all interfaces. |
| 05:21:01                                   | Displays the time stamp.                                   |
| Sending Ver:3                              | Sending OSPF3 version..                                    |

Example

default-information originate

Configure the system to generate a default external route into an OSPFv3 routing domain.

C9000 Series

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |               |                                                                                                                       |                                   |                                                                                                                                            |                                      |                                                                                                                                                                                                                                                 |                                  |                                                                                                 |

| Version   | Description                        |
|-----------|------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.           |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |

|                  |                                                                                               |

# graceful-restart grace-period

Enable OSPFv3 graceful restart globally by setting the grace period (in seconds) that an OSPFv3 router’s neighbors continues to advertise the router as adjacent during a graceful restart.

## C9000 Series

| Syntax            | <code>graceful-restart grace-period seconds</code><br>To disable OSPFv3 graceful restart, enter <code>no graceful-restart grace-period</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                           |         |             |          |                          |          |                          |           |                                    |         |                                       |          |                           |

| 9.1.(0.0)         | Introduced on the S4810 and Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                           |         |             |          |                          |          |                          |           |                                    |         |                                       |          |                           |
| 8.4.2.2           | Introduced on the E-Series TeraScale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                           |         |             |          |                          |          |                          |           |                                    |         |                                       |          |                           |
| 8.3.19.0          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                           |         |             |          |                          |          |                          |           |                                    |         |                                       |          |                           |
| Usage Information | <p>By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.</p> <p>To enable OSPFv3 graceful restart, enter the <code>ipv6 router ospf</code> command to enter OSPFv3 configuration mode and then configure a grace period using the <code>graceful-restart grace-period</code> command. The grace period is the length of time that OSPFv3 neighbors continue to advertise the restarting router as though it is fully adjacent. When graceful restart is enabled (restarting role), an OSPFv3 restarting expects its OSPFv3 neighbors to help when it restarts by not advertising the broken link.</p> <p>When you enable the helper-reject role on an interface with the <code>ipv6 ospf graceful-restart helper-reject</code> command, you reconfigure OSPFv3 graceful restart to function in a “restarting-only” role. In a “restarting-only” role, OSPFv3 does not participate in the graceful restart of a neighbor.</p> |                                                                                                                                                           |         |             |          |                          |          |                          |           |                                    |         |                                       |          |                           |

# graceful-restart mode

Specify the type of events that trigger an OSPFv3 graceful restart.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.              |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.              |
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.    |
| <b>8.4.2.2</b>   | Introduced on the E-Series TeraScale. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>OSPFv3 graceful restart supports planned-only and/or unplanned-only restarts. The default is support for both planned and unplanned restarts.</p> <ul style="list-style-type: none"> <li>• A planned restart occurs when you enter the <code>redundancy force-failover rpm</code> command to force the primary RPM to switch to the backup RPM. During a planned restart, OSPF sends out a Type-11 Grace LSA before the system switches over to the backup RPM.</li> <li>• An unplanned restart occurs when an unplanned event causes the active RPM to switch to the backup RPM, such as when an active process crashes, the active RPM is removed, or a power failure happens. During an unplanned restart, OSPF sends out a Grace LSA when the backup RPM comes online.</li> </ul> <p>By default, both planned and unplanned restarts trigger an OSPFv3 graceful restart. Selecting one or the other mode restricts OSPFv3 to the single selected mode.</p> |

ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

C9000 Series

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>ipv6 neighbor{ipv6-address} {interface interface} {hardware_address}[vrf vrf-name]</pre> <p>To remove a static IPv6 entry from the IPv6 neighbor discovery, use the <code>no ipv6 neighboripv6-address{interface interface</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b> | <div> <div> <b>ipv6-address</b> </div> <div> Enter the IPv6 address of the neighbor in the x:x:x:x:x format. <div> <i>i</i> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zero. </div> </div> </div> <div> <div> <b>interface<br/>intehardware_rfa<br/>ce</b> </div> <div> Enter the keyword <code>interface</code> then the interface type and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul> </div> </div> |

- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a port extender Gigabit Ethernet interface, enter the keyword `peGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is from 1 to 48
- For a port extender 10-Gigabit Ethernet interface, enter the keyword `peTenGigE` then the *pe-id / stack-unit / port-id* information. The *pe-id* range is from 0 to 255; the stack-unit *unit-number* range is from 0 to 7; and the *port-id* range is 25 to 28 or 49 to 52 depending on the PE.

**hardware\_addresses** Enter a 48-bit hardware MAC address in nn:nn:nn:nn:nn:nn format.

**vrf vrf-name** (Optional) Enter the keyword `vrf` and the name of the VRF to install IPv6 routes in that VRF.

**Defaults** none

**Command Modes** CONFIGURATION  
CONFIGURATION TERMINAL BATCH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version           | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>9.13.0.1P1</b> | Introduced <code>peTenGigE</code> interface support on the C9010. |
| <b>9.10(0.0)</b>  | Introduced the Configuration Terminal Batch mode on C9010.        |
| <b>9.9(0.0)</b>   | Introduced on the C9010.                                          |
| <b>9.8(0.0)</b>   | Introduced on the S3048-ON and S4048-ON.                          |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON.                |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                          |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                         |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                          |
| <b>8.3.7.1</b>    | Introduced on the S4810.                                          |

**Usage Information** Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link
- Prefix discovery: Hosts can discover address prefixes for the link.
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination· Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link
- Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

Use the `ipv6 neighbor` command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

 **NOTE:** The parameters `vrf`, `mac-address`, `interface` are not supported in the batch mode.

## ipv6 ospf area

Enable IPv6 OSPF on an interface.

| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.                    |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                             |
| <b>7.4.1.0</b>   | Introduced on the E-Series and C-Series.              |

## ipv6 ospf authentication

Configure an IPsec authentication policy for OSPFv3 packets on an IPv6 interface.

### C9000 Series

|                   |                                                                                                        |                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ipv6 ospf authentication {null   ipsec spi number {MD5   SHA1} [key-encryption-type] key}</code> |                                                                                                                  |
| <b>Parameters</b> | <b><i>null</i></b>                                                                                     | Causes an authentication policy configured for the area to not be inherited on the interface.                    |
|                   | <b><i>ipsec spi number</i></b>                                                                         | Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295. |
|                   | <b><i>MD5   SHA1</i></b>                                                                               | Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).                                  |
|                   | <b><i>key-encryption-type</i></b>                                                                      | (OPTIONAL) Specifies if the key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted). |
|                   | <b><i>key</i></b>                                                                                      | Text string used in authentication.                                                                              |

For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                    |
|------------------|--------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.       |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.       |
| <b>9.1.(0.0)</b> | Introduced on S4810 and Z9000. |
| <b>8.4.2.0</b>   | Introduced on the E-Series.    |
| <b>8.3.19.0</b>  | Introduced on the S4820T.      |

**Usage Information** Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same authentication policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec authentication policy from an interface, enter the `no ipv6 ospf authentication spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf authentication null` command.

**Related Commands** [area authentication](#) – configures an IPsec authentication policy for an OSPFv3 area.  
[show crypto ipsec policy](#) – displays the configuration of IPsec authentication policies.

[show crypto ipsec sa ipv6](#) – displays the security associations set up for OSPFv3 interfaces in authentication policies.

## ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

### C9000 Series

**Syntax** `ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode..

|                   |                                  |                                                                                                                                                                                                         |
|-------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>disable</b>                   | (OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.                                                                                                                     |
|                   | <b>interval<br/>milliseconds</b> | (OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>200</b> .    |
|                   | <b>min_rx<br/>milliseconds</b>   | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is <b>200</b> . |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>multiplier <i>value</i></b> | Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                                                              |
| <b>role [active   passive]</b> | <p>Enter the role that the local system assumes:</p> <ul style="list-style-type: none"> <li>• <code>Active</code> — The active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <code>Passive</code> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> <p>The default is <b>Active</b>.</p> |

**Defaults** See Parameters

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                 |
|-----------------|---------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                    |
| <b>9.2.0.0</b>  | Introduced on the Z9000, S4820T, and S4810. |

**Usage Information** This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

## ipv6 ospf cost

Explicitly specify the cost of sending a packet on an interface.

### C9000 Series

**Syntax** `ipv6 ospf interface-cost`

**Parameters** ***interface-cost*** Enter an unsigned integer value expressed as the link-state metric. The range is from 1 to 65535.

**Defaults** Default cost based on the bandwidth.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                        |
|------------------|------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.           |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.           |
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000. |

| Version  | Description                 |
|----------|-----------------------------|
| 7.8.1.0  | Added support for C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |
| 8.3.19.0 | Introduced on the S4820T.   |

#### Usage Information

In general, the path cost is calculated as:

$10^8 / \text{bandwidth}$

Using this formula, the default path cost is calculated as:

- 10-Gigabit Ethernet—Default cost is 1
- 40-Gigabit Ethernet — Default cost is 1

## ipv6 ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the time interval elapses, the neighboring routers declare the router down.

### C9000 Series

#### Syntax

```
ipv6 ospf dead-interval seconds
```

To return to the default time interval, use the `no ipv6 ospf dead-interval` command.

#### Parameters

**seconds**

Enter the time interval in seconds. The range is from 1 to 65535 seconds.

#### Defaults

40 seconds (Ethernet).

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.           |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |
| 8.3.19.0  | Introduced on the S4820T.          |

#### Usage Information

By default, the dead interval is four times longer than the default hello-interval.

#### Related Commands

[ipv6 ospf hello-interval](#) – specifies the time interval between hello packets.

# ipv6 ospf encryption

Configure an IPsec encryption policy for OSPFv3 packets on an IPv6 interface.

|                   | <b>authentication-algorithm</b>                                                                                                                                          | Specifies the authentication algorithm to use for encryption. Valid values are MD5 or SHA1.                                                                                                                                                         |
|                   | <b>key-encryption-type</b>                                                                                                                                               | (OPTIONAL) Specifies if the authentication key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                     |
| <b>Defaults</b>   | <b>key</b>                                                                                                                                                               | Text string used in authentication.<br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).<br>For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted). |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.              |
| 9.2(1.0)  | Introduced on the Z9500.              |
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.4.2.0   | Introduced on the E-Series TeraScale. |
| 8.3.19.0  | Introduced on the S4820T.             |

## Usage Information

Before you enable IPsec encryption on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same encryption policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec encryption policy from an interface, enter the `no ipv6 ospf encryption spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf no ipv6 ospf encryption null` command.

## Related Commands

[area encryption](#) – configures an IPsec encryption policy for an OSPFv3 area.

[show crypto ipsec policy](#) – displays the configuration of IPsec encryption policies.

[show crypto ipsec sa ipv6](#) – displays the security associations set up for OSPFv3 interfaces in encryption policies.

# ipv6 ospf graceful-restart helper-reject

Configure an OSPFv3 interface to not act upon the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

## C9000 Series

### Syntax

```
ipv6 ospf graceful-restart helper-reject
```

To disable the helper-reject role, enter `no ipv6 ospf graceful-restart helper-reject`.

### Defaults

The helper-reject role is not configured.

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.           |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.4.2.2   | Introduced on E-Series TeraScale.  |
| 8.3.19.0  | Introduced on the S4820T.          |

## Usage Information

By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

The graceful-restart role command is not supported in OSPFv3. When you enable the helper-reject role on an interface, you reconfigure an OSPFv3 router to function in a “restarting-only” role.

## ipv6 ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

### C9000 Series

| <b>Syntax</b>            | <code>ipv6 ospf hello-interval seconds</code><br>To return to the default time interval, enter <code>no ipv6 ospf hello-interval</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                             |         |             |                 |                          |                 |                          |                  |                                    |                |                                 |                |                             |                 |                           |

| Version          | Description                              |
|------------------|------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                 |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON. |
| <b>9.7(0.0)</b>  | Added support for VRF.                   |
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.       |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                |
| <b>7.8.1.0</b>   | Added support for the C-Series.          |
| <b>7.4.1.0</b>   | Introduced on the E-Series.              |

## maximum-paths

Enable the software to forward packets over multiple paths.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                                        |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>maximum-paths <i>number</i></code>                                                                                                                                                                                                                  |                                                                                        |
|                        | To disable packet forwarding over multiple paths, use the <code>no maximum-paths</code> command.                                                                                                                                                          |                                                                                        |
| <b>Parameters</b>      | <b><i>number</i></b>                                                                                                                                                                                                                                      | Specify the number of paths. The range is from 1 to 64. The default is <b>8</b> paths. |
| <b>Defaults</b>        | 8                                                                                                                                                                                                                                                         |                                                                                        |

| Version         | Description                           |
|-----------------|---------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.              |
| <b>9.2(1.0)</b> | Introduced on the Z9500.              |
| <b>8.3.19.0</b> | Introduced on the S4820T.             |
| <b>8.3.11.1</b> | Introduced on the Z9000.              |
| <b>8.3.7.0</b>  | Introduced on the S4810.              |
| <b>7.8.1.0</b>  | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.           |
| <b>7.5.1.0</b>  | Introduced on the C-Series.           |
| <b>6.1.1.1</b>  | Introduced on the E-Series.           |

## passive-interface

Disable (suppress) sending routing updates on an interface.

