|                        | 9.10(0.1)                                                                                                                                                     | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                            |
|                        | 9.10(0.0)                                                                                                                                                     | Introduced on the S3148.                                                                                                                                                                                                             |
|                        | 9.10(0.0)                                                                                                                                                     | Introduced on the S6100-ON.                                                                                                                                                                                                          |

| Version    | Description                     |
|------------|---------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.5(0.1)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.12.0   | Introduced on the S4810.        |
| 8.3.11.1   | Introduced on the Z9000.        |

#### Usage Information

Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The `seconds` parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

#### Related Commands

- [lsp-refresh-interval](#) — set the link-state packet (LSP) refresh interval.

## maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

#### Syntax

`maximum-paths number`

To return to the default values, use the `no maximum-paths` command.

#### Parameters

**number**

Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is **4**.

#### Defaults

**4**

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version  | Description                            |
|----------|----------------------------------------|
| 9.5(0.1) | Introduced on the Z9500.               |
| 9.0.2.0  | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.12.0 | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 7.8.1.0  | Added support for multi-topology ISIS. |
| 6.3.1.0  | Introduced.                            |

## metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

**Syntax** `metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]`

To return to the default values, use the `no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]` command.

| Parameters        |                                                                                                |  |
|-------------------|------------------------------------------------------------------------------------------------|--|
| <b>narrow</b>     | Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.            |  |
| <b>transition</b> | Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.    |  |
| <b>wide</b>       | Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215. |  |
| <b>level-1</b>    | Enables the metric style on Level 1.                                                           |  |
| <b>level-2</b>    | Enables the metric style on Level 2.                                                           |  |

**Defaults** **narrow**; if no Level is specified, Level-1 and Level-2 are configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version  | Description              |
|----------|--------------------------|
| 8.3.12.0 | Introduced on the S4810. |

#### Usage Information

If you enter the `metric-style wide` command, the Dell EMC Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.

The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that it requires.

#### Related Commands

- [isis metric](#) — configure a metric for an interface.

## multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

**Syntax** `multi-topology [transition]`

To return to a single topology configuration, use the `no multi-topology [transition]` command.

**Parameters** `transition`

**Defaults** Disabled

**Command Modes** CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.12.0   | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced.                               |

## net

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

**Syntax** `net network-entity-title`

To remove a net, use the `no net network-entity-title` command.

**Parameters** ***network-entity-title*** Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |

## passive-interface

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

**Syntax** `passive-interface interface`

To delete a passive interface configuration, use the `no passive-interface interface` command.

**Parameters** ***interface*** Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.

- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |

**Usage Information** Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

## redistribute

Redistribute routes from one routing domain to another routing domain.

**Syntax** `redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]`

To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [metric metric-value] [metric-type {external | internal}] [level-1 | level-1-2 | level-2] [route-map map-name]` command.

| Parameters                               |                                                                                                                                                                                                                                                |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                         | Enter the keyword <code>connected</code> to redistribute active routes into IS-IS.                                                                                                                                                             |
| <b>rip</b>                               | Enter the keyword <code>rip</code> to redistribute RIP routes into IS-IS.                                                                                                                                                                      |
| <b>static</b>                            | Enter the keyword <code>static</code> to redistribute user-configured routes into IS-IS.                                                                                                                                                       |
| <b>metric <i>metric-value</i></b>        | (OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is <b>0</b> . Use a value that is consistent with the destination protocol.                                                                 |
| <b>metric-type {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following: <ul style="list-style-type: none"> <li>• <code>external</code></li> <li>• <code>internal</code></li> </ul> |
| <b>level-1</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                                                                |

- level-1-2** (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
- level-2** (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
- route-map *map-name*** (OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.

**Defaults**

- metric metric-value = **0**
- metric-type= internal; **level-2**

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>7.5.1.0</b>    | Added support for IPv6 ISIS.              |
| <b>6.3.1.0</b>    | Introduced.                               |

**Usage Information**

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell EMC Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the `redistribute` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `redistribute` command is advertised.

**Related Commands**

- [default-information originate](#) — generate a default route for the IS-IS domain.
- [distribute-list out](#) — suppress networks from being advertised in updates. This command filters redistributed routing information.

# redistribute bgp

Redistribute routing information from a BGP process.

**Syntax** `redistribute bgp AS number [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]`

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

|                   |                                          |                                                                                                                                                                                                                                                                                                                                             |
|-------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>AS number</b>                         | Enter a number that corresponds to the autonomous system number. The range is from 1 to 65355.                                                                                                                                                                                                                                              |
|                   | <b>level-1</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.                                                                                                                                                                                                                                                           |
|                   | <b>level-1-2</b>                         | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.                                                                                                                                                                                                                                                    |
|                   | <b>level-2</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.                                                                                                                                                                                                                           |
|                   | <b>metric metric-value</b>               | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                                                                                                                                                      |
|                   | <b>metric-type {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"><li>• external</li><li>• internal</li></ul>                                                                                                                                    |
|                   | <b>route-map map-name</b>                | <code>map-name</code> is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol. If you do not specify a <code>map-name</code> , all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported. |

**Defaults** IS-IS Level 2 routes only

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |

| 8.3.12.0   | Introduced on the S4810.                  |

| Version | Description                  |
|---------|------------------------------|
| 7.5.1.0 | Added support for IPv6 ISIS. |
| 6.3.1.0 | Introduced.                  |

### Usage Information

BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

### Example

```
DelleMC(conf)# router is
DelleMC(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-
type
external route-map rmap-isis-to-bgp
DelleMC(conf-router_bgp)#show running-config isis
!
router isis
redistribute bgp 1 level-1 metric 32 metric-type external route-map
rmap-isis-to-bgp
```

## redistribute ospf

Redistribute routing information from an OSPF process.

### Syntax

```
redistribute ospf process-id [level-1 | level-1-2 | level-2] [match
{internal | external}] [metric metric-value] [metric-type {external |
internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

### Parameters

|                                          |                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>process-id</b>                        | Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65355.                                                                                                                                                                                                              |
| <b>metric metric-value</b>               | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                                                                                                                                 |
| <b>metric-type {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> <li>external</li> <li>internal</li> </ul>                                                                                                                |
| <b>level-1</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                                                                                                                                        |
| <b>level-1-2</b>                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.                                                                                                                                                                                                                                      |
| <b>level-2</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.                                                                                                                                                                                                           |
| <b>match {external   internal}</b>       | (OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are <ul style="list-style-type: none"> <li>internal</li> <li>external</li> </ul>                                                                                                                                 |
| <b>route-map map-name</b>                | map-name is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol. If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported. |

### Defaults

See *Parameters*.

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.12.0   | Introduced on the S4810.                  |
| 7.5.1.0    | Added support for IPv6 ISIS.              |
| 6.3.1.0    | Introduced.                               |

**Usage Information** How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

## router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

**Syntax** `router isis [vrf vrf-name] [tag]`  
 To disable IS-IS routing, use the `no router isis [tag]` command.

**Parameters**

**vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.

**tag** (OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the `tag` option is not specified. The tag name must be unique for all IP router processes for a given router.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |

#### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

#### Related Commands

- [ip router isis](#) — configure IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- [net](#) — configure an IS-IS network entity title (NET) for a routing process.
- [is-type](#) — assign a type for a given area.

## set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

#### Syntax

```
set-overload-bit
```

To return to the default values, use the `no set-overload-bit` command.

#### Defaults

Not set.

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version         | Description                            |
|-----------------|----------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.            |
| <b>9.5(0.1)</b> | Introduced on the Z9500.               |
| <b>9.0.2.0</b>  | Introduced on the S6000.               |
| <b>8.3.19.0</b> | Introduced on the S4820T.              |
| <b>8.3.12.0</b> | Introduced on the S4810.               |
| <b>8.3.11.1</b> | Introduced on the Z9000.               |
| <b>7.8.1.0</b>  | Added support for multi-topology ISIS. |
| <b>6.3.1.0</b>  | Introduced.                            |

### Usage Information

Set the overload bit when a router experiences problems, such as a memory shortage due to an incomplete link state database which can result in an incomplete or inaccurate routing table. If you set the overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovered.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 address.

## show config

Display the changes you made to the IS-IS configuration. Default values are not shown.

**Syntax** `show config`

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Example (Router-Isis)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
DellEMC(conf-router_isis)# show config
!
router isis
```

```

clns host ISIS 49.0000.0001.F100.E120.0013.00
log-adjacency-changes
net 49.0000.0001.F100.E120.0013.00
!
address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family

```

### Example (Address- Family\_IPv6)

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```

DellEMC(conf-router_isis-af_ipv6)# show conf
!
address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family

```

## show isis database

Display the IS-IS link state database.

### Syntax

```
show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail |
summary] [system-id] [lspid]
```

### Parameters

|                            |                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf <i>vrf-name</i></b> | (Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.<br><b>NOTE:</b> If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed. |
| <b>level-1</b>             | (OPTIONAL) Displays the Level 1 IS-IS link-state database.                                                                                                                                                                                                        |
| <b>level-2</b>             | (OPTIONAL) Displays the Level 2 IS-IS link-state database.                                                                                                                                                                                                        |
| <b>local</b>               | (OPTIONAL) Displays local link-state database information.                                                                                                                                                                                                        |
| <b>detail</b>              | (OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.                                                                                                                                |
| <b>summary</b>             | (OPTIONAL) Displays the summary of link-state database information when specified.                                                                                                                                                                                |
| <b><i>lspid</i></b>        | (OPTIONAL) Display only the specified LSP.                                                                                                                                                                                                                        |
| <b><i>system-id</i></b>    | (OPTIONAL) Displays the link-state database for system-id.                                                                                                                                                                                                        |

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON.                          |
| 9.8(2.0)   | Introduced on the S3100 series.                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                          |

| 9.7(0.0)   | Added supported for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                             |
| 9.2(0.2)   | Introduced on the Z9000.                             |
| 9.0.2.0    | Introduced on the S6000.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.7.1    | Introduced on the S4810.                             |

### Usage Information

The following describes the `show isis database` command shown in the following example.

| Field                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IS-IS Level-1/<br/>Level-2 Link<br/>State Database</b> | Displays the IS-IS link state database for Level 1 or Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LSPID</b>                                              | <p>Displays the LSP identifier.</p> <p>The first six octets are the System ID of the originating router.</p> <p>The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.</p> <p>The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.</p> <p>The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.</p> <p>An * after the LSPID indicates that the system originates an LSP where this command was issued.</p> |
| <b>LSP Seq Num</b>                                        | This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LSP Checksum</b>                                       | This is the checksum of the entire LSP packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LSP Holdtime</b>                                       | This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ATT</b>                                                | This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>P</b>                                                  | This value represents the P bit. This bit is always set to zero as Dell EMC Networking does not support area partition repair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>OL</b>                                                 | This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Example**

The bold sections identify that MultiTopology IS-IS is enabled.

```

# show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

**Syntax** `show isis [vrf vrf-name] graceful-restart detail`

- Command Modes**
- EXEC
  - EXEC Privilege

**Parameters** `vrf vrf-name` (Optional) Enter the keyword vrf followed by the name if the VRf to display IS-IS graceful restart details corresponding to that VRF.

 **NOTE:** If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.3.1.0    | Introduced on the E-Series.                        |

## Example

```
DelleMC# show isis graceful-restart detail
Configured Timer Value
=====
Graceful Restart : Enabled
T3 Timer : Manual
T3 Timeout Value : 30
T2 Timeout Value : 30 (level-1), 30 (level-2)
T1 Timeout Value : 5, retry count: 1
Adjacency wait time : 30

Operational Timer Value
=====
Current Mode/State : Normal/RUNNING
T3 Time left : 0
T2 Time left : 0 (level-1), 0 (level-2)
Restart ACK rcv count : 0 (level-1), 0 (level-2)
Restart Req rcv count : 0 (level-1), 0 (level-2)
Suppress Adj rcv count : 0 (level-1), 0 (level-2)
Restart CSNP rcv count : 0 (level-1), 0 (level-2)
Database Sync count : 0 (level-1), 0 (level-2)
```

# show isis hostname

Display IS-IS host names configured or learned on the switch.

|                      |                                                                             |                                                                                                              |
|----------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show isis [vrf vrf-name] hostname</code>                              |                                                                                                              |
| <b>Parameters</b>    | <b>vrf vrf-name</b>                                                         | Enter the keyword vrf followed by the name of the VRF to display IS-IS host names corresponding to that VRF. |
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul> |                                                                                                              |

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.12.0</b>   | Introduced on the S4810.                           |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                           |

## Example

```
DellEMC# show isis hostname
System Id Dynamic Name Static Name
 *F100.E120.0013 Force10 ISIS
DellEMC#
```

# show isis interface

Display detailed IS-IS interface status and configuration information.

|                   |                                                             |                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show isis [vrf vrf-name] interface [interface]</code> |                                                                                                                                                                                                                                                       |
| <b>Parameters</b> | <b>vrf vrf-name</b>                                         | (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.                                                                                                             |
|                   | <b>interface</b>                                            | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li></ul> |

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |

### Example

```
DelleMC> show isis int
TenGigabitEthernet 1/7/1 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 37847070, Local circuit ID 1
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.01
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-2 adjacencies: 1
 Next IS-IS LAN Level-1 Hello in 2 seconds
 Next IS-IS LAN Level-2 Hello in 1 seconds
 LSP Interval: 33
TenGigabitEthernet 1/8/1 is up, line protocol is up
 MTU 1497, Encapsulation SAP
 Routing Protocol: IS-IS
 Circuit Type: Level-1-2
 Interface Index 38371358, Local circuit ID 2
 Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
 Number of active level-1 adjacencies: 1
 Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.02
 Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
--More--
```

# show isis neighbors

Display information about neighboring (adjacent) routers.

**Syntax** `show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail] [interface]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display adjacent router information corresponding to that VRF.
  - level-1** (OPTIONAL) Displays information about Level 1 IS-IS neighbors.
  - level-2** (OPTIONAL) Displays information about Level 2 IS-IS neighbors.
  - detail** (OPTIONAL) Displays detailed information about neighbors.
  - interface** (OPTIONAL) Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |

**Usage Information** Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

| Field     | Description                                    |
|-----------|------------------------------------------------|
| System Id | The value that identifies a system in an area. |

| Field             | Description                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>  | The interface, slot, and port in which the router was discovered.                                                           |
| <b>State</b>      | The value providing status about the adjacency state. The range is Up and Init.                                             |
| <b>Type</b>       | This value displays the adjacency type (Layer 2, Layer 2 or both).                                                          |
| <b>Priority</b>   | IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface. |
| <b>Uptime</b>     | Displays the interfaces uptime.                                                                                             |
| <b>Circuit Id</b> | The neighbor's interpretation of the designated router for the interface.                                                   |

### Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
DellEMC# show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1/1 Up L1L2(M) 127 09:28:01 TEST.02
!
DellEMC#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
 IP Address(es): 25.1.1.3*
 MAC Address: 0000.0000.0000
 Hold Time: 28
 Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6 , Common (IPv4 IPv6)
Adjacency being used for MTs: IPv4 IPv6
DellEMC#
```

## show isis protocol

Display IS-IS routing information.

**Syntax** `show isis [vrf vrf-name] protocol`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version         | Description                                        |
|-----------------|----------------------------------------------------|
| <b>9.7(0.0)</b> | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                           |
| <b>9.2(0.2)</b> | Introduced on the Z9000.                           |
| <b>9.0.2.0</b>  | Introduced on the S6000.                           |
| <b>8.3.19.0</b> | Introduced on the S4820T.                          |
| <b>8.3.12.0</b> | Introduced on the S4810.                           |

### Example

The bold section identifies that Multi-Topology IS-IS is enabled.

```
DellEMC# show isis protocol
IS-IS Router: <Null Tag>
 System Id: F100.E120.0013 IS-Type: level-1-2
 Manual area address(es):
 49.0000.0001
 Routing for area address(es):
 49.0000.0001
 Interfaces supported by IS-IS:
 TenGigabitEthernet 1/1/1 - IP - IPv6
 TenGigabitEthernet 1/2/1 - IP - IPv6
 TenGigabitEthernet 1/10/1 - IP - IPv6
 Loopback 0 - IP - IPv6
 Redistributing:
 Distance: 115
 Generate narrow metrics: level-1-2
 Accept narrow metrics: level-1-2
 Generate wide metrics: none
 Accept wide metrics: none
Multi Topology Routing is enabled in transition mode.
DellEMC#
```

## show isis traffic

This command allows you to display IS-IS traffic interface information.

### Syntax

```
show isis [vrf vrf-name] traffic [interface]
```

### Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.
- interface** (OPTIONAL) Identifies the interface type and the interface following:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.2(0.2)   | Introduced on the Z9000.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |

### Usage Information

The following describes the `show isis traffic` command shown in the following example.

| Item                                              | Description                                                     |
|---------------------------------------------------|-----------------------------------------------------------------|
| <b>Level-1/Level-2 Hellos (sent/rcvd)</b>         | Displays the number of Hello packets sent and received.         |
| <b>PTP Hellos (sent/rcvd)</b>                     | Displays the number of point-to-point Hellos sent and received. |
| <b>Level-1/Level-2 LSPs sourced (new/refresh)</b> | Displays the number of new and refreshed LSPs.                  |
| <b>Level-1/Level-2 LSPs flooded (sent/rcvd)</b>   | Displays the number of flooded LSPs sent and received.          |
| <b>Level-1/Level-2 LSPs CSNPs (sent/rcvd)</b>     | Displays the number of CSNP LSPs sent and received.             |
| <b>Level-1/Level-2 LSPs PSNPs (sent/rcvd)</b>     | Displays the number of PSNP LSPs sent and received.             |
| <b>Level-1/Level-2 DR Elections</b>               | Displays the number of times designated router elections ran.   |
| <b>Level-1/Level-2 SPF Calculations</b>           | Displays the number of shortest path first calculations.        |
| <b>LSP checksum errors received</b>               | Displays the number of checksum errors LSPs received.           |
| <b>LSP authentication failures</b>                | Displays the number of LSP authentication failures.             |

### Example

```
DellEMC# show is traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
```

```

IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337

```

## spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

**Syntax** `spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]`

To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

|                   |                                      |                                                                                                                                                                      |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>level-1</b>                       | (OPTIONAL) Enter the keyword <code>level-1</code> to apply the configuration to Level-1 SPF calculations.                                                            |
|                   | <b>level-2</b>                       | (OPTIONAL) Enter the keyword <code>level-2</code> to apply the configuration to Level-2 SPF calculations.                                                            |
|                   | <b>interval seconds</b>              | Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is <b>10 seconds</b> .                                 |
|                   | <b>initial_wait_interval seconds</b> | (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |
|                   | <b>second_wait_interval seconds</b>  | (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |

**Defaults** See *Parameters*.

- Command Modes**
- ROUTER ISIS (*for IPv4*)
  - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                  |

| <b>Version</b>  | <b>Description</b>                            |
|-----------------|-----------------------------------------------|
| <b>9.0.2.0</b>  | Introduced on the S6000.                      |
| <b>8.3.19.0</b> | Introduced on the S4820T.                     |
| <b>8.3.11.1</b> | Introduced on the Z9000.                      |
| <b>8.3.12.0</b> | Introduced on the S4810.                      |
| <b>7.8.1.0</b>  | Added support for multi-topology ISIS.        |
| <b>7.5.1.0</b>  | Added support for SPF Throttling Enhancement. |

**Usage Information**

This command `spf-interval` in CONFIG-ROUTER-ISIS-AF-IPV6 mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in CONFIG-ROUTER-ISIS mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

# Link Aggregation Control Protocol (LACP)

This section contains commands for Dell EMC Networks' implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as "port-channels" in the Dell EMC Networking OS.

**NOTE:** For static LAG commands based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications, see [Port Channel Commands](#) .

## Topics:

- [clear lacp counters](#)
- [debug lacp](#)
- [lacp long-timeout](#)
- [lacp port-priority](#)
- [lacp system-priority](#)
- [port-channel-protocol lacp](#)
- [show lacp](#)

## clear lacp counters

Clear port channel counters.

**Syntax** `clear lacp port-channel-number counters`

**Parameters** *port-channel-number* Enter a port-channel number. The range is from 1 to 4096.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 6.2.1.1  | Introduced on the E-Series. |

#### Related Commands

- `show lacp` — display the LACP configuration.

## debug lacp

Debug LACP (configuration, events, and so on).

#### Syntax

```
debug lacp [config | events | pdu [interface-type [in | out]]]
```

To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>config</b>                  | (OPTIONAL) Enter the keyword <code>config</code> to debug the LACP configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>events</b>                  | (OPTIONAL) Enter the keyword <code>events</code> to debug the LACP event information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pdu</b>                     | (OPTIONAL) Enter the keyword <code>pdu</code> to debug the LACP Protocol Data Unit information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>interface-type in   out</b> | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> <p>Optionally, enter an <code>in</code> or <code>out</code> parameter:</p> <ul style="list-style-type: none"> <li>• Receive enter <code>in</code></li> <li>• Transmit enter <code>out</code></li> </ul> |

## lacp long-timeout

Configure a long timeout period (30 seconds) for an LACP session.

**Syntax** `lacp long-timeout`  
 To reset the timeout period to a short timeout (1 second), use the `no lacp long-timeout` command.

**Defaults** **1 second**

**Command Modes** INTERFACE (conf-if-po-number)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## lacp port-priority

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

|                        |                                                                                                                                                               |                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>lacp port-priority <i>priority-value</i></code>                                                                                                         |                                                                                                                                                 |
|                        | To return to the default setting, use the <code>no lacp port-priority <i>priority-value</i></code> command.                                                   |                                                                                                                                                 |
| <b>Parameters</b>      | <b><i>priority-value</i></b>                                                                                                                                  | Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is <b>32768</b> . |
| <b>Defaults</b>        | <b>32768</b>                                                                                                                                                  |                                                                                                                                                 |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |                                                                                                                                                 |

| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

## lacp system-priority

Configure the LACP system priority.

|               |                                                         |
|---------------|---------------------------------------------------------|
| <b>Syntax</b> | <code>lacp system-priority <i>priority-value</i></code> |
|---------------|---------------------------------------------------------|

**Parameters**      *priority-value*      Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is **32768**.

**Defaults**      **32768**

**Command Modes**      INTERFACE

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |

**Related Commands**

- [show lacp](#) — display the LACP information.
- [show interfaces port-channel](#) — display information on configured Port Channel groups.

## show lacp

Display the LACP matrix.

**Syntax** `show lacp port-channel-number [sys-id | counters]`

**Parameters**

- port-channel-number** Enter a port-channel number. The range is from 1 to 4096.
- sys-id** (OPTIONAL) Enter the keywords `sys-id` and the value that identifies a system.
- counters** (OPTIONAL) Enter the keyword `counters` to display the LACP counters.

**Defaults** Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.5.1.0 | Introduced on the C-Series. |
| 6.2.1.1 | Introduced on the E-Series. |

#### Example (Port-Channel-Number)

```
DelleMC# show lacp 1
Port-channel 1 admin up, oper up, mode lacp
Actor System ID:Priority 32768, Address 0001.e800.a12b
Partner System ID:Priority 32768, Address 0001.e801.45a5
 Actor Admin Key 1, Oper Key 1, Partner Oper Key 1
 LACP LAG 1 is an aggregatable link

A-Active LACP, B-Passive LACP, C-Short Timeout, D-Long Timeout
E-Aggregatable Link, F-Individual Link, G-IN_SYNC, H-OUT_OF_SYNC
I-Collection enabled, J-Collection disabled, K-Distribution_enabled L-
Distribution disabled,
M-Partner Defaulted, N-Partner Non-defaulted, O-Receiver is in expired
state,
P-Receiver is not in expired state

Port Te 1/6/1 is enabled, LACP is enabled and mode is lacp
 Actor Admin: State ACEHJLMP Key 1 Priority 128
 Oper: State ACEGIKNP Key 1 Priority 128
 Partner Admin: State BDFHJLMP Key 0 Priority 0
 Oper: State BCEGIKNP Key 1 Priority 128
DelleMC#
```

#### Example (Sys-id)

```
DelleMC# show lacp 1 sys-id
Actor System ID: Priority 32768, Address 0001.e800.a12b
Partner System ID: Priority 32768, Address 0001.e801.45a5

DelleMC#
```

#### Example (Counter)

```
DelleMC# show lacp 1 counters

Port LACP PDU Marker PDU Unknown Illegal
Xmit Recv Xmit Recv Pkts Rx Pkts Rx

Te 1/6/1 200 200 0 0 0 0
DelleMC#
```

## MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

### mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

|                        |                                                                                                                                                               |                                                                                                                                                                                                                          |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>mac-address-table aging-time seconds</code>                                                                                                             |                                                                                                                                                                                                                          |
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                | Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is <b>1800 seconds</b> . |
| <b>Defaults</b>        | <b>1800 seconds</b>                                                                                                                                           |                                                                                                                                                                                                                          |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |                                                                                                                                                                                                                          |
| <b>Command History</b> | This guide is platform-specific. | Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version     | Description                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.3.1.0     | On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                                                     |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                                     |
| pre-6.2.1.1 | Introduced on the E-Series.                                                                                                                     |

**Related Commands**

- [mac learning-limit](#) — set the MAC address learning limits for a selected interface.
- [show mac-address-table aging-time](#) — display the MAC aging time.

## mac-address-table static

Associate specific MAC or hardware addresses to an interface and VLANs.

**Syntax**

```
mac-address-table static mac-address {multicast vlan vlan-id output-range interface}{output interface vlan vlan-id}
```

To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.

**Parameters**

- mac-address** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.
- multicast** Enter a vlan port to where L2 multicast MAC traffic is forwarded.  
 **NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.
- output interface** For a unicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
- output-range interface** For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
- vlan vlan-id** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version     | Description                                                   |
|-------------|---------------------------------------------------------------|
| 9.10(0.0)   | Introduced on the S3148.                                      |
| 9.8(2.0)    | Introduced on the S3100 series.                               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                   |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                   |
| 9.7(0.0)    | Introduced on the S6000-ON.                                   |
| 9.2(1.0)    | Introduced on the Z9500.                                      |
| 9.0.2.0     | Introduced on the S6000.                                      |
| 9.1(0.0)    | Added support for output range parameter for S4810 and Z9000. |
| 8.3.19.0    | Introduced on the S4820T.                                     |
| 8.3.11.1    | Introduced on the Z9000.                                      |
| 8.5.1.0     | Added support for 4-port 40G line cards on the E-Series.      |
| 8.3.7.0     | Introduced on the S4810.                                      |
| 7.6.1.0     | Introduced on the S-Series.                                   |
| 7.5.1.0     | Introduced on the C-Series.                                   |
| pre-6.2.1.1 | Introduced on the E-Series.                                   |

**Example (Unicast)**

```
mac-address-table static 00:01:00:00:00:01 {output Te 1/2/1 vlan 2}
```

**Example (Multicast)**

```
mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-range Te 1/2/1, Te 1/3/1}
```

**Related Commands**

- [show mac-address-table](#) — display the MAC address table.

## mac-address-table station-move refresh-arp

Ensure that address resolution protocol (ARP) refreshes the egress interface when a station move occurs due to a topology change.

**Syntax**

```
mac-address-table station-move refresh-arp
```

To disable the ARP refresh feature, use the `no mac-address-table station-move refresh-arp` command.

**Defaults**

Enabled

| 8.3.7.0    | Introduced on the S4810.    |
| 7.7.1.0    | Introduced on the S-Series. |

**Usage Information**

For more information about using this command, see *NIC Teaming* in the Layer 2 section of the *Dell EMC Networking OS Configuration Guide*.

## mac learning-limit

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

**Syntax**

```
mac learning-limit address_limit [vlan vlan-id] [station-move-violation
[dynamic]] [dynamic [no-station-move| station-move]]
```

**Parameters**

- address\_limit** Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000.
- vlan vlan-id** Enter the keyword then the VLAN ID. The range is from 1 to 4094.
- dynamic** (OPTIONAL) Enter the keyword `dynamic` to allow aging of MACs even though a learning limit is configured.
- station-move-violation** (OPTIONAL) Enter the keywords `station-move` to allow a station move on learned MAC addresses.

**Defaults**

- On S-Series, the default behavior is dynamic.

 **NOTE:** “Static” means manually entered addresses, which do not age.

**Command Modes** INTERFACE

**Command History**

| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version  | Description                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.                                                                                                          |
| 9.0.2.0  | Introduced on the S6000.                                                                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                         |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                          |
| 8.3.12.0 | Deprecated the <code>no-station-move</code> command (replaced by the <code>mac-learning-limit mac-address-sticky</code> command). |
| 8.3.7.0  | Introduced on the S4810.                                                                                                          |
| 8.3.1.0  | Added the <code>vlan</code> option on the E-Series.                                                                               |
| 8.2.1.0  | Introduced on the S-Series.                                                                                                       |
| 7.7.1.0  | Introduced on the C-Series. Added the <code>station-move</code> option.                                                           |
| 6.5.1.0  | Added support for MAC Learning-Limit on the LAG.                                                                                  |

### Usage Information

This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the `vlan` option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword `no-station-move` option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the `dynamic` option. To clear statistics on MAC address learning, use the `clear counters` command with the `learning-limit` parameter.

**NOTE:** If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the `mac learning-limit` command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

### Related Commands

- [mac learning-limit mac-address-sticky](#) — replace deprecated `no-station-move` parameter.
- [show mac learning-limit](#) — display MAC learning-limit configuration.

## mac learning-limit learn-limit-violation

Configure an action for a MAC address learning-limit violation.

### Syntax

```
mac learning-limit learn-limit-violation {log | shutdown}
```

To return to the default, use the `no mac learning-limit learn-limit-violation {log | shutdown}` command.

### Parameters

- log** Enter the keyword `log` to generate a syslog message on a learning-limit violation.
- shutdown** Enter the keyword `shutdown` to shut down the port on a learning-limit violation.

### Defaults

None

**Command Modes** INTERFACE (conf-if-interface-slot/port)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.2.1.0    | Introduced on the S-Series.               |
| 7.8.1.0    | Introduced on the C-Series.               |
| 7.5.1.0    | Introduced on the E-Series.               |

## Usage Information

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

## Related Commands

- [show mac learning-limit](#) — display details of the mac learning-limit.

## mac learning-limit mac-address-sticky

Maintain the dynamically learned mac addresses as sticky MAC addresses on the selected port.

## Syntax

```
mac learning-limit mac-address-sticky
```

To convert the sticky MAC addresses to dynamic MAC addresses, use the `no mac learning-limit` command.

## Parameters

***mac-address-sticky*** Configures the dynamic MAC addresses as sticky on an interface.

## Defaults

None

## Command Modes

INTERFACE

| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.12.0   | Introduced on the S4810.        |

#### Usage Information

If you configure `mac-learning-limit` and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port.

#### Related Commands

- [show mac learning-limit](#) — display the details of the mac learning-limit.

## mac learning-limit station-move-violation

Specify the actions for a station move violation.

#### Syntax

```
mac learning-limit station-move-violation {log | shutdown-both | shutdown-offending | shutdown-original}
```

To disable a configuration, use the `no mac learning-limit station-move-violation` command, then the configured keyword.

#### Parameters

|                           |                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                | Enter the keyword <code>log</code> to generate a syslog message on a station move violation.                                  |
| <b>shutdown-both</b>      | Enter the keyword <code>shutdown</code> to shut down both the original and offending interface and generate a syslog message. |
| <b>shutdown-offending</b> | Enter the keywords <code>shutdown-offending</code> to shut down the offending interface and generate a syslog message.        |
| <b>shutdown-original</b>  | Enter the keywords <code>shutdown-original</code> to shut down the original interface and generate a syslog message.          |

#### Defaults

None

#### Command Modes

INTERFACE (conf-if-interface-slot/port)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version    | Description                 |
|------------|-----------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON. |
| 9.8(0.0P2) | Introduced on the S3048-ON. |
| 9.7(0.0)   | Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.    |
| 9.0.2.0    | Introduced on the S6000.    |
| 8.3.19.0   | Introduced on the S4820T.   |
| 8.3.11.1   | Introduced on the Z9000.    |
| 8.3.7.0    | Introduced on the S4810.    |
| 8.2.1.0    | Introduced on the S-Series. |
| 7.8.1.0    | Introduced on the C-Series. |
| 7.5.1.0    | Introduced on the E-Series. |

**Usage Information**

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

- [show mac learning-limit](#) — display details of the mac learning-limit.

## mac learning-limit reset

Reset the MAC address learning-limit error-disabled state.

**Syntax** `mac learning-limit reset`

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description                 |
|---------|-----------------------------|
| 8.2.1.0 | Introduced on the S-Series. |
| 7.7.1.0 | Introduced on the C-Series. |
| 7.5.1.0 | Introduced on the E-Series. |

## mac port-security

Enable or disable the port security feature globally in the system.

**Syntax** `mac port-security`  
To disable the port security, use the `no mac port-security` command.

**Defaults** Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the C9010, MXL, FN IOM, S3100 series, S4810, S4820T, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, and Z9500. |

**Usage Information** Only if you enable the port security, you will be able to configure MAC address learning limit configurations on the interface level.

When you disable the port security, all the interface level configurations are reset. Also, all dynamically learnt MAC addresses on the interfaces configured with MAC address learning limit are cleared.

## show mac-address-table

Display the MAC address table.

**Syntax** `show mac-address-table [address mac-address | interface interface | vlan vlan-id] [aging-time] [dynamic | static] [count [vlan vlan-id] [interface interface-type [slot [/port[/subport]]]]]`

**Parameters**

- address mac-address** (OPTIONAL) Enter the keyword `address` then a MAC address in the `nn:nn:nn:nn:nn:nn` format to display information on that MAC address.
- dynamic** (OPTIONAL) Enter the keyword `dynamic` to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: `address/mac-address`, `interface/interface`, or `vlan vlan-id`.
- static** (OPTIONAL) Enter the keyword `static` to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: `address/mac-address`, `interface/interface`, or `vlan vlan-id`.
- aging-time** Enter the keyword `aging-time` to display only aging-time information.
- interface interface** (OPTIONAL) Enter the keyword `interface` and the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

|                                           |                                                                                                                                                                                                      |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><b>interface-type</b> | (OPTIONAL) Instead of entering the keyword <code>interface</code> then the interface type, slot/port[/subport] information, as above, you can enter the interface type, then just a slot number.     |
| <b>vlan</b> <i>vlan-id</i>                | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.                                                             |
| <b>count</b>                              | (OPTIONAL) Enter the keyword <code>count</code> , then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>     | <b>Description</b>                                       |
|--------------------|----------------------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                 |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                              |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                          |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                              |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                              |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                              |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                              |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                 |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                 |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                 |
| <b>8.3.12.0</b>    | Updated the output.                                      |
| <b>8.5.1.0</b>     | Added support for 4-port 40G line cards on the E-Series. |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                 |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                              |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                              |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.                              |

**Usage Information** The following describes the `show mac-address-table` command shown in the following example.

| <b>Column Heading</b> | <b>Description</b>                                                                                                                          |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VlanId</b>         | Displays the VLAN ID number.                                                                                                                |
| <b>Mac Address</b>    | Displays the MAC address in nn:nn:nn:nn:nn:nn format.                                                                                       |
| <b>Type</b>           | Lists whether the MAC address was manually configured (Static), learned dynamically (Dynamic), or associated with a specific port (Sticky). |

| Column Heading   | Description                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Displays the interface type and slot/port[/subport] information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>• Po = port channel</li> <li>• Te = ten-gigabit Ethernet</li> <li>• Fo = forty-gigabit Ethernet</li> </ul> |
| <b>State</b>     | Lists if the MAC address is in use (Active) or not in use (Inactive).                                                                                                                                                                                                        |

### Example

```
DellEMC(conf)# do show mac-address-table
Codes: *N - VLT Peer Synced MAC
VlanId Mac Address Type Interface State
2 00:00:00:00:00:01 Dynamic (N) Po 128 Active
2 00:00:00:00:00:02 Dynamic (N) Po 10 Active
2 00:00:00:00:00:03 Dynamic Po 100 Active
2 00:00:00:00:00:04 Dynamic Po 10 Active
```

### Usage Information

The following describes the `show mac-address-table count` command shown in the following example.

| Line Beginning With       | Description                                              |
|---------------------------|----------------------------------------------------------|
| <b>MAC Entries...</b>     | Displays the number of MAC entries learned per VLAN.     |
| <b>Dynamic Address...</b> | Lists the number of dynamically learned MAC addresses.   |
| <b>Static Address...</b>  | Lists the number of user-defined MAC addresses.          |
| <b>Total MAC...</b>       | Lists the total number of MAC addresses the switch uses. |

### Example (Count)

```
DellEMC# show mac-address-table count
MAC Entries for all vlans :
Dynamic Address Count : 110
Static Address (User-defined) Count : 0
Sticky Address Count : 0
Total Synced Mac from Peer(N): 100
Total MAC Addresses in Use: 110
DellEMC#
```

### Related Commands

- [show mac-address-table aging-time](#) — display MAC aging time.

## show mac-address-table aging-time

Display the aging times assigned to the MAC addresses on the switch.

|                      |                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show mac-address-table aging-time [vlan <i>vlan-id</i>]</code>                                                                                                     |
| <b>Parameters</b>    | <b>vlan <i>vlan-id</i></b> (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094. |
| <b>Command Modes</b> | <ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>                                                                                       |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                         |
|-------------|-----------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.           |
| 9.10(0.0)   | Introduced on the S3148.                            |
| 9.10(0.0)   | Introduced on the S6100-ON.                         |
| 9.8(2.0)    | Introduced on the S3100 series.                     |
| 9.8(1.0)    | Introduced on the Z9100-ON.                         |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                         |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                         |
| 9.7(0.0)    | Introduced on the S6000-ON.                         |
| 9.2(1.0)    | Introduced on the Z9500.                            |
| 9.0.2.0     | Introduced on the S6000.                            |
| 8.3.19.0    | Introduced on the S4820T.                           |
| 8.3.11.1    | Introduced on the Z9000.                            |
| 8.3.7.0     | Introduced on the S4810.                            |
| 8.3.1.0     | Added the <code>vlan</code> option on the E-Series. |
| 7.7.1.0     | Introduced on the C-Series and S-Series.            |
| pre-6.2.1.1 | Introduced on the E-Series.                         |

## Example

```
DellEMC# show mac-address-table aging-time
Mac-address-table aging time : 1800

DellEMC#
```

## Related Commands

- [show mac-address-table](#) — display the current MAC address configuration.

# show mac learning-limit

Display MAC address learning limits set for various interfaces.

## Syntax

```
show mac learning-limit [violate-action] [detail] [interface interface]
```

## Parameters

- |                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>violate-action</b>             | (OPTIONAL) Enter the keywords <code>violate-action</code> to display the MAC learning limit violation status.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>detail</b>                     | (OPTIONAL) Enter the keyword <code>detail</code> to display the MAC learning limit in detail.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>interface <i>interface</i></b> | (OPTIONAL) Enter the keyword <code>interface</code> with the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |

| Version    | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                        |
| 9.0.2.0    | Introduced on the S6000.                                                           |
| 8.3.19.0   | Introduced on the S4820T.                                                          |
| 8.3.11.1   | Introduced on the Z9000.                                                           |
| 8.5.1.0    | Added support for 4-port 40G line cards on E-Series.                               |
| 8.3.7.0    | Introduced on the S4810.                                                           |
| 8.3.1.0    | Added the <code>vlan</code> option on the E-Series.                                |
| 7.7.1.0    | Introduced on the C-Series.                                                        |
| 7.5.1.0    | Added support for the <code>violate-action</code> and <code>detail</code> options. |
| 6.5.1.0    | Added support for Port Channel.                                                    |

**Example**

```
DellEMC# show mac learning-limit
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/1/1 10 0 0 0
Te 1/2/1 5 0 0 0
DellEMC#show mac learning-limit interface tengigabithethernet 1/1/1
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/1/1 10 0 0 0
```

## Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

**NOTE:** For more information, refer to [VLAN Stacking](#) and VLAN-related commands, such as `portmode hybrid` in the [Interfaces](#) chapter.

## default vlan-id

Specify a VLAN as the Default VLAN.

**Syntax** `default vlan-id vlan-id`

To remove the default VLAN status from a VLAN and VLAN 1 does not exist, use the `no default vlan-id vlan-id` syntax.

**Parameters** ***vlan-id*** Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is **1**.

**Defaults** Default VLAN is VLAN **1**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                               |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information** To return VLAN 1 as the Default VLAN, use this command syntax (`default-vlan-id 1`). The Default VLAN contains only untagged interfaces.

**Related Commands**

- [interface vlan](#) — configure a VLAN.

## description

Add a description about the selected VLAN.

**Syntax** `description description`

**Parameters**      **description**      Enter a text string description to identify the VLAN (80 characters maximum).

**Defaults**      none

**Command Modes**      INTERFACE VLAN

**Command History**

| <b>Version</b>   | <b>Description</b>                        |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON.  |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>   | Introduced on the S6000.                  |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>   | Introduced on the S4810.                  |
| <b>7.6.1.0</b>   | Introduced on the C-Series and S-Series.  |
| <b>6.3.1.1</b>   | Introduced on the E-Series.               |

**Related Commands**      [show vlan](#) – displays the VLAN configuration.

## default-vlan disable

Disable the default VLAN so that all switchports are placed in the Null VLAN until they are explicitly configured as a member of another VLAN.

**Defaults**      Enabled.

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.0 | Introduced on the S4810. |
| 8.3.1.0 | Introduced               |

**Usage Information**

The `no default vlan disable` command is not listed in the running-configuration, but when the default VLAN is disabled, `default-vlan disable` is listed in the running-configuration.

## name

Assign a name to the VLAN.

**Syntax**

`name vlan-name`

To remove the name from the VLAN, use the `no name` command.

**Parameters**

***vlan-name*** Enter up to 32 characters as the name of the VLAN.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |

| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.2.1.1 | Introduced on the E-Series.               |

**Usage Information**

To display information about a named VLAN, enter the `show vlan` command with the name parameter or the `show interfaces description` command.

**Related Commands**

- [interface vlan](#) — configure a VLAN.
- [show vlan](#) — display the current VLAN configurations on the switch.

## show config

Display the current configuration of the selected VLAN.

**Syntax** `show config`

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                               |

| <b>pre-6.2.1.1</b> | Introduced on the E-Series.               |

### Example

```
DellEMC(conf-if-vl-100)# show config
!
interface Vlan 100
 no ip address
 no shutdown
DellEMC(conf-if-vl-100)#
```

## show vlan

Display the current VLAN configurations on the switch.

**Syntax** `show vlan [brief | id vlan-id | name vlan-name]`

**Parameters**

**brief** (OPTIONAL) Enter the keyword `brief` to display the following information:

- VLAN ID
- VLAN name (left blank if none is configured)
- Spanning Tree Group ID
- MAC address aging time

- IP address

**id *vlan-id*** (OPTIONAL) Enter the keyword *id* then a number from 1 to 4094. Only information on the VLAN specified is displayed.

**name *vlan-name*** (OPTIONAL) Enter the keyword *name* then the name configured for the VLAN. Only information on the VLAN named is displayed.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                                                                                                                         |
| 9.10(0.0)   | Introduced on the S3148.                                                                                                                                          |
| 9.10(0.0)   | Introduced on the S6100-ON.                                                                                                                                       |
| 9.8(2.0)    | Introduced on the S3100 series.                                                                                                                                   |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                                                                                                       |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                                                                                                       |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                                                                                                       |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                                                                       |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                                                                          |
| 9.0.2.0     | Introduced on the S6000.                                                                                                                                          |
| 9.1.(0.0)   | Updated to support OpenFlow.                                                                                                                                      |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                                                         |
| 8.3.11.1    | Introduced on the Z9000.                                                                                                                                          |
| 8.3.7.0     | Introduced on the S4810.                                                                                                                                          |
| 7.8.1.0     | Augmented to display PVLAN data for the C-Series and S-Series and revised the output to include the Description field to display a user-entered VLAN description. |
| 7.6.1.0     | Introduced on the S-Series and revised the output to display Native VLAN.                                                                                         |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                                                       |
| pre-6.2.1.1 | Introduced on the E-Series.                                                                                                                                       |

**Usage Information**

The following describes the `show vlan` command shown in the following example.

| Column Heading          | Description                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Column 1 — no heading) | <ul style="list-style-type: none"> <li>• asterisk symbol (*) = Default VLAN</li> <li>• G = GVRP VLAN</li> <li>• P = primary VLAN</li> <li>• C = community VLAN</li> <li>• I = isolated VLAN</li> <li>• O = OpenFlow</li> </ul> |
| NUM                     | Displays existing VLAN IDs.                                                                                                                                                                                                    |
| Status                  | Displays the word <i>Inactive</i> for inactive VLANs and the word <i>Active</i> for active VLANs.                                                                                                                              |
| Q                       | <ul style="list-style-type: none"> <li>• Displays G for GVRP tagged</li> </ul>                                                                                                                                                 |

**Column Heading****Description**

- M for member of a VLAN-Stack VLAN
- T for tagged interface
- U for untagged interface
- x (not capitalized x) for Dot1x untagged
- X (capitalized X) for Dot1x tagged
- o (not capitalized o) for OpenFlow untagged
- O (capitalized O) for OpenFlow tagged
- H for VSN tagged
- i (not capitalized i) for Internal untagged
- I (capitalized I) for Internal tagged
- v (not capitalized v) for VLT untagged
- V (capitalized V) for VLT tagged

**Ports**

Displays the type, slot, and port information.

- Po = port channel
- Te = ten-gigabit Ethernet
- Fo = forty-gigabit Ethernet

**Example**

```
DellEMC# show vlan

Codes: * - Default VLAN, G - GVRP VLANs, P - Primary, C - Community, I -
Isolated
Q: U - Untagged, T - Tagged, O - Openflow
 x - Dot1x untagged, X - Dot1x tagged
 o - OpenFlow untagged, O - OpenFlow tagged
 G - GVRP tagged, M - Vlan-stack
 i - Internal untagged, I - Internal tagged, v - VLT untagged, V - VLT
tagged
 NUM Status Description Q Ports
* 1 Inactive
 2 Active U Po1(Te 1/1/1)
 T Po20(Te 1/6/1), Te 1/25/1
 T Te 1/7/1
 3 Active T Po20(Te 1/6/1)
 T Te 1/7/1
 U Te 1/1/1
 4 Active U Po2(Te 1/2/1)
 T Po20(Te 1/6/1)
 T Te 1/7/1
 5 Active T Po20(Te 1/6/1)
 T Te 1/7/1
 U Te 1/3/1
 6 Active U Po3(Te 1/4)
 T Po20(Te 1/6/1)
 T Te 1/7/1
 7 Active T Po20(Te 1/6/1)
 T Te 1/7/1
 U Te 1/5/1
P 100 Active T Po1(Te 1/1/1)
 T Te 1/2/1
C 101 Inactive T Te 1/3/1
I 102 Inactive T Te 1/4/1
DellEMC#
```

**Example (VLAN ID)**

```
DellEMC# show vlan id 40

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 G - GVRP tagged, M - Vlan-stack
```

```

NUM Status Description Q Ports
40 Active M Te 1/47/1

DelleMC# show vlan id 41

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM Status Description Q Ports
41 Active T Te 1/47/1

DelleMC# show vlan id 42

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM Status Description Q Ports
42 Active U Te 1/47/1
DelleMC#

```

#### Example (Brief)

```

DelleMC# show vlan br
VLAN Name STG MAC Aging IP Address

1 0 1800 unassigned
2 0 1800 2.2.2.2/24
3 0 1800 3.3.3.2/24
DelleMC#

```

#### Example (Name)

```

Dellconf)# interface vlan 222
DelleMC(conf-if-vl-222)#name test
DelleMC(conf-if-vl-222)#do show vlan name test

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM Status Description Q Ports
222 Inactive U Te 1/22/1
DelleMC(conf-if-vl-222)#

```

#### Example (OpenFlow instance)

```

NUM Status Description Q Ports
* 1 Inactive
3 Inactive
O 6 Inactive
O 8 Inactive
O 12 Inactive O Te 1/10/1

```

#### Related Commands

- [vlan-stack compatible](#) — enable the Stackable VLAN feature on the selected VLAN.
- [interface vlan](#) — configure a VLAN.

## tagged

Add a Layer 2 interface to a VLAN as a tagged interface.

#### Syntax

```
tagged interface
```

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

**Parameters**      *interface*      Enter the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**      All interfaces in Layer 2 mode are untagged.

**Command Modes**      INTERFACE VLAN

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                              |
|-------------|----------------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)   | Introduced on the S3148.                                 |
| 9.10(0.0)   | Introduced on the S6100-ON.                              |
| 9.8(2.0)    | Introduced on the S3100 series.                          |
| 9.8(1.0)    | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                              |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                              |
| 9.7(0.0)    | Introduced on the S6000-ON.                              |
| 9.2(1.0)    | Introduced on the Z9500.                                 |
| 9.0.2.0     | Introduced on the S6000.                                 |
| 8.3.19.0    | Introduced on the S4820T.                                |
| 8.3.11.1    | Introduced on the Z9000.                                 |
| 8.5.1.0     | Added support for 4-port 40G line cards on the E-Series. |
| 8.3.7.0     | Introduced on the S4810.                                 |
| 7.6.1.0     | Introduced on the S-Series.                              |
| 7.5.1.0     | Introduced on the C-Series.                              |
| pre-6.2.1.1 | Introduced on the E-Series.                              |

**Usage Information**      When you use the `no tagged` command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

**Related Commands**

- [interface vlan](#) — configure a VLAN.
- [untagged](#) — specify which interfaces in a VLAN are untagged.

## track ip

Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

**Syntax**      `track ip interface`

To remove the tracking feature from the VLAN, use the `no track ip interface` command.

#### Parameters

##### ***interface***

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

#### Defaults

Not configured.

#### Command Modes

INTERFACE VLAN

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>     | <b>Description</b>                                       |
|--------------------|----------------------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                |

| <b>7.5.1.0</b>     | Introduced on the C-Series.                              |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.                              |

#### Usage Information

When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and the Layer 2 traffic, is not affected by the `track ip` command configuration.

#### Related Commands

- [interface vlan](#) — configure a VLAN.
- [tagged](#) — specify which interfaces in a VLAN are tagged.

# untagged

Add a Layer 2 interface to a VLAN as an untagged interface.

**Syntax** `untagged interface`  
To remove an untagged interface from a VLAN, use the `no untagged interface` command.

**Parameters** **interface** Enter the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** All interfaces in Layer 2 mode are untagged.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|-------------|----------------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)   | Introduced on the S3148.                                 |
| 9.10(0.0)   | Introduced on the S6100-ON.                              |
| 9.8(2.0)    | Introduced on the S3100 series.                          |
| 9.8(1.0)    | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                              |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                              |
| 9.7(0.0)    | Introduced on the S6000-ON.                              |
| 9.2(1.0)    | Introduced on the Z9500.                                 |
| 9.0.2.0     | Introduced on the S6000.                                 |
| 8.3.19.0    | Introduced on the S4820T.                                |
| 8.3.11.1    | Introduced on the Z9000.                                 |
| 8.5.1.0     | Added support for 4-port 40G line cards on the E-Series. |
| 8.3.7.0     | Introduced on the S4810.                                 |
| 7.6.1.0     | Introduced on the S-Series.                              |
| 7.5.1.0     | Introduced on the C-Series.                              |
| pre-6.2.1.1 | Introduced on the E-Series.                              |

**Usage Information** Untagged interfaces can only belong to one VLAN.  
In the Default VLAN, you cannot use the `no untagged interface` command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the `no switchport` command.

**Related Commands**

- [interface vlan](#) — configure a VLAN.
- [tagged](#) — specify which interfaces in a VLAN are tagged.

# Far-End Failure Detection (FEFD)

The Dell EMC Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces of the platform.

The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

## debug fefd

Enable debugging of FEFD.

**Syntax** `debug fefd {events | packets} [interface]`  
To disable debugging of FEFD, use the `no debug fefd {events | packets} [interface]` command.

**Parameters**

|                  |                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>events</b>    | Enter the keyword <code>events</code> to enable debugging of FEFD state changes.                                                                                                                                                                                                                                                                                                |
| <b>packets</b>   | Enter the keyword <code>packets</code> to enable debugging of FEFD to view information on packets sent and received.                                                                                                                                                                                                                                                            |
| <b>interface</b> | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |

**Legacy E-Series command.**

**Related Commands**

- [fefd](#) — enable far-end failure detection on an interface.

- [fefd reset](#) — enable FEFD globally on the system.

## fefd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

**Syntax** `fefd {disable|interval|mode {aggressive|normal}}`

|                   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>disable</b>  | Enter the keyword <b>disable</b> to disable FEFD for the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>interval</b> | Enter the keyword <b>interval</b> , followed by a value to specify the FEFD interval in seconds. Range is from 3 to 300. Default is 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                   | <b>mode</b>     | Enter the keyword <b>mode</b> followed by the mode type to specify the FEFD mode. <ul style="list-style-type: none"> <li>• <b>normal</b>: Change the link state to “unknown” when a far-end failure is detected by the software on that interface. When the interface is placed in an “unknown” state, the software brings down the line protocol.</li> <li>• <b>aggressive</b>: Change the link state to “error-disabled” when a far-end failure is detected by the software on that interface. When an interface is placed in an “error-disabled” state, you must enter the <code>fefd reset</code> command to reset the interface state. Range is normal or aggressive. Default is normal.</li> </ul> |

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.12.0   | Introduced on the S4810.                  |

**Usage Information** When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

**Related Commands**

- [fefd disable](#) — disable far-end failure detection on an interface.
- [fefd reset](#) — enable FEFD globally on the system.
- [fefd mode](#) — change FEFD mode on an interface.

## fefd disable

Disable FEFD on an interface only. This command overrides the `fefd reset` command for the interface.

**Syntax** `fefd disable`

To re-enable FEFD on an interface, use the `no fefd disable` command.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |

| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

**Legacy E-Series command.**

**Usage Information** `FEFD disable` command on the interface prevents the interface from running FEFD when FEFD is enabled globally.

**Related Commands**

- [fefd reset](#) — clear an interface in Err-disabled state. It doesn't work until the interface is in err-disabled state.
- [fefd mode](#) — change FEFD mode on an interface.

## fefd interval

Set an interval between control packets.

**Syntax** `fefd interval seconds`

To return to the default value, use the `no fefd interval` command.

**Parameters** **seconds** Enter a number as the time between FEFD control packets. The range is from 3 to 255 seconds. The default is **15 seconds**.

**Defaults** **15 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.7.0    | Introduced on the S4810.                  |

**Legacy E-Series command.**

#### Usage Information

You can set up the interval between control packets using the `fefd interval` command.

#### Related Commands

- `fefd` — enable far-end failure detection.

## fefd mode

Change the FEFD mode on an interface.

**Syntax** `fefd mode {normal | aggressive}`

To return the FEFD mode to the default of normal, use the `no fefd mode` command.

#### Parameters

|                   |                                                                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>normal</b>     | (OPTIONAL) Enter the keyword <code>normal</code> to change the link state to “unknown” when a far-end failure the software detects on that interface. When the interface is placed in “unknown” state, the software brings down the line protocol.                                              |
| <b>aggressive</b> | (OPTIONAL) Enter the keyword <code>aggressive</code> to change the link state to “error-disabled” when a far-end failure the software detects on that interface. When an interface is placed in “error-disabled” state, enter the <code>fefd reset</code> command to reset the interface state. |

**Defaults** Normal

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version                         | Description                 |
|---------------------------------|-----------------------------|
| <b>9.8(0.0P2)</b>               | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>                 | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>                 | Introduced on the Z9500.    |
| <b>8.3.19.0</b>                 | Introduced on the S4820T.   |
| <b>8.3.11.1</b>                 | Introduced on the Z9000.    |
| <b>8.3.7.0</b>                  | Introduced on the S4810.    |

**Related Commands**

- [fehd](#) — enable far-end failure detection.

## fehd reset

Reset all interfaces or a single interface that was in “error-disabled” mode.

**Syntax** `fehd reset [interface]`

**Parameters** *interface* (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Related Commands

- [fefd](#) — enable far-end failure detection.

## fefd-global interval

Configure an interval between FEFD control packets.

### Syntax

```
fefd-global interval seconds
```

To return to the default value, use the `no fefd-global interval` command.

### Parameters

**seconds**

Enter a number as the time between FEFD control packets. The range is from 3 to 300 seconds. The default is **15 seconds**.

### Defaults

**15 seconds**

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

#### Version

#### Description

**9.10(0.1)**

Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)**

Introduced on the S3148.

**9.10(0.0)**

Introduced on the S6100-ON.

**9.8(2.0)**

Introduced on the S3100 series.

**9.8(1.0)**

Introduced on the Z9100-ON.

**9.8(0.0P5)**

Introduced on the S4048-ON.

**9.8(0.0P2)**

Introduced on the S3048-ON.

**9.7(0.0)**

Introduced on the S6000-ON.

**9.2(1.0)**

Introduced on the Z9500.

**8.3.19.0**

Introduced on the S4820T.

**8.3.11.1**

Introduced on the Z9000.

**8.3.7.0**

Introduced on the S4810.

**Legacy E-Series command.**

## Related Commands

- [fefd](#) — enable far-end failure detection.
- [fefd-global](#) — enable FEFD globally on the system.

## fefd-global

Enable FEFD globally on the system.

### Syntax

```
fefd-global [interval seconds][mode {normal | aggressive}]
```

To disable FEFD globally, use the `no fefd-global [mode {normal | aggressive}]` command.

### Parameters

**interval seconds**

Enter the keyword `interval` followed by the number of seconds to wait between FEFD control packets. Range is from 3 to 300 seconds. Default is 15 seconds.

**normal**

(OPTIONAL) Enter the keywords `mode normal` to change the link state to “unknown” when a far-end failure the software detects on that interface. When

the interface is placed in “unknown” state, the software brings down the line protocol. The default is **Normal mode**.

**aggressive** (OPTIONAL) Enter the keywords `mode aggressive` to change the link state to “error-disabled” when a far-end failure the software detects on that interface. When an interface is placed in “error-disabled” state, t enter the `fefd reset` command to reset the interface state.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |

**Legacy E-Series command.**

**Usage Information** If you enter only the `fefd-global` syntax, the mode is normal and the default interval is 15 seconds. If you disable FEFD globally (`no fefd-global`), the system does not remove the FEFD interface configuration.

**Related Commands**

- `fefd` — enable far-end failure detection.
- `fefd-global interval` — configure an interval between FEFD control packets.
- `show fefd` — display the FEFD command output.

## show fefd

View FEFD status globally or on a specific interface.

**Syntax** `show fefd [interface]`

**Parameters** *interface* (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.3.12.0   | Introduced on the S4810.                  |

**Legacy E-Series command.**

**Usage Information**

The following describes the `show fefd` command shown in the following example.

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Displays the interfaces type and number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Mode</b>      | Displays the mode (aggressive or normal) or NA if the interface contains <code>fefd reset</code> in its configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interval</b>  | Displays the interval between FEFD packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>State</b>     | Displays the state of the interface and can be one of the following: <ul style="list-style-type: none"> <li>• bi-directional (interface is up, connected and hearing neighbor's echoes).</li> <li>• err-disabled (only found when FEFD mode is aggressive and when the interface has not hearing its neighbor's echoes for three times the message interval. To reset an interface in this state, use the <code>fefd reset</code> command.)</li> <li>• unknown (only found when FEFD mode is normal).</li> <li>• locally disabled (interface contains the <code>fefd reset</code> command in its configuration).</li> <li>• Admin Shutdown (interface is disabled with the <code>shutdown</code> command).</li> </ul> |

**Example**

```
DelleMC# show fefd
FEFD is globally 'ON', interval is 10 seconds, mode is 'Aggressive'.

INTERFACE MODE INTERVAL STATE
 (second)
Te 5/1/1 Aggressive 10 Admin Shutdown
Te 5/2/1 Aggressive 10 Admin Shutdown
Te 5/3/1 Aggressive 10 Admin Shutdown
Te 5/4/1 Aggressive 10 Admin Shutdown
Te 5/5/1 Aggressive 10 Admin Shutdown
Te 5/6/1 Aggressive 10 Admin Shutdown
Te 5/7/1 Aggressive 10 Admin Shutdown
```

```
Te 5/8/1 Aggressive 10 Admin Shutdown
Te 5/9/1 Aggressive 10 Admin Shutdown
Te 5/10/1 NA NA Locally disabled
Te 5/11/1 Aggressive 10 Err-disabled
DellEMC#
```

### Related Commands

- [fefd](#) — enable far-end failure detection.
- [fefd disable](#) — disable FEFD on an interface only.
- [fefd-global](#) — enable FEFD globally on the system.
- [fefd reset](#) — reset all interfaces or a single interface that was in “error-disabled” mode.

# Link Layer Discovery Protocol (LLDP)

The link layer discovery protocol (LLDP) advertises connectivity and management from the local station to the adjacent stations on an IEEE 802 LAN.

LLDP facilitates multi-vendor interoperability by using standard management tools to discover and make available a physical topology for network management. The Dell EMC Networking operating software implementation of LLDP is based on IEEE standard 801.1ab.

The starting point for using LLDP is invoking LLDP with the `protocol lldp` command in either CONFIGURATION or INTERFACE mode.

The information LLDP distributes is stored by its recipients in a standard management information base (MIB). You can access the information by a network management system through a management protocol such as simple network management protocol (SNMP).

## advertise dot3-tlv

Advertise dot3 TLVs (Type, Length, Value).

#### Syntax

```
advertise dot3-tlv {max-frame-size}
```

To remove advertised dot3-tlv, use the `no advertise dot3-tlv {max-frame-size}` command.

#### Parameters

**max-frame-size** Enter the keywords `max-frame-size` to advertise the dot3 maximum frame size TLV.

#### Defaults

None

#### Command Modes

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| Version                  | Description                                                                                                                                                                                                                                                                                            |                    |                                                                            |                |                                                                                    |
| 9.11(2.0P1)              | Introduced the <code>description</code> and <code>port-id</code> options.                                                                                                                                                                                                                              |                    |                                                                            |                |                                                                                    |
| <b>Usage Information</b> | If you do not specify the option, by default the <code>port-id</code> takes higher precedence and sends the port-id in the LLDP packets.                                                                                                                                                               |                    |                                                                            |                |                                                                                    |

## clear lldp counters

Clear LLDP transmitting and receiving counters for all physical interfaces or a specific physical interface.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                            |                                                                                                                                                                                                                                                                                                                                                                                |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                              |
|------------|----------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)  | Introduced on the S3148.                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                              |
| 9.8(2.0)   | Introduced on the S3100 series.                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                              |
| 9.2(1.0)   | Introduced on the Z9500.                                 |
| 9.0.2.0    | Introduced on the S6000.                                 |
| 8.3.19.0   | Introduced on the S4820T.                                |
| 8.3.11.1   | Introduced on the Z9000.                                 |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series. |
| 8.3.7.0    | Introduced on the S4810.                                 |
| 7.7.1.0    | Introduced on the S-Series.                              |
| 7.6.1.0    | Introduced on the C-Series.                              |
| 7.4.1.0    | Introduced on the E-Series.                              |

## clear lldp neighbors

Clear LLDP neighbor information for all interfaces or a specific interface.

### Syntax

```
clear lldp neighbors [interface interface]
```

### Parameters

**interface**  
***interface***

(OPTIONAL)Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

### Defaults

None

### Command Modes

EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.4.1.0    | Introduced on the E-Series.                              |

## debug lldp interface

To display timer events, neighbor additions or deletions, and other information about incoming and outgoing packets, enable LLDP debugging.

**Syntax** `debug lldp interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}`

To disable debugging, use the `no debug lldp [interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}]` command.

| Parameters | interface        | Description                                                                                                                                                                                                                                                                                                                                                                         |
|------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <i>interface</i> | Enter the following keywords and slot/port[/subport] or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|            | <b>all</b>       | Enter the keyword <code>all</code> to display information on all interfaces.                                                                                                                                                                                                                                                                                                        |
|            | <b>events</b>    | Enter the keyword <code>events</code> to display major events such as timer events.                                                                                                                                                                                                                                                                                                 |
|            | <b>packet</b>    | Enter the keyword <code>packet</code> to display information regarding packets coming in or going out.                                                                                                                                                                                                                                                                              |
|            | <b>brief</b>     | Enter the keyword <code>brief</code> to display brief packet information.                                                                                                                                                                                                                                                                                                           |
|            | <b>detail</b>    | Enter the keyword <code>detail</code> to display detailed packet information.                                                                                                                                                                                                                                                                                                       |
|            | <b>tx</b>        | Enter the keyword <code>tx</code> to display transmit-only packet information.                                                                                                                                                                                                                                                                                                      |
|            | <b>rx</b>        | Enter the keyword <code>rx</code> to display receive-only packet information.                                                                                                                                                                                                                                                                                                       |
|            | <b>both</b>      | Enter the keyword <code>both</code> to display both receive and transmit packet information.                                                                                                                                                                                                                                                                                        |

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                         |
|----------|---------------------------------------------------------------------|
| 9.13.0.0 | Enhanced to display organizational specific unrecognized LLDP TLVs. |

| Version    | Description                                              |
|------------|----------------------------------------------------------|
| 9.11.2.5   | Enhanced to display unrecognized TLVs.                   |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)  | Introduced on the S3148.                                 |

## disable

Enable or disable LLDP.

**Syntax**            disable  
 To enable LLDP, use the `no disable` command.

**Defaults**           Enabled — no disable.

**Command Modes**   CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |

| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.7.1.0    | Introduced on the S-Series.               |
| 7.6.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

## Related Commands

- [protocol lldp \(Configuration\)](#) — enable LLDP globally.
- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## hello

Configure the rate at which the LLDP control packets are sent to its peer.

### Syntax

```
hello seconds
```

To revert to the default, use the `no hello seconds` command.

### Parameters

**seconds** Enter the rate, in seconds, at which the control packets are sent to its peer. The rate is from 5 to 180 seconds. The default is **30 seconds**.

### Defaults

**30 seconds**

**Command Modes** CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

| 7.6.1.0    | Introduced on the C-Series. |
| 7.4.1.0    | Introduced on the E-Series. |

## mode

To receive or transmit, set LLDP.

**Syntax** `mode {tx | rx}`

To return to the default, use the `no mode` command.

**Parameters**

|           |                                                                |
|-----------|----------------------------------------------------------------|
| <b>tx</b> | Enter the keyword <code>tx</code> to set the mode to transmit. |
| <b>rx</b> | Enter the keyword <code>rx</code> to set the mode to receive.  |

**Defaults** Both **transmit** and **receive**.

**Command Modes** CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

**Related Commands**

- [protocol lldp \(Configuration\)](#) — enable LLDP globally.
- [show lldp neighbors](#) — display the LLDP neighbors.

## multiplier

Set the multiple of the hello timer before LLDP declares the interface dead.

**Syntax**

`multiplier number`

To return to the default, use the `no multiplier` command.

**Parameters**

*integer*

Enter the number of consecutive misses before the LLDP declares the interface dead. The range is from 2 to 10.

**Defaults**

4

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.7.1.0    | Introduced on the S-Series.               |
| 7.6.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

## protocol lldp (Configuration)

Enable the LLDP globally on the switch.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>protocol lldp</code><br>To disable LLDP globally on the chassis, use the <code>no protocol lldp</code> command.                                         |
| <b>Defaults</b>        | Enabled.                                                                                                                                                      |
| <b>Command Modes</b>   | CONFIGURATION (conf-lldp)                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

## protocol lldp (Interface)

Enter the LLDP protocol in INTERFACE mode.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>[no] protocol lldp</code><br>To return to the global LLDP configuration mode, use the <code>no protocol lldp</code> command from Interface mode.        |
| <b>Defaults</b>        | LLDP is not enabled on the interface.                                                                                                                         |
| <b>Command Modes</b>   | INTERFACE (conf-if-interface-lldp)                                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.7.1.0    | Introduced on the S-Series.               |
| 7.6.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

#### Usage Information

Before LLDP can be configured on an interface, it must be enabled globally from CONFIGURATION mode. This command places you in LLDP mode on the interface; it does not enable the protocol.

When you enter the LLDP protocol in the Interface context, it overrides global configurations. When you execute the `no protocol lldp` from INTERFACE mode, interfaces begin to inherit the configuration from global LLDP CONFIGURATION mode.

## show lldp neighbors

Display LLDP neighbor information for all interfaces or a specified interface.

**Syntax** `show lldp neighbors [interface interface] [detail]`

**Parameters**

|                                      |                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><i>interface</i> | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
| <b>detail</b>                        | (OPTIONAL) Enter the keyword <code>detail</code> to display all the TLV information, remote management IP addresses, timers, and LLDP tx and rx counters.                                                                                                                                                                                                                      |

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                         |
|-----------|---------------------------------------------------------------------|
| 9.13.0.0  | Enhanced to display organizational specific unrecognized LLDP TLVs. |
| 9.11.2.5  | Enhanced to display unrecognized TLVs.                              |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                           |

| Version    | Description                                                                    |
|------------|--------------------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.                                                       |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                    |
| 9.8(2.0)   | Introduced on the S3100 series.                                                |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                    |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                    |
| 9.2(1.0)   | Introduced on the Z9500.                                                       |
| 9.0.2.0    | Introduced on the S6000.                                                       |
| 9.1.(0.0)  | Modified output of detail parameter to display remote management IP addresses. |
| 8.3.19.0   | Introduced on the S4820T.                                                      |
| 8.3.11.1   | Introduced on the Z9000.                                                       |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series.                       |
| 8.3.7.0    | Introduced on the S4810.                                                       |
| 7.7.1.0    | Introduced on the S-Series.                                                    |
| 7.6.1.0    | Introduced on the C-Series.                                                    |
| 7.4.1.0    | Introduced on the E-Series.                                                    |

### Usage Information

Omitting the keyword `detail` displays only the remote chassis ID, Port ID, and Dead Interval.

### Example

```
DellEMC(conf-if-te-1/31/1)# do show lldp neighbors
Loc PortID Rem Host Name Rem Port Id Rem Chassis Id

Te 1/21/1 R2 TenGigabitEthernet 2/11/1 00:01:e8:06:95:3e
Te 1/31/1 R3 TenGigabitEthernet 3/11/1 00:01:e8:09:c2:4a
```

### Example (Detail)

```
DellEMC(conf)#do show lldp neighbors detail

## show lldp statistics

Display the LLDP statistical information.

**Syntax** show lldp statistics

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------|
| 9.11(2.5)  | Enhanced to display total number of suppressed traps on the, S3048-ON, S4048-ON, S4048T-ON, S6010-ON and Z9100-ON. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                                           |
| 8.3.7.0    | Introduced on the S4810.                                                                                           |
| 7.7.1.0    | Introduced on the S-Series.                                                                                        |
| 7.6.1.0    | Introduced on the C-Series.                                                                                        |
| 7.4.1.0    | Introduced on the E-Series.                                                                                        |

#### Example

```
DellEMC# show lldp statistics
----- LLDP GLOBAL STATISTICS ON CHASSIS -----
Total number of neighbors: 3
Last table change time: 00:01:23, In ticks: 8388
Total number of Table Inserts: 3
Total number of Table Deletes: 0
Total number of Table Drops: 0
Total number of Table Age Outs: 0
Total number of suppressed Traps: 2
DellEMC#
```

## snmp-notification-interval

Used to configure the value for the lldp notification interval, to throttle lldp notification messages.

**Syntax** [no] snmp-notification-interval [seconds]  
To disable this feature, use the no snmp-notification-interval command.

**Parameters** **seconds** Enter a value from 5 to 3600 seconds.

**Defaults** 5 seconds

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                            |
|-----------|------------------------------------------------------------------------|
| 9.11(2.5) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON and Z9100-ON |

## Usage Information

SNMP notification for the changes in the lldp remote entry table is throttled by 5 seconds (default), or the configured time set using this command. If more than one notification message is generated within the configured time, only the first one will be sent and the remaining messages are suppressed.

# LLDP-MED Commands

The following are the LLDP-MED (Media Endpoint Discovery) commands.

Dell EMC Networking OS LLDP-MED commands are an extension of the set of LLDP TLV advertisement commands.

As defined by ANSI/TIA-1057, LLDP-MED provides organizationally specific TLVs (Type Length Value), so that endpoint devices and network connectivity devices can advertise their characteristics and configuration information. The Organizational Unique Identifier (OUI) for the Telecommunications Industry Association (TIA) is 00-12-BB.

- LLDP-MED Endpoint Device — any device that is on an IEEE 802 LAN network edge, can communicate using IP, and uses the LLDP-MED framework.
- LLDP-MED Network Connectivity Device — any device that provides access to an IEEE 802 LAN to an LLDP-MED endpoint device, and supports IEEE 802.1AB (LLDP) and TIA-1057 (LLDP-MED). The Dell EMC Networking system is an LLDP-MED network connectivity device.

Regarding connected endpoint devices, LLDP-MED provides network connectivity devices with the ability to:

- manage inventory
- identify physical location
- identify network policy

## advertise med guest-voice

To advertise a separate limited voice service for a guest user with their own IP telephony handset or other appliances that support interactive voice services, configure the system.

**Syntax** `advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version           | Description                              |
|-------------------|------------------------------------------|
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.              |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.              |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>    | Introduced on the S6000.                 |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                 |
| <b>7.7.1.0</b>    | Introduced on the S-Series.              |
| <b>7.6.1.0</b>    | Introduced on the C-Series and E-Series. |

**Related Commands**

- [protocol lldp \(Configuration\)](#) — enable LLDP globally.
- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med guest-voice-signaling

To advertise a separate limited voice service for a guest user when the guest voice control packets use a separate network policy than the voice data, configure the system.