### C9000 Series

|               |                                                 |
|---------------|-------------------------------------------------|
| <b>Syntax</b> | <code>passive-interface <i>interface</i></code> |
|---------------|-------------------------------------------------|

To enable sending routing updates on an interface, use the `no passive-interface interface` command.

| <b>Parameters</b>        | <p><b><i>interface</i></b></p> <p>Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>                                                                                                                                                |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|------------------|-------------------------------------------------------|-----------------|---------------------------|----------------|---------------------------------|----------------|-----------------------------|
| <b>Defaults</b>          | Enabled, that is sending of routing updates are enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |

| <b>9.2(1.0)</b>          | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>9.1.(0.0)</b>         | Introduced support for OSPFv3 on the S4810 and Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>8.3.19.0</b>          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>7.8.1.0</b>           | Added support for the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>7.4.1.0</b>           | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>Usage Information</b> | <p>By default, no interfaces are <i>passive</i>. Routing updates are sent to all interfaces on which the routing protocol is enabled.</p> <p>If you disable the sending of routing updates on an interface, the particular address prefix continues to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.</p> <p>OSPFv3 for IPv6 routing information is not sent or received through the specified router interface. The specified interface address appears as a stub network in the OSPFv3 for IPv6 domain.</p>                                                                                                                                                                                       |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |

## redistribute

Redistribute into OSPFv3.

### C9000 Series

|                   |                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>redistribute {bgp as number}{connected   static}[metric metric-value   metric-type type-value] [route-map map-name] [tag tag-value]</pre> <p>To disable redistribution, use the <code>no redistribute {connected   static}</code> command.</p> |
| <b>Parameters</b> | <p><b><i>bgp as number</i></b> Enter the keyword <code>bgp</code> then the autonomous system number.</p> <p>The range is from 1 to 65535.</p>                                                                                                       |

|                                      |                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                     | Enter the keyword <code>connected</code> to redistribute routes from physically connected interfaces.                                                                                                                                                                                     |
| <b>static</b>                        | Enter the keyword <code>static</code> to redistribute manually configured routes.                                                                                                                                                                                                         |
| <b>metric <i>metric-value</i></b>    | Enter the keyword <code>metric</code> then the metric value.<br>The range is from 0 to 16777214.<br>The default is <b>20</b> .                                                                                                                                                            |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then the OSPFv3 link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>• 1 for a type 1 external route</li> <li>• 2 for a type 2 external route</li> </ul> The default is <b>2</b> . |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map. If the route map is not configured, the default is <b>deny</b> (to drop all routes).                                                                                                      |
| <b>tag <i>tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPFv3.<br>The range is from 0 to 4294967295<br>The default is <b>0</b> .                                                                                                                      |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF for OSPFv2  
ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.  
The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                           |
|------------------|-------------------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                              |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                              |
| <b>9.1.(0.0)</b> | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                             |
| <b>7.8.1.0</b>   | Added support for the C-Series.                       |
| <b>7.4.1.0</b>   | Introduced on the E-Series.                           |

**Usage Information** To redistribute the default route (x:x:x::x), use the `default-information originate` command.

**Related Commands** [default-information originate](#) – configures default external route into OSPFv3.

## router-id

Designate a fixed router ID.

### C9000 Series

| <b>Syntax</b>            | <code>router-id ip-address</code><br>To return to the previous router ID, use the <code>no router-id ip-address</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------|-----------------|--------------------------|------------------|-------------------------------------------------------|-----------------|---------------------------|----------------|---------------------------------|----------------|-----------------------------|
| <b>Parameters</b>        | <b><i>ip-address</i></b> Enter the router ID in the dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>Defaults</b>          | The router ID is selected automatically from the set of IPv4 addresses configured on a router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>Command Modes</b>     | ROUTER OSPF for OSPFv2<br>ROUTER OSPFv3 for OSPFv3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                 |                          |                 |                          |                  |                                                       |                 |                           |                |                                 |                |                             |
| <b>Command History</b>   | <p>This guide is platform-specific. | <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.              |
| 9.2(1.0)  | Introduced on the Z9500.              |
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.4.2.0   | Introduced on the E-Series TeraScale. |
| 8.3.19.0  | Introduced on the S4820T.             |

#### Usage Information

The `show crypto ipsec policy` command output displays the AH and ESP parameters configured in IPsec security policies, including the SPI number, keys, and algorithms used.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

**Table 6. show crypto ipsec policy Command Description**

| Field                                             | Description                                                                                          |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Policy name                                       | Displays the name of an IPsec policy.                                                                |
| Policy refcount                                   | Number of interfaces on the router that use the policy                                               |
| Inbound ESP SPI<br>Outbound ESP SPI               | The encapsulating security payload (ESP) security policy index (SPI) for inbound and outbound links. |
| Inbound ESP Auth Key<br>Outbound ESP Auth Key     | The ESP authentication key for inbound and outbound links.                                           |
| Inbound ESP Cipher Key<br>Outbound ESP Cipher Key | The ESP encryption key for inbound and outbound links.                                               |
| Transform set                                     | The set of security protocols and algorithms used in the policy.                                     |
| Inbound AH SPI<br>Outbound AH SPI                 | The authentication header (AH) security policy index (SPI) for inbound and outbound links.           |
| Inbound AH Key<br>Outbound AH Key                 | The AH key for inbound and outbound links.                                                           |

| <b>8.4.2.0</b>           | Introduced on the E-Series TeraScale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |         |             |                 |                          |                 |                          |                  |                                    |                |                                       |                 |                           |
| <b>8.3.19.0</b>          | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |         |             |                 |                          |                 |                          |                  |                                    |                |                                       |                 |                           |
| <b>Usage Information</b> | <p>The <code>show crypto ipsec sa ipv6</code> command output displays security associations set up for OSPFv3 links in IPsec authentication and encryption policies on the router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |         |             |                 |                          |                 |                          |                  |                                    |                |                                       |                 |                           |

## Example

**Table 7. show crypto ipsec sa ipv6 Command Description**

| Field                    | Description                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| Interface                | IPv6 interface.                                                                                       |
| Link local address       | IPv6 address of interface                                                                             |
| IPSecv6 policy name      | Name of the IPsec security policy applied to the interface.                                           |
| inbound/outbound ah      | Authentication policy applied to inbound or outbound traffic.                                         |
| inbound/outbound esp     | Encryption policy applied to inbound or outbound traffic.                                             |
| spi                      | Security policy index number used to identify the policy.                                             |
| inbound/outbound esp     | Encryption policy applied to inbound or outbound traffic.                                             |
| spi                      | Security policy index number used to identify the policy.                                             |
| transform                | Security algorithm that is used to provide authentication, integrity, and confidentiality.            |
| in use settings          | Transform that the SA uses (only transport mode is supported).                                        |
| replay detection support | Y: An SA has enabled the replay detection feature.<br>N: The replay detection feature is not enabled. |
| STATUS                   | ACTIVE: The authentication or encryption policy is enabled on the interface.                          |

## Related Commands

[show crypto ipsec policy](#) – displays the configuration of IPsec authentication and encryption policies.

## Example

```
Dell#show crypto ipsec policy
Dell#show crypto ipsec sa ipv6

Interface: TenGigabitEthernet 0/0
Link Local address: fe80::201:e8ff:fe40:4d10
IPSecv6 policy name: OSPFv3-1-500

inbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

inbound esp sas

outbound esp sas
```

```

Interface: TenGigabitEthernet 0/1
Link Local address: fe80::201:e8ff:fe40:4d11
IPSecv6 policy name: OSPFv3-1-600

inbound ah sas

outbound ah sas

inbound esp sas
spi : 600 (0x258)
transform : esp-des esp-sha1-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound esp sas
spi : 600 (0x258)
transform : esp-des esp-sha1-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

```

## show ipv6 ospf interface

View OSPFv3 interface information.

### C9000 Series

#### Syntax

```
show ipv6 ospf [process-number] [vrf vrf-name] [interface]
```

#### Parameters

- process-number*** Enter the OSPF process number.
- vrf vrf-name*** (OPTIONAL) Enter the keyword *vrf* and the name of the VRF to display neighbors corresponding to that VRF.
-  **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.
- interface*** (OPTIONAL) Enter one of the following keywords and slot/port or number information:
- For a 1-Gigabit Ethernet interface, enter the keyword *GigabitEthernet* then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword *TenGigabitEthernet* then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword *fortyGigE* then the slot/port information.
  - For a Loopback interface, enter the keyword *loopback* then a number from 0 to 16383.
  - For a Null interface, enter the keywords *null 0*.
  - For a Port Channel interface, enter the keywords *port-channel* then a number.
  - For a tunnel interface, enter the keyword *tunnel* then the tunnel ID. The range is from 1 to 16383.
  - For a VLAN interface, enter the keyword *vlan* then a number from 1 to 4094.

#### Defaults

none

#### Command Modes

EXEC

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| 9.9(0.0)  | Introduced on the C9010.                                              |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.                              |
| 9.7(0.0)  | Added support for VRF on all platforms ( Except MXL and STOMP ).      |
| 9.2.(0.0) | Added support for showing BFD status on the S4820T, S4810, and Z9000. |
| 9.1.(0.0) | Added support for OSPFv3 on the S4810 and Z9000.                      |
| 8.3.19.0  | Introduced on the S4820T.                                             |
| 7.8.1.0   | Added support for the C-Series.                                       |
| 7.4.1.0   | Introduced on the E-Series.                                           |

## Usage Information

If you enable BFD at the global level, *show ipv6 ospf interface* shows the BFD provisioning.

If you enable BFD at the interface level, *show ipv6 ospf interface* shows the BFD interval timers.

## Example

```
Dell#show ipv6 ospf 3 interface gigabitethernet 1/2

GigabitEthernet 1/2 is up, line protocol is up
 Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID 67420217
 Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
 NetworkType BROADCAST, Cost: 1, Passive: No
 Transmit Delay is 100 sec, State DR, Priority 1
 Interface is using OSPF global mode BFD configuration.
 Designated router on this network is 11.1.1.1 (local)
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 1, Retransmit 5

Dell#
```

```
Dell#show ipv6 ospf 3 interface tengigabitethernet 1/2

TenGigabitEthernet 1/2 is up, line protocol is up
 Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID 67420217
 Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
 NetworkType BROADCAST, Cost: 1, Passive: No
 Transmit Delay is 100 sec, State DR, Priority 1
 Interface is using OSPF global mode BFD configuration.
 Designated router on this network is 11.1.1.1 (local)
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 1, Retransmit 5

Dell#
```

```
Dell#show ipv6 ospf 3 interface tengigabitethernet 1/2/1

TenGigabitEthernet 1/2/1 is up, line protocol is up
 Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID 67420217
 Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
 NetworkType BROADCAST, Cost: 1, Passive: No
 Transmit Delay is 100 sec, State DR, Priority 1
 Interface is using OSPF global mode BFD configuration.
 Designated router on this network is 11.1.1.1 (local)
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 1, Retransmit 5

Dell#
```

## Related Commands

[show ip ospf interface](#)—Display the OSPF interfaces configured.

## show ipv6 ospf database

Display information in the OSPFv3 database, including link-state advertisements (LSAs) in detail.

**Syntax** `show ipv6 ospf [process-number] [vrf vrf-name] database [database-summary | grace-lsa | external | inter-area-prefix | inter-area-router | intra-area-prefix | link | network | router | nssa-external]`

|                   |                          |                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>process-number</b>    | Enter the OSPF process number.                                                                                                                                                                                                                                                                                               |
|                   | <b>vrf vrf-name</b>      | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to display neighbors corresponding to that VRF.<br> <b>NOTE:</b> If you do not specify this option, neighbors corresponding to the default VRF are displayed. |
|                   | <b>database-summary</b>  | (OPTIONAL) Enter the keyword <code>database-summary</code> to view a summary of database LSA information.                                                                                                                                                                                                                    |
|                   | <b>external</b>          | (OPTIONAL): Enter the keyword <code>external</code> to display the external link states.                                                                                                                                                                                                                                     |
|                   | <b>grace-lsa</b>         | (OPTIONAL): Enter the keyword <code>grace-lsa</code> to display the Type-11 Grace LSAs sent and received on an OSPFv3 router.                                                                                                                                                                                                |
|                   | <b>inter-area-prefix</b> | (OPTIONAL): Enter the keyword <code>inter-area-prefix</code> to display the inter area prefix link states.                                                                                                                                                                                                                   |
|                   | <b>inter-area-router</b> | (OPTIONAL): Enter the keyword <code>inter-area-router</code> to display the inter area router link states.                                                                                                                                                                                                                   |
|                   | <b>intra-area-prefix</b> | (OPTIONAL): Enter the keyword <code>intra-area-prefix</code> to display the intra area prefix link states.                                                                                                                                                                                                                   |
|                   | <b>link</b>              | (OPTIONAL): Enter the keyword <code>link</code> to display the link states.                                                                                                                                                                                                                                                  |
|                   | <b>network</b>           | (OPTIONAL): Enter the keyword <code>network</code> to display the network link states.                                                                                                                                                                                                                                       |
|                   | <b>nssa-external</b>     | (OPTIONAL): Enter the keyword <code>nssa-external</code> to display the nssa link state information.                                                                                                                                                                                                                         |
|                   | <b>router</b>            | (OPTIONAL): Enter the keyword <code>router</code> to display the router link states.                                                                                                                                                                                                                                         |

**Defaults** None

**Command Modes** EXEC  
EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                               |
|-------------------|-----------------------------------------------------------|
| <b>9.13(0.0)</b>  | Added support to display all the types of LSAs in detail. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                 |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                               |
| <b>9.7(0.0)</b>   | Added support for VRF.                                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                  |

| Version   | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| 9.1.(0.0) | Added support for OSPFv3 on the S4810 and Z9000.                                                         |
| 8.4.2.2   | Added support for the display of graceful restart parameters and Type-11 Grace LSAs on E-Series routers. |
| 8.3.19.0  | Introduced on the S4820T.                                                                                |
| 7.8.1.0   | Added support for C-Series.                                                                              |

#### Usage Information

The `show ipv6 ospf database` command output displays detailed information on the OSPFv3 database, including link-state advertisements (LSAs).