**Syntax**

```
advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults**

Unconfigured.

**Command Modes**

CONFIGURATION (conf-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |

| 7.6.1.0  | Introduced on the C-Series and E-Series. |

#### Related Commands

- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med location-identification

To advertise a location identifier, configure the system.

#### Syntax

```
advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}
```

To return to the default, use the `no advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}` command.

#### Parameters

- coordinate-based value** Enter the keywords `coordinate-based` then the coordinated based location in hexadecimal value of 16 bytes.
- civic-based value** Enter the keywords `civic-based` then the civic based location in hexadecimal format. The range is from 6 to 255 bytes.
- ecs-elin value** Enter the keywords `ecs-elin` then the Emergency Call Service (ecs) Emergency Location Identification Number (elin) numeric location string. The range is from 10 to 25 characters.

#### Defaults

Unconfigured.

#### Command Modes

CONFIGURATION (conf-lldp)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |

| Version  | Description                              |
|----------|------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

**Usage Information**

- ECS — Emergency call service such as defined by TIA or the national emergency numbering association (NENA)
- ELIN — Emergency location identification number, a valid North America Numbering Plan format telephone number supplied for ECS purposes.

**Related Commands**

- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med power-via-mdi

To advertise the Extended Power via MDI TLV, configure the system.

**Syntax**

`advertise med power-via-mdi`

To return to the default, use the `no advertise med power-via-mdi` command.

**Defaults**

unconfigured.

**Command Modes**

CONFIGURATION (conf-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.7.1.0    | Introduced on the S-Series.               |
| 7.6.1.0    | Introduced on the C-Series.               |

**Usage Information**

Advertise the Extended Power via MDI on all ports that are connected to an 802.3af powered, LLDP-MED endpoint device.

**Related Commands**      [debug lldp interface](#) — debugs LLDP.  
                              [show lldp neighbors](#) — displays the LLDP neighbors.

## advertise med softphone-voice

To advertise softphone to enable IP telephony on a computer so that the computer can be used as a phone, configure the system.

**Syntax**                    `advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults**                Unconfigured.

**Command Modes**        CONFIGURATION (conf-lldp)

**Command History**        This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series and E-Series.  |

**Related Commands**

- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med streaming-video

To advertise streaming video services for broadcast or multicast-based video, configure the system. This command does not include video applications that rely on TCP buffering.

**Syntax** `advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |

| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series and E-Series.  |

**Related Commands**

- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med video-conferencing

To advertise dedicated video conferencing and other similar appliances that support real-time interactive video, configure the system.

**Syntax** `advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series and E-Series.  |

**Related Commands**

- [debug lldp interface](#) — debug LLDP.
- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med video-signaling

To advertise video control packets that use a separate network policy than video data, configure the system.

**Syntax** `advertise med video-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med video-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |

## advertise med voice

To advertise a dedicated IP telephony handset or other appliances supporting interactive voice services, configure the system.

**Syntax** `advertise med voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

- [show lldp neighbors](#) — display the LLDP neighbors.

## advertise med voice-signaling

To advertise when voice control packets use a separate network policy than voice data, configure the system.

**Syntax** `advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}`

To return to the default, use the `no advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

#### Parameters

|                                      |                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                  |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority. The range is from 0 to 7.                                            |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value. The range is from 0 to 63.                                                 |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> , the Layer 2 priority, and then the DSCP value. |

#### Defaults

Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

# Microsoft Network Load Balancing

Network load balancing (NLB) is a clustering functionality that is implemented by Microsoft on Windows 2000 Server and Windows Server 2003 operating systems. Microsoft NLB clustering allows multiple servers running Microsoft Windows to be represented by one MAC and one IP address to provide transparent failover and load-balancing. The Dell EMC Networking OS does not recognize server clusters by default; you must configure NLB functionality on a switch to support server clusters. The maximum NLB entry limit from 8 to 11 is increased and support for more CAM-ACL to increase.

## Topics:

- [arp \(for Multicast MAC Address\)](#)
- [mac-address-table static \(for Multicast MAC Address\)](#)
- [ip vlan-flooding](#)

## arp (for Multicast MAC Address)

To associate an IP address with a multicast MAC address in the switch when you configure multicast mode of network load balancing (NLB), use address resolution protocol (ARP).

**Syntax** `arp ip-address multicast-mac-address interface`

To remove an ARP address, use the `no arp ip-address` command.

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>            | Enter an IP address in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>multicast-mac-address</i></b> | Enter a 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format for the static MAC address to be used to switch multicast traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>interface</i></b>             | Enter any of the following keywords and slot/port[/subport] or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• The interface specified here must be one of the interfaces configured using the <code>{output-range   output} interface</code> option with the <code>mac-address-table static</code> command.</li> </ul> |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                                                          |
|------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                                                   |
| <b>9.3(0.0)</b>  | Added support for association of an IP address with multicast MAC address on the S4810, S4820T, S6000, and Z9000 platforms. |

**Usage Information** For multicast mode of NLB, to associate an IP address with a multicast MAC address in the switch, use address resolution protocol (ARP) by entering the `arp ip-address multicast-mac-address`

command in Global configuration mode. This setting causes the multicast MAC address to be mapped to the cluster IP address for NLB mode of operation of the switch.

**Related  
Commands**

- `clear arp-cache` — clear dynamic ARP entries from the ARP table.
- `show arp` — display the ARP table.

## mac-address-table static (for Multicast MAC Address)

For multicast mode of network load balancing (NLB), configure a static multicast MAC address, associate the multicast MAC address with the VLAN used to switch Layer 2 multicast traffic, and add output ports that will receive multicast streams on the VLAN. To delete a configured static multicast MAC address from the MAC address table on the router, enter the `no mac-address-table static multicast-mac-address` command.

**Syntax**

```
mac-address-table static multicast-mac-address multicast vlan vlan-id
range-output {single-interface | interface-list | interface-range}
```

To remove a MAC address, use the `no mac-address-table static multicast-mac-address output interface vlan vlan-id` command.

**Parameters**

**multicast-mac-address** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.

**multicast** Enter a vlan port to where L2 multicast MAC traffic is forwarded.  
 **NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

**output interface** For a multicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**output-range interface** For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Management interface, enter the keyword `managementethernet` followed by slot/port numbers.
- For a Port Channel interface, enter the keywords `port-channel` followed by a number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**vlan vlan-id** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                  |
|------------|--------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                    |
| 9.10(0.0)  | Introduced on the S3148.                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                  |
| 9.3(0.0)   | Added support for multicast MAC address on the MXL platform. |

**Example  
(Multicast)**

```
mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-
range Te 1/2/1,Te 1/3/1
```

## ip vlan-flooding

Enable unicast data traffic flooding on VLAN member ports.

**Syntax** `ip vlan-flooding`  
 To disable, use the `no ip vlan-flooding` command.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                       |
|------------|-------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                         |
| 9.10(0.0)  | Introduced on the S3148.                                          |
| 9.8(2.0)   | Introduced on the S3100 series.                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                       |
| 9.3(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms. |

**Default** Disabled

**Usage Information** By default this command is disabled. There might be some ARP table entries which are resolved through ARP packets which had Ethernet MAC SA different from MAC information inside the ARP packet. This unicast data traffic flooding occurs only for those packets which use these ARP entries.

# Multicast Source Discovery Protocol (MSDP)

Multicast source discovery protocol (MSDP) connects multiple PIM sparse-mode (PIM-SM) domains together.

MSDP peers connect using TCP port 639. Peers send keepalives every 60 seconds. A peer connection is reset after 75 seconds if no MSDP packets are received. MSDP connections are parallel with MBGP connections.

The Dell EMC Networking OS supports MSDP commands on the S6000-ON platform.

## Topics:

- [clear ip msdp peer](#)
- [clear ip msdp sa-cache](#)
- [clear ip msdp statistic](#)

## clear ip msdp peer

Reset the TCP connection to the peer and clear all the peer statistics.

**Syntax** `clear ip msdp peer {peer address}`

**Parameters** **peer address** Enter the peer address in a dotted decimal format (A.B.C.D.)

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| 8.3.7.1    | Introduced on the S4810.    |
| 6.2.1.1    | Introduced                  |

## clear ip msdp sa-cache

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

**Syntax** `clear ip msdp sa-cache [group-address | rejected-sa | local]`

**Parameters**

- group-address** Enter the group IP address in dotted decimal format (A.B.C.D.).
- rejected-sa** Enter the keywords `rejected-sa` to clear the cache source-active entries that are rejected because the RPF check failed, an SA filter or limit is configured, the RP or MSDP peer is unreachable, or because of a format error.
- local** Enter the keyword `local` to clear out local PIM advertised entries. It applies the redistribute filter (if present) while adding the local PIM SA entries to the SA cache.

**Defaults** Without any options, this command clears the entire source-active cache.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.1    | Introduced on the S4810.                  |

| Version | Description                                |
|---------|--------------------------------------------|
| 7.8.1.0 | Added the <code>local</code> option.       |
| 7.7.1.0 | Added the <code>rejected-sa</code> option. |
| 6.2.1.1 | Introduced                                 |

## clear ip msdp statistic

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

**Syntax** `clear ip msdp statistic peer peer-address`

**Parameters**

- peer** Enter the keyword `peer` to clear the MSDP peer entries.
- peer-address*** Enter the IP address of the MSDP peer.

**Defaults** Without any options, this command clears the entire source-active cache.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                |
|------------|--------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0)  | Introduced on the S3148.                   |
| 9.10(0.0)  | Introduced on the S6100-ON.                |
| 9.8(2.0)   | Introduced on the S3100 series.            |
| 9.8(1.0)   | Introduced on the Z9100-ON.                |
| 9.8(0.0P5) | Introduced on the S4048-ON.                |
| 9.8(0.0P2) | Introduced on the S3048-ON.                |
| 9.7(0.0)   | Introduced on the S6000-ON.                |
| 9.5(0.1)   | Introduced on the Z9500.                   |
| 9.0.2.0    | Introduced on the S6000.                   |
| 8.3.19.0   | Introduced on the S4820T.                  |
| 8.3.11.1   | Introduced on the Z9000.                   |
| 8.3.7.1    | Introduced on the S4810.                   |
| 7.8.1.0    | Added the <code>local</code> option.       |
| 7.7.1.0    | Added the <code>rejected-sa</code> option. |
| 6.2.1.1    | Introduced                                 |

# ip msdp cache-rejected-sa

Enable an MSDP cache for the rejected source-active entries.

|                        |                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip msdp cache-rejected-sa {number}</code><br>To clear the MSDP rejected source-active entries, use the <code>no ip msdp cache-rejected-sa {number}</code> command then the <code>ip msdp cache-rejected-sa {number}</code> command. |
| <b>Parameters</b>      | <b>number</b> Enter the number of rejected SA entries to cache. The range is from 0 to 32766.                                                                                                                                             |
| <b>Defaults</b>        | None                                                                                                                                                                                                                                      |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                             |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                             |

# ip msdp default-peer

Define a default peer from which to accept all source-active (SA) messages.

|                   |                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ip msdp default-peer peer address [list name]</code><br>To remove the default peer, use the <code>no ip msdp default-peer {peer address} list name</code> command. |
| <b>Parameters</b> | <b>peer address</b> Enter the peer address in a dotted decimal format (A.B.C.D.)                                                                                         |

**list name** Enter the keywords `list name` and specify a standard access list that contains the RP address that should be treated as the default peer. If no access list is specified, then all SAs from the peer are accepted.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                            |
| 7.8.1.0    | Added the <code>list</code> option and removed the <code>prefix-list</code> option. |
| 7.4.1.0    | Introduced                                                                          |

**Usage Information** If a list is not specified, all SA messages received from the default peer are accepted. You can enter multiple `default peer` commands.

## ip msdp log-adjacency-changes

Enable logging of MSDP adjacency changes.

**Syntax** `ip msdp log-adjacency-changes`  
To disable logging, use the `no ip msdp log-adjacency-changes` command.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

## ip msdp mesh-group

To be a member of a mesh group, configure a peer.

**Syntax** `ip msdp mesh-group {name} {peer address}`  
 To remove the peer from a mesh group, use the `no ip msdp mesh-group {name} {peer address}` command.

**Parameters**

|                            |                                                                        |
|----------------------------|------------------------------------------------------------------------|
| <b><i>name</i></b>         | Enter a string of up to 16 characters long for as the mesh group name. |
| <b><i>peer address</i></b> | Enter the peer address in a dotted decimal format (A.B.C.D.).          |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description |
|---------|-------------|
|---------|-------------|

|         |            |
|---------|------------|
| 6.2.1.1 | Introduced |
|---------|------------|

**Usage Information**

An MSDP mesh group is a mechanism for reducing SA flooding, typically in an intra-domain setting. When some subset of a domain's MSDP speakers are fully meshed, they can be configured into a mesh-group. If member X of a mesh-group receives a SA message from an MSDP peer that is also a member of the mesh-group, member X accepts the SA message and forwards it to all of its peers that are not part of the mesh-group. However, member X cannot forward the SA message to other members of the mesh-group.

## ip msdp originator-id

Configure the MSDP Originator ID.

**Syntax**

```
ip msdp originator-id {interface}
```

To remove the originator-id, use the `no ip msdp originator-id {interface}` command.

**Parameters**

**interface**

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

|---------|-------------|
| 6.2.1.1 | Introduced  |

## ip msdp peer

Configure an MSDP peer.

**Syntax** `ip msdp peer peer address [connect-source] [description] [sa-limit number]`

To remove the MSDP peer, use the `no ip msdp peer peer address [connect-source interface] [description name] [sa-limit number]` command.

### Parameters

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>peer address</i></b>             | Enter the peer address in a dotted decimal format (A.B.C.D.).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>connect-source interface</i></b> | Enter the keywords <code>connect-source</code> then one of the interfaces and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b><i>description name</i></b>         | (OPTIONAL) Enter the keyword <code>description</code> then a description name (maximum 80 characters) to designate a description for the MSDP peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>sa-limit number</i></b>          | (OPTIONAL) Enter the maximum number of SA entries in SA-cache. The range is from 1 to 100000. .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Defaults** See *Parameters* .

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version | Description                                                              |
|---------|--------------------------------------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                                                 |
| 8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.                 |
| 7.5.1.0 | Added option for SA upper limit and the <code>description</code> option. |
| 6.2.1.1 | Introduced                                                               |

### Usage Information

The `connect-source` option is used to supply a source IP address for the TCP connection. When an interface is specified using the `connect-source` option, the primary configured address on the interface is used.

If the total number of SA messages received from the peer is already larger than the limit when this command is applied, those SA messages continue to be accepted. To enforce the limit in such situation, use the `clear ip msdp peer` command to reset the peer.

### Related Commands

- `ip msdp sa-limit` — configure the MSDP SA Limit.
- `clear ip msdp peer` — clear the MSDP peer.
- `show ip msdp` — display the MSDP information.

## ip msdp redistribute

Filter local PIM SA entries in the SA cache. SAs which the ACL denies time out and are not refreshed. Until they time out, they continue to reside in the MSDP SA cache.

**Syntax** `ip msdp redistribute [list acl-name]`

**Parameters** `list acl-name` Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description |
|---------|-------------|
| 7.8.1.0 | Introduced  |

### Usage Information

Modifications to the ACL do not have an immediate effect on the sa-cache.

To apply the redistribute filter to entries already present in the SA cache, use the `clear ip msdp sa-cache local` command.

## ip msdp sa-filter

Permit or deny MSDP source active (SA) messages based on multicast source and/or group from the specified peer.

### Syntax

```
ip msdp sa-filter {in | out} peer-address list [access-list name]
```

Remove this configuration using the `no ip msdp sa-filter {in | out} peer address list [access-list name]` command.

### Parameters

|                         |                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>in</b>               | Enter the keyword <code>in</code> to enable incoming SA filtering.                                                           |
| <b>out</b>              | Enter the keyword <code>out</code> to enable outgoing SA filtering.                                                          |
| <b>peer-address</b>     | Enter the peer address of the MSDP peer in a dotted decimal format (A.B.C.D.).                                               |
| <b>access-list name</b> | Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked. |

### Defaults

Not configured.

| 7.7.1.0    | Introduced on the E-Series.               |

# ip msdp sa-limit

Configure the upper limit of source-active (SA) entries in SA-cache.

**Syntax** `ip msdp sa-limit number`

To return to the default, use the `no ip msdp sa-limit number` command.

**Parameters** ***number*** Enter the maximum number of SA entries in SA-cache. The range is from 1 to 500000.

**Defaults** **50000**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.5.1.0</b>    | Introduced on the E-Series.               |

**Usage Information** Dell EMC Networking OS counts the SA messages originated by itself and those messages received from the MSDP peers. When the total SA messages reach this limit, the subsequent SA messages are dropped (even if they pass RPF checking and policy checking).

If the total number of SA messages is already larger than the limit when this command is applied, those SA messages that are already in Dell EMC Networking OS continue to be accepted. To enforce the limit in such situation, use the `clear ip msdp sa-cache` command.

**Related Commands**

- [ip msdp peer](#) — configure the MSDP peer.
- [clear ip msdp peer](#) — clear the MSDP peer.
- [show ip msdp](#) — display the MSDP information.

# ip msdp shutdown

Administratively shut down a configured MSDP peer.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip msdp shutdown {peer address}</code>                                                                                                                  |
| <b>Parameters</b>      | <b>peer address</b> Enter the peer address in a dotted decimal format (A.B.C.D.).                                                                             |
| <b>Defaults</b>        | Not configured.                                                                                                                                               |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>6.2.1.1</b>    | Introduced                      |

## show ip msdp

Display the MSDP peer status, SA cache, or peer summary.

**Syntax** `show ip msdp {peer peer address | sa-cache | summary}`

**Parameters**

|                                 |                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------|
| <b>peer <i>peer address</i></b> | Enter the keyword <code>peer</code> then the peer address in a dotted decimal format (A.B.C.D.). |
| <b>sa-cache</b>                 | Enter the keywords <code>sa-cache</code> to display the Source-Active cache.                     |
| <b>summary</b>                  | Enter the keyword <code>summary</code> to display an MSDP peer summary.                          |

**Defaults** Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

# Multicast Listener Discovery Protocol

The Multicast Listener Discovery (MLD) protocol is used by IPv6 routers to discover multicast listeners on a directly attached link.

Similar to the Internet Group Management Protocol (IGMP), which handles multicast group memberships in IPv4 networks, MLD is used for multicast management on IPv6 networks.

## Topics:

- [clear ipv6 mld groups](#)
- [debug ipv6 mld](#)
- [ipv6 mld explicit-tracking](#)
- [ipv6 mld last-member-query-interval](#)
- [ipv6 mld query-interval](#)
- [ipv6 mld query-max-resp-time](#)
- [ipv6 mld version](#)
- [show ipv6 mld groups](#)
- [show ipv6 mld interface](#)
- [MLD Snooping](#)

## clear ipv6 mld groups

Clear entries from the group cache table.

**Syntax** `clear ipv6 mld [vrf vrf-name] groups [interface | group-address]`

### Parameters

***vrf vrf-name*** (Optional) Enter the keyword `vrf` followed by the name of the VRF.

***interface*** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

***group-address*** (OPTIONAL) Enter the group address in the following format: `x:x:x::x`. The `::` notation specifies successive hexadecimal fields of zero.

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

# debug ipv6 mld

Enable debugging on IPv6 MLD packets.

**Syntax** `debug ipv6 mld [vrf vrf-name] {group-address | interface}`  
To turn off debugging, use the `no debug ipv6 mld {group-address | interface}` command.

**Parameters**

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF.

**group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x::x` format. The `::` notation specifies successive hexadecimal fields of zero.

**interface** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

# ipv6 mld explicit-tracking

Enable MLD explicit tracking receivers.

**Syntax** `ipv6 mld explicit-tracking`  
To disable explicit tracking, use the `no ipv6 mld explicit-tracking` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld last-member-query-interval

Change the MAX Response Time inserted into the Group-Specific Queries sent in response to a Leave Group messages. This interval is also the interval between Group-Specific Query messages.

|                        |                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 mld last-member-query-interval {milliseconds}</code><br>To return to the default, use the <code>no ipv6 mld last-member-query-interval {milliseconds}</code> command. |
| <b>Parameters</b>      | <b>milliseconds</b> Enter the last member query interval in milliseconds. The range is from 100 to 65535.                                                                        |
| <b>Defaults</b>        | 1000 milliseconds.                                                                                                                                                               |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                    |
| <b>Version</b>         | <b>Description</b>                                                                                                                                                               |
| <b>9.11(3.0)</b>       | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.                                                                       |

## ipv6 mld query-interval

Change the transmission frequency of the MLD host.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 mld query-interval [seconds]</code><br>To return to the default interval, use the <code>no ipv6 mld query-interval</code> command.                 |
| <b>Parameters</b>      | <b>seconds</b> Enter the interval in seconds. The range is from 1 to 18000.                                                                                   |
| <b>Defaults</b>        | 60 seconds.                                                                                                                                                   |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |
| <b>Version</b>         | <b>Description</b>                                                                                                                                            |
| <b>9.11(3.0)</b>       | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.                                                    |

## ipv6 mld query-max-resp-time

Set the maximum query response time advertised in the general queries.

|                      |                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ipv6 mld query-max-resp-time {seconds}</code><br>To return to the default, use the <code>no ipv6 mld query-max-resp-time</code> command. |
| <b>Parameters</b>    | <b>seconds</b> Enter the interval in seconds. The range is from 1 to 25.                                                                       |
| <b>Defaults</b>      | 10 seconds.                                                                                                                                    |
| <b>Command Modes</b> | INTERFACE                                                                                                                                      |

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld version

Configure the MLD version on the system.

**Syntax** `ipv6 mld version {1 | 2}`

**Defaults** MLD version 2

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

**Usage Information** The `ipv6 mld version` command is applicable for MLD snooping-enabled interfaces.

**Example** The following is a sample configuration wherein MLD version 1 is selected on the system.

```
interface Vlan 61
 ip vrf forwarding red
 ipv6 address 61::9/64
 ipv6 ospf 2 area 0
 untagged TenGigabitEthernet 2/18
 ipv6 pim sparse-mode
 ipv6 mld version 1
 no shutdown
```

## show ipv6 mld groups

View the configured MDL groups.

**Syntax** `show ipv6 mld [vrf vrf-name] groups [detail] [group-address] [interface interface [detail]]`

| Parameters                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>        | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>group-address</b>       | Enter the group address for which you want to display information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>interface interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN, enter the keyword <code>vlan</code> followed by a number from 1 to 4094.</li></ul> |
| <b>detail</b>              | View detailed group information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

**Example**

```
Dell#show ipv6 mld groups
Total Number of Groups: 1
MLD Connected Group Membership
Group Address Interface Mode Uptime Expires Last
Reporter
Ff08::12 Vlan 10 MLDv2 00:00:12 00:02:05 1::2
```

## show ipv6 mld interface

View the configured MLD interfaces.

**Syntax** show ipv6 mld [*vrf vrf-name*] interface [*interface*]

- Parameters**
- vrf vrf-name** (Optional) Enter the keyword *vrf* followed by the name of the VRF.
  - interface interface** Enter the following keywords and slot/port or number information:
    - For a Port Channel interface, enter the keywords *port-channel* then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword *TenGigabitEthernet* then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword *fortyGigE* then the slot/port information.
    - For a VLAN, enter the keyword *vlan* followed by a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Updated the output to show both MLD versions 1 and 2.                                                      |
| 9.11(3.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

**Example**

```
DELL EMC# show ipv6 mld vrf red interface vlan 100
Vlan 100
 Inbound MLD access group is not set
 Internet address is 61::9/64
 MLD is up on the interface
 MLD query interval is 60 seconds
 MLD querier timeout is 0 seconds
 MLD max query response time is 10 seconds
 MLD last member query response interval is 1000 ms
 MLD immediate-leave is disabled
 MLD activity: 40 joins
 MLD querying router is fe80::211:33ff:fe44:7788
 MLD version is 1
```

# MLD Snooping

MLD snooping allows the switch to examine the MLD packets and forwards the decision based on their content. You can configure MLD snooping in subnets that receive MLD queries from either MLD or the MLD snooping querier. MLD snooping limits the IPv6 multicast traffic at Layer 2 by configuring Layer 2 LAN ports and dynamically forwards the IPv6 multicast traffic to the ports that want to receive it. Hosts join IPv6 multicast groups either by sending an unsolicited MLD report or by sending an MLD report in response to a general query from an IPv6 multicast router (the switch forwards general queries from IPv6 multicast routers to all the ports in a VLAN). The switch snoops these reports and in response to a snooped MLD report, the switch creates an entry in its forwarding table for the VLAN on which the report was received. When the other hosts that are interested in this multicast traffic send MLD reports, the switch snoops their report and adds them to the existing forwarding table entry. The switch creates only one entry per VLAN in the forwarding table for each multicast group, for which it snoops an MLD report.

## clear ipv6 mld snooping groups

Clear entries from the group cache table.

**Syntax** `clear ipv6 mld snooping groups [interface | group-address]`

**Parameters**

***interface*** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

***group-address*** (OPTIONAL) Enter the group address in the following format: `x:x:x::x`. The `::` notation specifies successive hexadecimal fields of zero.

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## debug ipv6 mld snooping

Enable debugging on IPv6 MLD snooping packets.

**Syntax** `debug ipv6 mld {group-address | interface}`

To turn off debugging, use the `no debug ipv6 mld {group-address | interface}` command.

**Parameters**

***group-address*** (OPTIONAL) Enter the multicast group address in the `x:x:x::x` format. The `::` notation specifies successive hexadecimal fields of zero.

***interface*** Enter the following keywords and slot/port or number information:

- For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld snooping

Enable MLD snooping on a VLAN.

**Syntax** `ipv6 mld snooping`

To disable MLD snooping, use the `no ipv6 mld snooping` command.

**Defaults** Enabled on all VLAN interfaces.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld snooping enable

Enable MLD snooping on the switch globally.

**Syntax** `ipv6 mld snooping enable`

To disable MLD snooping, use the `no ipv6 mld snooping enable` command.

**Defaults** Enabled on all VLAN interfaces.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |

| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

## ipv6 mld snooping explicit-tracking

Enable explicit MLD snooping tracking on an interface.

**Syntax** `ipv6 mld snooping explicit-tracking`  
To disable MLD snooping explicit tracking, use the `no ipv6 mld snooping explicit-tracking` command.

**Defaults** Disabled.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## ipv6 mld snooping mrouter

Configure a Layer 2 port as a multicast router port.

**Syntax** `ipv6 mld snooping mrouter interface {interface interface}`

**Parameters**

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b> | Enter the keyword <code>interface</code> to indicate the next-hop interface to the multicast router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface</b> | Enter one of the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a null interface, enter the keyword <code>null</code> then the slot/port information. The Null interface number is 0.</li><li>• For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul> |

**Defaults** None.

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Version</b>         | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>9.14(0.0)</b>       | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Example

```
Dell EMC#show ipv6 mld snooping groups
Total Number of Groups: 1
Channel ::/ff0e::225:1:1:1, interface Vlan 10
 Uptime 11:24:49 , Last join time 00:00:15
 Expires in 00:01:54
 Ports : Po 1
Dell EMC#
```

## show ipv6 mld snooping interface

View the configured MLD snooping interfaces.

**Syntax** `show ipv6 mld snooping interface [interface]`

**Parameters**

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><b>interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN, enter the keyword <code>vlan</code> followed by a number from 1 to 4094.</li></ul> |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Updated the output to show both MLD versions 1 and 2.                                                                 |
| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

### Example

```
DellEMC# show ipv6 mld snooping interface vlan 100
Vlan 100 is up, line protocol is up
Interface address is fe80::211:33ff:fe44:7788/64
MLD protocol processing disabled
Current MLD snooping version is 1
MLD snooping is enabled on this interface
MLD snooping querier is disabled and is currently inactive
MLD snooping last member query response interval is 1000 ms
MLD snooping explicit tracking is disabled
```

## show ipv6 mld snooping mrouter

Display information on the MLD snooping router.

**Syntax** `show ipv6 mld snooping mrouter [vlan]`

**Parameters**

|             |                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VLAN</b> | (OPTIONAL) Enter the keyword <code>VLAN</code> then the VLAN number to display the information on that specific VLAN. The VLAN range is from 1 to 4094. |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** None.

**Command Modes** EXEC

EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010. |

**Example**

```
Dell#show ipv6 mld snooping mrouter
Interface Ports (* - Dynamic)
Vlan 2 Gi 1/18
Dell#
```

# Multiple Spanning Tree Protocol (MSTP)

Multiple spanning tree protocol (MSTP), as implemented by the Dell EMC Networking OS, conforms to IEEE 802.1s.

This command supports the Dell EMC Networking OS.

## Topics:

- [debug spanning-tree mstp](#)
- [disable](#)
- [forward-delay](#)
- [hello-time](#)
- [max-age](#)
- [msti](#)
- [name](#)
- [port-channel path-cost custom](#)
- [protocol spanning-tree mstp](#)
- [revision](#)
- [show config](#)
- [show spanning-tree mst configuration](#)
- [show spanning-tree msti](#)
- [spanning-tree](#)
- [spanning-tree msti](#)
- [tc-flush-standard](#)

## debug spanning-tree mstp

Enable debugging of the multiple spanning tree protocol and view information on the protocol.

**Syntax** `debug spanning-tree mstp [all | bpdu interface {in | out} | events]`

To disable debugging, enter **no debug spanning-tree** mstp

### Parameters

- all** (OPTIONAL) Enter the keyword `all` to debug all spanning tree operations.
- bpdu interface {in | out}** (OPTIONAL) Enter the keyword `bpdu` to debug bridge protocol data units (BPDU). (OPTIONAL) Enter the interface keyword along with the type slot/port of the interface you want displayed. Type slot/port options are the following:
- For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- Optionally, enter an `in` or `out` parameter with the optional interface:
- For Receive, enter the keyword `in`.
  - For Transmit, enter the keyword `out`.
- events** (OPTIONAL) Enter the keyword `events` to debug MSTP events.

**Command Modes** EXEC Privilege

## Command History

| <b>8.3.19.0</b>    | Introduced on the S4820T.                                |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                 |
| <b>8.5.1.0</b>     | Added support for 4-port 40G line cards on the E-Series. |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                 |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                              |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                              |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.                              |

## Example

```
DellEMC# debug spanning-tree mstp bpdu tengigabitethernet 1/1 ?
in Receive (in)
out Transmit (out)
```

# disable

Globally disable the multiple spanning tree protocol on the switch.

## Syntax

`disable`

To enable MSTP, enter the `no disable` command.

## Defaults

Disabled.

## Command Modes

MULTIPLE SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version    | Description                 |
|------------|-----------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON. |
| 9.8(0.0P2) | Introduced on the S3048-ON. |
| 9.7(0.0)   | Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.    |
| 9.0.2.0    | Introduced on the S6000.    |

| 8.3.7.0    | Introduced on the S4810.    |
| 7.6.1.0    | Introduced on the S-Series. |
| 7.5.1.0    | Introduced on the C-Series. |
| 6.5.1.0    | Introduced.                 |

#### Related Commands

- [protocol spanning-tree mstp](#) — enter MULTIPLE SPANNING TREE mode.

## forward-delay

The amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

#### Syntax

`forward-delay seconds`

To return to the default setting, use the `no forward-delay` command.

#### Parameters

**seconds**

Enter the number of seconds the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State. The range is from 4 to 30. The default is **15 seconds**.

#### Defaults

**15 seconds**

#### Command Modes

MULTIPLE SPANNING TREE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Related Commands**

- [max-age](#) — change the wait time before MSTP refreshes protocol configuration information.
- [hello-time](#) — change the time interval between bridge protocol data units (BPDUs).

## hello-time

Set the time interval between generation of MSTB bridge protocol data units (BPDUs).

**Syntax**

`hello-time seconds`

To return to the default value, use the `no hello-time` command.

**Parameters**

**seconds** Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

**Defaults**

**2 seconds**

**Command Modes**

**Related Commands**

- [forward-delay](#) — amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.
- [max-age](#) — change the wait time before MSTP refreshes protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the MSTB.

**Syntax**

`max-age seconds`

To return to the default values, use the `no max-age` command.

**Parameters**

***max-age***

Enter a number of seconds the Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is **20 seconds**.

**Defaults**

**20 seconds**

**Command Modes**

MULTIPLE SPANNING TREE

**Command History**

- [hello-time](#) — change the time interval between BPDUs.

# msti

Configure multiple spanning tree instance, bridge priority, and one or multiple VLANs mapped to the MST instance.

**Syntax** `msti instance {vlan range | bridge-priority priority}`

To disable mapping or bridge priority, use the `no msti instance {vlan range | bridge-priority priority}` command.

**Parameters**

- msti instance** Enter the MSTP instance. The range is from zero (0) to 63.
- vlan range** Enter the keyword `vlan` then the identifier range value. The range is from 1 to 4094.
- bridge-priority priority** Enter the keywords `bridge-priority` then a value in increments of 4096 as the bridge priority. The range is from zero (0) to 61440.  
Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.

**Defaults** default bridge-priority is **32768**.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |

# port-channel path-cost custom

Sets the path cost to be constant for port-channel regardless of its operation status.

|                 |                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <code>port-channel path-cost custom</code><br>To change the path cost to comply with new IEEE standard behavior, use <code>no port-channel path-cost custom</code> command. |
| <b>Defaults</b> | Disabled                                                                                                                                                                    |

**Command Modes** SPANNING TREE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.1) | Introduced on MXL, FN IOM, S6000, S3100, S4810, S4820T, S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, S5048F-ON, C9010, and Z9100-ON, |

**Usage Information** This command is used to keep the port-channel path cost constant regardless of the operational status of the port-channel member ports.

This command is supported in all STP modes such as STP, RSTP, MSTP, and PVST.

The command behavior does not change when a new member port is added to the port-channel or an existing member port is deleted from the configuration. The path cost reflects the cumulative speed of the port-channel member ports.

**Example**

```
DELEMC(conf)#protocol spanning-tree pvst
DELEMC(conf-pvst)#port-channel path-cost custom
```

## protocol spanning-tree mstp

To enable and configure the multiple spanning tree group, enter MULTIPLE SPANNING TREE mode.

**Syntax** `protocol spanning-tree mstp`

To disable the multiple spanning tree group, use the `no protocol spanning-tree mstp` command.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.2.1.1 | Introduced on the E-Series. |

### Usage Information

MSTP is not enabled when you enter MULTIPLE SPANNING TREE mode. To enable MSTP globally on the switch, enter the `no disable` command while in MULTIPLE SPANNING TREE mode.

For more information about the multiple spanning tree protocol, refer to the *Dell EMC Networking OS Configuration Guide*.

### Example

```
DellEMC(conf)# protocol spanning-tree mstp
DellEMC(config-mstp)#no disable
```

### Related Commands

- [disable](#) — disable multiple spanning tree.

## revision

The revision number for the multiple spanning tree configuration.

### Syntax

`revision range`

To return to the default values, use the `no revision` command.

### Parameters

**range** Enter the revision number for the MST configuration. The range is from 0 to 65535. The default is **0**.

### Defaults

**0**

### Command Modes

MULTIPLE SPANNING TREE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                               |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information**

For two MSTP switches to be within the same MST region, the switches must share the same revision number.

**Related Commands**

- `msti` — map the VLAN(s) to an MST instance.
- `name` — assign the region name to the MST region.

## show config

View the current configuration for the mode. Only non-default values are shown.

**Syntax**

`show config`

**Command Modes**

MULTIPLE SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>6.5.1.0</b>    | Introduced on the E-Series.               |

**Example**

```
DellEMC(conf-mstp)# show config
!
protocol spanning-tree mstp
 no disable
 name CustomerSvc
 revision 2
 MSTI 10 VLAN 101-105
 max-hops 5
DellEMC(conf-mstp)#
```

# show spanning-tree mst configuration

View the multiple spanning tree configuration.

**Syntax** `show spanning-tree mst configuration`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |

| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.2.1.1 | Introduced on the E-Series.               |

**Usage Information** Enable the multiple spanning tree protocol prior to using this command.

**Example**

```
DellEMC# show spanning-tree mst configuration
MST region name: CustomerSvc
Revision: 2
MSTI VID
 10 101-105
DellEMC#
```

# show spanning-tree msti

View the multiple spanning tree instance.

**Syntax** `show spanning-tree msti [instance-number [brief]] [guard]`

**Parameters** *instance-number* (Optional) Enter the multiple spanning tree instance number. The range is from 0 to 63.

- brief** (Optional) Enter the keyword `brief` to view a synopsis of the MST instance.
- guard** (Optional) Enter the keyword `guard` to display the type of guard enabled on an MSTP interface and the current port state.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|-------------------|--------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                            |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                               |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                              |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                               |
| <b>8.4.2.1</b>    | Support for the optional keyword <code>guard</code> was added on the C-Series, S-Series, and E-Series. |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                               |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                            |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                            |
| <b>6.4.1.0</b>    | Expanded to display the port error disable state (EDS) loopback BPDU inconsistency causes.             |

**Usage Information** Enable the multiple spanning tree protocol prior to using this command.

**Example**

```
DellEMC# show spanning-tree msti 10
MSTI 10 VLANs mapped 101-105

Bridge Identifier has priority 32768, Address 0001.e802.3506
Configured hello time 2, max age 20, forward delay 15, max hops 5
Current root has priority 16384, Address 0001.e800.0a5c
Number of topology changes 0, last change occurred 3058087

Port 82 (TenGigabitEthernet 2/1/1) is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.82
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.82, designated path cost
Number of transitions to forwarding state 1
BPDU (Mrecords): sent 1109, received 0
The port is not in the portfast mode

Port 88 (TenGigabitEthernet 2/6/1) is root Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.88
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.88, designated path cost
Number of transitions to forwarding state 4
BPDU (Mrecords): sent 19, received 1103
```

```
The port is not in the portfast mode

Port 89 (TenGigabitEthernet 2/7/1) is alternate Discarding
Port path cost 0, Port priority 128, Port Identifier 128.89
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.89, designated path cost
Number of transitions to forwarding state 3
BPDU (Mrecords): sent 7, received 1103
The port is not in the portfast mode
```

### Example (EDS and LBK)

The bold line shows the loopback BPDU inconsistency (LBK\_INC).

```
DelleMC# show spanning-tree msti 0 brief
MSTI 0 VLANs mapped 1-4094

Executing IEEE compatible Spanning Tree Protocol

```

### Usage Information

The following describes the show spanning-tree msti 5 guard command shown in the following example.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | MSTP interface.                                                                                                         |
| <b>Instance</b>       | MSTP instance.                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |

| Field             | Description                                               |
|-------------------|-----------------------------------------------------------|
| <b>Guard Type</b> | Type of STP guard configured (Root, Loop, or BPDU guard). |

#### Example (Guard)

```
DellEMC# show spanning-tree msti 5 guard
Interface
Name Instance Sts Guard type

Te 1/1/1 5 INCON(Root) Rootguard
Te 1/2/1 5 FWD Loopguard
Te 1/3/1 5 EDS(Shut) Bpduguard
```

## spanning-tree

Enable the multiple spanning tree protocol on the interface.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>spanning-tree</code><br>To disable the multiple spanning tree protocol on the interface, use the <code>no spanning-tree</code> command.                 |
| <b>Parameters</b>      | <b>spanning-tree</b> Enter the keywords <code>spanning-tree</code> to enable the MSTP on the interface.                                                       |
| <b>Defaults</b>        | Enable.                                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version            | Description                               |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.2.1.0</b> | Introduced on the E-Series.               |

# spanning-tree msti

Configure multiple spanning tree instance cost and priority for an interface.

|                   |                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>spanning-tree msti <i>instance</i> {cost <i>cost</i>   priority <i>priority</i>}</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b> | <b>msti <i>instance</i></b>                                                                   | Enter the keyword <code>msti</code> and the MST instance number. The range is from zero (0) to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>cost <i>cost</i></b>                                                                       | (OPTIONAL) Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000. The defaults are: <ul style="list-style-type: none"><li>• 100 Mb/s Ethernet interface = <b>200000</b></li><li>• 1-Gigabit Ethernet interface = <b>20000</b></li><li>• 10-Gigabit Ethernet interface = <b>2000</b></li><li>• Port Channel interface with one 100 Mb/s Ethernet = <b>200000</b></li><li>• Port Channel interface with one 1 Gigabit Ethernet = <b>20000</b></li><li>• Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b></li><li>• Port Channel with two 1 Gigabit Ethernet = <b>18000</b></li><li>• Port Channel with two 10 Gigabit Ethernet = <b>1800</b></li><li>• Port Channel with two 100 Mbps Ethernet = <b>180000</b></li></ul> |
|                   | <b>priority <i>priority</i></b>                                                               | Enter keyword <code>priority</code> then a value in increments of 16 as the priority. The range is from 0 to 240. The default is <b>128</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- Defaults**
- cost = depends on the interface type
  - priority = **128**

**Command Modes** INTERFACE

| <b>6.5.1.0</b>    | Introduced on the E-Series.               |

# tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

**Syntax** `tc-flush-standard`

To disable, use the `no tc-flush-standard` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.5.1.0</b>    | Introduced                                |

**Usage Information** By default, Dell EMC Networking OS implements an optimized flush mechanism for MSTP. This mechanism helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, this `knob` command can be turned on to enable flushing MAC addresses after receiving every topology change notification.

# Multicast

The multicast commands are supported by Dell EMC Networking OS.

## Topics:

- [IPv4 Multicast Commands](#)
- [IPv6 Multicast Commands](#)

## IPv4 Multicast Commands

The following section contains the IPv4 multicast commands.

### clear ip mroute

Clear learned multicast routes on the multicast forwarding table. To clear the protocol-independent multicast (PIM) tree information base, use the `clear ip pim tib` command.

**Syntax** `clear ip mroute [vrf vrf-name] {group-address [source-address] | *}`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address [source-address]** Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

**\*** Enter \* to clear all multicast routes.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| 9.11.(3.0) | Removed support for keyword <code>snooping</code> .                              |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                        |
| 9.10(0.0)  | Introduced on the S3148.                                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                      |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON.                               |
| 9.2(1.0)   | Introduced on the Z9500.                                                         |
| 9.2.(0.0)  | Added support for keyword <code>snooping</code> on the Z9000, S4810, and S4820T. |
| 9.0.2.0    | Introduced on the S6000.                                                         |
| 8.3.19.0   | Introduced on the S4820T.                                                        |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.8.1.0 | Introduced on the C-Series. |

**E-Series legacy command**

**Related Commands**

- [show ip pim tib](#) — show the PIM tree information base.

## ip mroute

Assign a static mroute.

**Syntax**

```
ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]
```

To delete a specific static mroute, use the `no ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]` command.

To delete all mroutes matching a certain mroute, use the `no ip mroute [vrf vrf-name] destination mask` command.

**Parameters**

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                             | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to assign a static mroute to that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                                                                                                                                                                                                                                                                                 |
| <b>destination</b>                              | Enter the IP address in dotted decimal format of the destination device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>mask</b>                                     | Enter the mask in slash prefix formation ( /x ) or in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>null 0</b>                                   | (OPTIONAL) Enter the keyword <code>null</code> then zero (0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>[protocol [process-id   tag] ip-address]</b> | (OPTIONAL) Enter one of the routing protocols: <ul style="list-style-type: none"> <li>• Enter the BGP as-number then the IP address in dotted decimal format of the reverse path forwarding (RPF) neighbor. The range is from 1 to 65535.</li> <li>• Enter the OSPF process identification number then the IP address in dotted decimal format of the RPF neighbor. the range is from 1 to 65535.</li> <li>• Enter the IS-IS alphanumeric tag string then the IP address in dotted decimal format of the RPF neighbor.</li> <li>• Enter the RIP IP address in dotted decimal format of the RPF neighbor.</li> </ul> |
| <b>static ip-address</b>                        | (OPTIONAL) Enter the Static IP address in dotted decimal format of the RPF neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ip-address</b>                               | (OPTIONAL) Enter the IP address in dotted decimal format of the RPF neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>distance</b>                                 | (OPTIONAL) Enter a number as the distance metric assigned to the mroute. The range is from 0 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the C-Series. |
| 7.6.1.0  | Introduced on the E-Series. |

**Usage Information**

This feature allows you to limit the number of multicast entries on the system. This number is the total of all the multicast entries on all line cards in the system. On each line card, the multicast module only installs the maximum number of entries, depending on the configured CAM profile.

To store multicast routes, use the IN-L3-McastFib CAM partition. It is a separate hardware limit that exists per port-pipe. This hardware space limitation can supersede any software-configured limit. The opposite is also true, the CAM partition might not be exhausted at the time the system-wide route limit set by the `ip multicast-limit` command is reached.

**Related Commands**

- [show ip igmp groups](#) — display the IGMP groups.

## ip multicast-routing

Enable IP multicast forwarding.

|                        |                                                                                                                                                               |

|                                |  |
|--------------------------------|--|
| <b>E-Series legacy command</b> |  |
|--------------------------------|--|

**Usage Information**

After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the `ip pim sparse-mode` command to enable IGMP and PIM on the interface.

**Related Commands**

- `ip pim sparse-mode` — enable IGMP and PIM on an interface.

## mtrace

Trace a multicast route from the source to the receiver.

**Syntax**

```
mtrace [vrf vrf-name] {source-address/hostname} [destination-address/hostname] [group-address/hostname]
```

**Parameters**

- |                                     |                                                                                                                                                                                                                                                                                                |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                 | Enter the keyword <code>vrf</code> followed by the name of the VRF. If VRF name is not mentioned, the default VRF will be used. Mtrace is not supported for management VRF.                                                                                                                    |
| <b>source-address/hostname</b>      | Enter the source IP address in dotted decimal format (A.B.C.D). This is a unicast address of the beginning of the path to be traced.                                                                                                                                                           |
| <b>destination-address/hostname</b> | Enter the destination (receiver) IP address in dotted decimal format (A.B.C.D). If omitted, the mtrace starts from the system at which the command is typed.                                                                                                                                   |
| <b>group-address/hostnamae</b>      | Enter the multicast group address in dotted decimal format (A.B.C.D). If group address is not given then software shall invokes a weak mtrace. A weak mtrace is one that follows the RPF path to the source, regardless of whether any router along the path has multicast routing table state |

**Command Modes** EXEC Privilege

**Command History**

| Version  | Description                                                     |
|----------|-----------------------------------------------------------------|
| 9.11.0.0 | Re-introduced the mtrace command on the Dell EMC Networking OS. |
| 7.5.1.0  | Expanded to support originator.                                 |
| 7.4.1.0  | Expanded to support the intermediate (transit) router.          |

**Usage Information**

Mtrace is an IGMP based protocol that provides a multicast trace route facility and is implemented according to the IETF draft "A *trace route* facility for IP Multicast" (draft-fenner-traceroute-ipm-01.txt). Dell EMC Networking OS supports the Mtrace client and transit functionality.

As an Mtrace client, Dell EMC Networking OS transmits Mtrace queries, receives, parses, and prints out the details in the response packet received.

A transit or intermediate router, forwards mtrace requests to the RPF neighbor after appending its response block to the packet. In case it is the first hop router, it sends a response.

As an Mtrace transit or intermediate router, Dell EMC Networking OS returns the response to Mtrace queries. After receiving the Mtrace request, Dell EMC Networking OS computes the RPF neighbor for the source, fills in the request and the forwards the request to the RPF neighbor.

**Example**

```
R1>mtrace 103.103.103.3 1.1.1.1 226.0.0.3
Type Ctrl-C to abort.

Querying reverse path for source 103.103.103.3 to destination 1.1.1.1
via group 226.0.0.3
From source (?) to destination (?)

```

| Hop | OIF IP          | Proto | Forwarding Code | Source Network/Mask |
|-----|-----------------|-------|-----------------|---------------------|
| 0   | 1.1.1.1         | -->   | Destination     |                     |
| -1  | 1.1.1.1         | PIM   | Reached RP/Core | 103.103.103.0/24    |
| -2  | 101.101.101.102 | PIM   | -               | 103.103.103.0/24    |
| -3  | 2.2.2.1         | PIM   | -               | 103.103.103.0/24    |
| -4  | 103.103.103.3   | -->   | Source          |                     |

The mtrace command traverses the path of the response data block in the reverse direction of the multicast data traffic. The mtrace command traverses the reverse path to the source from the destination. As a result, the tabular output of the mtrace command displays the destination details in the first row, followed by the RPF router details along the path in the consequent rows, and finally the source details in the last row. The tabular output contains the following columns:

- Hop — a hop number(counted negatively to indicate reverse-path)
- OIF IP — outgoing interface address
- Proto — multicast routing protocol
- Forwarding code — error code as present in the response blocks
- Source Network/Mask — source mask

## show ip multicast-cam

Display the content addressable memory (CAM) size and the portions allocated for IP multicast traffic.

**Syntax** `show ip multicast-cam linecard slot-id port-set port-pipe`

**Parameters**

**linecard *slot-id*** Enter the keyword `linecard` with a slot number to select the line card for which to gather information. The range of Z9500 slot IDs is from 0 to 2.

**port-set *port-pipe*** Enter the keyword `port-set` with a port-pipe number to select the port pipe for which to gather information. The range of port pipes is from 0 to 3.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.1    | Introduced on the S4810.                  |

## Version Description

### E-Series legacy command

#### Example

```
DellEMC# show ip multicast-cam stack-unit 1 port 0
Vrf Id Group Address Source Address Vlan Id IPMC index L2 Ports

0 224.1.1.1 0.0.0.0 1000 1 Te 1/3/1,
Te 1/10/1,
0 224.1.1.2 0.0.0.0 1000 1 Te 1/3/1,
Te 1/10/1,
0 224.1.1.1 165.13.34.5 2000 2 Te 1/3/5,
Te 1/11/1,
```

## show ip mroute

View the multicast routing table.

#### Syntax

```
show ip mroute [vrf vrf-name] [static | group-address [source-address] |
count | snooping [vlan vlan-id] [group-address [source-address]] | summary
| vlt [group-address [source-address] | count]
```

#### Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- static** (OPTIONAL) Enter the keyword `static` to view static multicast routes.
- group-address [source-address]** (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.
- count** (OPTIONAL) Enter the keyword `count` to view the number of multicast routes and packets.
- snooping [vlan vlan-id] [group-address [source-address]]** Enter the keyword `snooping` to display information on the multicast routes PIM-SM snooping discovers.  
 Enter a VLAN ID to limit the information displayed to the multicast routes PIM-SM snooping discovers on a specified VLAN. The VLAN ID range is from 1 to 4094.  
 Enter a multicast group address and, optionally, a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes PIM-SM snooping discovers for a specified multicast group and source.
- summary** (OPTIONAL) Enter the keyword `summary` to view a summary of all routes.
- vlt** (OPTIONAL) Enter the keyword `vlt` to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword `count` to display the total number of multicast routes with the spanned IIF.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)                      | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                  |
| 9.10(0.0)                      | Introduced on the S3148.                                                                                                                                                                   |
| 9.10(0.0)                      | Introduced on the S6100-ON.                                                                                                                                                                |
| 9.8(2.0)                       | Introduced on the S3100 series.                                                                                                                                                            |
| 9.8(1.0)                       | Introduced on the Z9100-ON.                                                                                                                                                                |
| 9.8(0.0P5)                     | Introduced on the S4048-ON.                                                                                                                                                                |
| 9.8(0.0P2)                     | Introduced on the S3048-ON.                                                                                                                                                                |
| 9.7(0.0)                       | Added support for VRF. Introduced on the S6000-ON.                                                                                                                                         |
| 9.2(1.0)                       | Introduced on the Z9500.                                                                                                                                                                   |
| 9.0.2.0                        | Introduced on the S6000.                                                                                                                                                                   |
| 9.2.(0.0)                      | Added support for keyword <code>vlt</code> to the Z9000, S4810, and S4820T.                                                                                                                |
| 8.4.1.1                        | Support for the keyword <code>snooping</code> and the optional <code>vlan vlan-id</code> , <code>group-address</code> , and <code>source-address</code> parameters were added on E-Series. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                                                                                                                  |
| 8.3.7.0                        | Introduced on the S4810.                                                                                                                                                                   |
| 7.6.1.0                        | Introduced on the S-Series.                                                                                                                                                                |
| 7.5.1.0                        | Introduced on the C-Series.                                                                                                                                                                |
| <b>E-Series legacy command</b> |                                                                                                                                                                                            |

#### Example (Static)

```
DellEMC# show ip mroute static
Mroute: 23.23.23.0/24, interface: Lo 2
Protocol: static, distance: 0, route-map: none, last change: 00:00:23
```

#### Example (Snooping)

```
DellEMC# show ip mroute snooping
IPv4 Multicast Snooping Table
(*, 224.0.0.0), uptime 17:46:23
 Incoming vlan: Vlan 2
 Outgoing interface list:
 TenGigabitEthernet 4/13/1
(*, 225.1.2.1), uptime 00:04:16
 Incoming vlan: Vlan 2
 Outgoing interface list:
 TenGigabitEthernet 4/11/1
 TenGigabitEthernet 4/13/1
(165.87.1.7, 225.1.2.1), uptime 00:03:17
 Incoming vlan: Vlan 2
 Outgoing interface list:
 TenGigabitEthernet 4/11/1
 TenGigabitEthernet 4/13/1
 TenGigabitEthernet 4/20/1
```

#### Example (VLT)

```
DellEMC# show ip mroute vlt
IP Multicast Routing Table
Flags: S - Synced
(*, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
```

```

Vlan 20 (S)
Vlan 30

(50.1.1.2, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
Vlan 20 (S)

```

### Usage Information

The following describes the `show ip mroute` command shown in the following example.

| Field                           | Description                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>(S, G)</b>                   | Displays the forwarding entry in the multicast route table.                                                                                                                                                                                              |
| <b>uptime</b>                   | Displays the amount of time the entry has been in the multicast forwarding table.                                                                                                                                                                        |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) information towards the source for (S,G) entries and the RP for (*,G) entries.                                                                                                                                |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following: <ul style="list-style-type: none"> <li>• a directly connected member of the Group</li> <li>• statically configured member of the Group</li> <li>• received a (*,G) or (S,G) Join message</li> </ul> |

### Example

```

DellEMC# show ip mroute

IP Multicast Routing Table

(*, 224.10.10.1), uptime 00:05:12
Incoming interface: TenGigabitEthernet 3/12/1
Outgoing interface list:
TenGigabitEthernet 3/13/1

(1.13.1.100, 224.10.10.1), uptime 00:04:03
Incoming interface: TenGigabitEthernet 3/4/1
Outgoing interface list:
TenGigabitEthernet 3/12/1
TenGigabitEthernet 3/13/1

(*, 224.20.20.1), uptime 00:05:12
Incoming interface: TenGigabitEthernet 3/12/1
Outgoing interface list:
TenGigabitEthernet 3/4/1

```

## show ip rpf

View reverse path forwarding.

**Syntax** `show ip rpf`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |

| Version    | Description                     |
|------------|---------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.1    | Introduced on the S4810.        |

#### E-Series legacy command

#### Usage Information

Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

 **NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

#### Example

```
DelleMC# show ip rpf
RPF information for 10.10.10.9
 RPF interface: Te 3/4/1
 RPF neighbor: 165.87.31.4
 RPF route/mask: 10.10.10.9/255.255.255.255
 RPF type: unicast
```

## IPv6 Multicast Commands

The following section contains the IPv6 multicast commands.

### clear ipv6 mroute

Clear learned multicast routes on the multicast forwarding table.

**Syntax** `clear ipv6 mroute [vrf vrf-name] {group-address [source-address] | *}`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address [source-address]** Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

**\*** Enter `*` to clear all multicast routes.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

#### Related Commands

- [show ip pim tib](#) — show the PIM tree information base.

## ipv6 multicast-routing

Enables IPv6 multicast forwarding.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 multicast-routing [vrf vrf-name]</code><br>To disable multicast forwarding, use the <code>no ipv6 multicast-routing [vrf vrf-name]</code> command. |
| <b>Defaults</b>        | Disabled.                                                                                                                                                     |
| <b>Parameters</b>      | <b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable IP multicast forwarding on that VRF.              |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |
|                        | <b>9.11.3.0</b> Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.                                     |

#### Usage Information

After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the `ip pim sparse-mode` command to enable IGMP and PIM on the interface.

#### Related Commands

- [ip pim sparse-mode](#) — enable IGMP and PIM on an interface.

## show ipv6 mroute

View the IPv6 multicast routing table.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show ipv6 mroute [vrf vrf-name] [static   group-address [source-address]   count]   summary   vlt [group-address [source-address]   count]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b> | <p><b>vrf vrf-name</b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.</p> <p> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.</p> <p><b>static</b> (OPTIONAL) Enter the keyword <code>static</code> to view static multicast routes.</p> <p><b>group-address [source-address]</b> (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.</p> <p><b>count</b> (OPTIONAL) Enter the keyword <code>count</code> to view the number of multicast routes and packets.</p> <p><b>summary</b> (OPTIONAL) Enter the keyword <code>summary</code> to view a summary of all routes.</p> <p><b>vlt</b> (OPTIONAL) Enter the keyword <code>vlt</code> to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter</p> |

the keyword `count` to display the total number of multicast routes with the spanned IIF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**9.11.3.0** Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.

**Example**

```
Dell# show ipv6 mroute

IP Multicast Routing Table

(*, ff0e:225:0:1::1), uptime 18:01:56
 Incoming interface: Null
 Outgoing interface list:
 Vlan 401
 Vlan 1001

(2001:120:3:1::11, ff0e:225:0:1::1), uptime 18:02:03
 Incoming interface: Vlan 401
 Outgoing interface list:
 Vlan 1001

(2001:130:3:1::11, ff0e:225:0:1::1), uptime 18:01:17
 Incoming interface: Vlan 1001
 Outgoing interface list:
 Vlan 401

(2001:140:3:1::11, ff0e:225:0:1::1), uptime 18:01:13
 Incoming interface: Vlan 1001
 Outgoing interface list:
 Vlan 401

Dell#
```

## show ipv6 multicast-cam

Display the content addressable memory (CAM) size and the portions allocated for IP multicast traffic.

**Syntax** `show ipv6 multicast-cam [linecard slot-id | port-set port-pipe | stack-unit unit-id]`

- Parameters**
- linecard *slot-id*** Enter the keyword `linecard` with a slot id to select the line card for which to gather information. The range of slot IDs is from 0 to 2.
  - port-set *port-pipe*** Enter the keyword `port-set` with a port-pipe number to select the port pipe for which to gather information. The range of port pipes is from 0 to 3.
  - stack-unit *unit-id*** Enter the keyword `stack-unit` with a unit-id number to select the stack unit for which to gather information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**9.11.3.0** Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON.

### Example

```
Dell# show ipv6 multicast-cam stack-unit 1 port-set 0

Group Address : ff0e::228:1:1
Source Address : 400::2
VRF : 1
VlanId : 4095
IPMC : 609
L2 Ports : -
L3 Ports : Te 1/10/1
```

## show ipv6 rpf

View reverse path forwarding.

**Syntax** show ipv6 rpf

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version         | Description                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| <b>9.11.3.0</b> | Introduced on the C9000, S3048-ON, S3100, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

**Usage Information** Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

 **NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

### Example

```
Dell# show ipv6 rpf
RPF information for 2001:120:3:1::11
RPF interface: V1 401
RPF neighbor: 0.0.0.0
RPF route/mask: 2001:120:3:1::/ffff:ffff:ffff:ffff::
RPF type: unicast
```

# Neighbor Discovery Protocol (NDP)

The neighbor discovery protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. NDP defines mechanisms for solving the following problems:

- Router discovery — hosts can locate routers residing on a link
- Prefix discovery — hosts can discover address prefixes for the link
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination
- Neighbor unreachability detection (NUD) — determine that a neighbor is no longer reachable on the link.
- Duplicate address detection (DAD) — allow a node to check whether a proposed address is already in use.
- Redirect — the router can inform a node about a better first-hop.

NDP uses the following five ICMPv6 packet types in its implementation:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

## Topics:

- [IPv6 Router Advertisement \(RA\) Guard](#)

## IPv6 Router Advertisement (RA) Guard

The IPv6 RA guard provides support to perform conditional forwarding or blocking of the router advertisement messages that are received at the network device platform. This functionality analyzes and filters the RAs sent by the devices and compares the configuration information on the layer 2 device with the RA frame. Once the layer 2 device validates the content of the RA frame against the configuration, it forwards the RA to its unicast or multicast destination. On failure to validate the RA frame content, the RA frame is dropped.

The IPv6 RA guard supports two different modes:

- Host mode — When a policy with device role as host is applied on an interface, all the RA packets are dropped without validation. You can also configure the host mode policy with VLAN option to drop the RA packets on that specific VLAN and port.
- Router mode — When a policy with device role as router is applied on an interface, all the RA packets are validated based on the configuration information in the policy. Similarly, you can also apply this mode over any specific VLAN and the validation is performed only for that particular VLAN RA packets.

To configure the IPv6 RA guard, use the following Dell EMC Networking OS commands.

### clear ipv6 neighbors

Delete all entries in the IPv6 neighbor discovery cache or neighbors of a specific interface. Static entries are not removed using this command.

**Syntax**                    `clear ipv6 neighbors [vrf vrf-name] [ipv6-address | interface]`

|                   |                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf <i>vrf-name</i></b>        | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to clear the neighbor corresponding to that VRF.<br><b>i</b> <b>NOTE:</b> If you do not specify this option, the neighbors in the default VRF are cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>ipv6-address</b>               | Enter the IPv6 address of the neighbor in the <code>x:x:x::x</code> format to remove a specific IPv6 neighbor.<br><b>i</b> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>interface <i>interface</i></b> | To remove all neighbor entries learned on a specific interface, enter the keyword <code>interface</code> then the interface type and slot/port or number information of the interface: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

## debug ipv6 nd ra-guard

Enable debugging for IPv6 RA guard snooping information.

**Syntax** `debug ipv6 nd ra-guard [interface_type slot/port | count value]`

- Parameters**
- interface\_type slot/port*** Enter the one of the following interfaces and slot/port information:
- For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**count value** Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534. The default is infinity.

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                  |
|-------------------|------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>  | Introduced on the C9010.                                                     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                    |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                     |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                  |
| <b>9.9(0.0)</b>   | Introduced on the Z9500.                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                              |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

## device-role

Specify the role of the device attached to the port.

**Syntax** `device-role {host | router}`

To reset the device role, use the `no device-role {host | router}` command.

**Parameters**

|               |                                                                         |
|---------------|-------------------------------------------------------------------------|
| <b>host</b>   | Enter the keyword <code>host</code> to set the device-role as host.     |
| <b>router</b> | Enter the keyword <code>router</code> to set the device-role as router. |

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                  |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

#### Related Commands

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.

## ipv6 nd ra-guard attach-policy

Apply the IPv6 RA guard to a specific interface.

|               |                                                                                              |
|---------------|----------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ipv6 nd ra-guard attach-policy policy-name [vlan [vlan 1, vlan 2, vlan 3.....]]</code> |
|---------------|----------------------------------------------------------------------------------------------|

|                   |                                                  |                                                                                                                        |
|-------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>policy <i>policy-name</i></b>                 | Enter the keyword <code>policy</code> then the policy name. The policy-name allows a maximum of <b>140</b> characters. |
|                   | <b>vlan [<i>vlan 1, vlan 2, vlan 3.....</i>]</b> | Enter the keyword <code>vlan</code> then the VLAN range. The VLAN range is from 1 to 4094.                             |

**Defaults** None

|-------------------|------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>  | Introduced on the C9010.                                                     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                    |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                     |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                  |
| <b>9.9(0.0)</b>   | Introduced on the Z9500.                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                              |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.

## ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

**Syntax** `ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} {hardware_address}`

To remove a static IPv6 entry from the IPv6 neighbor discovery, use the `no ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface}` command.

**Parameters**

|                            |                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>vrf <i>vrf-name</i></b> | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF. |
| <b><i>ipv6-address</i></b> | Enter the IPv6 address of the neighbor in the x:x:x:x format.                                                     |

 **NOTE:** The :: notation specifies successive hexadecimal fields of zero.

**interface**  
*interface*

Enter the keyword `interface` then the interface type and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

**hardware\_addresses** Enter a 48-bit hardware MAC address in nn:nn:nn:nn:nn:nn format.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                 |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |

| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                           |
| <b>8.3.7.1</b>    | Introduced on the S4810.                           |

**Usage Information**

Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link.
- Prefix discovery: Hosts can discover address prefixes for the link.
- Parameter discovery .
- Address autoconfiguration — configuration of addresses for an interface .
- Address resolution — mapping from IP address to link-layer address.
- Next-hop determination.
- Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link.

- Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

Use the `ipv6 neighbor` command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

## managed-config-flag

Set the managed address configuration flag.

**Syntax** `managed-config-flag {on | off}`

To clear the flag, use the `no managed-config-flag {on | off}` command.

**Parameters**

- on** Enter the keyword `on` to set the managed-config-flag value as ON.
- off** Enter the keyword `off` to set the managed-config flag value as OFF.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                        |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## match ra

Enable verifying either of the configured source IPv6 address or prefix address or the source MAC address in the inspected messages. If this command is not configured, the verification process is bypassed.

**Syntax** `match ra {ipv6-access-list name | ipv6-prefix-list name | mac-access-list name}`

To reset the access list, use the `no match ra {ipv6-access-list | ipv6-prefix-list | mac-access-list}` command.

**Parameters**

- ipv6-access-list name** Enter the keywords `ipv6-access-list` then the access-list name. The access-list name allows a maximum of **140** characters.

- ipv6-prefix-list *name*** Enter the keywords `ipv6-prefix-list` then the prefix-list name. The prefix-list name allows a maximum of **140** characters.
- ipv6-mac-access-list *name*** Enter the keywords `ipv6-mac-access-list` then the mac-access-list name. The mac-access-list name allows a maximum of **140** characters.

**Defaults** None

## match ra

Enable verifying either of the configured source IPv6 address or prefix address or the source MAC address in the inspected messages. If this command is not configured, the verification process is bypassed.

**Syntax** `match ra {ipv6-access-list name | ipv6-prefix-list name | mac-access-list name}`

To reset the access list, use the `no match ra{ipv6-access-list | ipv6-prefix-list | mac-access-list}` command.

- Parameters**
- ipv6-access-list *name*** Enter the keywords `ipv6-access-list` then the access-list name. The access-list name allows a maximum of **140** characters.
  - ipv6-prefix-list *name*** Enter the keywords `ipv6-prefix-list` then the prefix-list name. The prefix-list name allows a maximum of **140** characters.
  - ipv6-mac-access-list *name*** Enter the keywords `ipv6-mac-access-list` then the mac-access-list name. The mac-access-list name allows a maximum of **140** characters.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                        |
|------------|--------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                           |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                          |
| 9.10(0.0)  | Introduced on the S3148.                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                        |
| 9.9(0.0)   | Introduced on the Z9500.                                           |
| 9.8(2.0)   | Introduced on the S3100 series.                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                        |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.

## mtu

Enable the verification of the configured maximum transmission unit (MTU) value in the received RA packets.

**Syntax** `mtu value`  
 To reset the MTU value, use the `no mtu value` command.

**Parameters** `value` Enter the maximum transmission unit value in bytes. The range is from 1,280 to 11,982 bytes.

**Defaults** 0

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                        |
|------------|--------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                           |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                          |
| 9.10(0.0)  | Introduced on the S3148.                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                        |
| 9.9(0.0)   | Introduced on the Z9500.                                           |
| 9.8(2.0)   | Introduced on the S3100 series.                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                        |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd rguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.

## other-config-flag

Enable the verification of the advertised other configuration parameter. If this command is not configured, the verification process is bypassed.

**Syntax** `other-config-flag {on | off}`

To reset the other configuration parameter, use the `no other-config-flag {on | off}` command.

**Parameters**

**on** Enter the keyword `on` to set the other-config-flag value as ON.

**off** Enter the keyword `off` to set the other-config flag value as OFF.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                        |
|------------|--------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                           |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                          |
| 9.10(0.0)  | Introduced on the S3148.                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                        |
| 9.9(0.0)   | Introduced on the Z9500.                                           |
| 9.8(2.0)   | Introduced on the S3100 series.                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                        |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd rguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## reachable-time

Enable the verification of the configured reachability time in the received RA packets.

**Syntax** `reachable-time value`

To reset the advertised reachability time, use the `no reachable-time value` command.

**Parameters**

**value** Enter the advertised reachability time in milliseconds. The range is from 0 to 3,600,000 milliseconds.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                  |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.

## retrans-time

Enable the verification of the configured retransmission timer value in the received RA packets.

**Syntax** `retrans-timer value`  
To reset the advertised retransmission interval, use the `no retrans-timer value` command.

**Parameters** **value** Enter the advertised retransmission time interval in milliseconds. The range is from 100 to 4,294,967,295 milliseconds.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                  |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.9(0.0)   | Introduced on the Z9500.                  |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                                                                  |
|----------|------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

[ipv6 nd raguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

[ipv6 nd ra-guard enable](#) — configure the RA guard related commands.

## router-lifetime

Set the router lifetime.

**Syntax** `router-lifetime value`

**Parameters** **value** Enter the router lifetime in seconds. The range is from 0 to 9,000 seconds.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                  |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## router-preference maximum

Enable the verification of the advertised default router preference (DRP) value. The preference value is lower than or equal to the specified limit. If this command is not configured, the verification process is bypassed.

**Syntax** `router-preference maximum {high | low | medium}`

To reset the default router preference value, use the `no router-preference maximum {high | low | medium}` command.

**Parameters**

**high** Enter the keyword `high` to set the DRP value as high.

**low** Enter the keyword `low` to set the DRP value as low.

**medium** Enter the keyword `medium` to set the DRP value as medium.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                  |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## show config

Display the RA guard policy mode configurations.

**Syntax** `show config`

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                  |
|------------|------------------------------------------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                                                     |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                    |
| 9.10(0.0)  | Introduced on the S3148.                                                     |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                  |
| 9.9(0.0)   | Introduced on the Z9500.                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                              |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

## Example

```
DellEMC(conf)# ipv6 nd ra-guard policy test
DellEMC(conf-ra_guard_policy_list)#show config
!
ipv6 nd ra-guard policy test
 device-role router
 hop-limit maximum 251
 mtu 1350
 other-config-flag on
 reachable-time 540
 retrans-timer 101
 router-preference maximum medium
 trusted-port
DellEMC(conf-ra_guard_policy_list)#
```

## Related Commands

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) — define the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) — specify the role of the device attached to the port.
- [hop-limit](#) — enable the verification of the advertised hop count limit.
- [mtu](#) — set the maximum transmission unit (MTU) value.
- [other-config-flag](#) — enable the verification of the advertised other configuration parameter.
- [reachable-time](#) — set the advertised reachability time.
- [retrans-timer](#) — set the advertised retransmission time.
- [router-preference maximum](#) — enable the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) — apply the policy to trusted ports.

## show ipv6 nd ra-guard policy

Display the configurations applied on all the RA guard policies or a specific RA guard policy.

**Syntax** `show ipv6 nd ra-guard policy policy-name`

**Parameter** **policy *policy-name*** Enter the keyword `policy` then the policy name. The policy name allows a maximum of **140** characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.11(0.0)  | Introduced on the C9010.                  |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.9(0.0)   | Introduced on the Z9500.                  |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                                                                                    |
|----------|------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, Introduced on the S6000-ON, and Z9000 switches. |

### Example

```
DellEMC# show ipv6 nd ra-guard policy test

ipv6 nd ra-guard policy test
 device-role router
 hop-limit maximum 1
 match ra ipv6-access-list access
 other-config-flag on
 router-preference maximum medium
 trusted-port
 Interfaces :
 Te 1/1/1
DellEMC#
```

```
DellEMC# show ipv6 nd ra-guard policy test

ipv6 nd ra-guard policy test
 device-role router
 hop-limit maximum 1
 match ra ipv6-access-list access
 other-config-flag on
 router-preference maximum medium
 trusted-port
 Interfaces :
 Te 1/1/1
DellEMC#
```

### Related Commands

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) — define the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) — specify the role of the device attached to the port.
- [hop-limit](#) — enable the verification of the advertised hop count limit.
- [mtu](#) — set the maximum transmission unit (MTU) value.
- [other-config-flag](#) — enable the verification of the advertised other configuration parameter.
- [reachable-time](#) — set the advertised reachability time.
- [retrans-timer](#) — set the advertised retransmission time.
- [router-preference maximum](#) — enable the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) — apply the policy to trusted ports.
- [ipv6 nd raguard attach-policy](#) — apply the IPv6 RA guard to a specific interface.

## show ipv6 neighbors

Display IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

**Syntax** `show ipv6 neighbors [vrf vrf-name] [ipv6-address| interface interface]`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword vrf and the name of the VRF to display the neighbors corresponding to that VRF.

**NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

**ipv6-address**

Enter the IPv6 address of the neighbor in the x:x:x:x format.

**NOTE:** The :: notation specifies successive hexadecimal fields of zero.

**interface**  
**interface**

Enter the keyword `interface` then the interface type and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Management interface, enter the keyword `managementethernet` followed by slot/port numbers.
- For a Port Channel interface, enter the keywords `port-channel` followed by a number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** None

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.                           |
| 9.0.0.0    | Introduced on the Z9000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.3.7.1    | Introduced on the S4810.                           |

**Example**