#### Example (grace-lsa)

#### Example (database-summary)

#### Example (external)

```
DellEMC# show ipv6 ospf database external

 OSPFv3 Router with ID (10.160.3.37) (Process ID 6)

 AS External Link States (Area 0)

LS Age: 1651
LS Type: OSPFv3 AS external LSA
Link State ID: 0.0.0.1
Advertising Router: 10.130.254.101
LS Seq Number: 0x80000001
Checksum: 0xF038
Length: 36
 Prefix: 9001::/64
 Prefix Options: 0x10 (DN)
 Metric Type: 2 Metric: 20
```

#### Example (nssa-external)

```
DellEMC#show ipv6 ospf 10 database nssa-external

 OSPFv3 Router with ID (1.1.1.1) (Process ID 10)

 AS External Link States (Area 1)

LS Age: 35
LS Type: OSPFv3 NSSA LSA
Link State ID: 0.0.0.1
Advertising Router: 1.1.1.1
LS Seq Number: 0x80000001
Checksum: 0xD2DD
Length: 52
 Prefix: 101:101:1::/64
 Prefix Options: 0x8 (P)
 Metric Type: 2 Metric: 20
 Forwarding Address: 101:101:1::1
```

## show ipv6 ospf neighbor

Display the OSPF neighbor information on a per-interface basis.

## C9000 Series

#### Syntax

```
show ipv6 ospf [process-number] [vrf vrf-name] neighbor [interface]
```

## Parameters

- process-number*** Enter the OSPF process number.
- vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display OSPF neighbors corresponding to that VRF.
-  **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.
- interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:
- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

## Defaults

none

## Command Modes

EXEC

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                      |
|------------------|------------------------------------------------------------------|
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                         |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON.                         |
| <b>9.7(0.0)</b>  | Added support for VRF on all platforms ( Except MXL and STOMP ). |
| <b>9.1.(0.0)</b> | Introduced support for OSPFv3 on the S4810 and Z9000.            |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                        |
| <b>7.8.1.0</b>   | Added support for the C-Series.                                  |
| <b>7.4.1.0</b>   | Introduced on the E-Series.                                      |

## Example

```
Dell#show ipv6 ospf 3 neighbor gi 1/2
```

| Neighbor ID | Pri | State   | Dead Time | Interface | ID | Interface |
|-------------|-----|---------|-----------|-----------|----|-----------|
| 63.114.8.36 | 1   | FULL/DR | 00:00:38  | 4         |    | Gi 1/2    |

```
Dell#
```

```
Dell#show ipv6 ospf 3 neighbor gi 1/2
```

| Neighbor ID | Pri | State   | Dead Time | Interface | ID | Interface |
|-------------|-----|---------|-----------|-----------|----|-----------|
| 63.114.8.36 | 1   | FULL/DR | 00:00:38  | 4         |    | Te 1/2    |

```
Dell#
```

```
Dell#show ipv6 ospf 3 neighbor gi 1/2
```

| Neighbor ID | Pri | State   | Dead Time | Interface | ID | Interface |
|-------------|-----|---------|-----------|-----------|----|-----------|
| 63.114.8.36 | 1   | FULL/DR | 00:00:38  | 4         |    | Te 1/2/1  |

```
Dell#
```

## snmp context

Configure SNMPv3 context name to map multiple OSPFv3 VRF instances.

**Syntax** `snmp context {context-name}`

To clear snmp context, use the `no snmp context {context-name}` command.

**Parameters** **context-name** Enter the SNMP context name. The maximum length is 32 alphanumeric characters.

**Defaults** None.

**Command Modes** IPv6 ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, S6000-ON, C9010, MXL, and FN IOM. |

**Usage Information** Use SNMPv3 context configuration to distinguish between various OSPFv3 VRF instances.

### Example

```
DellEMC(conf-ipv6-router_ospf)#snmp context ospf1
```

```
DellEMC>show runnig-config ospf
!
ipv6 router ospf 10
 router-id 10.10.10.1
 snmp context ospf1
!
DellEMC>
```

# PE Console Commands

To configure a C1048P port extender from an attached PE console, you can use the following commands. Use these commands when the port extender cannot connect to a C9010.

You can also enter the PE console commands to debug an error condition in a PE stack.

- `cd`
- `clear logging`
- `copy`
- `delete`
- `diag`
- `dir`
- `disable`
- `enable`
- `exit`
- `format`
- `hostname`
- `offline`
- `online`
- `power-cycle`
- `pwd`
- `reload`
- `rename`
- `reset`
- `show boot system`
- `show clock`
- `show control-bridge status`
- `show diag`
- `show diag information`
- `show diag testcase`
- `show environment`
- `show file`
- `show file-systems`
- `show interfaces`
- `show inventory`
- `show lldp neighbors`
- `show logging`
- `show logging driverlog`
- `show logging kernellog`
- `show os-version`
- `show privilege`
- `show redundancy`
- `show revision`
- `show system`
- `show tech-support`
- `show version`
- `telnet-peer-stack-unit`

For information about the commands you can enter from a C9010 console to configure a port extender, see [Port Extenders \(PE\)](#) chapter.

## Topics:

- `diag`

- [offline](#)
- [online](#)
- [power-cycle](#)
- [show control-bridge status](#)
- [show system](#)
- [telnet-peer-stack-unit](#)
- [upgrade system](#)

## diag

Run offline diagnostics on all stack-units.

### C9000 Series

|                          |                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | diag {stack-unit <i>unit-number</i> } [alllevels   level0   level1   level2] [interactive] [testname <i>name</i> ] [terminate]                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>        | <b>stack-unit <i>unit-number</i></b>                                                                                                                                                                                                                | Enter the <code>stack-unit</code> value to run offline diagnostic test on a specified stack-unit. The stack-unit range is 0 to 7.                                                                                                                                                                                                                                                                                                                                             |
|                          | <b>alllevels</b>                                                                                                                                                                                                                                    | Enter the keyword <code>all levels</code> to run the complete set of offline diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                |
|                          | <b>level0</b>                                                                                                                                                                                                                                       | Enter the keyword <code>level0</code> to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.                                                                                                                                                                                                            |
|                          | <b>level1</b>                                                                                                                                                                                                                                       | Enter the keyword <code>Level1</code> to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD) wherever possible. At this level, ports are shut down automatically.  |
|                          | <b>level2</b>                                                                                                                                                                                                                                       | Enter the keyword <code>level2</code> to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations. |
|                          | <b>interactive</b>                                                                                                                                                                                                                                  | Enter the keyword <code>interactive</code> to run offline diagnostics in interactive mode. <div> <div></div> <div><b>NOTE:</b> On a C1048P, interactive diagnostic tests are supported only in standalone mode; they are not supported in stacking mode.</div> </div>                                                                                                                      |
|                          | <b>testname <i>name</i></b>                                                                                                                                                                                                                         | Enter the <code>testname name</code> parameters to run a specified offline diagnostic test. Enclose the test-case name in double quotes (" "). For example: <code>diag level1 testname "first"</code> .                                                                                                                                                                                                                                                                       |
|                          | <b>terminate</b>                                                                                                                                                                                                                                    | Enter the keyword <code>terminate</code> to stop the offline diagnostic tests that are running.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Defaults</b>          | All offline diagnostic tests are run on all switch CPUs (Control Processor, Route Processor, and line cards).                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Command Modes</b>     | EXEC Privilege                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Usage Information</b> | Before you use this command to run diagnostic test, make sure that the port extender (PE) stack-unit is offline ( <code>offline stack-unit <i>unit number</i></code> command). You are prompted to reboot when the offline diagnostics is complete. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

The PE unit goes offline and reboots automatically after the test is completed. Once the test is finished, the diag report is generated, and it is stored in the PE flash. To view the diag report, use the `show diag pe pe-id stack-unit unit-number` command from C9000 system. The `show diag pe` command uploads the TestReport from the PE to the C9000.

The filename of the TestReport is: `TestReport-SU-Stack-Unit-Number-PE-pe-id-Year_Month_Day_Unique-Tag.txt`, where SU identifies the PE stack-unit on which the offline diag test was run, Year\_Month\_Day is a timestamp to identify when the offline diag test was run for that unit, and the Unique Tag is to identify that specific diag test. Diag test reports on PE are not overwritten. Offline diag test reports for PE are stored in the following directory: `flash://default_diag_report_dir`. To view the test report, use the `show file flash://filename` command.

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                     |
|----------|---------------------------------|
| 9.9(0.0) | Introduced on C9010 and C1048P. |
| 9.2(1.0) | Introduced on the Z9500.        |
| 8.3.19.0 | Introduced on the S4820T.       |
| 8.3.11.1 | Introduced on the Z9000.        |
| 8.3.7.0  | Introduced on the S4810.        |
| 8.3.1.0  | Introduced the verbose option.  |
| 7.7.1.0  | Introduced on the S-Series.     |

## Example

```
Dell#offline stack-unit 3
Warning - offline of unit will bring down all the protocols and
the unit will be operationally down, except for running Diagnostics.
Please make sure that stacking is not configured for Diagnostics
execution.
If configured, the unit roles may change. The unit will become
standalone once diags are executed.
Also reboot/online command is necessary for normal operation after the
offline command is issued.
Proceed with Offline [confirm yes/no]:yes

Dell#diag stack-unit 3 level0
Warning - diagnostic execution will cause multiple link flaps on the
peer side - advisable to shut directly connected ports
Proceed with Diags [confirm yes/no]: yes
```

## Related Commands

# offline

Place the PE stack-unit in the offline state to run the diagnostics tests.

## C9000 Series

### Syntax

`offline stack-unit unit-number`

| <b>Parameters</b>        | <b>stack-unit <i>slot-id</i></b> Enter the keyword <code>stack-unit</code> and specify the stack-unit number. The stack-unit number range is from 0 to 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |                 |                                     |

| <b>9.9(0.0)</b>          | Introduced on the C9010 and C1048P.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |                 |                                     |
| <b>Usage Information</b> | <p>Use this command to make the port extender offline and run offline diagnostics tests. After this command is issued, a warning message appears cautioning you about bringing down all the protocols and turning down the PE unit operationally during the diagnostics tests. If offline diagnostics are not run after issuing the <code>offline stack-unit</code> command, you must issue the <code>online stack-unit</code> command to bring up the PE stack-unit.</p> <pre>Dell#offline stack-unit 3 Warning - offline of unit will bring down all the protocols and the unit will be operationally down, except for running Diagnostics. Please make sure that stacking is not configured for Diagnostics execution. If configured, the unit roles may change. The unit will become standalone once diags are executed. Also reboot/online command is necessary for normal operation after the offline command is issued. Proceed with Offline [confirm yes/no]:</pre> |         |             |                 |                                     |

## online

Bring a PE stack-unit back to an online state after running the offline diagnostics tests.