```
DellEMC# show ipv6 neighbors

400::1 0.60 00:01:e8:17:5c:ae REACH Te 1/2/1 V1 100 CP
DellEMC#
```

## trusted-port

Allow bypassing the configured RA guard validation and forwards the RA packets received on the interface, which has the trusted port policy attached.

**Syntax** `trusted-port`

To reset the policy applied to the trusted port, use the `no trusted-port` command.

**Defaults** None

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|-------------------|------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>  | Introduced on the C9010.                                                     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                    |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                     |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                  |
| <b>9.9(0.0)</b>   | Introduced on the Z9500.                                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                              |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                  |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                  |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                  |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches. |

**Usage Information** Use this command to disable all the RA guard policies.

**Related Commands**

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

# Object Tracking

Object Tracking supports IPv4 and IPv6, and is available on the Dell EMC Networking platforms.

Object tracking allows you to define objects of interest, monitor their state, and report to a client when a change in an object's state occurs. The following tracked objects are supported:

- Link status of Layer 2 interfaces
- Routing status of Layer 3 interfaces (IPv4 and IPv6)
- Reachability of IPv4 and IPv6 routes
- Metric thresholds of IPv4 and IPv6 routes

You can configure client applications, such virtual router redundancy protocol (VRRP), to receive a notification when the state of a tracked object changes.

## Topics:

- [IPv4 Object Tracking Commands](#)
- [IPv6 Object Tracking Commands](#)

## IPv4 Object Tracking Commands

The following section describes the IPv4 VRRP commands.

### debug track

Enables debugging for tracked objects.

|                        |                                                                                                                                                               |                                                                                                          |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>debug track [all   notifications   <i>object-id</i>]</code>                                                                                             |                                                                                                          |
| <b>Parameters</b>      | <b>all</b>                                                                                                                                                    | Enables debugging on the state and notifications of all tracked objects.                                 |
|                        | <b>notifications</b>                                                                                                                                          | Enables debugging on the notifications of all tracked objects.                                           |
|                        | <b><i>object-id</i></b>                                                                                                                                       | Enables debugging on the state and notifications of the specified tracked object. The range is 1 to 500. |
| <b>Defaults</b>        | Enable debugging on the state and notifications of all tracked objects ( <code>debug track all</code> ).                                                      |                                                                                                          |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>                                                                            |                                                                                                          |

|                        | <b>Version</b>                                                                                                                                                | <b>Description</b>                                                                                       |
|                        | <b>9.10(0.1)</b>                                                                                                                                              | Introduced on the S6010-ON and S4048T-ON.                                                                |
|                        | <b>9.10(0.0)</b>                                                                                                                                              | Introduced on the S3148.                                                                                 |
|                        | <b>9.10(0.0)</b>                                                                                                                                              | Introduced on the S6100-ON.                                                                              |
|                        | <b>9.8(2.0)</b>                                                                                                                                               | Introduced on the S3100 series.                                                                          |
|                        | <b>9.8(1.0)</b>                                                                                                                                               | Introduced on the Z9100-ON.                                                                              |
|                        | <b>9.8(0.0P5)</b>                                                                                                                                             | Introduced on the S4048-ON.                                                                              |
|                        | <b>9.8(0.0P2)</b>                                                                                                                                             | Introduced on the S3048-ON.                                                                              |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

### Example

```
DellEMC# debug track all

04:35:04: %RPM0-P:RP2 %OTM-5-STATE: track 6 - Interface
TenGigabitEthernet 1/2/1
line-protocol DOWN

04:35:04: %RPM0-P:RP2 %OTM-5-NOTIF: VRRP notification: resource ID 6 DOWN
```

## delay

Configure the time delay used before communicating a change in the status of a tracked object to clients.

**Syntax** `delay {[up seconds] [down seconds]}`

To return to the default setting, use the `no delay` command.

**Parameters** ***seconds*** Enter the number of seconds the object tracker waits before sending a notification about the change in the UP and/or DOWN state of a tracked object to clients. The range is 0 to 180. The default is **0 seconds**.

**Defaults** **0 seconds**

**Command Modes** OBJECT TRACKING (*conf\_track\_object-id*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

### Usage Information

You can configure an UP and/or DOWN timer for each tracked object to set the time delay before a change in the state of a tracked object is communicated to clients. The configured time delay starts when the state changes from UP to DOWN or vice-versa.

If the state of an object changes back to its former UP/DOWN state before the timer expires, the timer is cancelled and the client is not notified. For example, if the DOWN timer is running when an interface goes down and comes back up, the DOWN timer is cancelled and the client is not notified of the event.

If the timer expires and an object's state has changed, a notification is sent to the client. If no delay is configured, a notification is sent immediately after a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

#### Related Commands

- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configure object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configure object tracking on the reachability of an IPv4 route.

## description

Enter a description of a tracked object.

#### Syntax

```
description {text}
```

To remove the description, use the `no description {text}` command.

#### Parameters

**text**

Enter a description to identify a tracked object (80 characters maximum).

#### Defaults

None

#### Command Modes

OBJECT TRACKING (*conf\_track\_object-id*)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |

| <b>8.4.1.0</b>    | Introduced.                               |

#### Related Commands

- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configure object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configure object tracking on the reachability of a specific IP address. Policy-based Routing uses the track command to track the next-hop ip address.

## show running-config track

Display the current configuration of tracked objects.

#### Syntax

```
show running-config track [object-id]
```

**Parameters** *object-id* (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

#### Example

```
DellEMC# show running-config track

track 1 ip route 23.0.0.0/8 reachability

track 2 ipv6 route 2040::/64 metric threshold
delay down 3
delay up 5
threshold metric up 200

track 3 ipv6 route 2050::/64 reachability

track 4 interface TenGigabitEthernet 1/2/1 ip routing

track 5 ip route 192.168.0.0/24 reachability vrf red

track resolution ip route isis 20
track resolution ip route ospf 10
```

#### Example (Object-id)

```
DellEMC# show running-config track 300

track 300 ip route 10.0.0.0/8 metric threshold
delay down 3
delay up 5
threshold metric up 100
```

#### Related Commands

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configure object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configure object tracking on the reachability of an IPv4 route.

# show track

Display information about tracked objects, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

**Syntax** `show track [object-id [brief] | interface [brief] [vrf vrf-name] | ip route [brief] [vrf vrf-name] | resolution | vrf vrf-name [brief] | brief]`

|                   |                     |                                                                                                                                                                                                                                                    |
|-------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>object-id</b>    | (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.                                                                                                                                                             |
|                   | <b>interface</b>    | (OPTIONAL) Display information on all tracked interfaces (Layer 2 and IPv4 Layer 3).                                                                                                                                                               |
|                   | <b>ip route</b>     | (OPTIONAL) Display information on all tracked IPv4 routes.                                                                                                                                                                                         |
|                   | <b>resolution</b>   | (OPTIONAL) Display information on the configured resolution values used to scale protocol-specific route metrics. The range is 0 to 255.                                                                                                           |
|                   | <b>brief</b>        | (OPTIONAL) Display a single line summary of the tracking information for a specified object, object type, or all tracked objects.                                                                                                                  |
|                   | <b>vrf vrf-name</b> | (OPTIONAL) E-Series only: Display information on only the tracked objects that are members of the specified VRF instance. The maximum is 32 characters. If you do not enter a VRF name, information on the tracked objects from all VRFs displays. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

**Usage Information** The following describes the `show track` command shown in the Example below.

| Output                                                                        | Description                                                                                                                           |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Track object-id</b>                                                        | Displays the number of the tracked object.                                                                                            |
| <b>Interface type slot/port, IP route ip-address, IPv6 route ipv6-address</b> | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.                             |
| <b>object is Up/Down</b>                                                      | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.                        |
| <b>number changes, last change time</b>                                       | Number of times that the state of the tracked object has changed and the time since the last change in <i>hours:minutes:seconds</i> . |

| Output                     | Description                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------|
| <b>First hop interface</b> | Displays the type and slot/port number of the first-hop interface of the tracked route. |
| <b>Tracked by</b>          | Client that is tracking an object's state; for example, VRRP.                           |

### Example

```
DelleMC# show track

Track 1
 IP route 23.0.0.0/8 reachability
 Reachability is Down (route not in route table)
 2 changes, last change 00:16:08
 Tracked by:

Track 2
 IPv6 route 2040::/64 metric threshold
 Metric threshold is Up (STATIC/0/0)
 5 changes, last change 00:02:16
 Metric threshold down 255 up 254
 First-hop interface is TenGigabitEthernet 1/2/1
 Tracked by:
 VRRP TenGigabitEthernet 2/3/4 IPv6 VRID 1

Track 3
 IPv6 route 2050::/64 reachability
 Reachability is Up (STATIC)
 5 changes, last change 00:02:16
 First-hop interface is TenGigabitEthernet 1/2/1
 Tracked by:
 VRRP TenGigabitEthernet 2/3/4 IPv6 VRID 1
```

### Usage Information

The following describes the `show track brief` command shown in the Example below.

| Output             | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <b>ResID</b>       | Number of the tracked object.                                  |
| <b>Resource</b>    | Type of tracked object.                                        |
| <b>Parameter</b>   | Detailed description of the tracked object.                    |
| <b>State</b>       | Up or Down state of the tracked object.                        |
| <b>Last Change</b> | Time since the last change in the state of the tracked object. |

### Example (Brief)

```
DelleMC> show track brief
ResID Resource Parameter State LastChange
 1 IP route reachability 10.16.0.0/16 Up 00:01:08
 2 Interface line-protocol Ethernet0/2 Down 00:05:00
 3 Interface ip routing VLAN100 Up 01:10:05
```

### Related Commands

- [show running-config track](#) – display configuration information about tracked objects.
- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configure object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configure object tracking on the reachability of an IPv4 route.

## threshold metric

Configure the metric threshold used to determine the UP and/or DOWN state of a tracked IPv4 or IPv6 route.

**Syntax**            `threshold metric {up number | down number}`

To return to the default setting, use the `no threshold metric {up number | down number}` command.

## Parameters

- up number** Enter a number for the UP threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default UP threshold is **254**. The routing state is UP if the scaled route metric is less than or equal to the UP threshold.
- down number** Enter a number for the DOWN threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default DOWN threshold is **255**. The routing state is DOWN if the scaled route metric is greater than or equal to the DOWN threshold.

## Defaults

None

**Command Modes** OBJECT TRACKING (`conf_track_object-id`)

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.4.1.0</b>    | Introduced.                               |

## Usage Information

Use this command to configure the UP and/or DOWN threshold for the scaled metric of a tracked IPv4 or IPv6 route.

Determine the UP/DOWN state of a tracked route by the threshold for the current value of the route metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value.

The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

Configure the UP and DOWN thresholds for each tracked route with the `threshold metric` command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

The tracking process uses a protocol-specific resolution value to convert the actual metric in the routing table to a scaled metric in the range 0 to 255. You can configure the resolution value used to scale route metrics for supported protocols with the `track resolution ip route` and `track resolution ipv6 route` commands.

## Related Commands

- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.
- [track resolution ip route](#) – configure the protocol-specific resolution value used to scale an IPv4 route metric.

# track interface ip routing

Configure object tracking on the routing status of an IPv4 Layer 3 interface.

**Syntax** `track object-id interface interface ip routing`

To return to the default setting, use the `no track object-id` command.

**Parameters**

- object-id** Enter the ID number of the tracked object. The range is 1 to 500.
- interface** Enter one of the following values:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** None

| 9.8(1.0)   | Introduced on the Z9100-ON.                                                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                  |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                  |
| 9.7(0.0)   | Introduced on the S6000-ON. Added support for <code>tunnel</code> interface. |
| 8.3.12.0   | Introduced on the S4810.                                                     |
| 8.4.1.0    | Introduced.                                                                  |

**Usage Information**

Use this command to create an object that tracks the routing state of an IPv4 Layer 2 interface:

- The status of the IPv4 interface is UP only if the Layer 2 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv4 interface goes DOWN when its Layer 2 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

**Related Commands**

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface line-protocol](#) – configure object tracking on the line-protocol state of a Layer 2 interface.

## track interface line-protocol

Configure object tracking on the line-protocol state of a Layer 2 interface.

**Syntax** `track object-id interface interface line-protocol`

To return to the default setting, use the `no track object-id` command.

**Parameters**

- object-id** Enter the ID number of the tracked object. The range is 1 to 500.
- interface** Enter one of the following values:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

**Usage Information**

Use this command to create an object that tracks the line-protocol state of a Layer 2 interface by monitoring its operational status (UP or DOWN).

When the link-level status goes down, the tracked object status is considered to be DOWN; if the link-level status is up, the tracked object status is considered to be UP.

**Related Commands**

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.

## track ip route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

**Syntax** `track object-id ip route ip-address/prefix-len metric threshold [vrf vrf-name]`

To return to the default setting, use the `no track object-id` command.

#### Parameters

|                                          |                                                                                                                                                                  |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>                  | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                |
| <b><i>ip-address/<br/>prefix-len</i></b> | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.                                                                |
| <b><i>vrf vrf-name</i></b>               | (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs. |

| <b>8.4.1.0</b>    | Introduced.                               |

#### Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv4 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv4 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

#### Related Commands

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [threshold metric](#) – configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track resolution ip route](#) – configure the protocol-specific resolution value used to scale an IPv4 route metric.

# track ip route reachability

Configure object tracking on the reachability of an IPv4 route.

**Syntax** `track object-id ip route ip-address/prefix-len reachability [vrf vrf-name]`  
To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                   |                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>object-id</b>                  | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                |
| <b>ip-address/<br/>prefix-len</b> | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.                                                                |
| <b>vrf vrf-name</b>               | (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs. |

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |

| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

**Usage Information** Use this command to create an object that tracks the reachability of an IPv4 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure IPv4 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

**Related Commands**

- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.

## track reachability refresh

Change the refresh interval for tracking the reachability of the next-hop. If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to check if the next-hop address is reachable after a certain refresh interval before considering the route DOWN.

|                        |                                                                                                                                                               |                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>track reachability refresh <i>interval</i></code>                                                                                                       |                                                                                                                                 |
| <b>Parameters</b>      | <b><i>interval</i></b>                                                                                                                                        | Enter the refresh interval, in seconds, for object tracking reachability. The range is from 0 to 60 seconds. The default is 60. |
| <b>Defaults</b>        | Enabled                                                                                                                                                       |                                                                                                                                 |

## track resolution ip route

Configure the protocol-specific resolution value used to scale an IPv4 route metric.

|                      |                                                                                                                                                                                                   |                                                                                                          |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>track resolution ip route {isis <i>resolution-value</i>   ospf <i>resolution-value</i>}</code><br>To return to the default setting, use the <code>no track <i>object-id</i></code> command. |                                                                                                          |
| <b>Parameters</b>    | <b><i>object-id</i></b>                                                                                                                                                                           | Enter the ID number of the tracked object. The range is 1 to 500.                                        |
|                      | <b><i>isis resolution-value</i></b>                                                                                                                                                               | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
|                      | <b><i>ospf resolution-value</i></b>                                                                                                                                                               | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |
| <b>Defaults</b>      | None                                                                                                                                                                                              |                                                                                                          |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                                                                                     |                                                                                                          |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>8.3.12.0</b>   | Introduced on the S4810.                  |
| <b>8.4.1.0</b>    | Introduced.                               |

## Usage Information

Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv4 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv4 route is determined by a user-configurable threshold (the `threshold metric` command) for the route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is **10**.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is **1**.
- The resolution value used to map static routes is not configurable. By default, Dell EMC Networking OS assigns a metric of **0** to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

## Related Commands

- [threshold metric](#) – configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ip route metric threshold](#) – configure object tracking on the threshold of an IPv4 route metric.

# IPv6 Object Tracking Commands

The following section describes the IPv6 object tracking commands.

The following object tracking commands apply to IPv4 and IPv6:

- [debug track](#)
- [delay](#)
- [description](#)
- [show running-config track](#)
- [threshold metric](#)
- [track interface line-protocol](#)

# show track ipv6 route

Display information about all tracked IPv6 routes, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

- Syntax** `show track ipv6 route [brief]`
- Parameters** **brief** (OPTIONAL) Display a single line summary of information for tracked IPv6 routes.
- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

**Usage Information** The following describes the `show track ipv6 route` command shown in the Example below.

| Output                                                                               | Description                                                                                                                           |
|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Track <i>object-id</i></b>                                                        | Displays the number of the tracked object.                                                                                            |
| <b>Interface <i>type slot/port, IP route ip-address, IPv6 route ipv6-address</i></b> | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.                             |
| <b><i>object is Up/Down</i></b>                                                      | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.                        |
| <b><i>number changes, last change time</i></b>                                       | Number of times that the state of the tracked object has changed and the time since the last change in <i>hours:minutes:seconds</i> . |
| <b>First hop interface</b>                                                           | Displays the type and slot/port number of the first-hop interface of the tracked route.                                               |
| <b>Tracked by</b>                                                                    | Client that is tracking an object's state; for example, VRRP.                                                                         |

## Example

```
DelleMC# show track ipv6 route

Track 2
 IPv6 route 2040::/64 metric threshold
 Metric threshold is Up (STATIC/0/0)
 5 changes, last change 00:02:30
 Metric threshold down 255 up 254
 First-hop interface is TenGigabitEthernet 1/2/1
 Tracked by:
 VRRP TenGigabitEthernet 2/4/1 IPv6 VRID 1
```

```
Track 3
IPv6 route 2050::/64 reachability
Reachability is Up (STATIC)
 5 changes, last change 00:02:30
First-hop interface is TenGigabitEthernet 1/2/1
Tracked by:
 VRRP TenGigabitEthernet 2/4/1 IPv6 VRID 1
```

**Usage Command** The following describes the show track ipv6 route brief command shown in the Example below.

| Output             | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <b>ResID</b>       | Number of the tracked object.                                  |
| <b>Resource</b>    | Type of tracked object.                                        |
| <b>Parameter</b>   | Detailed description of the tracked object.                    |
| <b>State</b>       | Up or Down state of the tracked object.                        |
| <b>Last Change</b> | Time since the last change in the state of the tracked object. |

#### Example (Brief)

```
DelleMC# show track ipv6 route brief

ResId Resource Parameter State LastChange
 2 IPv6 route metric threshold 2040::/64 Up 00:02:36
 3 IPv6 route reachability 2050::/64 Up 00:02:36
```

#### Related Commands

- [show running-config track](#) – display configuration information about tracked objects.
- [show track](#) – display information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ipv6 routing](#) – configure object tracking on the routing status of an IPv6 Layer 3 interface.
- [track ipv6 route metric threshold](#) – configure object tracking on the threshold of an IPv6 route metric.
- [track ipv6 route reachability](#) – configure object tracking on the reachability of an IPv6 route.

## track interface ipv6 routing

Configure object tracking on the routing status of an IPv6 Layer 3 interface.

**Syntax** `track object-id interface interface ipv6 routing`

To return to the default setting, use the `no track object-id` command.

#### Parameters

***object-id*** Enter the ID number of the tracked object. The range is 1 to 500.

***interface*** Enter one of the following values:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a tunnel interface, enter the keyword `tunnel`.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** None

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 8.3.12.0   | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced.                               |

## Usage Information

Use this command to create an object that tracks the routing state of an IPv6 Layer 3 interface:

- The status of the IPv6 interface is UP only if the Layer 2 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv6 interface goes DOWN when its Layer 2 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

## Related Commands

- [show track ipv6 route](#) – display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- [track interface ip routing](#) – configure object tracking on the routing status of an IPv4 Layer 3 interface.

# track ipv6 route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

**Syntax** `track object-id ipv6 route ipv6-address/prefix-len metric threshold`

To return to the default setting, use the `no track object-id` command.

## Parameters

|                                     |                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------|
| <b>object-id</b>                    | Enter the ID number of the tracked object. The range is 1 to 500.                            |
| <b>ipv6-address/<br/>prefix-len</b> | Enter an IPv6 address in X:X:X:X format. The valid IPv6 prefix lengths are from /0 to / 128. |

**Defaults** None

### Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv6 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv6 route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv6 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked IPv6 route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

### Related Commands

- [show track ipv6 route](#) – display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- [threshold metric](#) – configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track resolution ipv6 route](#) – configure the protocol-specific resolution value used to scale an IPv6 route metric.

## track ipv6 route reachability

Configure object tracking on the reachability of an IPv6 route.

**Syntax** `track object-id ipv6 route ip-address/prefix-len reachability`

To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                       |                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>               | Enter the ID number of the tracked object. The range is 1 to 500.                            |
| <b><i>ipv6-address/prefix-len</i></b> | Enter an IPv6 address in X:X:X:X format. The valid IPv6 prefix lengths are from /0 to / 128. |

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                     |
|------------|---------------------------------|
| 9.10(0.0)  | Introduced on the S3148.        |
| 9.10(0.0)  | Introduced on the S6100-ON.     |
| 9.8(2.0)   | Introduced on the S3100 series. |

| 8.4.1.0    | Introduced.                     |

### Usage Information

Use this command to create an object that tracks the reachability of an IPv6 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the tracked route is considered to be DOWN.

When you configure IPv6 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

### Related Commands

- [show track ipv6 route](#) – display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- [track ipv6 route reachability](#) – configure object tracking on the reachability of an IPv4 route.

## track resolution ipv6 route

Configure the protocol-specific resolution value used to scale an IPv6 route metric.

**Syntax** `track resolution ipv6 route {isis resolution-value | ospf resolution-value}`  
To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                     |                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b>             | Enter the ID number of the tracked object. Use the range to 1 to 500.                                    |
| <b><i>isis resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
| <b><i>ospf resolution-value</i></b> | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version    | Description                     |
|------------|---------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 8.3.12.0   | Introduced on the S4810.        |
| 8.4.1.0    | Introduced.                     |

### Usage Information

Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv6 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv6 route is determined by the user-configurable threshold (the `threshold metric` command) for a route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
- The resolution value used to map static routes is not configurable. By default, Dell EMC Networking OS assigns a metric of 0 to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

### Related Commands

- [threshold metric](#) – configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ipv6 route metric threshold](#) – configure object tracking on the threshold of an IPv6 route metric.

# Open Shortest Path First (OSPFv2 and OSPFv3)

Open Shortest Path First version 2 for IPv4 is supported on platform.

OSPF is an interior gateway protocol (IGP), which means that it distributes routing information between routers in a single autonomous system (AS). OSPF is also a link-state protocol in which all routers contain forwarding tables derived from information about their links to their neighbors.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) are the same for OSPFv2 and OSPFv3. OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis.

The Dell EMC Networking OS versions 9.4(0.0) and 9.7(0.0) introduce support for VRF on OSPFv2 and OSPFv3 respectively. The multi-process OSPF feature supported on Dell EMC Networking OS version 7.8.1.0 is modified. In earlier versions, multiple OSPF processes were created without VRF (prior to 9.4(0.0)). In the Dell EMC Networking OS versions 9.4(0.0) and 9.7(0.0) (for OSPFv3), multiple OSPF processes can be created on a router, but with only one OSPF process per VRF. However, there can be one OSPFv2 and one OSPFv3 on the same VRF.

This section is divided into two sections. There is no overlap between the two sets of commands. You cannot use an OSPFv2 command in the IPv6 OSPFv3 mode. OSPFv2 is supported on IPv4 tunnels only and OSPFv3 is supported on IPv6 tunnels only.

## Topics:

- [OSPFv2 Commands](#)
- [OSPFv3 Commands](#)

## OSPFv2 Commands

The Dell EMC Networking implementation of OSPFv2 is based on IETF RFC 2328. .

### area default-cost

Set the metric for the summary default route the area border router (ABR) generates into the stub area. Use this command on the border routers at the edge of a stub area.

### S6000-ON

|                        |                                                                                                                                                               |                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>area <i>area-id</i> default-cost <i>cost</i></code>                                                                                                     |                                                                                                     |
|                        | To return default values, use the <code>no area <i>area-id</i> default-cost</code> command.                                                                   |                                                                                                     |
| <b>Parameters</b>      | <b><i>area-id</i></b>                                                                                                                                         | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535. |
|                        | <b><i>cost</i></b>                                                                                                                                            | Specifies the stub area's advertised external route metric. The range is from zero (0) to 65535.    |
| <b>Defaults</b>        | <code>cost = 1</code> ; no areas are configured.                                                                                                              |                                                                                                     |

| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Usage Information

In the Dell EMC Networking operating software (OS), `cost` is defined as reference bandwidth/bandwidth.

#### Related Commands

- [area stub](#) — create a stub area.

## area nssa

Specify an area as a not so stubby area (NSSA).

#### Syntax

```
area area-id nssa [default-information-originate] [no-redistribution] [no-summary]
```

To delete an NSSA, use the `no area area-id nssa` command.

#### Parameters

|                                      |                                                                                                                                                                                                                              |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>area-id</b>                       | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.                                                                                                                          |
| <b>no-redistribution</b>             | (OPTIONAL) Specify that the <code>redistribute</code> command does not distribute routes into the NSSA. This command can be used when the router is an autonomous system boundary router (ASBR) or area border router (ABR). |
| <b>default-information-originate</b> | (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.                                                                                                                         |
| <b>no-summary</b>                    | (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.                                                                                                                                                        |

#### Defaults

Not configured.

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|                        | 9.10(0.1)                                                                                                                                                     | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                               |

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information**

Only the routes within an area are summarized, and that summary is advertised to other areas by the ABR. External routes are not summarized.

**Related Commands**

- [area stub](#) — create a stub area.
- [router ospf](#) — enter ROUTER OSPF mode to configure an OSPF instance.

## area stub

Configure a stub area, which is an area not connected to other areas.

### S6000-ON

**Syntax**

`area area-id stub [no-summary]`

To delete a stub area, use the `no area area-id stub` command.

**Parameters**

- area-id** Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.
- no-summary** (OPTIONAL) Enter the keywords `no-summary` to prevent the ABR from sending summary Link State Advertisements (LSAs) into the stub area.

**Defaults**

Disabled.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Usage Information

To configure all routers and access servers within a stub, use this command.

#### Related Commands

- [router ospf](#) — enter ROUTER OSPF mode to configure an OSPF instance.

## auto-cost

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

## S6000-ON

#### Syntax

```
auto-cost [reference-bandwidth ref-bw]
```

To return to the default bandwidth or to assign cost based on the interface type, use the `no auto-cost [reference-bandwidth]` command.

#### Parameters

***ref-bw*** (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is **100 megabits per second**.

#### Defaults

**100 megabits per second.**

#### Command Modes

ROUTER OSPF

#### Command History

| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## clear ip ospf statistics

Clear the packet statistics in interfaces and neighbors.

**Syntax** `clear ip ospf [process-id] [vrf vrf-name] statistics [interface name {neighbor router-id}]`

| Parameters                       |            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>         |            | Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>vrf vrf-name</i></b>       |            | Enter the keyword <code>vrf</code> followed by the name of the VRF to clear all OSPF routing tables corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>statistics</i></b>         |            | Enter the keyword <code>statistics</code> to clear the packet statistics in interfaces and neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>interface name</i></b>     | (OPTIONAL) | Enter the keyword <code>interface</code> then one of the following interface keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> <li>For Port Channel groups, enter the keywords <code>port-channel</code> then a number.</li> </ul> |
| <b><i>neighbor router-id</i></b> | (OPTIONAL) | Enter the keyword <code>neighbor</code> then the neighbor's router-id in dotted decimal format (A.B.C.D.).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Defaults** None

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.12(1.0)  | Introduced on the S5048F-ON.              |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## debug ip ospf

Display debug information on OSPF. Entering the `debug ip ospf` commands enables OSPF debugging for the first OSPF process.

### S6000-ON

#### Syntax

```
debug ip ospf [process-id] [vrf vrf-name] [bfd | event | packet | spf |
database-timer rate-limit]
```

To cancel the debug command, use the `no debug ip ospf` command.

#### Parameters

|                                         |                                                                                                                                                                |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>                | Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.                                            |
| <b><i>vrf vrf-name</i></b>              | Enter the keyword <code>vrf</code> to view debugging information on OSPF corresponding to that VRF.                                                            |
| <b><i>bfd</i></b>                       | (OPTIONAL) Enter the keyword <code>bfd</code> to debug only OSPF BFD information.                                                                              |
| <b><i>event</i></b>                     | (OPTIONAL) Enter the keyword <code>event</code> to debug only OSPF event information.                                                                          |
| <b><i>packet</i></b>                    | (OPTIONAL) Enter the keyword <code>packet</code> to debug only OSPF packet information.                                                                        |
| <b><i>spf</i></b>                       | (OPTIONAL) Enter the keyword <code>spf</code> to display the Shortest Path First information.                                                                  |
| <b><i>database-timer rate-limit</i></b> | (OPTIONAL) Enter the keywords <code>database-timer rate-limit</code> to display the LSA throttling timer information. This applies to the S4810 platform only. |

**Command Modes** EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version      | Description                                                            |
|--------------|------------------------------------------------------------------------|
| 9.8(0.0P2)   | Introduced on the S3048-ON.                                            |
| 9.4(0.0)     | Added support for VRF. Introduced on the S6000-ON.                     |
| 9.2(1.0)     | Introduced on the Z9500.                                               |
| 9.0.2.0      | Introduced on the S6000.                                               |
| 8.3.19.0     | Introduced on the S4820T.                                              |
| 8.3.11.1     | Introduced on the Z9000.                                               |
| 8.3.8.0      | Added the <code>database-timer rate-limit</code> option for the S4810. |
| 8.3.7.0      | Introduced on the S4810.                                               |
| 7.8.1.0      | Added support for the Multi-Process OSPF.                              |
| 7.6.1.0      | Introduced on the S-Series.                                            |
| 7.5.1.0      | Introduced on the C-Series.                                            |
| pre- 6.1.1.1 | Introduced on the E-Series.                                            |

### Usage Information

The following describes the `debug ip ospf` command shown in the Example below.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8:14</b>        | Displays the time stamp.                                                                                                                                                                                                                                                                                                                                                           |
| <b>OSPF</b>        | Displays the OSPF process ID: instance ID.                                                                                                                                                                                                                                                                                                                                         |
| <b>v:</b>          | Displays the OSPF version. Dell EMC Networking OS supports version 2 only.                                                                                                                                                                                                                                                                                                         |
| <b>t:</b>          | Displays the type of packet sent: <ul style="list-style-type: none"> <li>● 1 - Hello packet</li> <li>● 2 - database description</li> <li>● 3 - link state request</li> <li>● 4 - link state update</li> <li>● 5 - link state acknowledgement</li> </ul>                                                                                                                            |
| <b>l:</b>          | Displays the packet length.                                                                                                                                                                                                                                                                                                                                                        |
| <b>rid:</b>        | Displays the OSPF router ID.                                                                                                                                                                                                                                                                                                                                                       |
| <b>aid:</b>        | Displays the Autonomous System ID.                                                                                                                                                                                                                                                                                                                                                 |
| <b>chk:</b>        | Displays the OSPF checksum.                                                                                                                                                                                                                                                                                                                                                        |
| <b>aut:</b>        | States if OSPF authentication is configured. One of the following is listed: <ul style="list-style-type: none"> <li>● 0 - no authentication configured</li> <li>● 1 - simple authentication configured using the <code>ip ospf authentication-key</code> command</li> <li>● 2 - MD5 authentication configured using the <code>ip ospf message-digest-key</code> command</li> </ul> |
| <b>auk:</b>        | If the <code>ip ospf authentication-key</code> command is configured, this field displays the key used.                                                                                                                                                                                                                                                                            |
| <b>keyid:</b>      | If the <code>ip ospf message-digest-key</code> command is configured, this field displays the MD5 key                                                                                                                                                                                                                                                                              |
| <b>to:</b>         | Displays the interface to which the packet is intended.                                                                                                                                                                                                                                                                                                                            |
| <b>dst:</b>        | Displays the destination IP address.                                                                                                                                                                                                                                                                                                                                               |
| <b>netmask:</b>    | Displays the destination IP address mask.                                                                                                                                                                                                                                                                                                                                          |
| <b>pri:</b>        | Displays the OSPF priority                                                                                                                                                                                                                                                                                                                                                         |
| <b>N, MC, E, T</b> | Displays information available in the Options field of the HELLO packet:                                                                                                                                                                                                                                                                                                           |

netmask:255.255.255.0 pri:1 N-, MC-, E+, T-,
hi:10 di:40 dr:90.1.1.1 bdr:0.0.0.0
```

## default-information originate

To generate a default external route into an OSPF routing domain, configure Dell EMC Networking Operating System (OS).

**Syntax** `default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]`

To return to the default values, use the `no default-information originate` command.

| Parameters                           |                                                                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                        | (OPTIONAL) Enter the keyword <code>always</code> to specify that default route information must always be advertised.                                                                                                                                |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number to configure a metric value for the route. The range is from 1 to 16777214.                                                                                                           |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then an OSPF link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>• 1 = Type 1 external route</li> <li>• 2 = Type 2 external route</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map.                                                                                                                                                      |

**Defaults** Disabled.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Related Commands

- redistribute — redistributes routes from other routing protocols into OSPF.

## default-metric

Change the metrics of redistributed routes to a value useful to OSPF. Use this command with the `redistribute` command.

### S6000-ON

**Syntax** `default-metric number`

To return to the default values, use the `no default-metric [number]` command.

**Parameters** *number* Enter a number as the metric. The range is from 1 to 16777214.

**Defaults** Disabled.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Related Commands

- [show ip ospf asbr](#) — display the VLAN configuration.

## distance

Define an administrative distance for particular routes to a specific IP address.

### S6000-ON

#### Syntax

```
distance weight [ip-address mask access-list-name]
```

To delete the settings, use the `no distance weight [ip-address mask access-list-name]` command.

#### Parameters

|                         |                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>weight</b>           | Specify an administrative distance. The range is from 1 to 255. The default is <b>110</b> .                                    |
| <b>ip-address</b>       | (OPTIONAL) Enter a router ID in the dotted decimal format. If you enter a router ID, include the mask for that router address. |
| <b>mask</b>             | (OPTIONAL) Enter a mask in dotted decimal format or /n format.                                                                 |
| <b>access-list-name</b> | (OPTIONAL) Enter the name of an IP standard access list, up to 140 characters.                                                 |

#### Defaults

110

#### Command Modes

ROUTER OSPF

| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Added support for the Multi-Process OSPF. |
| 7.6.1.0    | Introduced on the S-Series.               |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## distance ospf

Configure an OSPF distance metric for different types of routes.

### S6000-ON

**Syntax** `distance ospf [external dist3] [inter-area dist2] [intra-area dist1]`

To delete these settings, use the `no distance ospf` command.

| Parameters                     |                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>external <i>dist3</i></b>   | (OPTIONAL) Enter the keyword <code>external</code> then a number to specify a distance for external type 5 and 7 routes. The range is from 1 to 255. The default is <b>110</b> .        |
| <b>inter-area <i>dist2</i></b> | (OPTIONAL) Enter the keywords <code>inter-area</code> then a number to specify a distance metric for routes between areas. The range is from 1 to 255. The default is <b>110</b> .      |
| <b>intra-area <i>dist1</i></b> | (OPTIONAL) Enter the keywords <code>intra-area</code> then a number to specify a distance metric for all routes within an area. The range is from 1 to 255. The default is <b>110</b> . |

- Defaults**
- external *dist3* = **110**
  - inter-area *dist2* = **110**
  - intra-area *dist1* = **110**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 6.1.1.1 | Introduced on the E-Series. |

#### Usage Information

To specify a distance for routes learned from other routing domains, use the `redistribute` command.

## distribute-list in

Apply a filter to incoming routing updates from OSPF to the routing table.

### S6000–ON

#### Syntax

```
distribute-list prefix-list-name in [interface]
```

To delete a filter, use the `no distribute-list prefix-list-name in [interface]` command.

#### Parameters

- prefix-list-name*** Enter the name of a configured prefix list.
- interface*** (OPTIONAL) Enter one of the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For Port Channel groups, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

#### Defaults

Not configured.

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Added support for the Multi-Process OSPF. |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## distribute-list out

To restrict certain routes destined for the local routing table after the SPF calculation, apply a filter.

### S6000-ON

**Syntax** `distribute-list prefix-list-name out [bgp | connected | isis | rip | static]`

To remove a filter, use the `no distribute-list prefix-list-name out [bgp | connected | isis | rip | static]` command.

**Parameters**

- prefix-list-name*** Enter the name of a configured prefix list.
- bgp** (OPTIONAL) Enter the keyword `bgp` to specify that BGP routes are distributed.  
i **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- connected** (OPTIONAL) Enter the keyword `connected` to specify that connected routes are distributed.
- isis** (OPTIONAL) Enter the keyword `isis` to specify that IS-IS routes are distributed.  
i **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- rip** (OPTIONAL) Enter the keyword `rip` to specify that RIP routes are distributed.  
i **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- static** (OPTIONAL) Enter the keyword `static` to specify that only manually configured routes are distributed.

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|

| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information**

The `distribute-list out` command applies to routes autonomous system boundary routers (ASBRs) redistributes into OSPF. It can be applied to external type 2 and external type 1 routes, but not to intra-area and inter-area routes.

## fast-convergence

This command sets the minimum LSA origination and arrival times to zero (0), allowing more rapid route computation so that convergence takes less time.

### S6000-ON

**Syntax**

`fast-convergence {number}`

To cancel fast-convergence, use the `no fast convergence` command.

**Parameters**

**number** Enter the convergence level desired. The higher this parameter is set, the faster OSPF converge takes place. The range is from 1 to 4.

**Defaults**

None.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version | Description                  |
|---------|------------------------------|
| 8.3.7.0 | Introduced on the S4810.     |
| 7.8.1.0 | Introduced on all platforms. |

### Usage Information

The higher this parameter is set, the faster OSPF converge takes place.

**NOTE:** The faster the convergence, the more frequent the route calculations and updates. This behavior impacts CPU utilization and may impact adjacency stability in larger topologies.

Generally, convergence level 1 meets most convergence requirements. Higher convergence levels should only be selected following consultation with Dell EMC Networking technical support.

## flood-2328

Enable RFC-2328 flooding behavior.

## S6000-ON

**Syntax** `flood-2328`  
To disable, use the `no flood-2328` command.

**Defaults** Disabled.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.  |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.2(1.0)  | Introduced on the Z9500.                  |
| 9.0.2.0   | Introduced on the S6000.                  |
| 8.3.19.0  | Introduced on the S4820T.                 |
| 8.3.11.1  | Introduced on the Z9000.                  |
| 8.3.7.0   | Introduced on the S4810.                  |
| 7.8.1.0   | Added support for Multi-Process OSPF.     |
| 7.6.1.0   | Introduced on the S-Series.               |
| 7.5.1.0   | Introduced on the C-Series and E-Series.  |

### Usage Information

In OSPF, flooding is the most resource-consuming task. The flooding algorithm, described in RFC-2328, requires that OSPF flood LSAs (Link State Advertisements) on all interfaces, as governed by LSA's flooding scope (see Section 13 of the RFC). When multiple direct links connect two routers, the RFC-2328 flooding algorithm generates significant redundant information across all links.

By default, Dell EMC Networking OS implements an enhanced flooding procedure that dynamically and intelligently determines when to optimize flooding. Whenever possible, the OSPF task attempts to reduce flooding overhead by selectively flooding on a subset of the interfaces between two routers.

When you enable  `flood-2328`, this command configures Dell EMC Networking OS to flood LSAs on all interfaces.

## graceful-restart grace-period

Specifies the time duration, in seconds, that the router's neighbors continue to advertise the router as fully adjacent regardless of the synchronization state during a graceful restart.

**NOTE:** This command enables OSPFv2 graceful restart globally by setting the grace period (in seconds) that an OSPFv2 router's neighbors continues to advertise the router as adjacent during a graceful restart.

### S6000-ON

**Syntax** `graceful-restart grace-period seconds`

To disable the grace period, use the `no graceful-restart grace-period` command.

**Parameters** **seconds** Time duration, in seconds, that specifies the duration of the restart process before OSPF terminates the process. The range is from 40 to 1800 seconds.

**Defaults** Not Configured

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                       |
|--------------|-------------------------------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                         |
| 9.10(0.0)    | Introduced on the S3148.                                          |
| 9.10(0.0)    | Introduced on the S3148.                                          |
| 9.10(0.0)    | Introduced on the S6100-ON.                                       |
| 9.8(2.0)     | Introduced on the S3100 series.                                   |
| 9.8(1.0)     | Introduced on the Z9100-ON.                                       |
| 9.8(0.0P5)   | Introduced on the S4048-ON.                                       |
| 9.8(0.0P2)   | Introduced on the S3048-ON.                                       |
| 9.7(0.0)     | Introduced on the S6000-ON.                                       |
| 9.2(1.0)     | Introduced on the Z9500.                                          |
| 9.0.2.0      | Introduced on the S6000.                                          |
| 8.3.19.0     | Introduced on the S4820T.                                         |
| 8.3.11.1     | Introduced on the Z9000.                                          |
| 8.3.7.0      | Introduced on the S4810.                                          |
| 7.8.1.0      | Introduced on the S-Series. Added support for Multi-Process OSPF. |
| 7.5.1.0      | Introduced on the C-Series.                                       |
| pre- 6.1.1.1 | Introduced on the E-Series.                                       |

**Usage Information** The Helper mode is enabled by default on the device. To enable the restart mode also on the device, you must configure the grace period using this command. After you enable restart mode the router advertises the neighbor as fully adjacent during a restart.

## graceful-restart helper-reject

Specify the OSPF router to not act as a helper during graceful restart.

### S6000-ON

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>graceful-restart helper-reject ip-address</code><br>To return to default value, use the <code>no graceful-restart helper-reject</code> command.         |
| <b>Parameters</b>      | <b><i>ip-address</i></b> Enter the OSPF router-id, in IP address format, of the restart router that <i>will not</i> act as a helper during graceful restart.  |
| <b>Defaults</b>        | Not configured.                                                                                                                                               |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version             | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                    |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                                                                                                                                                     |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.                                                                                                                                                  |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.                                                                                                                                              |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.                                                                                                                                                  |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.                                                                                                                                                  |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                                                                                                                                                  |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                                                                                                                                                  |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                                                                                                                                                     |
| <b>9.0.2.0</b>      | Introduced on the S6000.                                                                                                                                                     |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                                                                                                                                                    |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                                                                                                                                                     |
| <b>8.3.12.0</b>     | Introduced on the S4810.                                                                                                                                                     |
| <b>7.8.1.0</b>      | <code>Restart role</code> enabled on the S-Series (Both <code>Helper</code> and <code>Restart</code> roles now supported on S-Series). Added support for Multi-Process OSPF. |
| <b>7.7.1.0</b>      | Added <code>Helper-Role</code> support on the S-Series.                                                                                                                      |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                                                                                                                                                  |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                                                                                                                                                  |

## graceful-restart mode

Enable the graceful restart mode.

### S6000-ON

|               |                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>graceful-restart mode [planned-only   unplanned-only]</code><br>To disable graceful restart mode, use the <code>no graceful-restart mode</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                       |                                                                                                                                             |
|-------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>planned-only</b>   | (OPTIONAL) Enter the keywords <code>planned-only</code> to indicate graceful restart is supported in a planned restart condition only.      |
|                   | <b>unplanned-only</b> | (OPTIONAL) Enter the keywords <code>unplanned-only</code> to indicate graceful restart is supported in an unplanned restart condition only. |

**Defaults** Support for both planned and unplanned failures.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>      | <b>Description</b>                        |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.12.0</b>     | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.               |

## graceful-restart role

Specify the role for your OSPF router during graceful restart.

### S6000-ON

**Syntax** `graceful-restart role [helper-only | restart-only]`  
To disable graceful restart role, use the `no graceful-restart role` command.

|                   |                          |                                                                                                                               |
|-------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>role helper-only</b>  | (OPTIONAL) Enter the keywords <code>helper-only</code> to specify the OSPF router is a helper only during graceful restart.   |
|                   | <b>role restart-only</b> | (OPTIONAL) Enter the keywords <code>restart-only</code> to specify the OSPF router is a restart only during graceful-restart. |

**Defaults** By default, OSPF routers are both helper and restart routers during a graceful restart.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                                                                               |
| 9.10(0.0)    | Introduced on the S3148.                                                                                                |
| 9.10(0.0)    | Introduced on the S6100-ON.                                                                                             |
| 9.8(1.0)     | Introduced on the Z9100-ON.                                                                                             |
| 9.8(0.0)     | Introduced on the S3048-ON and S4048-ON.                                                                                |
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                                             |
| 9.2(1.0)     | Introduced on the Z9500.                                                                                                |
| 9.0.2.0      | Introduced on the S6000.                                                                                                |
| 8.3.19.0     | Introduced on the S4820T.                                                                                               |
| 8.3.11.1     | Introduced on the Z9000.                                                                                                |
| 8.3.12.0     | Introduced on the S4810.                                                                                                |
| 7.8.1.0      | Added support for Multi-Process OSPF. Added <code>Restart</code> and <code>Helper</code> roles support on the S-Series. |
| 7.7.1.0      | Added <code>Helper-Role</code> support on the S-Series.                                                                 |
| 7.5.1.0      | Introduced on the C-Series.                                                                                             |
| pre- 6.1.1.1 | Introduced on the E-Series.                                                                                             |

## ip ospf auth-change-wait-time

OSPF provides a grace period while OSPF changes its interface authentication type. During the grace period, OSPF sends out packets with new and old authentication scheme until the grace period expires.

### S6000-ON

**Syntax** `ip ospf auth-change-wait-time seconds`  
 To return to the default, use the `no ip ospf auth-change-wait-time` command.

**Parameters** `seconds` Enter the seconds. The range is from 0 to 300.

**Defaults** `zero (0) seconds.`

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version      | Description                 |
|--------------|-----------------------------|
| 9.2(1.0)     | Introduced on the Z9500.    |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## ip ospf authentication-key

Enable authentication and set an authentication key on OSPF traffic on an interface.

### S6000-ON

|                        |                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ospf authentication-key [encryption-type] key</code><br>To delete an authentication key, use the <code>no ip ospf authentication-key</code> command.               |
| <b>Parameters</b>      | <p><b>encryption-type</b> (OPTIONAL) Enter 7 to encrypt the key.</p> <p><b>key</b> Enter an eight-character string. Strings longer than eight characters are truncated.</p> |
| <b>Defaults</b>        | Not configured.                                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .               |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

| Version      | Description                 |
|--------------|-----------------------------|
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information**

All neighboring routers in the same network must use the same password to exchange OSPF information.

## ip ospf cost

Change the cost associated with the OSPF traffic on an interface.

### S6000-ON

**Syntax** `ip ospf cost cost`  
 To return to default value, use the `no ip ospf cost` command.

**Parameters** **cost** Enter a number as the cost. The range is from 1 to 65535.

**Defaults** The default cost is based on the reference bandwidth.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information**

If this command is not configured, cost is based on the `auto-cost` command.

When you configure OSPF over multiple vendors, to ensure that all routers use the same cost, use the `ip ospf cost` command. Otherwise, OSPF routes improperly.

**Related Commands**

- [auto-cost](#) — control how the OSPF interface cost is calculated.

# ip ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

## S6000-ON

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ospf dead-interval seconds</code><br>To return to the default values, use the <code>no ip ospf dead-interval</code> command.                         |
| <b>Parameters</b>      | <b>seconds</b> Enter the number of seconds for the interval. The range is from 1 to 65535. The default is <b>40 seconds</b> .                                 |
| <b>Defaults</b>        | <b>40 seconds</b>                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.6.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.               |

**Usage Information** By default, the dead interval is four times the default hello-interval.

**Related Commands**

- [ip ospf hello-interval](#) — set the time interval between the hello packets.

## ip ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

### S6000–ON

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ospf hello-interval seconds</code><br>To return to the default value, use the <code>no ip ospf hello-interval</code> command.                        |
| <b>Parameters</b>      | <b>seconds</b> Enter the number of seconds for the interval. The range is from 1 to 65535. The default is <b>10 seconds</b> .                                 |
| <b>Defaults</b>        | <b>10 seconds</b>                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.6.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.               |

|                          |                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The time interval between the hello packets must be the same for routers in a network.                                                            |
| <b>Related Commands</b>  | <ul style="list-style-type: none"><li>• <a href="#">ip ospf dead-interval</a> — set the time interval before a router is declared dead.</li></ul> |

## ip ospf message-digest-key

Enable OSPF MD5 authentication and send an OSPF message digest key on the interface.

### S6000–ON

|               |                                                       |
|---------------|-------------------------------------------------------|
| <b>Syntax</b> | <code>ip ospf message-digest-key keyid md5 key</code> |
|---------------|-------------------------------------------------------|

To delete a key, use the `no ip ospf message-digest-key keyid` command.

#### Parameters

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <b><i>keyid</i></b> | Enter a number as the key ID. The range is from 1 to 255. |
| <b><i>key</i></b>   | Enter a continuous character string as the password.      |

#### Defaults

No MD5 authentication is configured.

| <b>9.8(2.0)</b>     | Introduced on the S3100 series.                                            |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.                                                |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.                                                |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                                                |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                                                |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                                                   |
| <b>9.0.2.0</b>      | Introduced on the S6000.                                                   |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                                                  |
| <b>9.1(0.0)</b>     | Included usage information on maximum number of digest keys per interface. |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                                                   |
| <b>8.3.7.0</b>      | Introduced on the S4810.                                                   |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                                                |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                                                |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                                                |

#### Usage Information

You can configure a maximum of six digest keys on an interface. Of the available six digest keys, the switches select the MD5 key that is common. The remaining MD5 keys are unused.

To change to a different key on the interface, enable the new key while the old key is still enabled. Dell EMC Networking OS sends two packets: the first packet authenticated with the old key and the second packet authenticated with the new key. This process ensures that the neighbors learn the new key and communication is not disrupted by keeping the old key enabled.

After the reply is received and the new key is authenticated, delete the old key. Dell EMC recommends keeping only one key per interface.

**i** **NOTE:** The MD5 secret is stored as plain text in the configuration file with service password encryption. Write down or otherwise record the key. You cannot learn the key once it is configured. Use caution when changing the key.

## ip ospf mtu-ignore

Disable OSPF MTU mismatch detection upon receipt of database description (DBD) packets.

### S6000-ON

|                        |                                                                                                                                                               |

| <b>point-to-point</b> | Enter the keywords <code>point-to-point</code> to designate the interface as part of a point-to-point network.                                                                                                                                                                                                              |                  |                                                                                                     |                       |                                                                                                                |
| <b>Defaults</b>       | Broadcast.                                                                                                                                                                                                                                                                                                                  |                  |                                                                                                     |                       |                                                                                                                |
| <b>Command Modes</b>  | ROUTER OSPF                                                                                                                                                                                                                                                                                                                 |                  |                                                                                                     |                       |                                                                                                                |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for Multi-Process OSPF.     |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## ip ospf priority

To determine the designated router for the OSPF network, set the priority of the interface.

### S6000-ON

#### Syntax

```
ip ospf priority number
```

To return to the default setting, use the `no ip ospf priority` command.

#### Parameters

***number*** Enter a number as the priority. The range is from 0 to 255. The default is **1**.

#### Defaults

**1**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version             | Description                 |
|---------------------|-----------------------------|
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.    |
| <b>9.0.2.0</b>      | Introduced on the S6000.    |
| <b>8.3.19.0</b>     | Introduced on the S4820T.   |
| <b>8.3.11.1</b>     | Introduced on the Z9000.    |
| <b>8.3.7.0</b>      | Introduced on the S4810.    |
| <b>7.6.1.0</b>      | Introduced on the S-Series. |
| <b>7.5.1.0</b>      | Introduced on the C-Series. |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series. |

#### Usage Information

Setting a priority of 0 makes the router ineligible for election as a designated router or backup designated router.

Use this command for interfaces connected to multi-access networks, not point-to-point networks.

## ip ospf retransmit-interval

Set the retransmission time between lost link state advertisements (LSAs) for adjacencies belonging to the interface.

### S6000-ON

#### Syntax

```
ip ospf retransmit-interval seconds
```

To return to the default values, use the `no ip ospf retransmit-interval` command.

#### Parameters

**seconds** Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is **5 seconds**.

This interval must be greater than the expected round-trip time for a packet to travel between two routers.

#### Defaults

**5 seconds**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version      | Description                 |
|--------------|-----------------------------|
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

#### Usage Information

Set the time interval to a number large enough to prevent unnecessary retransmissions.

## ip ospf transmit-delay

To send a link state update packet on the interface, set the estimated time elapsed.

### S6000-ON

#### Syntax

```
ip ospf transmit-delay seconds
```

To return to the default value, use the `no ip ospf transmit-delay` command.

#### Parameters

***seconds***

Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is **1 second**.

This value must be greater than the transmission and propagation delays for the interface.

#### Defaults

**1 second**

#### Command Modes

| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                           |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                              |
| <b>9.0.2.0</b>      | Introduced on the S6000.                              |
| <b>9.1(0.0)</b>     | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                             |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                              |
| <b>8.3.7.0</b>      | Introduced on the S4810.                              |
| <b>7.8.1.0</b>      | Added support for Multi-Process OSPF.                 |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                           |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                           |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                           |

## mib-binding

Enable this OSPF process ID to manage the SNMP traps and process SNMP queries.

### S6000–ON

|               |                          |
|---------------|--------------------------|
| <b>Syntax</b> | <code>mib-binding</code> |
|---------------|--------------------------|

To mib-binding on this OSPF process, use the `no mib-binding` command.

**Defaults**

none.

**Command Modes** ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>  | Introduced on the S3048-ON and S4048-ON.  |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>  | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>   | Introduced on the S6000.                  |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>  | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>   | Introduced on the S4810.                  |
| <b>7.8.1.0</b>   | Introduced to all platforms.              |

**Usage Information**

This command is either enabled or disabled. If no OSPF process is identified as the MIB manager, the first OSPF process is used.

If an OSPF process has been selected, it must be disabled prior to assigning new process ID the MIB responsibility.

## network area

Define which interfaces run OSPF and the OSPF area for those interfaces.

### S6000-ON

**Syntax**

`network ip-address mask area area-id`

To disable an OSPF area, use the `no network ip-address mask area area-id` command.

**Parameters**

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b> | Specify a primary or secondary address in dotted decimal format. The primary address is required before adding the secondary address.                                                                                                                                                                                                                                                                                     |
| <b><i>mask</i></b>       | Enter a network mask in /prefix format. (/x)                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>area-id</i></b>    | Enter the OSPF area ID as either a decimal value or in a valid IP address. Decimal value range is from 0 to 65535. IP address format is dotted decimal format A.B.C.D.<br> <b>NOTE:</b> If the area ID is smaller than 65535, it is converted to a decimal value. For example, if you use an area ID of 0.0.0.1, it is converted to 1. |

**Command Modes** ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Introduced to all platforms.              |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Usage Information

To enable OSPF on an interface, the `network area` command must include, in its range of addresses, the primary IP address of an interface.

 **NOTE:** An interface can be attached only to a single OSPF area.

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

## passive-interface

Suppress both receiving and sending routing updates on an interface.

### S6000-ON

#### Syntax

```
passive-interface {default | interface}
```

To enable both the receiving and sending routing, use the `no passive-interface interface` command.

To return all OSPF interfaces (current and future) to active, use the `no passive-interface default` command.

#### Parameters

- |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>   | Enter the keyword <code>default</code> to make all OSPF interfaces (current and future) passive.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>      | <b>Description</b>                                     |
|---------------------|--------------------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON.              |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                               |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.                            |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.                        |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.                            |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.                            |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                            |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                            |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                               |
| <b>9.0.2.0</b>      | Introduced on the S6000.                               |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                              |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                               |
| <b>8.3.7.0</b>      | Introduced on the S4810.                               |
| <b>7.8.1.0</b>      | Added support for Multi-Process OSPF.                  |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                            |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                            |
| <b>7.4.1.0</b>      | Modified to include the keyword <code>default</code> . |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                            |

**Usage Information** Although the passive interface does not send or receive routing updates, the network on that interface is still included in OSPF updates sent using other interfaces.

The `default` keyword sets all interfaces as passive. You can then configure individual interfaces, where adjacencies are desired, using the `no passive-interface interface` command. The `no` form of this command is inserted into the configuration for individual interfaces when the `no passive-interface interface` command is issued while `passive-interface default` is configured.

This command behavior has changed as follows:

`passive-interface interface`

- The previous `no passive-interface interface` is removed from the running configuration.
- The ABR status for the router is updated.
- Save `passive-interface interface` into the running configuration.

`passive-interface default`

- All present and future OSPF interfaces are marked as *passive*.
- Any adjacency is explicitly terminated from all OSPF interfaces.
- All previous `passive-interface interface` commands are removed from the running configuration.
- All previous `no passive-interface interface` commands are removed from the running configuration.

`no passive-interface interface`

- Remove the interface from the passive list.
- The ABR status for the router is updated.
- If `passive-interface default` is specified, then save `no passive-interface interface` into the running configuration.

No `passive-interface default`

- Clear everything and revert to the default behavior.
- All previously marked passive interfaces are removed.
- May update ABR status.

On configuring suppression using the `passive-interface` command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

## redistribute

Redistribute information from another routing protocol throughout the OSPF process.

**Syntax** `redistribute {connected | isis | ospf | rip | static} [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]`

To disable redistribution, use the `no redistribute {connected | isis | rip | static}` command.

|                   |                                      |                                                                                                                                                                                                 |
|-------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>connected</b>                     | Enter the keyword <code>connected</code> to specify that information from active routes on interfaces is redistributed.                                                                         |
|                   | <b>isis</b>                          | Enter the keyword <code>isis</code> to specify that ISO IS-IS information is redistributed.                                                                                                     |
|                   | <b>ospf</b>                          | Enter the keyword <code>ospf</code> to specify that information corresponding to OSPF is redistributed.                                                                                         |
|                   | <b>rip</b>                           | Enter the keyword <code>rip</code> to specify that RIP routing information is redistributed.                                                                                                    |
|                   | <b>static</b>                        | Enter the keyword <code>static</code> to specify that information from static routes is redistributed.                                                                                          |
|                   | <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number. The range is from 0 (zero) to 16777214.                                                                                         |
|                   | <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"><li>• 1 = OSPF External type 1</li><li>• 2 = OSPF External type 2</li></ul> |
|                   | <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                            |
|                   | <b>tag <i>tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> then a number. The range is from 0 to 4294967295.                                                                                                 |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.           |
| 9.2(1.0)     | Introduced on the Z9500.              |
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

### Usage Information

To redistribute the default route (0.0.0.0/0), configure the `default-information originate` command.

Despite removing an OSPF process globally, the OSPF process is not completely removed from the BGP configuration.

### Related Commands

- [default-information originate](#) — generate a default route into the OSPF routing domain.

## redistribute bgp

Redistribute BGP routing information throughout the OSPF instance.

### Syntax

```
redistribute bgp as number [metric metric-value] | [metric-type type-value]
| [tag tag-value]
```

To disable redistribution, use the `no redistribute bgp as number [metric metric-value] | [metric-type type-value] [route-map map-name] [tag tag-value]` command.

### Parameters

|                                      |                                                                                                                                                                                                            |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>as number</i></b>              | Enter the autonomous system number. The range is from 1 to 65535.                                                                                                                                          |
| <b><i>metric metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then the metric-value number. The range is from 0 to 16777214.                                                                                            |
| <b><i>metric-type type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"> <li>• 1 = for OSPF External type 1</li> <li>• 2 = for OSPF External type 2</li> </ul> |
| <b><i>route-map map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                                       |
| <b><i>tag tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.                                                                        |

### Defaults

None

### Command Modes

ROUTER OSPF

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version             | Description                                     |
|---------------------|-------------------------------------------------|
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.                 |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.                     |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.                     |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                     |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                     |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                        |
| <b>9.0.2.0</b>      | Introduced on the S6000.                        |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                       |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                        |
| <b>8.3.7.0</b>      | Introduced on the S4810.                        |
| <b>7.8.1.3</b>      | Added Route Map for BGP Redistribution to OSPF. |
| <b>7.8.1.0</b>      | Added support for Multi-Process OSPF.           |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                     |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                     |
| <b>7.4.1.0</b>      | Added the keyword <code>default</code> .        |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                     |

## redistribute isis

Redistribute IS-IS routing information throughout the OSPF instance.

**Syntax** `redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]`

To disable redistribution, use the `no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]` command.

**Parameters**

|                                      |                                                                                                                                                                                                            |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tag</b>                           | (OPTIONAL) Enter the name of the IS-IS routing process.                                                                                                                                                    |
| <b>level-1</b>                       | (OPTIONAL) Enter the keywords <code>level-1</code> to redistribute only IS-IS Level-1 routes.                                                                                                              |
| <b>level-1-2</b>                     | (OPTIONAL) Enter the keywords <code>level-1-2</code> to redistribute both IS-IS Level-1 and Level-2 routes.                                                                                                |
| <b>level-2</b>                       | (OPTIONAL) Enter the keywords <code>level-2</code> to redistribute only IS-IS Level-2 routes.                                                                                                              |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number. The range is from 0 (zero) to 4294967295.                                                                                                  |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"> <li>• 1 = for OSPF External type 1</li> <li>• 2 = for OSPF External type 2</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                                       |
| <b>tag <i>tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.                                                                        |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for Multi-Process OSPF.     |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## router-id

To configure a fixed router ID, use this command.

**Syntax** `router-id ip-address`

To remove the fixed router ID, use the `no router-id ip-address` command.

**Parameters** *ip-address* Enter the router ID in the IP address format.

**Defaults** None.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.2(1.0)     | Introduced on the Z9500.              |
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

### Usage Information

You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique. If you use this command on an OSPF router process, which is already active (that is, has neighbors), a prompt reminding you that changing the router-id brings down the existing OSPF adjacency. The new router ID is effective at the next reload.

### Example

```
DellEMC(conf)# router ospf 100
DellEMC(conf-router_ospf)#router-id 1.1.1.1
Changing router-id will bring down existing OSPF adjacency [y/n]:

DellEMC(conf-router_ospf)#show config
!
router ospf 100
router-id 1.1.1.1
DellEMC(conf-router_ospf)# no router-id
Changing router-id will bring down existing OSPF adjacency [y/n]:
DellEMC#
```

## router ospf

To configure an OSPF instance, enter ROUTER OSPF mode.

**Syntax** `router ospf process-id [vrf {vrf name}]`

To clear an OSPF instance, use the `no router ospf process-id` command.

### Parameters

**process-id** Enter a number for the OSPF instance. The range is from 1 to 65535.

**vrf name** (Optional) Enter the VRF process identifier to tie the OSPF instance to the VRF. All network commands under this OSPF instance are then tied to the VRF instance.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version             | Description                                      |
|---------------------|--------------------------------------------------|
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                      |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                      |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                         |
| <b>9.0.2.0</b>      | Introduced on the S6000.                         |
| <b>9.1(0.0)</b>     | Added support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                        |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                         |
| <b>8.3.7.0</b>      | Introduced on the S4810.                         |
| <b>7.9.1.0</b>      | Added support for VRF.                           |
| <b>7.8.1.0</b>      | Added support for Multi-Process OSPF.            |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                      |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                      |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                      |

**Usage Information**

You must have an IP address assigned to an interface to enter ROUTER OSPF mode and configure OSPF. You can create only one OSPFv2 process per VRF.

**Example**

```
DellEMC(conf)# router ospf 2
DellEMC(conf-router_ospf)#
```

## show config

Display the non-default values in the current OSPF configuration.

### S6000-ON

**Syntax** show config

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |

| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

#### Example

```
DellEMC(conf-router_ospf)# show config
!
router ospf 3
passive-interface 0 TenGigabitEthernet 1/1/1
DellEMC(conf-router_ospf)#
```

## show ip ospf

Display information on the OSPF process configured on the switch.

**Syntax** `show ip ospf [process-id | vrf vrf name]`

**Parameters**

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf name*** Show only the OSPF information tied to the VRF process.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4.(0.0)  | Added support for VRF.                    |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.8.0    | Added output for LSA throttling timers.   |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.9.1.0    | Added support for VRF.                    |
| 7.8.1.0    | Added support of Multi-Process OSPF.      |

| Version      | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| 7.8.1.0      | Added the <i>process-id</i> option, in support of Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.                                           |
| 7.5.1.0      | Introduced on the C-Series.                                           |
| pre- 6.1.1.1 | Introduced on the E-Series.                                           |

### Usage Information

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

The following describes the `show ip ospf` command shown in the following example.

| Line Beginning with  | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| “Routing Process...” | Displays the OSPF process ID and the IP address associated with the process ID. |
| “Supports only...”   | Displays the number of Type of Service (TOS) routes supported.                  |
| “SPF schedule...”    | Displays the delay and hold time configured for this process ID.                |
| “Convergence Level”  |                                                                                 |
| “Min LSA....”        | Displays the intervals set for LSA transmission and acceptance.                 |
| “Number of...”       | Displays the number and type of areas configured for this process ID.           |

### Example

```
DellEMC# show ip ospf 10
Routing Process ospf 10 with ID 1.1.1.1 Virtual router default-vrf
Supports only single TOS (TOS0) routes
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
 Area BACKBONE (0)
 Number of interface in this area is 1
 SPF algorithm executed 205 times
 Area ranges are
DellEMC#
```

## show ip ospf asbr

Display all autonomous system boundary router (ASBR) routers visible to OSPF.

### S6000-ON

|                      |                                                                                |                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show ip ospf [<i>process-id</i>   vrf <i>vrf-name</i>] asbr</code>       |                                                                                                                                    |
| <b>Parameters</b>    | <b><i>process-id</i></b>                                                       | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
| <b>Defaults</b>      | None                                                                           |                                                                                                                                    |
| <b>Command Modes</b> | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul> |                                                                                                                                    |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                           |
|------------|-----------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                             |
| 9.10(0.0)  | Introduced on the S3148.                                              |
| 9.10(0.0)  | Introduced on the S6100-ON.                                           |
| 9.8(2.0)   | Introduced on the S3100 series.                                       |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                           |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                           |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                           |
| 9.7(0.0)   | Introduced on the S6000-ON.                                           |
| 9.4.(0.0)  | Added support for VRF.                                                |
| 9.2(1.0)   | Introduced on the Z9500.                                              |
| 9.0.2.0    | Introduced on the S6000.                                              |
| 8.3.19.0   | Introduced on the S4820T.                                             |
| 8.3.11.1   | Introduced on the Z9000.                                              |
| 8.3.7.0    | Introduced on the S4810.                                              |
| 7.8.1.0    | Added support of Multi-Process OSPF.                                  |
| 7.8.1.0    | Added the <i>process-id</i> option, in support of Multi-Process OSPF. |
| 7.6.1.0    | Introduced on the S-Series.                                           |
| 7.5.1.0    | Introduced on the C-Series and E-Series.                              |

## Usage Information

To isolate problems with external routes, use this command. In OSPF, external routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, use this command to determine if the path to the originating router is correct. The display output is not sorted in any order.

 **NOTE:** ASBRs that are not in directly connected areas are also displayed.

You can determine if an ASBR is in a directly connected area (or not) by the flags. For ASBRs in a directly connected area, E flags are set. In the following example, router 1.1.1.1 is in a directly connected area since the Flag is E/-/-/. For remote ASBRs, the E flag is clear (-/-/-/).

## Example

```
DellEMC# show ip ospf lasbr

RouterID Flags Cost Nexthop Interface Area
3.3.3.3 -/-/-/ 2 10.0.0.2 Te 1/1/1 1
1.1.1.1 E/-/-/ 0 0.0.0.0 - 0
DellEMC#
```

## show ip ospf database

Display all LSA information. If you do not enable OSPF on the switch, no output is generated.

## S6000-ON

### Syntax

```
show ip ospf process-id [vrf vrf-name] database [database-summary]
```

|                   |                                |                                                                                                                                           |
|-------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>process-id</i></b>       | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.        |
|                   | <b><i>vrf vrf-name</i></b>     | Enter the keyword <code>vrf</code> and then the name of the VRF to view LSA information on OSPF processes corresponding to that VRF.      |
|                   | <b><i>database-summary</i></b> | (OPTIONAL) Enter the keywords <code>database-summary</code> to display the number of LSA types in each area and the total number of LSAs. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

#### Related Commands

- [show ip ospf database asbr-summary](#) — display only ASBR summary LSA information.

## show ip ospf database asbr-summary

Display information about autonomous system (AS) boundary LSAs.

### S6000-ON

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] database asbr-summary [link-state-id] [adv-router ip-address]
```

#### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- link-state-id*** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
- the network's IP address for Type 3 LSAs or Type 5 LSAs
  - the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- adv-router ip-address*** (OPTIONAL) Enter the keywords `adv-router` and the ip-address to display only the LSA information about that router.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.10(0.0)    | Introduced on the S6100-ON.           |
| 9.8(2.0)     | Introduced on the S3100 series.       |
| 9.8(1.0)     | Introduced on the Z9100-ON.           |
| 9.8(0.0P5)   | Introduced on the S4048-ON.           |
| 9.8(0.0P2)   | Introduced on the S3048-ON.           |
| 9.7(0.0)     | Introduced on the S6000-ON.           |
| 9.4.(0.0)    | Added support for VRF.                |
| 9.2(1.0)     | Introduced on the Z9500.              |
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

#### Usage Information

The following describes the `show ip ospf database asbr-summary` command shown in the following example.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the advertising router's ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>TOS</b>                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metric</b>             | Displays the LSA metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### Example

```
DellEMC# show ip ospf 100 database asbr-summary
 OSPF Router with ID (1.1.1.10) (Process ID 100)
 Summary Asbr (Area 0.0.0.0)
```

```

LS age: 1437
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 103.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000000f
Checksum: 0x8221
Length: 28
Network Mask: /0
 TOS: 0 Metric: 2

LS age: 473
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 104.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000010
Checksum: 0x4198
Length: 28
--More--

```

### Related Commands

- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database external

Display information on the AS external (type 5) LSAs.

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database external [link-state-id]
[adv-router ip-address]
```

### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword `vrf` followed by the name of the VRF to view information on AS external LSAs corresponding to the OSPF processes that are tied to a specific VRF.
- link-state-id*** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network's IP address for Type 3 LSAs or Type 5 LSAs
  - the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- adv-router ip-address*** (OPTIONAL) Enter the keywords `adv-router` and the `ip-address` to display only the LSA information about that router.

### Command Modes

- EXEC
- EXEC Privilege

### Usage Information

The following describes the `show ip ospf process-id database external` command shown in the following example.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LS Seq Number</b>      | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Metrics Type</b>       | Displays the external type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>TOS</b>                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metric</b>             | Displays the LSA metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Forward Address</b>    | Identifies the address of the forwarding router. Data traffic is forwarded to this router. If the forwarding address is 0.0.0.0, data traffic is forwarded to the originating router.                                                                                                                                                                                                                                                                                                              |
| <b>External Route Tag</b> | Displays the 32-bit field attached to each external route. The OSPF protocol does not use this field, but you can use the field for external route management.                                                                                                                                                                                                                                                                                                                                     |

## Example

```
DellEMC# show ip ospf 1 database external

 OSPF Router with ID (20.20.20.5) (Process ID 1)

 Type-5 AS External

LS age: 612
Options: (No TOS-capability, No DC, E)
LS type: Type-5 AS External
Link State ID: 12.12.12.2
Advertising Router: 20.31.3.1
LS Seq Number: 0x80000007
Checksum: 0x4cde
Length: 36
Network Mask: /32
 Metrics Type: 2
 TOS: 0
 Metrics: 25
 Forward Address: 0.0.0.0
 External Route Tag: 43

LS age: 1868
Options: (No TOS-capability, DC)
LS type: Type-5 AS External
Link State ID: 24.216.12.0
Advertising Router: 20.20.20.8
LS Seq Number: 0x80000005
Checksum: 0xa00e
Length: 36
Network Mask: /24
 Metrics Type: 2
 TOS: 0
 Metrics: 1
 Forward Address: 0.0.0.0
 External Route Tag: 701
DellEMC#
```

## Related Commands

- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database network

Display the network (type 2) LSA information.

### Syntax

```
show ip ospf [process-id] database network [link-state-id] [adv-router ip-address]
```

### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- link-state-id*** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
- the network's IP address for Type 3 LSAs or Type 5 LSAs
  - the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- adv-router ip-address*** (OPTIONAL) Enter the keywords `adv-router` and the ip-address to display only the LSA information about that router.

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.4.(0.0)   | Added support for VRF.                    |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.8.1.0     | Added support for Multi-Process OSPF.     |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.1 | Introduced on the E-Series.               |

## Usage Information

The following describes the `show ip ospf process-id database network` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"><li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li><li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li><li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li></ul> |
| LS Type            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Advertising Router | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Checksum           | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                          |
| Length             | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Network Mask       | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Attached Router    | Identifies the IP address of routers attached to the network.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Example

```
DellEMC# show ip ospf 1 data network

 OSPF Router with ID (20.20.20.5) (Process ID 1)

 Network (Area 0.0.0.0)
 LS age: 1372
Options: (No TOS-capability, DC, E)
LS type: Network
Link State ID: 202.10.10.2
Advertising Router: 20.20.20.8
LS Seq Number: 0x80000006
Checksum: 0xa35
Length: 36
Network Mask: /24
 Attached Router: 20.20.20.8
 Attached Router: 20.20.20.9
 Attached Router: 20.20.20.7

 Network (Area 0.0.0.1)

 LS age: 252
Options: (TOS-capability, No DC, E)
LS type: Network
Link State ID: 192.10.10.2
Advertising Router: 192.10.10.2
LS Seq Number: 0x80000007
Checksum: 0x4309
Length: 36
Network Mask: /24
 Attached Router: 192.10.10.2
 Attached Router: 20.20.20.1
 Attached Router: 20.20.20.5
DellEMC#
```

## Related Commands

- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database nssa-external

Display NSSA-External (type 7) LSA information.