## C9000 Series

| <b>Syntax</b>          | <code>online stack-unit <i>unit-number</i></code>                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                           |

```

#### Related Commands

- [diag](#) — run diagnostic tests on an offline switch.
- [offline](#) — places the stack-unit in the offline state to run the diagnostics tests.

## power-cycle

Power-cycle the port extender (PE) stack-unit from the PE console

### C9000 Series

**Syntax** `power-cycle stack-unit {unit-number | all }`

**Parameters**

|                           |                                                  |
|---------------------------|--------------------------------------------------|
| <b><i>unit-number</i></b> | Enter a stack-unit number. Range is from 0 to 7. |
| <b>all</b>                | Enter all to power-cycle all the stack-units.    |

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                         |
|-----------------|-------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010 and C1048P. |

**Usage Information**  **CAUTION: Do not attempt to reset or power cycle when the system is going through the process of upgrading.**

#### Example

```

Dell#power-cycle ?
stack-unit Stack-unit
Dell#power-cycle stack-unit ?
<0-7> Unit number
all Entire stack
Dell#power-cycle stack-unit 0

Dell#power-cycle stack-unit all ?

```

## show control-bridge status

Display the status of the control bridge from the port extender (PE) console.

### C9000 Series

**Syntax** `show control-bridge status`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C1048P. |

#### Example

```
Dell#show control-bridge status
Reason: CNU - CSP Not Up, IPE - IPC Program Error
PPE - PEM Program Error, CPE - CHM Program Error
UE - UnKnown Error

CB System MAC : 34:17:eb:00:20:00
Csp Sess Status : UP
Active CB : YES
Uplink LAG : Port-channel 257
LAG Admin Status : UP
LAG Oper Status : UP

Status Reason RPM-Id PE-Id

Online - 0 255
```

#### Usage Information

Use the `show control-bridge status` command output information to debug the connectivity issues between the control bridge and port extender.

## show system

Display the status of a specific stack-unit from the port extender (PE) console.

**Syntax** `show system [brief | stack-unit unit-id | stack-ports [status | topology]`

**Parameters**

|                                                    |                                                                                                                                               |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b>                                       | (OPTIONAL) Enter the keyword <code>brief</code> to view an abbreviated list of system information.                                            |
| <b>stack-unit <i>unit-id</i></b>                   | (OPTIONAL) Enter the keywords <code>stack-unit</code> then the stack unit number for information. The stack-unit number range is from 0 to 7. |
| <b>stack-ports <i>status</i>   <i>topology</i></b> | (OPTIONAL) Enter the keywords <code>stack-ports</code> for information about the status or topology of the stack ports.                       |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010 and C1048P.                                                                                                                                                                                                                  |
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                                                                                                                                          |
| 9.4(0.0) | Added support for the <code>disabled-ports</code> parameter .                                                                                                                                                                                        |
| 9.0.2.0  | Introduced on the S6000.                                                                                                                                                                                                                             |
| 9.0.0.0  | Introduced on the Z9000.                                                                                                                                                                                                                             |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                                                                                                                                            |
| 8.3.11.4 | The <code>brief</code> parameter no longer displays the current Reload mode. To display Reload mode, use the <code>show reload-type</code> command. Modified the <code>show system stack-unit</code> command output to support Piece Part ID (PPID). |

| Version         | Description                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                   |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                   |
| <b>7.8.1.0</b>  | The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot codes display as "Present". |
| <b>7.7.1.0</b>  | Added Master Priority field.                                                                                               |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                                                |

## telnet-peer-stack-unit

Connect through Telnet to a peer stack-unit from a port extender (PE) console.

### C9000 Series

**Syntax** `telnet-peer-stack-unit`

**Defaults** Not configured.

**Command Modes** • EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                         |
|------------------|-------------------------------------|
| <b>9.9 (0.0)</b> | Introduced on the C9010 and C1048P. |

**Usage Information** In a PE stack setup (master unit), use the `telnet-peer-stack-unit` command to open a telnet session to the port extender standby unit.

After connecting to the standby unit, you can access the following subset of commands:

```

Dell (standby) #?
cd Change current directory
copy Copy from one file to another
delete Delete a file
dir List files on a filesystem

```

|                                      |                                      |
|--------------------------------------|--------------------------------------|
| disable                              | Turn off privileged commands         |
| enable                               | Turn on privileged commands          |
| exit                                 | Exit from the EXEC                   |
| format                               | Format a filesystem                  |
| pwd                                  | Display current working directory    |
| rename                               | Rename a file                        |
| reset                                | Reset selected card                  |
| show                                 | PE Show running system information   |
| telnet-peer-stack-unit<br>stack-unit | Open a telnet connection to the peer |

### Example

```
Dell#telnet-peer-stack-unit
Trying Unit 2...
Connected to Unit 2.
Exit character is '^]'.

Dell(standby)>en
Dell(standby)#exit
Session terminated for user admin on line vty 0 (Unit 3)

Closed connection.
Dell#Jun 24 10:14:29: %PE-UNKN-UNIT2-S:CP %SEC-5-LOGOUT: Exec session is
terminated for user admin on line vty0 (Unit 3)
```

## upgrade system

Upgrade the Dell Networking OS image to the stack-unit.

### C9000 Series

|                        |                                                                                                                                                           |                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | upgrade system {stack-unit <i>unit number</i>   all } {usbflash:   flash:} {rpmA:  rpmB:}                                                                 |                                                                                                                                                                                                                                 |
| <b>Parameters</b>      | <b>stack-unit <i>unit number</i></b>                                                                                                                      | Enter the keyword <code>stack-unit</code> and specify the stack-unit ID to sync the image to that of the stack-unit or enter <code>all</code> to sync the image on all stack-units. The stack-unit number range is from 0 to 7. |
|                        | <b>all</b>                                                                                                                                                | Enter the keyword <code>all</code> to sync the image on all the stack-units configured.                                                                                                                                         |
|                        | <b>flash: <i>file-url</i></b>                                                                                                                             | Enter the keyword <code>flash:</code> and specify the location of the image file in the format <code>//directory-path</code> or press Enter to launch a prompt sequence.                                                        |
|                        | <b>usbflash: <i>file-url</i></b>                                                                                                                          | Enter the keyword <code>usbflash:</code> and copy the image from usbflash file <code>systemusbflash://filepath</code> press Enter to launch a prompt sequence.                                                                  |
|                        | <b>rpmA:   rpm B:</b>                                                                                                                                     | Specify the flash partition of the operating-system image that you want to upgrade.                                                                                                                                             |
| <b>Defaults</b>        | none                                                                                                                                                      |                                                                                                                                                                                                                                 |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                            |                                                                                                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                 |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                         |
|----------|-------------------------------------|
| 9.9(0.0) | Introduced on the C9010 and C1048P. |

| Version         | Description                                                           |
|-----------------|-----------------------------------------------------------------------|
| <b>9.7(0.0)</b> | Added support for NFS mount.                                          |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                              |
| <b>9.0(0.0)</b> | Added support for IPv6 for the <code>file-url</code> parameter.       |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                             |
| <b>8.3.11.1</b> | Introduced on the Z9000. Added support for the SSD on the Z9000 only. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                              |
| <b>7.7.1.0</b>  | Added support for TFTP and SCP.                                       |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                           |

### Usage Information

You can specify the source location and can choose `usbflash:` or `flash:` as a source location. You can choose `rpmA` (for partition A) or `rpm B` (for partition B) as your destination. The system boots up from the newly upgraded partition after you reload the system with the `reload` command. To verify that the Dell Networking OS image was correctly upgraded, use the `show boot system all` command.

For more information on the upgrade process, see the *Dell Networking C9010 and C1048P Release Notes*.

### Example

```
Dell# upgrade system stack-unit 0 usbflash://FTOS-C1048.bin rpmA:
00:39:32 : Discarded 1 pkts. Expected block num : 51. Received block
num: 50
!00:39:36 : Discarded 1 pkts. Expected block num : 65. Received block
num: 64
!!

93924044 bytes successfully copied
System image upgrade completed successfully.
!!

Image upgraded to all
```

# PE Stacking

Use the commands in this chapter to configure and manage C1048P port-extender (PE) stacking. Stacking is not supported on C9010 switches.

For information about using the PE stacking feature, see the “Port Extender (PE) Stacking” chapter in the *Dell Networking OS Configuration Guide for the C9000 Series*.

You can use the commands to pre-configure a port extender, so that the configuration settings are invoked when the switch is attached to the chassis.

## Topics:

- [renumber](#)
- [reset](#)
- [show pe system](#)
- [show hardware pe](#)
- [stack unit](#)
- [stack-unit](#)

## renumber

To rearrange the stack units, reassign a stack unit ID number.

## C9000 Series

Command Modes EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010 and C1048P.                                               |
| 9.2(1.0) | Introduced on the Z9500.                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                         |
| 8.3.7.0  | Introduced on the S4810.                                                          |
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.3.1.0  | Added the <code>hard reset</code> option.                                         |
| 7.8.1.0  | Augmented to run on the standby unit in order to reset the standby unit directly. |
| 7.7.1.0  | Introduced on the S-Series.                                                       |

**Usage Information** Resetting is a soft reboot, including flushing the forwarding tables. The `hard` option is available for PE stack-unit from the PE console only.

To reset (soft reboot) a stack-unit from PE console, use the `reset` command and specify the stack-unit number. To perform a hard reset or power-cycle to a specified stack-unit, use the `reset stack-unit unit-number hard` command.

**Example: linecard**

```
Dell#reset linecard 0
Dell#Jun 24 15:26:39: %RPM1-P:CP %CHMGR-5-LINECARD_RESET: linecard 0
being reset
Jun 24 15:26:39: %RPM1-P:CP %CHMGR-2-LINECARD_DOWN: linecard 0 down -
reset
Jun 24 15:26:39: %RPM1-P:CP %IFMGR-1-DEL_PORT: Removed port: Fo 0/0-20,
Dell#Jun 24 15:28:24: %RPM1-P:CP %CHMGR-5-CHECKIN: Checkin from linecard
```

```

0 (type C9000LC0640, 24 ports)
Jun 24 15:28:24: %RPM1-P:CP %CHMGR-5-LINECARD_UP: linecard 0 is up
Jun 24 15:28:28: %C9000LC0640:0 %IFAGT-5-INSERT_OPTICS_QSFP: Optics QSFP
inserted in slot 0 port 0
Jun 24 15:28:28: %C9000LC0640:0 %IFAGT-5-INSERT_OPTICS_QSFP: Optics QSFP
inserted in slot 0 port 4
Jun 24 15:28:28: %C9000LC0640:0 %IFAGT-5-INSERT_OPTICS_QSFP: Optics QSFP
inserted in slot 0 port
16

```

#### Example: pe stack-unit

```

Dell#reset stack-unit 2
Dell#Jun 24 15:19:52: %PE255-UNIT1-M:CP %CHMGR-5-STACKUNIT_RESET: stack-
unit 2 being reset
Jun 24 15:19:52: %PE255-UNIT1-M:CP %CHMGR-2-STACKUNIT_DOWN: stack-unit 2
down - reset
Jun 24 15:19:53: %PE255-UNIT1-M:CP %IFMGR-5-OSTATE_DN: Changed interface
state to down: Te 2/48
Jun 24 15:19:53: %PE255-UNIT1-M:CP %IFMGR-1-DEL_PORT: Removed port: Te
2/48-49,
Jun 24 15:19:53: %PE255-UNIT2-S:CP %IFMGR-1-DEL_PORT: Removed port: Te
2/48-49,
Jun 24 15:19:58: %PE255-UNIT1-M:CP %POLLGR-2-ALT_STACKUNIT_STATE:
Alternate Stack-unit is not present
Jun 24 15:19:58: %PE255-UNIT1-M:CP %CHMGR-2-STACKUNIT_DOWN: stack-unit 2
down - card removed
Jun 24 15:20:06: %PE255-UNIT1-M:CP %POLLGR-2-ALT_STACKUNIT_STATE:
Alternate Stack-unit is not present
Jun 24 15:20:06: %PE255-UNIT1-M:CP %POLLGR-2-ALT_STACKUNIT_STATE:
Alternate Stack-unit is present
Jun 24 15:21:06: %PE-UNKN-UNIT3-S:CP %RAM-5-STACKUNIT_STATE: Stack-unit
3 is in Standby State.
Jun 24 15:21:08: %PE255-UNIT3-S:CP %EVL-6-EVENT_LOGGING: Start uploading
pre-recorded traps(count:1) to CB
Jun 24 15:21:09: %PE255-UNIT3-S:CP %EVL-6-EVENT_LOGGING: Completed
uploading pre-recorded traps(send count:1, pending traps:0) to CB
Jun 24 15:21:21: %PE255-UNIT1-M:CP %CHMGR-5-STACKUNIT_DETECTED: stack-
unit 2 present
Jun 24 15:21:23: %PE255-UNIT1-M:CP %CHMGR-5-CHECKIN: Checkin from stack-
unit 2 (type C1048P, 52 ports)
Jun 24 15:21:23: %PE255-UNIT1-M:CP %CHMGR-5-STACKUNIT_UP: stack-unit 2
is up
Jun 24 15:21:25: %PE-UNKN-C1048P:2 %IFAGT-5-INSERT_OPTICS_PLUS: Optics
SFP+ inserted in slot 2 port 48
Jun 24 15:21:26: %PE-UNKN-C1048P:2 %CHMGR-2-FAN_SPEED_CHANGE: Fan speed
changed to 60 % of the full speed
Jun 24 15:21:26: %PE255-UNIT1-M:CP %CHMGR-5-FANTRAY_INSERTED: Fan tray 0
of Unit 2 is inserted
Jun 24 15:21:26: %PE255-UNIT1-M:CP %CHMGR-0-PS_UP: Power supply 0 in
unit 2 is up
Jun 24 15:21:26: %PE255-UNIT1-M:CP %CHMGR-0-PS_UP: Power supply 1 in
unit 2 is up
Jun 24 15:21:26: %PE-UNKN-C1048P:2 %CHMGR-2-FAN_SPEED_CHANGE: Fan speed
changed to 60 % of the full speed
Jun 24 15:21:26: %PE255-UNIT1-M:CP %IFMGR-5-OSTATE_UP: Changed interface
state to up: Te 2/48
Jun 24 15:21:27: %PE-UNKN-C1048P:2 %CHMGR-2-FAN_SPEED_CHANGE: Fan speed
changed to 75 % of the full speed
Jun 24 15:21:27: %PE255-UNIT1-M:CP %CHMGR-4-TEMP_STATUS_CHANGE: Unit 2
temperature state changed to 1 (Current temperature 35C).

```

#### Related Commands

- [reload](#) – reboots the Dell Networking OS.

# show pe system

Display information on all the system components of a port extender on a stack.

## C9000 Series

| Usage Information | <p>The <code>show pe <i>pe-id</i> system</code> output displays detailed summary on different hardware and software components of all the stack units attached to a port extender. You can use the <i>brief</i> option to view a short summary of the stack-units attached to a port extender. Use the <i>stack-port status</i> to view the status of the stack-units attached to a port extender. The <i>stack-port topology</i> option allows you to view whether the stack is forming a daisy chain or a ring topology. Use the <i>stack-unitunit-number</i> option to display the detailed summary of both hardware and software components of a specific stack-unit.</p> |                                                                                                                                                                         |  |         |             |          |                          |

# show hardware pe

Display input and output traffic statistics and other operational information about a specified hardware component.

## C9000 Series

### Syntax

```
show hardware pe pe-id stack-unit unit number {cpu | drops | stack-port | unit}
```

### Parameters

- pe *pe-id* stack-unit *unit-number*** Enter *pe pe-id stack-unit unit number* parameters with a command option to display hardware statistics from the specified port extender (PE) and stack-unit. The port extender ID range is from 0 to 255 and the stack-unit ID range is from 0 to 7. The command options are:
- *cpu data-plane statistics*: Displays data-plane statistics, including thebc pci driver statistics for the device.
  - *drops unit unit number [user-port {port {port-num | range}}]*: Displays the number of internal drops of control-plane and protocol control packets on the port specified. User port range is 1–51.
  - *stack-port* Displays traffic statistics for the stacking ports on a specified PE.
  - *unit unit-number* to view with the following options:
    - *counters*: Displays the traffic counters.
    - *details*: Displays more detailed hardware information.
    - *port-stats*: Displays the internal statistics on a per-port basis.
    - *register*: Displays the internal registers.
    - *table-dump*: Displays the tables from the bShell.

### Defaults

none

### Command Modes

- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                                                                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the C9010.                                                                                                                                                                                                                                       |
| 9.2(1.0) | Introduced on the Z9500.                                                                                                                                                                                                                                       |
| 9.2(0.0) | Modified the drops keyword range, unit keyword range and added the buffer and cpu management statistics options.                                                                                                                                               |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                                                                                                                                                      |
| 8.3.11.5 | Added i2c statistics and sata-interfaces statistics.                                                                                                                                                                                                           |
| 8.3.11.4 | Added user port information.                                                                                                                                                                                                                                   |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                                                                                                                                                       |
| 8.3.7.0  | Introduced on the S4810.                                                                                                                                                                                                                                       |
| 7.8.1.0  | Modified the stack-port keyword range expanded from 49-52 to 0-52; output modified for the cpu data-plane statistics option; the following options were added: drops [unit 0-1 [port 0-27]] and unit 0-1 {counters   details   port-stats [detail]   register} |
| 7.7.1.0  | Introduced on the S-Series.                                                                                                                                                                                                                                    |

## Related Commands

[clear hardware system-flow](#) — clears the statistics from selected hardware components.

[show system](#) — displays the current status of all the stack members or a specific member.

# stack unit

Pre-provision the specified port-extender stack unit.

## C9000 Series

### Syntax

```
stack-unit unit-number {type unit-type | priority value}
```

To de-provision or delete a port extender stack unit, use the `no stack-unit unit-number {type unit-type | priority value}` command.

### Parameters

|                               |                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit unit-number</b> | Enter the stack-unit ID number to locate a specific stack unit. Stack unit number range is 0–7.                                                                     |
| <b>type PE-type</b>           | Enter a value for the stack-unit type.                                                                                                                              |
| <b>priority value</b>         | Enter the master priority value for the unit. The priority value range is from 1 to 14. The unit with the numerically highest priority value is elected the master. |

### Default

None

### Command Modes

PE CONFIG

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                        |
|------------------|--------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced the port extender types for the N20xx and N30xx series. |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                           |

### Usage Information

You can pre-provision a port extender stack unit using the `stack unit` command in the PE configuration mode and specify the stack-unit type. Only similar types of stack units are provisioned under a single port extender. The maximum number of stack units allowed for provisioning is 8. In a PE stack, by default, the stack unit with the highest MAC address is elected master; the stack unit with the second highest MAC address is elected standby. To change the default master and standby assignment, you can assign `stack-unit priority value`. If multiple units tie for the highest priority, the unit with the highest MAC address is elected master.

In the following example, **stack-unit 0** with priority 14 is the master and **stack-unit 1** with priority 13 is the standby.

 **NOTE:** You can configure a stack-unit priority only when the unit is online.

### Example (stack-unit priority)

```
Dell(conf)#pe 2
Dell(conf-pe-2)#stack-unit 0 priority 14
Dell(conf-pe-2)#stack-unit 1 priority 13
```

### Example (stack-unit type)

```
Dell(conf-pe-201)#stack-unit 1 type ?
C1048P 52-port GE/TE
```

```
N2024-PE 28-port GE/TE
N2024P-PE 28-port GE/TE
N2048-PE 52-port GE/TE
N2048P-PE 52-port GE/TE
N3024-PE 28-port GE/TE
N3024F-PE 28-port GE/TE
N3024P-PE 28-port GE/TE
N3048-PE 52-port GE/TE
N3048P-PE 52-port GE/TE
Dell (conf-pe-201) #
```

#### Example (stack unit type)

```
Dell (conf-pe-5) # stack-unit 4 type C1048P
```

```
Dell (conf-pe-5) # show config
!
pe provision 5
 stack-unit 4 type C1048P
```

#### Related Commands

- [redundancy force-failover](#) — Force the standby unit to become the primary or master unit
- [reset](#) — Reset or reboot the linecard, RPM, PE and PE stack-unit.

## stack-unit

Extend the unused uplink ports as access ports.

#### Syntax

```
stack-unit unit-id access-ports port-range
```

To convert the port back to uplink, use the `no stack-unit unit-id access-ports port-range` command.

#### Parameters

**stack-unit unit-id** Enter the keyword `stack-unit` and the stack unit-id number. The stack-unit range is from 0 to 7.

**access-ports port-range** Enter the keyword `access-ports` and the port-range, separated by comma. There are maximum of 4 uplink ports in a PE, and the range is from 1 to 4.

 **NOTE:** Enter the *port-range* as 1 to 2 for front-end uplink ports and 3 to 4 for uplink ports in back panel (available in N30xx).

#### Default

None

#### Command Modes

PE CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced support for extending unused uplink port as access-port. |

#### Usage Information

You can configure the unused uplink port as access-port even on a provisioned PE.

#### Example

```
DellEMC (conf) # pe provision 2
DellEMC (conf-pe-2) # stack-unit 1 access-ports 1
DellEMC (conf-pe-2) #
```

#### Example (stack unit type)

```
Dell (conf-pe-2) # show config
!
pe provision 2
```

```
stack-unit 1 type C1048P
stack-unit 1 access-ports 1
stack-unit 3 type N2024P-PE
cascade interface TenGigabitEthernet 1/2
```

# Per-VLAN Spanning Tree Plus (PVST+)

The Dell Networking operating software implementation of per-VLAN spanning tree plus (PVST+) is based on the IEEE 802.1w standard spanning tree protocol.

 **NOTE:** For easier command line entry, the plus (+) sign is not used at the command line.

|                        |                                                                                                                                                                                                                                                       |                                                                            |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>description {<i>description</i>}</code><br>To remove the description, use the <code>no description {<i>description</i>}</code> command.                                                                                                         |                                                                            |
| <b>Parameters</b>      | <b><i>description</i></b>                                                                                                                                                                                                                             | Enter a description to identify the spanning tree (80 characters maximum). |
| <b>Defaults</b>        | none                                                                                                                                                                                                                                                  |                                                                            |
| <b>Command Modes</b>   | SPANNING TREE PVST+ (The prompt is “config-pvst”.)                                                                                                                                                                                                    |                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |                                                                            |

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>7.7.1.1</b>  | Introduced.               |

**Related  
Commands**

[protocol spanning-tree pvst](#) — enter SPANNING TREE mode on the switch.

## disable

Disable PVST+ globally.

### C9000 Series

**Syntax**

`disable`

To enable PVST+, use the `no disable` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION (conf-pvst)

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Related  
Commands**

[protocol spanning-tree pvst](#) — enter PVST+ mode.

## extend system-id

To augment the Bridge ID with a VLAN ID so that PVST+ differentiate between BPDUs for each VLAN, use extend system ID. If the VLAN receives a BPDU meant for another VLAN, PVST+ does not detect a loop, and both ports can remain in Forwarding state.

### C9000 Series

**Syntax**

`extend system-id`

**Defaults**

Disabled

**Command Modes**

PROTOCOL PVST

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>8.3.1.0</b>  | Introduced.               |

#### Example

```
Dell(conf-pvst)#do show spanning-tree pvst vlan 5 brief
VLAN 5
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32773, Address 0001.e832.73f7
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 32773 (priority 32768 sys-id-ext 5), Address
0001.e832.73f7
We are the root of Vlan 5
Configured hello time 2, max age 20, forward delay 15

Interface Designated

#### Example

```
Dell#conf
Dell(conf)#protocol spanning-tree pvst
Dell(conf-pvst)#no disable
Dell(conf-pvst)#vlan 2 bridge-priority 4096
Dell(conf-pvst)#vlan 3 bridge-priority 16384
Dell(conf-pvst)#
Dell(conf-pvst)#show config
!
protocol spanning-tree pvst
no disable
vlan 2 bridge-priority 4096
vlan 3 bridge-priority 16384
Dell#
```

#### Usage Information

After you enable PVST+, the device runs an STP instance for each VLAN it supports.

#### Related Commands

[disable](#) — disables PVST+.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

## show spanning-tree pvst

View the Per-VLAN spanning tree configuration.

### C9000 Series

#### Syntax

```
show spanning-tree pvst [vlan vlan-id] [brief] [guard] [interface
interface]
```

#### Parameters

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-id</i></b>        | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID. The range is 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>brief</b>                      | (OPTIONAL) Enter the keyword <code>brief</code> to view a synopsis of the PVST+ configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>interface <i>interface</i></b> | <p>(OPTIONAL) Enter one of the interface keywords along with the slot/port information:</p> <ul style="list-style-type: none"> <li>For a Port Channel interface, enter the keyword <code>port-channel</code> then a number: The range is 1 to 4096.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port extender (PE) Gigabit Ethernet interface, enter the keyword <code>peGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information.</li> <li>For a port extender 10-Gigabit Ethernet interface, enter the keyword <code>peTenGigE</code> then the <i>pe-id</i> / <i>stack-unit</i> / <i>port-id</i> information. The <i>pe-id</i> range is from 0 to 255; the <i>stack-unit</i> <i>unit-number</i> range is from 0 to 7; and the <i>port-id</i> range is 25 to 28 or 49 to 52 depending on the PE.</li> </ul> |

  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------|
| 9.13.0.1P1 | Introduced <code>peTenGigE</code> interface support on the C9010.                                                        |
| 9.9(0.0)   | Introduced on the C9010.                                                                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                                 |
| 8.3.19.0   | Introduced on the S4820T.                                                                                                |
| 8.3.11.1   | Introduced on the Z9000.                                                                                                 |
| 8.3.7.0    | Introduced on the S4810.                                                                                                 |
| 8.5.1.0    | Added support for 4-port 40G line cards on ExaScale.                                                                     |
| 8.4.2.1    | Support for the optional <code>guard</code> keyword was added on the C-Series, S-Series, and E-Series TeraScale.         |
| 7.6.1.0    | Introduced on the S-Series.                                                                                              |
| 7.5.1.0    | Introduced on the C-Series.                                                                                              |
| 6.4.1.0    | Expanded to display port error disable state (EDS) caused by loopback BPDU inconsistency and Port VLAN ID inconsistency. |
| 6.2.1.1    | Introduced.                                                                                                              |

**Usage Information** The following describes the `show spanning-tree pvst` command shown in the following examples.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | PVST interface.                                                                                                         |
| <b>Instance</b>       | PVST instance.                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

The `peGigE` ports and VP-LAG ports information is displayed as part of the `show spanning-tree 0` command output, only when the `guard` option is entered.