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database nssa-external [link-state-id] [adv-router ip-address]
```

### Parameters

- |                                     |                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                           |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view NSSA-External LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                   |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>• the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the <code>ip-address</code> to display only the LSA information about that router.                                                                                                                                                                                                                                 |

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.4.(0.0)   | Added support for VRF.                    |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.8.1.0     | Added support for Multi-Process OSPF.     |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.1 | Introduced on the E-Series.               |

## Related Commands

- 
- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database opaque-area

Display the opaque-area (type 10) LSA information.

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database opaque-area [link-state-id] [adv-router ip-address]
```

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                           |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view opaque-area LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                     |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>• the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                              |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.4.(0.0)   | Added support for VRF.                    |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.8.1.0     | Added support for Multi-Process OSPF.     |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.1 | Introduced on the E-Series.               |

## Usage Information

The following describes the `show ip ospf process-id database opaque-area` command shown in the following example.

| Item                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the advertising router's ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Checksum</b>           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Opaque Type</b>        | Displays the Opaque type field (the first 8 bits of the Link State ID).                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Opaque ID</b>          | Displays the Opaque type-specific ID (the remaining 24 bits of the Link State ID).                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Example

```
DellEMC> show ip ospf 1 database opaque-area

 OSPF Router with ID (3.3.3.3) (Process ID 1)
 Type-10 Opaque Link Area (Area 0)

LS age: 1133
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.1
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000416
Checksum: 0x376
Length: 28
Opaque Type: 1
Opaque ID: 1
Unable to display opaque data

LS age: 833
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.2
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000002
Checksum: 0x19c2
--More--
```

## Related Commands

- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database opaque-as

Display the opaque-as (type 11) LSA information.

### Syntax

```
show ip ospf process-id database opaque-as [link-state-id] [adv-router ip-address]
```

### Parameters

- |                                     |                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                           |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>• the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                              |

#### Usage Information

The following describes the `show ip ospf process-id database router` command shown in the following example.

| Item                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LS Seq Number</b>      | Displays the link state sequence number. This number detects duplicate or old LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Checksum</b>           | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Number of Links</b>    | Displays the number of active links to the type of router (Area Border Router or AS Boundary Router) listed in the previous line.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Link connected to:</b> | Identifies the type of network to which the router is connected.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>(Link ID)</b>          | Identifies the link type and address.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>(Link Data)</b>        | Identifies the router interface address.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Item                        | Description                        |
|-----------------------------|------------------------------------|
| <b>Number of TOS Metric</b> | Lists the number of TOS metrics.   |
| <b>TOS 0 Metric</b>         | Lists the number of TOS 0 metrics. |

### Example

```
DelleMC# show ip ospf 100 database router
 OSPF Router with ID (1.1.1.10) (Process ID 100)
 Router (Area 0)
LS age: 967
Options: (No TOS-capability, No DC, E)
LS type: Router
Link State ID: 1.1.1.10
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000012f
Checksum: 0x3357
Length: 144
AS Boundary Router
Area Border Router
 Number of Links: 10
Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.129.1
 (Link Data) Router Interface address: 192.68.129.1
 Number of TOS metric: 0
 TOS 0 Metric: 1
Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.130.1
 (Link Data) Router Interface address: 192.68.130.1
 Number of TOS metric: 0
 TOS 0 Metric: 1
Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.142.2
 (Link Data) Router Interface address: 192.68.142.2
 Number of TOS metric: 0
 TOS 0 Metric: 1
Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.141.2
 (Link Data) Router Interface address: 192.68.141.2
 Number of TOS metric: 0
 TOS 0 Metric: 1
Link connected to: a Transit Network
 (Link ID) Designated Router address: 192.68.140.2
 (Link Data) Router Interface address: 192.68.140.2
 Number of TOS metric: 0
 TOS 0 Metric: 1
Link connected to: a Stub Network
 (Link ID) Network/subnet number: 11.1.5.0

```

### Related Commands

- [show ip ospf database](#) — display OSPF database information.

## show ip ospf database summary

Display the network summary (type 3) LSA routing information.

**Syntax** `show ip ospf [process-id | vrf vrf-name ] database summary [link-state-id] [adv-router ip-address]`

**Parameters**

**process-id** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

**vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to view LSA routing information corresponding to the OSPF process that is tied to a specific VRF.

**link-state-id** (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:

- the network's IP address for Type 3 LSAs or Type 5 LSAs
- the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

**adv-router ip-address** (OPTIONAL) Enter the keywords `adv-router` then the IP address of an Advertising Router to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.4.(0.0)   | Added support for VRF.                    |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.8.1.0     | Added support for Multi-Process OSPF.     |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.1 | Introduced on the E-Series.               |

**Usage Information** The following describes the `show ip ospf process-id database summary` command shown in the following example.

| Item                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LS Age</b>             | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| <b>LS Type</b>            | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Link State ID</b>      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertising Router</b> | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LS Seq Number</b>      | Displays the link state sequence number. This number allows you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Checksum</b>           | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Length</b>             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Network Mask</b>       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>TOS</b>                | Displays the TOS options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Metric</b>             | Displays the LSA metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Example

```
DellEMC# show ip ospf 100 database summary
 OSPF Router with ID (1.1.1.10) (Process ID 100)
 Summary Network (Area 0.0.0.0)
LS age: 1551
Options: (No TOS-capability, DC, E)
LS type: Summary Network
Link State ID: 192.68.16.0
Advertising Router: 192.168.17.1
LS Seq Number: 0x80000054
Checksum: 0xb5a2
Length: 28
Network Mask: /24
 TOS: 0 Metric: 1

LS age: 9
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.32.0
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000016
Checksum: 0x987c
Length: 28
Network Mask: /24
 TOS: 0 Metric: 1

LS age: 7
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.33.0
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000016
Checksum: 0x1241
Length: 28
Network Mask: /26
```

```
TOS: 0 Metric: 1
DellEMC#
```

## Related Commands

- [show ip ospf database](#) — display OSPF database information.

# show ip ospf interface

Display the OSPF interfaces configured. If OSPF is not enabled on the switch, no output is generated.

## Syntax

```
show ip ospf [process-id | vrf vrf-name] interface [interface]
```

## Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword `vrf` followed by the name of the VRF to show the OSPF processes that are tied to a specific VRF.
- interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4.(0.0)  | Added support for VRF.                    |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version     | Description                           |
|-------------|---------------------------------------|
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

## Usage Information

The following describes the `show ip ospf process-id interface` command shown in the following example.

| Item                          | Description                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GigabitEthernet..</b><br>. | This line identifies the interface type slot/port and the status of the OSPF protocol on that interface.                                    |
| <b>Internet Address...</b>    | This line displays the IP address, network mask and area assigned to this interface.                                                        |
| <b>Process ID...</b>          | This line displays the OSPF Process ID, Router ID, Network type and cost metric for this interface.                                         |
| <b>Transmit Delay...</b>      | This line displays the interface's settings for Transmit Delay, State, and Priority. In the State setting, BDR is Backup Designated Router. |
| <b>Designated Router...</b>   | This line displays the ID of the Designated Router and its interface address.                                                               |
| <b>Backup Designated...</b>   | This line displays the ID of the Backup Designated Router and its interface address.                                                        |
| <b>Timer intervals...</b>     | This line displays the interface's timer settings for Hello interval, Dead interval, Transmit Delay (Wait), and Retransmit Interval.        |
| <b>Hello due...</b>           | This line displays the amount time until the next Hello packet is sent out this interface.                                                  |
| <b>Neighbor Count...</b>      | This line displays the number of neighbors and adjacent neighbors. Listed below this line are the details about each adjacent neighbor.     |

## Example

```
DellEMC> show ip ospf int

TenGigabitEthernet 1/7/1 is up, line protocol is up
 Internet Address 192.168.1.2/30, Area 0.0.0.1
 Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
 Transmit Delay is 1 sec, State DR, Priority 1
 Designated Router (ID) 192.168.253.2, Interface address 192.168.1.2
 Backup Designated Router (ID) 192.168.253.1, Interface address
192.168.1.1
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Neighbor Count is 1, Adjacent neighbor count is 1
 Adjacent with neighbor 192.168.253.1 (Backup Designated Router)

TenGigabitEthernet 1/8/1 is up, line protocol is up
 Internet Address 192.168.0.1/24, Area 0.0.0.1
 Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
 Transmit Delay is 1 sec, State DROTHER, Priority 1
 Designated Router (ID) 192.168.253.5, Interface address 192.168.0.4

## show ip ospf neighbor

Display the OSPF neighbors connected to the local router.

|                   |                                                                 |                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show ip ospf [process-id   vrf vrf-name ] neighbor</code> |                                                                                                                                                             |
| <b>Parameters</b> | <b>process-id</b>                                               | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                          |
|                   | <b>vrf vrf-name</b>                                             | Enter the keyword <code>vrf</code> followed by the name of the VRF to show information corresponding to the OSPF neighbors that are tied to a specific VRF. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                               |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>   | Added support for VRF.                    |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000..                 |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.8.1.0</b>     | Added support for Multi-Process OSPF.     |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.1.1.1</b> | Introduced on the E-Series.               |

**Usage Information** The following describes the `show ip ospf process-id neighbor` command shown in the following example.

| Item               | Description                              |
|--------------------|------------------------------------------|
| <b>Neighbor ID</b> | Displays the neighbor router ID.         |
| <b>Pri</b>         | Displays the priority assigned neighbor. |
| <b>State</b>       | Displays the OSPF state of the neighbor. |

| Item             | Description                                                              |
|------------------|--------------------------------------------------------------------------|
| <b>Dead Time</b> | Displays the expected time until the Dell OS declares the neighbor dead. |
| <b>Address</b>   | Displays the IP address of the neighbor.                                 |
| <b>Interface</b> | Displays the interface type slot/port information.                       |
| <b>Area</b>      | Displays the neighbor's area (process ID).                               |

### Example

```
DellEMC# show ip ospf 34 neighbor

Neighbor ID Pri State Dead Time Address Interface Area
20.20.20.7 1 FULL/DR 00:00:32 182.10.10.3 Te 1/1/1 0.0.0.2
192.10.10.2 1 FULL/DR 00:00:37 192.10.10.2 Te 1/2/1 0.0.0.1
20.20.20.1 1 FULL/DROTHER 00:00:36 192.10.10.4 Te 1/3/1 0.0.0.1
DellEMC#
```

## show ip ospf routes

Display routes OSPF calculates and stores in OSPF RIB.

**Syntax** `show ip ospf [process-id | vrf vrf-name ] routes`

**Parameters**

***process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

***vrf vrf-name*** Enter the keyword `vrf` followed by the name of the VRF to show the OSPF RIB information corresponding to the OSPF processes that are tied to a specific VRF.

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>  | Added support for VRF.                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version | Description                              |
|---------|------------------------------------------|
| 7.8.1.0 | Added support for Multi-Process OSPF.    |
| 7.6.1.0 | Introduced on the S-Series.              |
| 7.5.1.0 | Introduced on the C-Series and E-Series. |

### Usage Information

This command is useful in isolating routing problems between the OSPF and the RTM. For example, if a route is missing from the RTM/FIB but is visible from the display output of this command, the problem is with downloading the route to the RTM.

This command has the following limitations:

- The display output is sorted by prefixes; intra-area ECMP routes are not displayed together.
- For Type 2 external routes, Type 1 cost is not displayed.

**NOTE:** Starting with Version 9.4(0.0), the loopback IP address advertised to the neighbor is not displayed in the output because they are not accounted as inactive OSPF routes, whereas the loopback IP address is displayed until Dell EMC Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the `show ip ospf routes` command displays the interface and area ID information of connected networks in addition to the other settings, whereas these details are not displayed until Dell EMC Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the metric of E2 routes in the output is displayed as an external metric, whereas until Dell EMC Networking OS Version 9.3(0.0), the number of hops to the ASBR for E2 routes are displayed in the output.

### Example

```
DellEMC# show ip ospf 100 route
```

| Prefix        | Cost | Nexthop  | Interface | Area | Type       |
|---------------|------|----------|-----------|------|------------|
| 1.1.1.1       | 1    | 0.0.0.0  | Lo 0      | 0    | Intra-Area |
| 3.3.3.3       | 2    | 13.0.0.3 | Te 1/4/1  | 1    | Intra-Area |
| 13.0.0.0      | 1    | 0.0.0.0  | Te 1/4/1  | 0    | Intra-Area |
| 150.150.150.0 | 2    | 13.0.0.3 | Te 1/4/1  | -    | External   |
| 172.30.1.0    | 2    | 13.0.0.3 | Te 1/4/1  | 1    | Intra-Area |

```
DellEMC#
```

## show ip ospf statistics

Display OSPF statistics.

### Syntax

```
show ip ospf [process-id | vrf vrf-name] statistics global | [interface name {neighbor router-id}]
```

### Parameters

- process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name*** Enter the keyword `vrf` followed by the name of the VRF to display statistics corresponding to the OSPF process that is tied to a specific VRF.
- global*** Enter the keyword `global` to display the packet counts received on all running OSPF interfaces and packet counts OSPF neighbors receive and transmit.
- interface name*** (OPTIONAL) Enter the keyword `interface` then one of the following interface keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**neighbor *router-id*** (OPTIONAL) Enter the keyword `neighbor` then the neighbor's router-id in dotted decimal format (A.B.C.D.).

**Defaults** None

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Added support for Multi-Process OSPF.     |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

**Usage Information** The following describes the `show ip ospf statistics process-id global` command shown in the following example.

| Row Heading    | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| <b>Total</b>   | Displays the total number of packets the OSPF process receives/transmits.              |
| <b>Error</b>   | Displays the error count while receiving and transmitting packets by the OSPF process. |
| <b>Hello</b>   | Number of OSPF Hello packets.                                                          |
| <b>DDiscr</b>  | Number of database description packets.                                                |
| <b>LSReq</b>   | Number of link state request packets.                                                  |
| <b>LSUpd</b>   | Number of link state update packets.                                                   |
| <b>LSAck</b>   | Number of link state acknowledgement packets.                                          |
| <b>TxQ-Len</b> | The transmission queue length.                                                         |
| <b>RxQ-Len</b> | The reception queue length.                                                            |
| <b>Tx-Mark</b> | The highest number mark in the transmission queue.                                     |

| Row Heading    | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Rx-Mark</b> | The highest number mark in the reception queue.                                                                         |
| <b>Hello-Q</b> | The queue, for transmission or reception, for the hello packets.                                                        |
| <b>LSR-Q</b>   | The queue, for transmission or reception, for the link state request packets.                                           |
| <b>Other-Q</b> | The queue, for transmission or reception, for the link state acknowledgement, database description, and update packets. |

The following describes the error definitions for the `show ip ospf statistics process-id global` command.

| Error Type          | Description                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <b>Intf_Down</b>    | Received packets on an interface that is either down or OSPF is not enabled.                        |
| <b>Non-Dr</b>       | Received packets with a destination address of ALL_DRS even though SELF is not a designated router. |
| <b>Self-Org</b>     | Receive the self originated packet.                                                                 |
| <b>Wrong_Len</b>    | The received packet length is different to what was indicated in the OSPF header.                   |
| <b>Invld-Nbr</b>    | LSA, LSR, LSU, and DDB are received from a peer which is not a neighbor peer.                       |
| <b>Nbr-State</b>    | LSA, LSR, and LSU are received from a neighbor with stats less than the loading state.              |
| <b>Auth-Error</b>   | Simple authentication error.                                                                        |
| <b>MD5-Error</b>    | MD5 error                                                                                           |
| <b>Cksum-Err</b>    | Checksum Error                                                                                      |
| <b>Version</b>      | Version mismatch                                                                                    |
| <b>AreaMismatch</b> | Area mismatch                                                                                       |
| <b>Conf-Issue</b>   | The received hello packet has a different hello or dead interval than the configuration.            |
| <b>No-Buffer</b>    | Buffer allocation failure.                                                                          |
| <b>Seq-no</b>       | A sequence no errors occurred during the database exchange process.                                 |
| <b>Socket</b>       | Socket Read/Write operation error.                                                                  |
| <b>Q-overflow</b>   | Packets dropped due to queue overflow.                                                              |
| <b>Unknown-Pkt</b>  | Received packet is not an OSPF packet.                                                              |

### Example

```
DellEMC# show ip ospf 1 statistics global

OSPF Packet Count
 Total Error Hello DDiscr LSReq LSUpd LSAck
RX 10 0 8 2 0 0 0
TX 10 0 10 0 0 0 0

```

### Usage Information

The `show ip ospf process-id statistics` command displays the error packet count received on each interface as:

- The hello-timer remaining value for each interface
- The wait-timer remaining value for each interface
- The grace-timer remaining value for each interface
- The packet count received and transmitted for each neighbor
- Dead timer remaining value for each neighbor
- Transmit timer remaining value for each neighbor
- The LSU Q length and its highest mark for each neighbor
- The LSR Q length and its highest mark for each neighbor

### Example (Statistics)

```
DellEMC(conf-if-te-1/6/1)# do show ip ospf statistics
Interface TenGigabitEthernet 1/6/1
Error packets (Receive statistics)

DellEMC(conf-if-te-1/6/1)#
```

### Related Commands

- [clear ip ospf statistics](#) — clear the packet statistics in all interfaces and neighbors.

## show ip ospf timers rate-limit

Show the LSA currently in the queue waiting for timers to expire.

### Syntax

```
show ip ospf [process-id] timers rate-limit
```

### Parameters

***process-id*** Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

### Defaults

None

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4(0.0)   | Added support for VRF.                    |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.8.0    | Introduced on the S4810.                  |

### Example

```
DellEMC# show ip ospf 10 timers rate-limit

List of LSAs in rate limit Queue
LSA id: 1.1.1.0 Type: 3 Adv Rtid: 3.3.3.3 Expiry time: 00:00:09.111
LSA id: 3.3.3.3 Type: 1 Adv Rtid: 3.3.3.3 Expiry time: 00:00:23.96
DellEMC#
```

## show ip ospf topology

Display routers in directly connected areas.

|                        |                                                                                                                                                               |                                                                                                                                    |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show ip ospf [ <i>process-id</i> ] topology                                                                                                                   |                                                                                                                                    |
| <b>Parameters</b>      | <b><i>process-id</i></b>                                                                                                                                      | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
| <b>Defaults</b>        | None                                                                                                                                                          |                                                                                                                                    |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                |                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                                    |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version           | Description                              |
|-------------------|------------------------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.              |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.              |
| <b>9.4.(0.0)</b>  | Added support for VRF.                   |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                 |
| <b>9.0.2.0</b>    | Introduced on the S6000.                 |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                 |
| <b>7.8.1.0</b>    | Added support for Multi-Process OSPF.    |
| <b>7.6.1.0</b>    | Introduced on the S-Series.              |
| <b>7.5.1.0</b>    | Introduced on the C-Series and E-Series. |

**Usage Information**

To isolate problems with inter-area and external routes, use this command. In OSPF inter-area and external routes are calculated by adding LSA cost to the cost of reaching the router. If an inter-area or external route is not of correct cost, the display can determine if the path to the originating router is correct or not.

**Example**

```
DellEMC# show ip ospf 1 topology

Router ID Flags Cost Nexthop Interface Area
3.3.3.3 E/B/-/ 1 20.0.0.3 Te 1/1/1 0
1.1.1.1 E/-/-/ 1 10.0.0.1 Gi 1/1/7 1
DellEMC#
```

## summary-address

To advertise one external route, set the OSPF ASBR.

**Syntax**

`summary-address ip-address mask [not-advertise] [tag tag-value]`

To disable summary address, use the `no summary-address ip-address mask` command.

**Parameters**

- ip-address** Specify the IP address in dotted decimal format of the address to summarize.
- mask** Specify the mask in dotted decimal format of the address to summarize.
- not-advertise** (OPTIONAL) Enter the keywords `not-advertise` to suppress that match the network prefix/mask pair.
- tag tag-value** (OPTIONAL) Enter the keyword `tag` then a value to match on routes redistributed through a route map. The range is from 0 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |

| <b>8.3.11.1</b>    | Introduced on the Z9000.              |
| <b>8.3.7.0</b>     | Introduced on the S4810.              |
| <b>7.8.1.0</b>     | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>     | Introduced on the S-Series.           |
| <b>7.5.1.0</b>     | Introduced on the C-Series.           |
| <b>pre-6.1.1.1</b> | Introduced on the E-Series.           |

#### Usage Information

The `area range` command summarizes routes for the different areas.

With the `not-advertise` parameter configured, you can use this command to filter out some external routes. For example, if you want to redistribute static routes to OSPF, but you don't want OSPF to advertise routes with prefix 1.1.0.0, you can configure the `summary-address 1.1.0.0 255.255.0.0 not-advertise` to filter out all the routes fall in range 1.1.0.0/16.

#### Related Commands

- [area range](#) — summarize routes within an area.

## timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

#### Syntax

```
timers spf delay holdtime msec
```

To return to the default, use the `no timers spf` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>delay</i></b>    | Enter a number as the delay. The range is from 0 to 2147483647. The default is <b>5 seconds</b> .                                                                                                                                                                                            |
| <b><i>holdtime</i></b> | Enter a number as the hold time. The range is from 0 to 2147483647. The default is <b>10 seconds</b> .                                                                                                                                                                                       |
| <b><i>msec</i></b>     | Enter the keyword <code>msec</code> to specify the time interval value in milli seconds.<br> <b>NOTE:</b> If you do not specify the <code>msec</code> option, the timer values are considered as seconds. |

#### Defaults

- `delay` = 5 seconds
- `holdtime` = 10 seconds

**Command Modes** ROUTER OSPFv2

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                |
|-------------|--------------------------------------------|
| 9.11.0.0    | Introduced the keyword <code>msec</code> . |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0)   | Introduced on the S3148.                   |
| 9.10(0.0)   | Introduced on the S6100-ON.                |
| 9.8(2.0)    | Introduced on the S3100 series.            |
| 9.8(1.0)    | Introduced on the Z9100-ON.                |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                |
| 9.7(0.0)    | Introduced on the S6000-ON.                |
| 9.2(1.0)    | Introduced on the Z9500.                   |
| 9.0.2.0     | Introduced on the S6000.                   |
| 8.3.19.0    | Introduced on the S4820T.                  |
| 8.3.11.1    | Introduced on the Z9000.                   |
| 8.3.7.0     | Introduced on the S4810.                   |
| 7.8.1.0     | Added support for Multi-Process OSPF.      |
| 7.6.1.0     | Introduced on the S-Series.                |
| 7.5.1.0     | Introduced on the C-Series.                |
| pre-6.1.1.1 | Introduced on the E-Series.                |

**Usage Information**

Setting the *delay* and *holdtime* parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

**Example**

```
DelleMC# conf
DelleMC(conf)# router ospf 1
DelleMC(conf-router_ospf-1)# timer spf 2 5 msec
DelleMC(conf-router_ospf-1)# show config
!
router ospf 1
timers spf 2 5 msec
DelleMC(conf-router_ospf-1)# end
```

## timers throttle lsa all

Configure LSA transmit intervals.

**Syntax**

`timers throttle lsa all {start-interval | hold-interval | max-interval}`

To return to the default, use the `no timers throttle lsa` command.

**Parameters**

- start-interval** Set the minimum interval between initial sending and resending the same LSA. The range is from 0 to 600,000 milliseconds.
- hold-interval** Set the next interval to send the same LSA. This interval is the time between sending the same LSA after the start-interval has been attempted. The range is from 1 to 600,000 milliseconds.
- max-interval** Set the maximum amount of time the system waits before sending the LSA. The range is from 1 to 600,000 milliseconds.

- Defaults**
- start-interval: **0 msec**
  - hold-interval: **5000 msec**
  - max-interval: **5000 msec**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>9.0.2.0</b>    | Introduced on the S6000..                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.8.0</b>    | Introduced on the S4810.                  |

**Usage Information** LSAs are sent after the start-interval and then after hold-interval until the maximum interval is reached. In throttling, exponential backoff is used when sending same LSA, so that the interval is multiplied until the maximum time is reached. For example, if the *start-interval 5000* and *hold-interval 1000* and *max-interval 100,000*, the LSA is sent at 5000 msec, then 1000 msec, then 2000 msec, then 4000 until 100,000 msec is reached.

## timers throttle lsa arrival

Configure the LSA acceptance intervals.

**Syntax** `timers throttle lsa arrival arrival-time`

To return to the default, use the `no timers throttle lsa` command.

**Parameters** **arrival-time** Set the interval between receiving the same LSA repeatedly, to allow sufficient time for the system to accept the LSA. The range is from 0 to 600,000 milliseconds.

**Defaults** **1000 msec**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## OSPFv3 Commands

Open shortest path first version 3 (OSPFv3) for IPv6 is supported on the platform.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) remain unchanged. However, OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis. Most changes were necessary to handle the increased address size of IPv6.

The Dell EMC Networking OS implementation of OSPFv3 is based on IETF RFC 2740.

### area authentication

Configure an IPsec authentication policy for OSPFv3 packets in an OSPFv3 area.

|                   |                                                                                                                       |                                                                                                                                                                                                                                                     |

| <b>9.1.(0.0)</b>  | Introduced on the S4810 and Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.4.2.0</b>    | Introduced on the E-Series.               |

**Usage Information**

Before you enable IPsec authentication on an OSPFv3 area, you must first enable OSPFv3 globally on the router. Configure the same authentication policy (same SPI and key) on each interface in an OSPFv3 link. An SPI number must be unique to one IPsec security policy (authentication or encryption) on the router.

If you have enabled IPsec encryption in an OSPFv3 area with the `area encryption` command, you cannot use the `area authentication` command in the area at the same time.

The configuration of IPsec authentication on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area authentication policy that has been configured is applied to the interface.

To remove an IPsec authentication policy from an OSPFv3 area, enter the `no area area-id authentication spi number` command.

**Related Commands**

- [ipv6 ospf authentication](#) – configure an IPsec authentication policy on an OSPFv3 interface.
- [show crypto ipsec policy](#) – display the configuration of IPsec authentication policies.

## area encryption

Configure an IPsec encryption policy for OSPFv3 packets in an OSPFv3 area.

**Syntax**

```
area area-id encryption ipsec spi number esp encryption-algorithm [key-encryption-type] key authentication-algorithm [key-encryption-type] key
```

**Parameters**

**area *area-id*** Area for which OSPFv3 traffic is to be encrypted. For *area-id*, enter a number. The range is from 0 to 4294967295.

**ipsec spi *number*** Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.

**esp encryption-algorithm** Encryption algorithm used with ESP. Valid values are: 3DES, DES, AES-CBC, and NULL. For AES-CBC, only the AES-128 and AES-192 ciphers are supported.

|                                 |                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>key-encryption-algorithm</b> | (OPTIONAL) Specifies if the key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                                            |
| <b>key</b>                      | Text string used in encryption.<br><br>The required lengths of a non-encrypted or encrypted key are:<br>3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.                |
| <b>authentication-algorithm</b> | Specifies the authentication algorithm to use for encryption.<br>Valid values are MD5 or SHA1.                                                                                                                                                              |
| <b>key-encryption-type</b>      | (OPTIONAL) Specifies if the authentication key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                             |
| <b>key</b>                      | Text string used in authentication.<br><br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).<br><br>For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted). |
| <b>null</b>                     | Causes an encryption policy configured for the area to not be inherited on the interface.                                                                                                                                                                   |

**Defaults** Not configured.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

**Usage Information**

Before you enable IPsec encryption on an OSPFv3 interface, first enable OSPFv3 globally on the router. Configure the same encryption policy (same SPI and keys) on each interface in an OSPFv3 link.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router.

When you configure encryption for an OSPFv3 area with the `area encryption` command, you enable both IPsec encryption and authentication. However, when you enable authentication on an area with the `area authentication` command, you do not enable encryption at the same time.

If you have enabled IPsec authentication in an OSPFv3 area with the `area authentication` command, you cannot use the `area encryption` command in the area at the same time.

The configuration of IPsec encryption on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area encryption policy that has been configured is applied to the interface.

To remove an IPsec encryption policy from an interface, enter the `no area area-id encryption spi number` command.

#### Related Commands

- [ipv6 ospf encryption](#) – configure an IPsec encryption policy on an OSPFv3 interface.
- [show crypto ipsec policy](#) – display the configuration of IPsec encryption policies.

## area nssa

Specify an area as a not so stubby area (NSSA).

**Syntax** `area area-id nssa [default-information-originate] [no-redistribution] [no-summary]`

To delete an NSSA, use the `no area area-id nssa` command.

#### Parameters

|                                      |                                                                                                                                                                                                                              |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>area-id</i></b>                | Specify the OSPF area by entering a number from zero (0) to 65535.                                                                                                                                                           |
| <b>no-redistribution</b>             | (OPTIONAL) Specify that the <code>redistribute</code> command does not distribute routes into the NSSA. This command can be used when the router is an autonomous system boundary router (ASBR) or area border router (ABR). |
| <b>default-information-originate</b> | (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.                                                                                                                         |
| <b>no-summary</b>                    | (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.                                                                                                                                                        |

**Defaults** Not configured.

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                    |
| <b>8.3.7.0</b>    | Introduced on the S4810.                    |
| <b>7.8.1.0</b>    | Added support for the Multi-Process OSPF.   |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                 |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## auto-cost

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

### S6000-ON

|                        |                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>auto-cost [reference-bandwidth ref-bw]</pre> <p>To return to the default bandwidth or to assign cost based on the interface type, use the <code>no auto-cost [reference-bandwidth ref-bw]</code> command.</p> |
| <b>Parameters</b>      | <p><b>ref-bw</b> (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is <b>100 megabits per second</b>.</p>                                               |
| <b>Defaults</b>        | <b>100 megabits per second.</b>                                                                                                                                                                                    |
| <b>Command Modes</b>   | ROUTER OSPFv3                                                                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                      |

| Version   | Description                                                                            |
|-----------|----------------------------------------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                              |
| 9.9(0.0)  | Introduced on the S6000-ON, S6000, S4820T, S4810, S5000, Z9500, S3048-ON, and S4048-ON |

### Usage Information

#### Example

```
DellEMC# show running-config ospf
!
ipv6 router ospf 10
 log-adjacency-changes
 auto-cost reference-bandwidth 2000
DellEMC(conf-ipv6-router_ospf)# auto-cost reference-bandwidth ?
<1-4294967> Reference bandwidth in Mbits/second (default =
100)
DellEMC(conf-ipv6-router_ospf)# no auto-cost ?
reference-bandwidth Use reference bandwidth method to assign OSPF
cost
<cr>
DellEMC(conf-ipv6-router_ospf)#
```

## clear ipv6 ospf process

Reset an OSPFv3 router process without removing or re-configuring the process.

|               |                                                     |
|---------------|-----------------------------------------------------|
| <b>Syntax</b> | <code>clear ipv6 ospf [vrf vrf-name] process</code> |
|---------------|-----------------------------------------------------|

**Parameters**      **vrf vrf-name**      (Optional) Enter the keyword `vrf` followed by the name of the VRF to clear IPv6 routes corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Added support for VRF.                    |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 7.8.1.0    | Added support for C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

## debug ipv6 ospf bfd

Display debug information and interface types for bidirectional forwarding detection (BFD) on OSPF IPv6 packets.

**Syntax**      `[no] debug ipv6 ospf bfd [interface] [vrf vrf-name]`

**Parameters**

**interface**      (OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**vrf vrf-name**      Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

**Command Modes**      EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description             |
|-------------|-------------------------|
| 9.11(2.1P1) | Introduced VRF support. |

| Version    | Description                                 |
|------------|---------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.   |
| 9.10(0.0)  | Introduced on the S3148.                    |
| 9.10(0.0)  | Introduced on the S6100-ON.                 |
| 9.8(2.0)   | Introduced on the S3100 series.             |
| 9.8(1.0)   | Introduced on the Z9100-ON.                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                 |
| 9.2(1.0)   | Introduced on the Z9500.                    |
| 9.2.(0.0)  | Introduced on the S4820T, S4810, and Z9000. |

### Usage Information

The following section describes the command fields.

| Lines Beginning With or Including | Description                                                |
|-----------------------------------|------------------------------------------------------------|
| OSPFv3...                         | Debugging is on for all OSPFv3 packets and all interfaces. |
| 05:21:01                          | Displays the time stamp.                                   |
| Sending Ver:3                     | Sending OSPF3 version..                                    |

### Example

```
DellEMC(conf-if-te-1/2/1)# do debug ipv6 ospf bfd te 1/2/1

```

## debug ipv6 ospf events

Display debug information and interface types on OSPF IPv6 events.

**Syntax** `debug ipv6 ospf events [interface] [vrf vrf-name]`

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b>    | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> to view debugging information on OSPF corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.1.(0.0)</b>  | Introduced on the S4810 and Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>7.8.1.0</b>    | Added support for C-Series.               |
| <b>7.4.1.0</b>    | Introduced on E-Series.                   |

### Example

```
DellEMC# debug ipv6 ospf packet
OSPFv3 packet related debugging is on for all interfaces
05:21:01 : OSPFv3: Sending, Ver:3, Type:1(Hello), Len:40, Router

| <b>Beginning With or Including</b> |                                                                                                                                                                                                                                                         |
| <b>OSPFv3...</b>                   | Debugging is on for all OSPFv3 packets and all interfaces.                                                                                                                                                                                              |
| <b>05:21:01</b>                    | Displays the time stamp.                                                                                                                                                                                                                                |
| <b>Sending Ver:3</b>               | Sending OSPF3 version..                                                                                                                                                                                                                                 |
| <b>type:</b>                       | Displays the type of packet sent: <ul style="list-style-type: none"> <li>• 1 - Hello packet</li> <li>• 2 - database description</li> <li>• 3 - link state request</li> <li>• 4 - link state update</li> <li>• 5 - link state acknowledgement</li> </ul> |
| <b>Length:</b>                     | Displays the OSPFv3 packet length.                                                                                                                                                                                                                      |
| <b>Router ID:</b>                  | Displays the OSPFv3 router ID.                                                                                                                                                                                                                          |
| <b>Area ID:</b>                    | Displays the OSPFv3 area ID.                                                                                                                                                                                                                            |
| <b>Chksum:</b>                     | Displays the OSPFv3 checksum.                                                                                                                                                                                                                           |

## debug ipv6 ospf packet

Display debug information and interface types on OSPF IPv6 packets.