**Example (Brief)**

```
Dell#show spanning-tree pvst vlan 3 brief
VLAN 3
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 4096, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 16384, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15

Interface
Name PortID Prio Cost Sts Cost Designated

Te 1/0 128.130 128 20000 FWD 20000 4096 0001.e801.6aa8 128.426
Te 1/1 128.131 128 20000 BLK 20000 4096 0001.e801.6aa8 128.427
Te 1/16 128.146 128 20000 FWD 20000 16384 0001.e805.e306 128.146
Te 1/17 128.147 128 20000 FWD 20000 16384 0001.e805.e306 128.147
```

| Interface |      |         |      |       |     |       |           |      |
|-----------|------|---------|------|-------|-----|-------|-----------|------|
| Name      | Role | PortID  | Prio | Cost  | Sts | Cost  | Link-type | Edge |

### Example

```
Dell#show spanning-tree pvst vlan 2
VLAN 2
Root Identifier has priority 4096, Address 0001.e805.e306
Root Bridge hello time 2, max age 20, forward delay 15
Bridge Identifier has priority 4096, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15
We are the root of VLAN 2
Current root has priority 4096, Address 0001.e805.e306
Number of topology changes 3, last change occurred 00:57:00

Port 130 (TenGigabitEthernet 1/0) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.130
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.130, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 3
The port is not in the Edge port mode

Port 131 (TenGigabitEthernet 1/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.131
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.131, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 0
The port is not in the Edge port mode

Port 146 (TenGigabitEthernet 1/16) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.146
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.146, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1578, received 0
The port is in the Edge port mode

Port 147 (TenGigabitEthernet 1/17) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.147
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.147, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1579, received 0
The port is in the Edge port mode
```

### Example (EDS/LBK)

```
Dell#show spanning-tree pvst vlan 2 interface tengigabitethernet 1/0

TenGigabitEthernet 1/0 of VLAN 2 is LBK_INC discarding

Edge port:no (default) port guard :none (default)
Link type: point-to-point (auto) bpdu filter:disable (default)
Bpdu guard :disable (default)
Bpdus sent 152, received 27562

Interface Designated
Name PortID Prio Cost Sts Cost Bridge ID PortID

Te 1/0 128.1223 128 20000 EDS 0 32768 0001.e800.a12b 128.1223
```

Example (EDS/  
PVID)

```
Dell#show spanning-tree pvst vlan 2 interface tengigabitethernet 1/0

TenGigabitEthernet 1/0 of VLAN 2 is PVID_INC discarding

Edge port:no (default) port guard :none (default)
Link type: point-to-point (auto) bpdu filter:disable (default)
Bpdu guard :disable (default)
Bpdus sent 1, received 0

Interface Designated
Name PortID Prio Cost Sts Cost Bridge ID PortID

Te 1/0 128.1223 128 20000 EDS 0 32768 0001.e800.a12b 128.1223
```

Example (Guard)

```
Dell#show spanning-tree pvst vlan 5 guard
Interface
Name Instance Sts Guard type

Te 0/1 5 INCON(Root) Rootguard
Te 0/2 5 FWD Loopguard
Te 0/3 5 EDS(Shut) Bpduguard
```

Related  
Commands

[spanning-tree pvst](#) — configure PVST+ on an interface.

# spanning-tree pvst

Configure a PVST+ interface with one of these settings: edge port with optional bridge port data unit (BPDU) guard, port disablement if an error condition occurs, port priority or cost for a VLAN range, loop guard, or root guard.

## C9000 Series

Syntax

```
spanning-tree pvst {edge-port [bpduguard [shutdown-on-violation]] | err-
disable | vlan vlan-range {cost number | priority value} | loopguard |
rootguard}
```

Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>edge-port</b>              | Enter the keywords <code>edge-port</code> to configure the interface as a PVST+ edge port.                                                                                                                                                                                                                                                             |
| <b>bpduguard</b>              | Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.<br><br>Enter the keyword <code>bpduguard</code> to disable the port when it receives a BPDU.                                                                                                                   |
| <b>shutdown-on-violation</b>  | (OPTIONAL) Enter the keywords <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                                                                                                                                                    |
| <b>err-disable</b>            | Enter the keywords <code>err-disable</code> to enable the port to be put into the error-disable state (EDS) if an error condition occurs.                                                                                                                                                                                                              |
| <b>vlan <i>vlan-range</i></b> | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                                                                                                                                                                                                                |
| <b>cost <i>number</i></b>     | Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000.<br><br>Defaults: <ul style="list-style-type: none"><li>10-Gigabit Ethernet interface = <b>2000</b>.</li><li>Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b>.</li><li>Port Channel with two 10 Gigabit Ethernet = <b>1800</b>.</li></ul> |
| <b>priority <i>value</i></b>  | Enter the keyword <code>priority</code> then the Port priority value in increments of 16. The range is from 0 to 240. The default is <b>128</b> .                                                                                                                                                                                                      |

|                  |                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------|
| <b>loopguard</b> | Enter the keyword <code>loopguard</code> to enable loop guard on a PVST+ port or port-channel interface. |
| <b>rootguard</b> | Enter the keyword <code>rootguard</code> to enable root guard on a PVST+ port or port-channel interface. |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                                                    |
| <b>9.2(1.0)</b> | Introduced on the Z9500.                                                                                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                    |
| <b>8.4.2.1</b>  | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series TeraScale, C-Series, and S-Series. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                    |
| <b>8.2.1.0</b>  | Introduced the hardware <code>shutdown-on-violation</code> option.                                                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                                                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                                                 |
| <b>7.4.1.0</b>  | Added the optional Bridge Port Data Unit (BPDU) guard.                                                                      |
| <b>6.2.1.1</b>  | Introduced.                                                                                                                 |

## Usage Information

The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into the Error Disable state if a BPDU appears, and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on a PVST switch, immediately transitions to the forwarding state. Only ports connected to end-hosts should be configured as an edge port. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the route process module (RPM) CPU.

You cannot enable `root guard` and `loop guard` at the same time on a port. For example, if you configure `loop guard` on a port on which `root guard` is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

When used in a PVST+ network, loop guard is performed per-port or per-port channel at a VLAN level. If no BPDUs are received on a VLAN interface, the port or port-channel transitions to a Loop-Inconsistent (blocking) state only for this VLAN.

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

On PE ports and on VP-LAGs (LAGs formed with PE ports)

- Spanning-tree with `bpdu guard shutdown-on-violation` is enabled by default
- No spanning tree command is valid. This command is not visible and issuing this command on VP-LAG ports results in a failure.

-

### Example

```
Dell(conf-if-te-1/1)#spanning-tree pvst vlan 3 cost 18000
Dell(conf-if-te-1/1)#end
Dell(conf-if-te-1/1)#show config
!
interface TenGigabitEthernet 1/1
 no ip address
 switchport
 spanning-tree pvst vlan 3 cost 18000
 no shutdown
Dell(conf-if-te-1/1)#end
```

## spanning-tree pvst err-disable

Place ports in an Err-Disabled state if they receive a PVST+ BPDU when they are members an untagged VLAN.

### C9000 Series

#### Syntax

`spanning-tree pvst err-disable cause invalid-pvst-bpdu`

#### Defaults

Enabled; ports are placed in the Err-Disabled state if they receive a PVST+ BPDU when they are members of an untagged VLAN.

**Command Modes** INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description               |
|-----------------|---------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.  |
| <b>9.2(1.0)</b> | Introduced on the Z9500.  |
| <b>8.3.19.0</b> | Introduced on the S4820T. |
| <b>8.3.11.1</b> | Introduced on the Z9000.  |
| <b>8.3.7.0</b>  | Introduced on the S4810.  |
| <b>8.2.1.0</b>  | Introduced.               |

#### Usage Information

Some non-Dell Networking systems which have hybrid ports participating in PVST+ transmit two kinds of BPDUs: an 802.1D BPDU and an untagged PVST+ BPDU.

Dell Networking systems do not expect PVST+ BPDU on an untagged port. If this happens, the system places the port in the Error-Disable state. This behavior might result in the network not converging. To prevent the system from executing this action, use the `no spanning-tree pvst err-disable command cause invalid-pvst-bpdu`.

| <b>Usage Information</b> | By default, the system implements an optimized flush mechanism for PVST+. This implementation helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn this <i>knob</i> command on to enable flushing MAC addresses after receiving every topology change notification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                          |                 |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |             |

# vlan bridge-priority

Set the PVST+ bridge-priority for a VLAN or a set of VLANs.

## C9000 Series

| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced.                 |

#### Related Commands

[vlan forward-delay](#) — changes the time interval before the system transitions to the Forwarding state.

[vlan hello-time](#) — change the time interval between BPDUs.

[vlan max-age](#) — changes the time interval before PVST+ refreshes.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

## vlan forward-delay

Set the amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

### C9000 Series

#### Syntax

`vlan vlan-range forward-delay seconds`

To return to the default setting, use the `no vlan forward-delay` command.

#### Parameters

**vlan *vlan-range*** Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

**forward-delay *seconds*** Enter the keywords `forward-delay` then the time interval, in seconds, that the system waits before transitioning PVST+ to the forwarding state. The range is from 4 to 30 seconds. The default is **15 seconds**.

#### Defaults

**15 seconds**

#### Command Modes

CONFIGURATION (conf-pvst)

#### Command History

# vlan max-age

To maintain configuration information before refreshing that information, set the time interval for the PVST+ bridge.

## C9000 Series

| Syntax           | <code>vlan <i>vlan-range</i> max-age <i>seconds</i></code><br>To return to the default, use the <code>no vlan max-age</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                      |         |             |          |                          |          |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |             |

# PIM-Source Specific Mode (PIM-SSM)

The protocol-independent multicast source-specific mode (PIM-SSM) commands in this section are supported in the Dell Networking operating system.

## Topics:

- [IPv4 PIM Commands](#)
- [IPv4 PIM-Source Specific Mode Commands](#)

## IPv4 PIM Commands

The following commands apply to IPv4 PIM-SM, IPv4 PIM-SSM, and PIM-DM.

- [clear ip pim tib](#)
- [debug ip pim](#)
- [ip pim dr-priority](#)
- [ip pim neighbor-filter](#)
- [ip pim query-interval](#)
- [show ip pim interface](#)
- [show ip pim neighbor](#)
- [show ip pim tib](#)

## clear ip pim tib

Clear PIM tree information from the PIM database.

## C9000 Series

|                        |                                                                                                                                                           |                                                                                  |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip pim tib [group]</code>                                                                                                                     |                                                                                  |
| <b>Parameters</b>      | <b>group</b>                                                                                                                                              | (OPTIONAL) Enter the multicast group address in dotted decimal format (A.B.C.D). |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                            |                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                  |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.0)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

**Usage Information**

If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.

If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

debug ip pim

View IP PIM debugging messages.

C9000 Series

**Syntax**

```
debug ip pim [bsr | events | group | packet [in | out] | register | state |
timer [assert | hello | joinprune | register]]
```

To disable PIM debugging, use the `no debug ip pim` command or use the `undebg all`to disable all debugging command.

**Parameters**

- |                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bsr</b>                                           | (OPTIONAL) Enter the keyword <code>bsr</code> to view PIM Candidate RP/BSR activities.                                                                                                                                                                                                                                                                                                                                                    |
| <b>events</b>                                        | (OPTIONAL) Enter the keyword <code>group</code> to view PIM messages for a specific group.                                                                                                                                                                                                                                                                                                                                                |
| <b>group</b>                                         | (OPTIONAL) Enter the keyword <code>group</code> to view PIM messages for a specific group.                                                                                                                                                                                                                                                                                                                                                |
| <b>packet [in   out]</b>                             | (OPTIONAL) Enter the keyword <code>packet</code> to view PIM packets. Enter one of the optional parameters: <ul style="list-style-type: none"><li>• <code>in</code>: to view incoming packets</li><li>• <code>out</code>: to view outgoing packets</li></ul>                                                                                                                                                                              |
| <b>register</b>                                      | (OPTIONAL) Enter the keyword <code>register</code> to view PIM register address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                       |
| <b>state</b>                                         | (OPTIONAL) Enter the keyword <code>state</code> to view PIM state changes.                                                                                                                                                                                                                                                                                                                                                                |
| <b>timer [assert   hello   joinprune   register]</b> | (OPTIONAL) Enter the keyword <code>timer</code> to view PIM timers. Enter one of the optional parameters: <ul style="list-style-type: none"><li>• <code>assert</code>: to view the assertion timer</li><li>• <code>hello</code>: to view the PIM neighbor keepalive timer</li><li>• <code>joinprune</code>: to view the expiry timer (join/prune timer)</li><li>• <code>register</code>: to view the register suppression timer</li></ul> |

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.0) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |

| Version  | Description                          |
|----------|--------------------------------------|
| 8.3.12.0 | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

## ip pim dr-priority

Change the designated router (DR) priority for the interface.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim dr-priority <i>priority-value</i></code><br>To remove the DR priority value assigned, use the <code>no ip pim dr-priority</code> command.                                                                                                |                                                                                                                   |
| <b>Parameters</b>      | <b><i>priority-value</i></b>                                                                                                                                                                                                                          | Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1. |
| <b>Defaults</b>        | <b>1</b>                                                                                                                                                                                                                                              |                                                                                                                   |
| <b>Command Modes</b>   | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                                                                                                                                   |                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |                                                                                                                   |

| Version   | Description                                                   |
|-----------|---------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010.    |
| 9.9(0.0)  | Introduced on the C9010.                                      |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.                      |
| 9.7(0.0)  | Introduced on the S6000-ON.                                   |
| 9.5(0.0)  | Introduced on the Z9500.                                      |
| 9.0.2.0   | Introduced on the S6000.                                      |
| 8.3.19.0  | Introduced on the S4820T.                                     |
| 8.3.11.1  | Introduced on the Z9000.                                      |
| 8.3.7.0   | Introduced on the S4810.                                      |
| 8.1.1.0   | Introduced on the E-Series ExaScale.                          |
| 7.8.1.0   | Introduced on the C-Series on port-channels and the S-Series. |

|                          |                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router. |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

### C9000 Series

|                        |                                                                                                                                                           |                                                                  |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim neighbor-filter {access-list}</code><br>To remove the restriction, use the <code>no ip pim neighbor-filter {access-list}</code> command.     |                                                                  |
| <b>Parameters</b>      | <b><i>access-list</i></b>                                                                                                                                 | Enter the name of a standard access list. Maximum 16 characters. |
| <b>Defaults</b>        | none                                                                                                                                                      |                                                                  |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                             |                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                  |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                 |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.     |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series. |
| <b>7.6.1.0</b>  | Introduced on the E-Series.              |

|                          |                                                            |
|--------------------------|------------------------------------------------------------|
| <b>Usage Information</b> | Do not enter this command before creating the access-list. |
|--------------------------|------------------------------------------------------------|

## ip pim query-interval

Change the frequency of PIM Router-Query messages.

### C9000 Series

|                        |                                                                                                                                                                |                                                                                                                                         |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim query-interval seconds</code><br>To return to the default value, use the <code>no ip pim query-interval seconds</code> command.                   |                                                                                                                                         |
| <b>Parameters</b>      | <b><i>seconds</i></b>                                                                                                                                          | Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is <b>30 seconds</b> . |
| <b>Defaults</b>        | <b>30 seconds</b>                                                                                                                                              |                                                                                                                                         |
| <b>Command Modes</b>   | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                                            |                                                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                         |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                        |
|-----------|--------------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010.         |
| 9.9(0.0)  | Introduced on the C9010.                                           |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.                           |
| 9.7(0.0)  | Introduced on the S6000-ON.                                        |
| 9.5(0.0)  | Introduced on the Z9500.                                           |
| 9.0.2.0   | Introduced on the S6000.                                           |
| 8.3.19.0  | Introduced on the S4820T.                                          |
| 8.3.11.1  | Introduced on the Z9000.                                           |
| 8.3.7.0   | Introduced on the S4810.                                           |
| 8.1.1.0   | Introduced on the E-Series ExaScale.                               |
| 7.8.1.0   | Introduced on the C-Series for the port-channels and the S-Series. |

## show ip pim interface

View information on the interfaces with IP PIM enabled.

### C9000 Series

**Syntax** `show ip pim interface`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.9(0.0) | Introduced on the C9010.             |
| 9.5(0.0) | Introduced on the Z9500.             |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

**Usage Information** The following describes the `show ip pim interface` command shown in the following example.

| Field     | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| Address   | Lists the IP addresses of the interfaces participating in PIM.                                                                   |
| Interface | List the interface type, with either slot/port information or ID (VLAN or Port Channel), of the interfaces participating in PIM. |
| Ver/Mode  | Displays the PIM version number and mode for each interface participating in PIM:                                                |

| Field              | Description                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
|                    | <ul style="list-style-type: none"> <li>v2 = PIM version 2</li> <li>S = PIM Sparse mode</li> </ul>                                     |
| <b>Nbr Count</b>   | Displays the number of PIM neighbors discovered over this interface.                                                                  |
| <b>Query Intvl</b> | Displays the query interval for Router Query messages on that interface (configured with <code>ip pim query-interval</code> command). |
| <b>DR Prio</b>     | Displays the Designated Router priority value configured on the interface (use the <code>ip pim dr-priority</code> command).          |
| <b>DR</b>          | Displays the IP address of the Designated Router for that interface.                                                                  |

The `show ip pim interface` command does not display information corresponding to the loop-back interfaces.

#### Example

```
Dell#show ip pim interface
Address Interface Ver/ Nbr Query DR DR
 Mode Count Intvl Prio
172.21.200.254 Te 0/9 v2/S 0 30 1 172.21.200.254
172.60.1.2 Te 0/11 v2/S 0 30 1 172.60.1.2
192.3.1.1 Te 0/16 v2/S 1 30 1 192.3.1.1
192.4.1.1 Te 1/5 v2/S 0 30 1 192.4.1.1
172.21.110.1 Te 1/6 v2/S 0 30 1 172.21.110.1
172.21.203.1 Te 1/7 v2/S 0 30 1 172.21.203.1
```

## show ip pim neighbor

View PIM neighbors.

### C9000 Series

**Syntax** `show ip pim neighbor`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.0)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.12.0</b> | Introduced on the S4810.             |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

**Usage Information** The following describes the `show ip pim neighbor` command shown in the following example.

| Field                   | Description                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor address</b> | Displays the IP address of the PIM neighbor.                                                                                                                                                                                                              |
| <b>Interface</b>        | List the interface type, with either slot/port information or ID (VLAN or Port Channel), on which the PIM neighbor was found.                                                                                                                             |
| <b>Uptime/expires</b>   | Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).                                                              |
| <b>Ver</b>              | Displays the PIM version number. <ul style="list-style-type: none"> <li>v2 = PIM version 2</li> </ul>                                                                                                                                                     |
| <b>DR prio/Mode</b>     | Displays the Designated Router priority and the mode. <ul style="list-style-type: none"> <li>1 = default Designated Router priority (use the <code>ip pim dr-priority</code> command)</li> <li>DR = Designated Router</li> <li>S = Sparse mode</li> </ul> |

#### Example

```
Dell#show ip pim neighbor↵
Neighbor Interface Uptime/Expires Ver DR↵
Address Prio/Mode↵
127.87.3.4 Te 1/16 09:44:58/00:01:24 v2 1 / S↵
```

## show ip pim tib

View the PIM tree information base (TIB).

### C9000 Series

**Syntax** `show ip pim tib [group-address [source-address]]`

**Parameters**

- group-address** (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D).
- source-address** (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D).

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.0)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.12.0</b> | Introduced on the S4810.             |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

## Usage Information

The following describes the `show ip pim tib` command shown in the following example.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>(S, G)</b>                   | Displays the entry in the multicast PIM database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>uptime</b>                   | Displays the amount of time the entry has been in the PIM route table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>expires</b>                  | Displays the amount of time until the entry expires and is removed from the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>RP</b>                       | Displays the IP address of the RP/source for this entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>flags</b>                    | List the flags to define the entries: <ul style="list-style-type: none"><li>• D = PIM Dense Mode</li><li>• S = PIM Sparse Mode</li><li>• C = directly connected</li><li>• L = local to the multicast group</li><li>• P = route was pruned</li><li>• R = the forwarding entry is pointing toward the RP</li><li>• F = Dell Networking OS is registering this entry for a multicast source</li><li>• T = packets were received via Shortest Tree Path</li><li>• J = first packet from the last hop router is received and the entry is ready to switch to SPT</li><li>• K = acknowledge pending state</li></ul> |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>RPF neighbor</b>             | Displays the next hop from this interface towards the RP/source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following criteria: <ul style="list-style-type: none"><li>• a directly connect member of the Group</li><li>• statically configured member of the Group</li><li>• received a (*,G) Join message</li></ul>                                                                                                                                                                                                                                                                                                                                                            |

## Example

```
Dell#do show ip pim tib

PIM Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned,
 R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT,
 M - MSDP created entry, A - Candidate for MSDP Advertisement
 K - Ack-Pending State
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

# IPv4 PIM-Source Specific Mode Commands

The following IPv4 PIM-source specific mode (PIM-SSM) commands are supported:

- `ip pim ssm-range`
- `show ip pim ssm-range`

## ip pim ssm-range

Specify the SSM group range using an access list.

### C9000 Series

| <b>Syntax</b>            | <code>ip pim ssm-range {access_list_name}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                                         |          |                                                                                                        |          |                        |          |                          |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |

| 7.7.1.0                  | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                          |          |                                         |          |                                                                                                        |          |                        |          |                          |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |
| 7.5.1.0                  | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                          |          |                                         |          |                                                                                                        |          |                        |          |                          |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |
| <b>Usage Information</b> | <p>Dell Networking OS supports standard access lists for the SSM range. You cannot use extended ACLs for configuring the SSM range. If you configure an extended ACL and then used in the <code>ip pim ssm-range {access_list_name}</code> configuration, an error is reported.</p> <p>However, if you configure <code>ip pim ssm-range {access_list_name}</code> first and then you configure the ACL as an Extended ACL, an error is not reported and the ACL is not applied to the SSM range.</p> <p>Dell Networking OS-recommended best-practices are to configure the standard ACL, and then apply the ACL to the SSM range. After the SSM range is applied, the changes are applied internally without requiring clearing of the tree information base (TIB).</p> <p>When the ACL rules change, the ACL and protocol-independent multicast (PIM) modules apply the new rules automatically.</p>                                                                                                                                                                                                                                                                                                                             |         |             |          |                          |          |                                         |          |                                                                                                        |          |                        |          |                          |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |         |                             |

When you configure the SSM range, Dell Networking OS supports SSM for configured group range as well as the default SSM range.

When you remove the SSM ACL, PIM SSM is supported for the default SSM range only.

## show ip pim ssm-range

Display the non-default groups added using the SSM range feature.

### C9000 Series

**Syntax** `show ip pim ssm-range`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                                                                               |
| <b>9.7(0.1)</b> | Introduced on the S3048-ON and S4048-ON.                                                               |
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. Added support for VRF on S6000, S4810, S4820T, Z9000, Z9500, and S6000-ON. |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                                                                               |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                               |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                              |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                               |
| <b>8.3.7.1</b>  | Introduced on the S4810.                                                                               |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.                                                                   |
| <b>7.8.1.0</b>  | Introduced on the S-Series.                                                                            |
| <b>7.7.1.0</b>  | Introduced on the C-Series.                                                                            |
| <b>7.5.1.0</b>  | Introduced on the E-Series.                                                                            |

#### Example

```
Group Address / MaskLen
```

# PIM-Sparse Mode (PIM-SM)

The protocol-independent multicast sparse-mode (PIM-SM) commands in this section are supported in the Dell Networking operating system.

## Topics:

- [IPv6 PIM-Sparse Mode Commands](#)

## IPv4 PIM-Sparse Mode Commands

The following describes the IPv4 PIM-sparse mode (PIM-SM) commands.

### clear ip pim rp-mapping

The bootstrap router (BSR) feature uses this command to remove all or particular rendezvous point (RP) advertisement.

#### C9000 Series

**Syntax** `clear ip pim rp-mapping [rp-address]`

**Parameters** *rp-address* (OPTIONAL) Enter the RP address in dotted decimal format (A.B.C.D).

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.0)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

**Usage Information** This command re-applies the RP mapping logic for all the groups learnt by the node. Any stale information corresponding to the existing mapping configuration is updated. As a result, the existing BSR cache and the \*,G's are deleted only if these entries are stale.

# clear ip pim tib

Clear PIM tree information from the PIM database.

## C9000 Series

|                 |                                                                                                                                                           |                                                                                  |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|

| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Information | <p>If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.</p> <p>If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.</p> |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# debug ip pim

View IP PIM debugging messages.

## C9000 Series

|            |                                                                                                                            |                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Syntax     | debug ip pim [bsr   events   group   packet [in   out]   register   state   timer [assert   hello   joinprune   register]] |                                                                                                |
|            | To disable PIM debugging, use the no debug ip pim command or use the undebg allto disable all debugging command.           |                                                                                                |
| Parameters | bsr                                                                                                                        | (OPTIONAL) Enter the keyword bsr to view PIM Candidate RP/BSR activities.                      |
|            | events                                                                                                                     | (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.                  |
|            | group                                                                                                                      | (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.                  |
|            | packet [in   out]                                                                                                          | (OPTIONAL) Enter the keyword packet to view PIM packets. Enter one of the optional parameters: |

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>register</b>                                      | (OPTIONAL) Enter the keyword <code>register</code> to view PIM register address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                            |
| <b>state</b>                                         | (OPTIONAL) Enter the keyword <code>state</code> to view PIM state changes.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>timer [assert   hello   joinprune   register]</b> | (OPTIONAL) Enter the keyword <code>timer</code> to view PIM timers. Enter one of the optional parameters: <ul style="list-style-type: none"> <li>• <code>assert</code>: to view the assertion timer</li> <li>• <code>hello</code>: to view the PIM neighbor keepalive timer</li> <li>• <code>joinprune</code>: to view the expiry timer (join/prune timer)</li> <li>• <code>register</code>: to view the register suppression timer</li> </ul> |

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.0)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.12.0</b> | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

## ip pim bsr-border

Define the border of PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

### C9000 Series

**Syntax** `ip pim bsr-border`

To return to the default value, use the `no ip pim bsr-border` command.

**Defaults** Disabled.

**Command Modes** INTERFACE  
INTERFACE (BATCH Mode)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                                |
|------------------|------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010. |

| Version         | Description                          |
|-----------------|--------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.             |
| <b>9.5(0.1)</b> | Introduced on the Z9500.             |
| <b>9.0.2.0</b>  | Introduced on the S6000.             |
| <b>8.3.19.0</b> | Introduced on the S4820T.            |
| <b>8.3.11.1</b> | Introduced on the Z9000.             |
| <b>8.3.7.0</b>  | Introduced on the S4810.             |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>  | Introduced on the S-Series.          |

**Usage Information** This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out. To clean the candidate RP advertisements, use the `clear ip pim rp-mapping` command.

## ip pim bsr-candidate

To join the Bootstrap election process, configure the PIM router.

### C9000 Series

**Syntax** `ip pim bsr-candidate interface ] [hash-mask-length] [priority]`

To return to the default value, use the `no ip pim bsr-candidate` command.

|                   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b>        | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|                   | <b>hash-mask-length</b> | (OPTIONAL) Enter the hash mask length. The range is from zero (0) to 32. The default is <b>30</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>priority</b>         | (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. The default is <b>zero (0)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                              |
|-----------------|------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                 |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON. |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                           |
| <b>8.1.1.0</b>  | Introduced on the E-Series ExaScale.               |
| <b>6.1.1.0</b>  | Added support for the VLAN interface.              |

## ip pim dr-priority

Change the designated router (DR) priority for the interface.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim dr-priority <i>priority-value</i></code><br>To remove the DR priority value assigned, use the <code>no ip pim dr-priority</code> command.                                                                                                |                                                                                                                   |
| <b>Parameters</b>      | <b><i>priority-value</i></b>                                                                                                                                                                                                                          | Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1. |
| <b>Defaults</b>        | <b>1</b>                                                                                                                                                                                                                                              |                                                                                                                   |
| <b>Command Modes</b>   | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                                                                                                                                   |                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |                                                                                                                   |

| Version          | Description                                                   |
|------------------|---------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.    |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                      |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON.                      |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.                                   |
| <b>9.5(0.0)</b>  | Introduced on the Z9500.                                      |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                      |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                     |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                      |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                      |
| <b>8.1.1.0</b>   | Introduced on the E-Series ExaScale.                          |
| <b>7.8.1.0</b>   | Introduced on the C-Series on port-channels and the S-Series. |

|                          |                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router. |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ip pim graceful-restart

This feature permits configuration of non-stop forwarding (NSF or graceful restart) capability on a PIM enabled router.

**Syntax** `ip pim graceful-restart {nsf [restart-time | stale-entry-time]}`

### Parameters

|                         |                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nsf</b>              | Enter the keyword <code>nsf</code> to configure the non-stop forwarding capability.<br> <b>NOTE:</b> <code>ip pim graceful-restart nsf</code> is applicable for the entire multicast sub-system. |
| <b>restart-time</b>     | (OPTIONAL) Enter the keywords <code>restart-time</code> followed by the number of seconds estimated for the PIM speaker to restart. The range is 30 to 300 seconds. The default is <b>180 seconds</b> .                                                                           |
| <b>stale-entry-time</b> | (OPTIONAL) Enter the keywords <code>stale-entry-time</code> followed by the number of seconds for which entries are kept alive after restart. The range is 30 to 300 seconds. The default is <b>60 seconds</b> .                                                                  |

**Defaults** as above

**Command Modes** CONFIGURATION

### Command History

| Version          | Description                                                                               |
|------------------|-------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b> | Added support on the C9000.                                                               |
| <b>9.0(1.3)</b>  | Introduced on the S5000.                                                                  |
| <b>8.2.1.0</b>   | Introduced on the E-Series ExaScale. Added the <code>ipv6</code> option for the E-Series. |
| <b>7.6.1.0</b>   | Introduced on the E-Series.                                                               |

### Usage Information

The PIM-SM component uses the graceful-restart feature to relearn the PIM JOIN messages (\*,G/S,G) from upstream neighbors. The upstream neighbors detect the RPM failover of the downstream router, on reception of a different gen-id in the PIM-hello message. They then start to send relevant PIM JOINS to the downstream router after establishing neighbor-ship with the new active RPM.

## ip pim join-filter

Permit or deny PIM Join/Prune messages on an interface using an extended IP access list. This command prevents the PIM-SM router from creating state based on multicast source and/or group.

## C9000 Series

**Syntax** `ip pim [vrf vrf-name] join-filter ext-access-list`

To remove the access list, use the `no ip pim [vrf vrf-name] join-filter ext-access-list` command.

### Parameters

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>    | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to permit or deny PIM join or prune messages on an interface associated with that VRF. |
| <b>ext-access-list</b> | Enter the name of an extended access list.                                                                                                                           |

**Defaults** none

**Command Modes** INTERFACE  
INTERFACE (BATCH Mode)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                        |
|-----------|--------------------------------------------------------------------|
| 9.10(0.0) | Introduced the Configuration Terminal Batch mode on C9010.         |
| 9.9(0.0)  | Introduced on the C9010.                                           |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.                           |
| 9.7(0.0)  | Removed the in and out parameters. Introduced on the S6000-ON.     |
| 9.5(0.0)  | Introduced on the Z9500.                                           |
| 9.0.2.0   | Introduced on the S6000.                                           |
| 8.3.19.0  | Introduced on the S4820T.                                          |
| 8.3.11.1  | Introduced on the Z9000.                                           |
| 8.3.7.0   | Introduced on the S4810.                                           |
| 8.1.1.0   | Introduced on the E-Series ExaScale.                               |
| 7.8.1.0   | Introduced on the C-Series for the port-channels and the S-Series. |
| 7.7.1.0   | Introduced on the E-Series.                                        |

#### Example

```
Dell(config)# ip access-list extended iptv-channels
Dell(config-ext-nacl)# permit ip 10.1.2.3/24 225.1.1.0/24
Dell(config-ext-nacl)# permit ip any 232.1.1.0/24
Dell(config-ext-nacl)# permit ip 100.1.1.0/16 any
Dell(config-if-te-1/1)# ip pim join-filter iptv-channels
Dell(config-if-te-1/1)# ip pim join-filter iptv-channels
```

#### Related Commands

[ip access-list extended](#) — configure an access list based on IP addresses or protocols.

## ip pim ingress-interface-map

When the Dell Networking system is the RP, statically map potential incoming interfaces to (\*,G) entries to create a lossless multicast forwarding environment.

### C9000 Series

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim ingress-interface-map <i>std-access-list</i></code>                                                                                               |
| <b>Parameters</b>      | <b><i>std-access-list</i></b> Enter the name of a standard access list.                                                                                        |
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.9(0.0) | Introduced on the C9010.  |
| 9.5(0.1) | Introduced on the Z9500.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |

| Version | Description |
|---------|-------------|
| 8.4.1.0 | Introduced  |

#### Example

```
Dell(config)# ip access-list standard map1
Dell(config-std-nacl)# permit 224.0.0.1/24
Dell(config-std-nacl)#exit
Dell(config)#int tengig 1/1
Dell(config-if-te-1/1)# ip pim ingress-interface-map map1
```

## ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

| 8.1.1.0  | Introduced on the E-Series ExaScale.     |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |
| 7.6.1.0  | Introduced on the E-Series.              |

|                          |                                                            |
|--------------------------|------------------------------------------------------------|
| <b>Usage Information</b> | Do not enter this command before creating the access-list. |
|--------------------------|------------------------------------------------------------|

## ip pim query-interval

Change the frequency of PIM Router-Query messages.

### C9000 Series

|               |                                      |
|---------------|--------------------------------------|
| <b>Syntax</b> | ip pim query-interval <i>seconds</i> |
|---------------|--------------------------------------|

To return to the default value, use the `no ip pim query-interval seconds` command.

|                        |                                                                                                                                                                                                                                                           |                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                                                                                                            | Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is <b>30 seconds</b> . |
| <b>Defaults</b>        | <b>30 seconds</b>                                                                                                                                                                                                                                         |                                                                                                                                         |

## ip pim register-filter

To prevent a PIM source DR from sending register packets to an RP for the specified multicast source and group, use this feature.

### C9000 Series

|                        |                                                                                                                                                                                                                                                           |                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim register-filter access-list</code><br><br>To return to the default, use the <code>no ip pim register-filter access-list [vrf vrf-name]</code> command.                                                                                       |                                                                   |
| <b>Parameters</b>      | <b>access-list</b>                                                                                                                                                                                                                                        | Enter the name of an extended access list. |                        | <b>9.8(0.0)</b>                                                                                                                                                                                                                                           | Introduced on the S3048-ON and S4048-ON.                          |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. Added support for VRF. |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |
| <b>8.3.7.0</b>  | Introduced on the S4810.                           |
| <b>7.8.1.0</b>  | Introduced on the C-Series and S-Series.           |
| <b>7.6.1.0</b>  | Introduced                                         |

#### Usage Information

The access name is an extended IP access list that denies PIM register packets to RP at the source DR based on the multicast and group addresses. Do not enter this command before creating the access-list

## ip pim rp-address

Configure a static PIM rendezvous point (RP) address for a group or access-list.

### C9000 Series

#### Syntax

```
ip pim rp-address address {group-address group-address mask} [override]
```

To remove an RP address, use the `no ip pim rp-address address {group-address group-address mask} [vrf vrf-name] [override]` command.

#### Parameters

|                                                 |                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address</b>                                  | Enter the RP address in dotted decimal format (A.B.C.D).                                                                                         |
| <b>group-address<br/>group-address<br/>mask</b> | Enter the keywords <code>group-address</code> then a group-address mask, in dotted decimal format (/xx), to assign that group address to the RP. |
| <b>override</b>                                 | Enter the keyword <code>override</code> to override the BSR updates with static RP. The override takes effect immediately during enable/disable. |

 **NOTE:** This option is applicable to multicast group range.

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.8(0.0)</b> | Introduced on the S3048-ON and S4048-ON.           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.11.1</b> | Introduced on the Z9000.                           |

| Version             | Description                          |
|---------------------|--------------------------------------|
| <b>8.3.7.0</b>      | Introduced on the S4810.             |
| <b>8.1.1.0</b>      | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>      | Introduced on the S-Series.          |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.          |

#### Usage Information

First-hop routers use this address by to send register packets on behalf of source multicast hosts. The RP addresses are stored in the order in which they are entered. RP addresses learned using BSR take priority over static RP addresses. Without the `override` option, RPs advertised by the BSR updates take precedence over the statically configured RPs.

## ip pim rp-candidate

To send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR, configure a PIM router.

### C9000 Series

#### Syntax

```
ip pim rp-candidate {interface [priority] [acl-name]}
```

To return to the default value, use the `no ip pim rp-candidate {interface [priority] [vrf vrf-name]}` command.

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a 1-Gigabit Ethernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b><i>priority</i></b>  | (OPTIONAL) Enter the priority used in Bootstrap election process. The range is zero (0) to 255. The default is <b>192</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>acl-name</i></b>  | (OPTIONAL) Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.11.0.0</b> | Introduced the <code>acl-name</code> parameter.    |
| <b>9.9(0.0)</b> | Introduced on the C9010.                           |
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.0)</b> | Introduced on the Z9500.                           |

| Version             | Description                          |
|---------------------|--------------------------------------|
| <b>9.0.2.0</b>      | Introduced on the S6000.             |
| <b>8.3.19.0</b>     | Introduced on the S4820T.            |
| <b>8.3.11.1</b>     | Introduced on the Z9000.             |
| <b>8.3.7.0</b>      | Introduced on the S4810.             |
| <b>8.1.1.0</b>      | Introduced on the E-Series ExaScale. |
| <b>7.8.1.0</b>      | Introduced on the S-Series.          |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.          |

**Usage Information** Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.

## ip pim sparse-mode

Enable PIM sparse mode and IGMP on the interface.

### C9000 Series

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip pim sparse-mode</code><br>To disable PIM sparse mode and IGMP, use the <code>no ip pim sparse-mode</code> command.                                                                                                                           |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE<br>INTERFACE (BATCH Mode)                                                                                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |

| Version          | Description                                                        |
|------------------|--------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced the Configuration Terminal Batch mode on C9010.         |
| <b>9.9(0.0)</b>  | Introduced on the C9010.                                           |
| <b>9.5(0.1)</b>  | Introduced on the Z9500.                                           |
| <b>9.0.2.0</b>   | Introduced on the S6000.                                           |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                                          |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                                           |
| <b>8.3.7.0</b>   | Introduced on the S4810.                                           |
| <b>8.1.1.0</b>   | Introduced on the E-Series ExaScale.                               |
| <b>7.8.1.0</b>   | Introduced on the C-Series for the port-channels and the S-Series. |

**Usage Information** The interface must be enabled (the `no shutdown` command) and not have the `switchport` command configured. Multicast must also be enabled globally (using the `ip multicast-lag-hashing` command). PIM is supported on the port-channel interface.

## ip pim spt-threshold

To switch to the shortest path tree when the traffic reaches the specified threshold value, configure the PIM router.

### C9000 Series

| <b>Syntax</b>            | <code>ip pim spt-threshold [infinity]</code><br><br>To return to the default value, use the <code>no ip pim spt-threshold [infinity] [vrf vrf-name]</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                        |         |             |                 |                          |                 |                                          |                 |                                                    |                 |                          |                 |                           |                 |                          |                |                                      |