**Syntax** `debug ipv6 ospf packet [interface] [vrf vrf-name] [detail]`

| Parameters          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b>    | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> to view debugging information on OSPF corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>detail</b>       | Enter the keyword <code>detail</code> to view detailed debugging information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version         | Description                                                           |
|-----------------|-----------------------------------------------------------------------|
| <b>9.14.1.0</b> | The <code>detail</code> option is introduced on the S4810 and S4820T. |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.13(0.0)</b>  | Added support for detailed debugging.     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.1.(0.0)</b>  | Introduced on the S4810 and Z9000.        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>7.8.1.0</b>    | Added support for C-Series.               |
| <b>7.4.1.0</b>    | Introduced on E-Series.                   |

### Example

```
DellEMC# debug ipv6 ospf packet
OSPFv3 packet related debugging is on for all interfaces
05:21:01 : OSPFv3: Sending, Ver:3, Type:1(Hello), Len:40, Router
ID:223.255.255.254, Area ID:0, Inst:0, on Po 255
05:21:03 : OSPFv3: Received, Ver:3, Type:1(Hello), Len:40, Router
ID:223.255.255.255, Area ID:0, Chksum:a177, Inst:0, from Vl 100
05:20:25 : OSPFv3: Sending, Ver:3, Type:4(LS Update), Len:580, Router
ID:223.255.255.254, Area ID:0, Inst:0, on Vl 1000
07:21:40 : OSPFv3: Received, Ver:3, Type:1(Hello), Len:40, Router

## default-information originate

Configure the Dell EMC Networking OS to generate a default external route into an OSPFv3 routing domain.

**Syntax** `default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]`

To return to the default values, use the `no default-information originate` command.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b>always</b> (OPTIONAL) Enter the keyword <code>always</code> to specify that default route information must always be advertised.</p> <p><b>metric <i>metric-value</i></b> (OPTIONAL) Enter the keyword <code>metric</code> then a number to configure a metric value for the route. The range is from 1 to 16777214.</p> <p><b>metric-type <i>type-value</i></b> (OPTIONAL) Enter the keywords <code>metric-type</code> then an OSPFv3 link state type of 1 or 2 for default routes. The values are:</p> <ul style="list-style-type: none"> <li>• 1 = Type 1 external route</li> <li>• 2 = Type 2 external route</li> </ul> <p><b>route-map <i>map-name</i></b> (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map.</p> |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** Disabled.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                        |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |

| Version    | Description                        |
|------------|------------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series.    |
| 9.8(1.0)   | Introduced on the Z9100-ON.        |
| 9.8(0.0P5) | Introduced on the S4048-ON.        |
| 9.8(0.0P2) | Introduced on the S3048-ON.        |
| 9.2(1.0)   | Introduced on the Z9500.           |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000. |
| 8.3.19.0   | Introduced on the S4820T.          |
| 7.8.1.0    | Added support for C-Series.        |
| 7.4.1.0    | Introduced on the E-Series.        |

**Related Commands**

- [redistribute](#) — redistribute routes from other routing protocols into OSPFv3.

## graceful-restart grace-period

Enable OSPFv3 graceful restart globally by setting the grace period (in seconds) that an OSPFv3 router's neighbors continues to advertise the router as adjacent during a graceful restart.

**Syntax** `graceful-restart grace-period seconds`  
 To disable OSPFv3 graceful restart, enter `no graceful-restart grace-period`.

**Parameters** **seconds** Time duration, in seconds, that specifies the duration of the restart process before OSPFv3 terminates the process. The range is from 40 to 1800 seconds.

**Defaults** OSPFv3 graceful restart is disabled and functions in a helper-only role.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.4.2.2    | Introduced on the E-Series.               |
| 8.3.19.0   | Introduced on the S4820T.                 |

**Usage Information** By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

To enable OSPFv3 graceful restart, enter the `ipv6 router ospf` command to enter OSPFv3 configuration mode and then configure a grace period using the `graceful-restart grace-period` command. The grace period is the length of time that OSPFv3 neighbors continue to advertise the restarting router as though it is fully adjacent. When graceful restart is enabled (restarting role), an OSPFv3 restarting expects its OSPFv3 neighbors to help when it restarts by not advertising the broken link.

When you enable the `helper-reject` role on an interface with the `ipv6 ospf graceful-restart helper-reject` command, you reconfigure OSPFv3 graceful restart to function in a “restarting-only” role. In a “restarting-only” role, OSPFv3 does not participate in the graceful restart of a neighbor.

## graceful-restart mode

Specify the type of events that trigger an OSPFv3 graceful restart.

**Syntax** `graceful-restart mode {planned-only | unplanned-only}`

To disable graceful restart mode, enter `no graceful-restart mode`.

**Parameters**

- planned-only** (OPTIONAL) Enter the keywords `planned-only` to indicate graceful restart is supported in a planned restart condition only.
- unplanned-only** (OPTIONAL) Enter the keywords `unplanned-only` to indicate graceful restart is supported in an unplanned restart condition only.

**Defaults** OSPFv3 graceful restart supports both planned and unplanned failures.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.4.2.2    | Introduced on the E-Series.               |
| 8.3.19.0   | Introduced on the S4820T.                 |

**Usage Information** OSPFv3 graceful restart supports planned-only and/or unplanned-only restarts. The default is support for both planned and unplanned restarts.

- A planned restart occurs when you enter the `redundancy force-failover rpm` command to force the primary RPM to switch to the backup RPM. During a planned restart, OSPF sends out a Type-11 Grace LSA before the system switches over to the backup RPM.
- An unplanned restart occurs when an unplanned event causes the active RPM to switch to the backup RPM, such as when an active process crashes, the active RPM is removed, or a power failure happens. During an unplanned restart, OSPF sends out a Grace LSA when the backup RPM comes online.

By default, both planned and unplanned restarts trigger an OSPFv3 graceful restart. Selecting one or the other mode restricts OSPFv3 to the single selected mode.

## ipv6 ospf area

Enable IPv6 OSPF on an interface.

|                        |                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 ospf process id area area id</code><br>To disable OSPFv6 routing for an interface, use the <code>no ipv6 ospf process-id area area-id</code> command. |
| <b>Parameters</b>      | <b>process-id</b> Enter the process identification number.<br><b>area area-id</b> Specify the OSPF area. The range is from 0 to 4294967295.                      |
| <b>Defaults</b>        | None                                                                                                                                                             |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .    |

| Version    | Description                                           |
|------------|-------------------------------------------------------|
| 9.14(0.2)  | Increased the area ID value from 65535 to 4294967295. |
| 9.12(1.0)  | Introduced on the S5048F-ON.                          |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.             |
| 9.10(0.0)  | Introduced on the S3148.                              |
| 9.10(0.0)  | Introduced on the S6100-ON.                           |
| 9.8(2.0)   | Introduced on the S3100 series.                       |
| 9.8(1.0)   | Introduced on the Z9100-ON.                           |
| 9.8(0.0P5) | Introduced on the S4048-ON.                           |
| 9.8(0.0P2) | Introduced on the S3048-ON.                           |
| 9.2(1.0)   | Introduced on the Z9500.                              |
| 9.1(0.0)   | Introduced on the S4810 and Z9000.                    |
| 8.3.19.0   | Introduced on the S4820T.                             |
| 7.4.1.0    | Introduced on the E-Series and C-Series.              |

## ipv6 ospf authentication

Configure an IPsec authentication policy for OSPFv3 packets on an IPv6 interface.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ipv6 ospf authentication {null   ipsec spi number {MD5   SHA1} [key-encryption-type] key}}</code>                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b> | <b>null</b> Causes an authentication policy configured for the area to not be inherited on the interface.<br><b>ipsec spi number</b> Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.<br><b>MD5   SHA1</b> Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).<br><b>key-encryption-type</b> (OPTIONAL) Specifies if the key is encrypted. |

Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

**key**

Text string used in authentication.

For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.12(1.0)</b>  | Introduced on the S5048F-ON.              |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.1.(0.0)</b>  | Introduced on S4810 and Z9000.            |
| <b>8.4.2.0</b>    | Introduced on the E-Series.               |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

**Usage Information**

Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same authentication policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec authentication policy from an interface, enter the `no ipv6 ospf authentication spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf authentication null` command.

## ipv6 ospf cost

Explicitly specify the cost of sending a packet on an interface.

**Syntax** `ipv6 ospf interface-cost`

**Parameters** ***interface-cost*** Enter a unsigned integer value expressed as the link-state metric. The range is from 1 to 65535.

**Defaults** Default cost based on the bandwidth.

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 7.8.1.0    | Added support for C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |
| 8.3.19.0   | Introduced on the S4820T.                 |

## Usage Information

In general, the path cost is calculated as:

$10^8 / \text{bandwidth}$

Using this formula, the default path cost is calculated as:

- GigabitEthernet — Default cost is 1
- TenGigabitEthernet — Default cost is 1
- FortygigEthernet — Default cost is 1
- Ethernet — Default cost is 10

## ipv6 ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the time interval elapses, the neighboring routers declare the router down.

### Syntax

```
ipv6 ospf dead-interval seconds
```

To return to the default time interval, use the `no ipv6 ospf dead-interval` command.

### Parameters

***seconds*** Enter the time interval in seconds. The range is from 1 to 65535 seconds.

### Defaults

40 seconds (Ethernet).

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version    | Description                        |
|------------|------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.        |
| 9.8(0.0P2) | Introduced on the S3048-ON.        |
| 9.2(1.0)   | Introduced on the Z9500.           |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000. |
| 7.8.1.0    | Added support for C-Series.        |
| 7.4.1.0    | Introduced on the E-Series.        |
| 8.3.19.0   | Introduced on the S4820T.          |

#### Usage Information

By default, the dead interval is four times longer than the default hello-interval.

#### Related Commands

- [ipv6 ospf hello-interval](#) – specify the time interval between hello packets.

## ipv6 ospf encryption

Configure an IPsec encryption policy for OSPFv3 packets on an IPv6 interface.

#### Syntax

```
ipv6 ospf encryption {null | ipsec spi number esp encryption-algorithm
[key-encryption-type] key authentication-algorithm [key-encryption-type]
key}}
```

#### Parameters

|                                 |                                                                                                                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>null</b>                     | Causes an encryption policy configured for the area to not be inherited on the interface.                                                                                                                                                           |
| <b>ipsec spi number</b>         | Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.                                                                                                                                    |
| <b>esp encryption-algorithm</b> | Encryption algorithm used with ESP.<br>Valid values are: 3DES, DES, AES-CBC, and NULL.<br>For AES-CBC, only the AES-128 and AES-192 ciphers are supported.                                                                                          |
| <b>key-encryption-type</b>      | (OPTIONAL) Specifies if the key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                                    |
| <b>key</b>                      | Text string used in authentication.<br>The required lengths of a non-encrypted or encrypted key are:<br>3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.        |
| <b>authentication-algorithm</b> | Specifies the authentication algorithm to use for encryption. Valid values are MD5 or SHA1.                                                                                                                                                         |
| <b>key-encryption-type</b>      | (OPTIONAL) Specifies if the authentication key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                     |
| <b>key</b>                      | Text string used in authentication.<br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).<br>For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted). |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.12(1.0)  | Introduced on the S5048F-ON.              |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.4.2.0    | Introduced on the E-Series.               |
| 8.3.19.0   | Introduced on the S4820T.                 |

**Usage Information**

Before you enable IPsec encryption on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same encryption policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec encryption policy from an interface, enter the `no ipv6 ospf encryption spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf no ipv6 ospf encryption null` command.

## ipv6 ospf graceful-restart helper-reject

Configure an OSPFv3 interface to not act upon the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

**Syntax**

```
ipv6 ospf graceful-restart helper-reject
```

To disable the helper-reject role, enter `no ipv6 ospf graceful-restart helper-reject`.

**Defaults**

The helper-reject role is not configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version   | Description                        |
|-----------|------------------------------------|
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.4.2.2   | Introduced on E-Series.            |
| 8.3.19.0  | Introduced on the S4820T.          |

### Usage Information

By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

The graceful-restart role command is not supported in OSPFv3. When you enable the helper-reject role on an interface, you reconfigure an OSPFv3 router to function in a “restarting-only” role.

## ipv6 ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

### Syntax

```
ipv6 ospf hello-interval seconds
```

To return to the default time interval, enter `no ipv6 ospf hello-interval`.

### Parameters

**seconds** Enter the time interval in seconds as the time between hello packets. The range is from 1 to 65525 seconds.

### Defaults

10 seconds (Ethernet).

**Command Modes** INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |

| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

|                          |                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Setting a priority of 0 makes the router ineligible for election as a Designated Router or Backup Designated Router.<br>Use this command for interfaces connected to multi-access networks, not point-to-point networks. |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ipv6 router ospf

Enable OSPF for IPv6 router configuration.

|                      |                                                                                                                                                                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ipv6 router ospf process-id [vrf vrf-name]</code><br>To exit OSPF for IPv6, use the <code>no ipv6 router ospf process-id</code> command.                                                                                    |
| <b>Parameters</b>    | <b>process-id</b> Enter the process identification number. The range is from 1 to 65535.<br><b>vrf vrf-name</b> (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF. |
| <b>Defaults</b>      | None                                                                                                                                                                                                                              |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                                                                                                                     |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Added support for VRF.                    |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 7.8.1.0    | Added support for the C-Series.           |
| 7.4.1.0    | Introduced on the E-Series.               |

## maximum-paths

Enable the software to forward packets over multiple paths.

### Syntax

```
maximum-paths number
```

To disable packet forwarding over multiple paths, use the `no maximum-paths` command.

### Parameters

***number*** Specify the number of paths. The range is from 1 to 64. The default is **8** paths.

### Defaults

8

### Command Modes

ROUTER OSPF

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version     | Description                           |
|-------------|---------------------------------------|
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

## max-metric router-lsa

Configure the maximum cost of 65535 on a new router so that it functions as a stub router in the network and OSPF traffic destined to other networks is not forwarded on a path through the router.

### C-Series, E-Series, Z-Series, S4810

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                          |

|                          | <b>8.4.1.3</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Introduced on E-Series ExaScale.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Usage Information</b> | When you bring a new router onto an OSPF network, you can configure the router to function as a stub router by globally reconfiguring the OSPF link cost so that other routers do not use a path that forwards traffic destined to other networks through the new router for a specified time until the router's switching and routing functions are up and running, and the routing tables in network routers have converged.<br><br>By using the <b>max-metric router-lsa</b> command, you force the link cost of all OSPF non-stub links to the maximum link cost (65535). The advertisement of this maximum metric causes other routers to assign a cost to the new router that is higher than the cost of using an alternate path. Because of the high cost assigned to paths that pass through the new router, other routers will not use a path through the router as a transit path to forward traffic to other networks. |                                                                                                                                                                                                                                                                                                                                                                                                          |

Use the **max-metric router-lsa** command to gracefully shut down or reload a router without dropping packets destined for other networks.

**NOTE:** If you enter the **max-metric router-lsa** command without an option (**on-startup announce-time** or **on-startup wait-for-bgp** [*wait-time*]), the maximum metric of 65535 is always announced in LSAs sent by the router.

## Example

### max-metric router-lsa

```
DelleMC(conf)#router ospf 10
DelleMC(conf-router_ospf)#log-adjacency-changes
DelleMC(conf-router_ospf)#network 4.1.1.0/24 area 0
DelleMC(conf-router_ospf)#network 1.1.1.0/24 area 1
DelleMC(conf-router_ospf)#max-metric router-lsa on-startup wait-for-bgp
DelleMC(conf-router_ospf)#exit

DelleMC(conf)#show ip ospf
Routing Process ospf 10 with ID 100.1.1.1 Virtual router default-vrf
Supports only single TOS (TOS0) routes
It is an Area Border Router
Originating router lsas with maximum metric
Time remaining 00:07:07
Condition : On-Startup while BGP is converging for 600 secs. State :
Active
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Convergence Level 0
Min LSA origination 5 secs, Min LSA arrival 1 secs
Number of area in this router is 2, normal 2 stub 0 nssa 0
Area BACKBONE (0)
 Number of interface in this area is 1
 SPF algorithm executed 3 times
Area ranges are
Area 1
 Number of interface in this area is 1
 SPF algorithm executed 3 times
Area ranges are

DelleMC(conf)#show ip ospf database router
Exception Flag: Announcing maximum link costs
LS age: 198
Options: (No TOS-capability, DC)
LS Type: Router Links
Link State ID: 2.1.1.1
Advertising Router: 2.1.1.1
LS Seq Number: 80000005
Checksum: 0x9F5D
Length: 48
Number of Links: 2
```

## passive-interface

Disable (suppress) sending routing updates on an interface.

**Syntax** `passive-interface interface`

To enable sending routing updates on an interface, use the `no passive-interface interface` command.

**Parameters** ***interface*** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Enabled, that is sending of routing updates are enabled by default.

**Command Modes** ROUTER OSPF for OSPFv2  
ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                           |
|-------------------|-------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.             |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                              |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                           |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                       |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                           |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                              |
| <b>9.1.(0.0)</b>  | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                             |
| <b>7.8.1.0</b>    | Added support for the C-Series.                       |
| <b>7.4.1.0</b>    | Introduced on the E-Series.                           |

**Usage Information** By default, no interfaces are *passive*. Routing updates are sent to all interfaces on which the routing protocol is enabled.

If you disable the sending of routing updates on an interface, the particular address prefix continues to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

OSPFv3 for IPv6 routing information is not sent or received through the specified router interface. The specified interface address appears as a stub network in the OSPFv3 for IPv6 domain.

On configuring suppression using the `passive-interface` command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

## redistribute

Redistribute into OSPFv3.

**Syntax** `redistribute {bgp as number}{connected | static}[metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]`

To disable redistribution, use the `no redistribute {connected | static}` command.

**Parameters** **bgp as number** Enter the keyword `bgp` then the autonomous system number.  
The range is from 1 to 65535.

|                                      |                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                     | Enter the keyword <code>connected</code> to redistribute routes from physically connected interfaces.                                                                                                                                                                                     |
| <b>static</b>                        | Enter the keyword <code>static</code> to redistribute manually configured routes.                                                                                                                                                                                                         |
| <b>metric <i>metric-value</i></b>    | Enter the keyword <code>metric</code> then the metric value.<br>The range is from 0 to 16777214.<br>The default is <b>20</b> .                                                                                                                                                            |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then the OSPFv3 link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>• 1 for a type 1 external route</li> <li>• 2 for a type 2 external route</li> </ul> The default is <b>2</b> . |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map. If the route map is not configured, the default is <b>deny</b> (to drop all routes).                                                                                                      |
| <b>tag <i>tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPFv3.<br>The range is from 0 to 4294967295<br>The default is <b>0</b> .                                                                                                                      |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF for OSPFv2  
ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                           |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                       |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                           |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                           |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                              |
| <b>9.1.(0.0)</b>  | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                             |
| <b>7.8.1.0</b>    | Added support for the C-Series.                       |
| <b>7.4.1.0</b>    | Introduced on the E-Series.                           |

**Usage Information** To redistribute the default route (x:x:x:x), use the `default-information originate` command.

## router-id

Designate a fixed router ID.

**Syntax** `router-id ip-address`

To return to the previous router ID, use the `no router-id ip-address` command.

**Parameters** ***ip-address*** Enter the router ID in the dotted decimal format.

**Defaults** The router ID is selected automatically from the set of IPv4 addresses configured on a router.

**Command Modes** ROUTER OSPF for OSPFv2  
ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                           |
|------------|-------------------------------------------------------|
| 9.12(1.0)  | Introduced on the S5048F-ON.                          |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.             |
| 9.10(0.0)  | Introduced on the S3148.                              |
| 9.10(0.0)  | Introduced on the S6100-ON.                           |
| 9.8(2.0)   | Introduced on the S3100 series.                       |
| 9.8(1.0)   | Introduced on the Z9100-ON.                           |
| 9.8(0.0P5) | Introduced on the S4048-ON.                           |
| 9.8(0.0P2) | Introduced on the S3048-ON.                           |
| 9.2(1.0)   | Introduced on the Z9500.                              |
| 9.1.(0.0)  | Introduced support for OSPFv3 on the S4810 and Z9000. |
| 8.3.19.0   | Introduced on the S4820T.                             |
| 7.8.1.0    | Added support for the C-Series.                       |
| 7.4.1.0    | Introduced on the E-Series.                           |

**Usage Information** You can configure an arbitrary value in the IP address for each router. However, each router ID must be unique.

If this command is used on an OSPFv3 process that is already active (has neighbors), all the neighbor adjacencies are brought down immediately and new sessions are initiated with the new router ID.

## show crypto ipsec policy

Display the configuration of IPsec authentication and encryption policies.

**Syntax** `show crypto ipsec policy [name name]`

**Parameters** ***name name*** (OPTIONAL) Displays configuration details about a specified policy.

**Defaults** No default behavior or values.

**Command Modes** EXEC  
EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000.        |
| 8.4.2.0    | Introduced on the E-Series.               |
| 8.3.19.0   | Introduced on the S4820T.                 |

## Usage Information

The `show crypto ipsec policy` command output displays the AH and ESP parameters configured in IPsec security policies, including the SPI number, keys, and algorithms used.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

## Related Commands

[show crypto ipsec sa ipv6](#)— displays the IPsec security associations used on OSPFv3 interfaces.

## Example

```
DellEMC# show crypto ipsec policy

Crypto IPSec client security policy data

Policy name : OSPFv3-1-502
Policy refcount : 1
Inbound ESP SPI : 502 (0x1F6)
Outbound ESP SPI : 502 (0x1F6)
Inbound ESP Auth Key : 123456789a123456789b123456789c12
Outbound ESP Auth Key : 123456789a123456789b123456789c12
Inbound ESP Cipher Key :
123456789a123456789b123456789c123456789d12345678
Outbound ESP Cipher Key :

```

## show crypto ipsec policy Command Fields

| Field                                                     | Description                                                                                          |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Policy name</b>                                        | Displays the name of an IPsec policy.                                                                |
| <b>Policy refcount</b>                                    | Number of interfaces on the router that use the policy.                                              |
| <b>Inbound ESP SPI and Outbound ESP SPI</b>               | The encapsulating security payload (ESP) security policy index (SPI) for inbound and outbound links. |
| <b>Inbound ESP Auth Key and Outbound Auth Key</b>         | The ESP authentication key for inbound and outbound links.                                           |
| <b>Inbound ESP Cipher Key and Outbound ESP Cipher Key</b> | The ESP encryption key for inbound and outbound links.                                               |
| <b>Transform set</b>                                      | The set of security protocols and algorithms used in the policy.                                     |
| <b>Inbound AH SPI and Outbound AH SPI</b>                 | The authentication header (AH) security policy index (SPI) for inbound and outbound links.           |
| <b>Inbound AH Key and Outbound AH Key</b>                 | The AH key for inbound and outbound links.                                                           |

## show crypto ipsec sa ipv6

Display the IPsec security associations (SAs) used on OSPFv3 interfaces.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show crypto ipsec sa ipv6 [interface <i>interface</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>      | <p><b>interface</b><br/><b><i>interface</i></b> (OPTIONAL) Displays information about the SAs used on a specified OSPFv3 interface, where <i>interface</i> is one of the following values:</p> <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>Defaults</b>        | No default behavior or values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Version</b>         | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>9.10(0.1)</b>       | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>9.10(0.0)</b>       | Introduced on the S3148.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Version    | Description                        |
|------------|------------------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON.        |
| 9.8(2.0)   | Introduced on the S3100 series.    |
| 9.8(1.0)   | Introduced on the Z9100-ON.        |
| 9.8(0.0P5) | Introduced on the S4048-ON.        |
| 9.8(0.0P2) | Introduced on the S3048-ON.        |
| 9.2(1.0)   | Introduced on the Z9500.           |
| 9.1.(0.0)  | Introduced on the S4810 and Z9000. |
| 8.4.2.0    | Introduced on the E-Series.        |
| 8.3.19.0   | Introduced on the S4820T.          |

### Usage Information

The `show crypto ipsec sa ipv6` command output displays security associations set up for OSPFv3 links in IPsec authentication and encryption policies on the router.

### Related Commands

[show crypto ipsec policy](#) – displays the configuration of IPsec authentication and encryption policies.

### Example

```
DelleMC# show crypto ipsec policy
DelleMC# show crypto ipsec sa ipv6

Interface: TenGigabitEthernet 1/1/1
Link Local address: fe80::201:e8ff:fe40:4d10
IPSecv6 policy name: OSPFv3-1-500

inbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

inbound esp sas

outbound esp sas

Interface: TenGigabitEthernet 1/2/1
Link Local address: fe80::201:e8ff:fe40:4d11
IPSecv6 policy name: OSPFv3-1-600

inbound ah sas

outbound ah sas

inbound esp sas
spi : 600 (0x258)
transform : esp-des esp-shal-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound esp sas
spi : 600 (0x258)
transform : esp-des esp-shal-hmac
in use settings : {Transport, }
```

```
replay detection support : N
STATUS : ACTIVE
```

## show crypto ipsec sa ipv6 Command Fields

| Field                           | Description                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                | IPv6 interface                                                                                        |
| <b>Link local address</b>       | IPv6 address of interface                                                                             |
| <b>IPSecv6 policy name</b>      | Name of the IPsec security policy applied to the interface.                                           |
| <b>inbound/outbound ah</b>      | Authentication policy applied to inbound or outbound traffic.                                         |
| <b>inbound/outbound esp</b>     | Encryption policy applied to inbound or outbound traffic.                                             |
| <b>spi</b>                      | Security policy index number used to identify the policy.                                             |
| <b>transform</b>                | Security algorithm that is used to provide authentication, integrity, and confidentiality.            |
| <b>in use settings</b>          | Transform that the SA uses (only transport mode is supported).                                        |
| <b>replay detection support</b> | Y: An SA has enabled the replay detection feature.<br>N: The replay detection feature is not enabled. |
| <b>STATUS</b>                   | ACTIVE: The authentication or encryption policy is enabled on the interface.                          |

## show ipv6 ospf database

Display information in the OSPFv3 database, including link-state advertisements (LSAs) in detail.

**Syntax** `show ipv6 ospf [process-number] [vrf vrf-name] database [database-summary | grace-lsa | external | inter-area-prefix | inter-area-router | intra-area-prefix | link | network | router | nssa-external]`

| Parameters                      |                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-number</i></b>    | Enter the OSPF process number.                                                                                                                                                                                                                                                                                                 |
| <b><i>vrf vrf-name</i></b>      | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to display neighbors corresponding to that VRF.<br> <b>NOTE:</b> If you do not specify this option, neighbors corresponding to the default VRF are displayed. |
| <b><i>database-summary</i></b>  | (OPTIONAL) Enter the keyword <code>database-summary</code> to view a summary of database LSA information.                                                                                                                                                                                                                      |
| <b><i>external</i></b>          | (OPTIONAL): Enter the keyword <code>external</code> to display the external link states.                                                                                                                                                                                                                                       |
| <b><i>grace-lsa</i></b>         | (OPTIONAL): Enter the keyword <code>grace-lsa</code> to display the Type-11 Grace LSAs sent and received on an OSPFv3 router.                                                                                                                                                                                                  |
| <b><i>inter-area-prefix</i></b> | (OPTIONAL): Enter the keyword <code>inter-area-prefix</code> to display the inter area prefix link states.                                                                                                                                                                                                                     |
| <b><i>inter-area-router</i></b> | (OPTIONAL): Enter the keyword <code>inter-area-router</code> to display the inter area router link states.                                                                                                                                                                                                                     |
| <b><i>intra-area-prefix</i></b> | (OPTIONAL): Enter the keyword <code>intra-area-prefix</code> to display the intra area prefix link states.                                                                                                                                                                                                                     |
| <b><i>link</i></b>              | (OPTIONAL): Enter the keyword <code>link</code> to display the link states.                                                                                                                                                                                                                                                    |

|                      |                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------|
| <b>network</b>       | (OPTIONAL): Enter the keyword <code>network</code> to display the network link states.               |
| <b>nssa-external</b> | (OPTIONAL): Enter the keyword <code>nssa-external</code> to display the nssa link state information. |
| <b>router</b>        | (OPTIONAL): Enter the keyword <code>router</code> to display the router link states.                 |

| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                              |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                          |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                              |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                              |
| <b>9.7(0.0)</b>   | Added support for VRF.                                                                                   |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                 |
| <b>9.1.(0.0)</b>  | Added support for OSPFv3 on the S4810 and Z9000.                                                         |
| <b>8.4.2.2</b>    | Added support for the display of graceful restart parameters and Type-11 Grace LSAs on E-Series routers. |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                |
| <b>7.8.1.0</b>    | Added support for C-Series.                                                                              |

**Usage Information** The `show ipv6 ospf database` command output displays detailed information on the OSPFv3 database, including link-state advertisements (LSAs).

**Example (grace-lsa)**

```
DellEMC# show ipv6 ospf 3 database grace-lsa
!
Type-11 Grace LSA (Area 0)

LS Age : 10
Link State ID : 6.16.192.66
Advertising Router : 100.1.1.1
LS Seq Number : 0x80000001
Checksum : 0x1DF1
Length : 36
Associated Interface : Te 1/3/1
Restart Interval : 180
Restart Reason : Switch to Redundant Processor
```

**Example (database-summary)**

```
DellEMC# show ipv6 ospf 3 database database-summary
OSPFv3 Router with ID (1.1.1.1) (Process ID 1)
```

| <b>Command History</b>       | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Added support for VRF.                    |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version   | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| 9.2.(0.0) | Added support for showing BFD status on the S4820T, S4810, and Z9000. |
| 9.1.(0.0) | Added support for OSPFv3 on the S4810 and Z9000.                      |
| 8.3.19.0  | Introduced on the S4820T.                                             |
| 7.8.1.0   | Added support for the C-Series.                                       |
| 7.4.1.0   | Introduced on the E-Series.                                           |

### Usage Information

If you enable BFD at the global level, `show ipv6 ospf interface` shows the BFD provisioning.

If you enable BFD at the interface level, `show ipv6 ospf interface` shows the BFD interval timers.

### Example

```
DellEMC# show ipv6 ospf 3 interface tengigabitethernet 1/2/1

TenGigabitEthernet 1/2/1 is up, line protocol is up
 Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID 67420217
 Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
 NetworkType BROADCAST, Cost: 1, Passive: No
 Transmit Delay is 100 sec, State DR, Priority 1
 Interface is using OSPF global mode BFD configuration.
 Designated router on this network is 11.1.1.1 (local)
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 1, Retransmit 5

DellEMC#
```

## show ipv6 ospf neighbor

Display the OSPF neighbor information on a per-interface basis.

### Syntax

```
show ipv6 ospf [process-number] [vrf vrf-name] neighbor [interface]
```

### Parameters

***process-number*** Enter the OSPF process number.

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display OSPF neighbors corresponding to that VRF.

 **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

***interface*** (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Defaults

None

### Command Modes

EXEC

EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.             |
| 9.10(0.0)  | Introduced on the S3148.                              |
| 9.10(0.0)  | Introduced on the S6100-ON.                           |
| 9.8(2.0)   | Introduced on the S3100 series.                       |
| 9.8(1.0)   | Introduced on the Z9100-ON.                           |
| 9.8(0.0P5) | Introduced on the S4048-ON.                           |
| 9.8(0.0P2) | Introduced on the S3048-ON.                           |
| 9.7(0.0)   | Added support for VRF.                                |
| 9.2(1.0)   | Introduced on the Z9500.                              |
| 9.1.(0.0)  | Introduced support for OSPFv3 on the S4810 and Z9000. |
| 8.3.19.0   | Introduced on the S4820T.                             |
| 7.8.1.0    | Added support for the C-Series.                       |
| 7.4.1.0    | Introduced on the E-Series.                           |

### Example

```
DellEMC# show ipv6 ospf 3 neighbor te 1/2/1

Neighbor ID Pri State Dead Time Interface ID Interface
63.114.8.36 1 FULL/DR 00:00:38 4 Te 1/2/1

DellEMC#
```

## snmp context

Configure SNMPv3 context name to map multiple OSPFv3 VRF instances.

### Syntax

```
snmp context {context-name}
```

To clear snmp context, use the `no snmp context {context-name}` command.

### Parameters

**context-name** Enter the SNMP context name. The maximum length is 32 alphanumeric characters.

### Defaults

None.

### Command Modes

IPv6 ROUTER OSPF

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, S6000-ON, C9010, MXL, and FN IOM. |

### Usage Information

Use SNMPv3 context configuration to distinguish between various OSPFv3 VRF instances.

### Example

```
DellEMC(conf-ipv6-router_ospf)#snmp context ospf1

DellEMC>show runnig-config ospf
!
ipv6 router ospf 10
```

```
router-id 10.10.10.1
snmp context ospf1
!
DellEMC>
```

## timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

### S6000-ON

| <b>Syntax</b>            | <code>timers spf delay holdtime msec</code><br>To return to the default, use the <code>no timers spf</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                 |                                            |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----------------|--------------------------------------------|------------------|-------------------------------------------|------------------|--------------------------|------------------|-----------------------------|-----------------|---------------------------------|-----------------|-----------------------------|-------------------|-----------------------------|-------------------|-----------------------------|-----------------|----------------------------------------------------------|
| <b>Parameters</b>        | <p><b>delay</b> Enter a number as the delay. The range is from 0 to 2147483647. The default is <b>5 seconds</b>. When configured in milli seconds, 100 is the least value that is allowed to be configured.</p> <p><b>holdtime</b> Enter a number as the hold time. The range is from 0 to 2147483647. The default is <b>10 seconds</b>. When configured in milli seconds, 200 is the least value that is allowed to be configured.</p> <p><b>msec</b> Enter the keyword <code>msec</code> to specify the time interval value in milli seconds.<br/>  <b>NOTE:</b> If you do not specify the <code>msec</code> option, the timer values are considered as seconds.</p>                                                                                                                                                             |         |             |                 |                                            |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                                          |
| <b>Defaults</b>          | <ul style="list-style-type: none"> <li>• delay = 5 seconds</li> <li>• holdtime = 10 seconds</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |                 |                                            |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                                          |
| <b>Command Modes</b>     | ROUTER OSPFv3 for OSPFv3 and ROUTER OSPFv2 for OSPFv2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                 |                                            |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                                          |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                 |                                            |                  |                                           |                  |                          |                  |                             |                 |                                 |                 |                             |                   |                             |                   |                             |                 |                                                          |

# Policy-based Routing (PBR)

Policy-based routing (PBR) allows you to apply routing policies to specific interfaces. To enable PBR, create a redirect list and apply it to the interface. After the redirect list is applied to the interface, all traffic passing through the interface is subject to the rules defined in the redirect list. PBR is supported by the Dell EMC Networking OS.

You can apply PBR to physical interfaces and logical interfaces (such as a link aggregation group [LAG] or virtual local area network [VLAN]). Trace lists and redirect lists do not function correctly when you configure both in the same configuration.

**NOTE:** Apply PBR to Layer 3 interfaces only.

**NOTE:** For more information, see [Content Addressable Memory \(CAM\)](#).

| 7.7.1.0 | Introduced on the E-Series. |

#### Related Commands

- [ip redirect-list](#) – enable an IP Redirect List.

## ip redirect-group

Apply a redirect list (policy-based routing) on an interface. You can apply multiple redirect lists to an interface by entering this command multiple times.

**Syntax** `ip redirect-group redirect-list-name test [l2-switch]`  
 To remove a redirect list from an interface, use the `no ip redirect-group name` command.

**Parameters**

|                                  |                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------|
| <b><i>redirect-list-name</i></b> | Enter the name of a configured redirect list.                                        |
| <b><i>l2-switch</i></b>          | Enter the keyword <code>l2-switch</code> to enable PBR on Layer2 (switched) traffic. |

**Defaults** None

**Command Modes** INTERFACE (conf-if-vl-)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.4.2.0     | Introduced on the E-Series.                        |
| 7.7.1.0     | Introduced on the E-Series.                        |

#### Usage Information

You can apply any number of redirect-groups to an interface. A redirect list can contain any number of configured rules. These rules includes the next-hop IP address where the incoming traffic is to be redirected.

If the next hop address is reachable, traffic is forwarded to the specified next hop. Otherwise, the normal routing table is used to forward traffic. When a redirect-group is applied to an interface and the next-hop is reachable, the rules are added into the PBR CAM region. When incoming traffic hits an entry in the CAM, the traffic is redirected to the corresponding next-hop IP address specified in the rule.

**i** **NOTE:** Apply the redirect list to physical, VLAN, or LAG interfaces only.

The Layer2 PBR option matches the layer2 traffic flow. If you un-configure this option, then the Layer2 traffic is not matched. You can apply the `l2-switch` option to redirect Layer2 traffic only on a VLAN interface. This VLAN interface must be configured with an IP address for ARP resolution.

**i** **NOTE:** The `l2-switch` option that redirects Layer2 traffic is applicable only on VLAN interfaces.

The Layer3 routing is not affected on the same interface on which Layer2 PBR is applied. The port from which Layer2 packets egress and the destination MAC are re-written from static ARP. Layer 2 packets with the re-written destination MAC are forwarded through the outgoing port on the same incoming VLAN interface. The `l2-switch` option ensures that the outgoing VLAN and MAC-SA are changed and TTL is not decremented.

#### Related Commands

- `show cam pbr` – display the content of the PBR CAM.
- `show ip redirect-list` – display the redirect-list configuration.

## ip redirect-list

Configure a redirect list and enter REDIRECT-LIST mode.

#### Syntax

```
ip redirect-list redirect-list-name
```

To remove a redirect list, use the `no ip redirect-list` command.

#### Parameters

***redirect-list-name*** Enter the name of a redirect list.

#### Defaults

None

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |
| 8.4.2.1    | Introduced on the C-Series and S-Series.           |
| 8.4.2.0    | Introduced on the E-Series.                        |
| 6.5.3.0    | Introduced on the E-Series.                        |

# permit

Configure a permit rule. A permit rule excludes the matching packets from PBR classification and routes them using conventional routing.

**Syntax** `permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]`

To remove the rule, use one of the following:

- If you know the filter sequence number, use the `no seq sequence-number` syntax command.
- You can also use the `no permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]` command.

|                   |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ip-protocol-number</b> | Enter a number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b>protocol-type</b>      | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"><li>• <code>icmp</code> for internet control message protocol</li><li>• <code>ip</code> for any internet protocol</li><li>• <code>tcp</code> for transmission control protocol</li><li>• <code>udp</code> for user datagram protocol</li></ul>                                                                                                              |
|                   | <b>source</b>             | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>mask</b>               | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>any</b>                | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>host ip-address</b>    | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>destination</b>        | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                              |
|                   | <b>bit</b>                | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags: <ul style="list-style-type: none"><li>• <code>ack</code> = acknowledgement</li><li>• <code>fin</code> = finish (no more data from the user)</li><li>• <code>psh</code> = push function</li><li>• <code>rst</code> = reset the connection</li><li>• <code>syn</code> = synchronize sequence number</li><li>• <code>urg</code> = urgent field</li></ul> |
|                   | <b>operator</b>           | (OPTIONAL) For TCP and UDP parameters only. Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>portcommand</code> parameter.)</li></ul>                          |

**Defaults** None

## redirect

Configure a rule for the redirect list.

### Syntax

```
redirect {ip-address | slot/port} | tunnel tunnel-id [track <obj-id>] {ip-protocol-number | protocol-type [bit]} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator]
```

To remove this filter, use one of the following:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- You can also use the `no redirect {ip-address | slot/port} | tunnel tunnel-id [track <obj-id>] {ip-protocol-number [bit] | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator]` command.

### Parameters

|                             |                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>redirect</b>             | Enter the keyword <code>redirect</code> to assign the sequence to the redirect list.                                                                                                                                                                                                                                                            |
| <b>ip-address</b>           | Enter the IP address of the forwarding router.                                                                                                                                                                                                                                                                                                  |
| <b>slot/port</b>            | Enter the keyword <code>slot / port</code> followed by the slot/port information.                                                                                                                                                                                                                                                               |
| <b>tunnel</b>               | Enter the keyword <code>tunnel</code> to configure the tunnel setting.                                                                                                                                                                                                                                                                          |
| <b>tunnel-id</b>            | Enter the keyword <code>tunnel-id</code> to redirect the traffic.                                                                                                                                                                                                                                                                               |
| <b>track</b>                | Enter the keyword <code>track</code> to enable the tracking.                                                                                                                                                                                                                                                                                    |
| <b>track &lt;obj-id&gt;</b> | Enter the keyword <code>track &lt;obj-id&gt;</code> to track object-id.                                                                                                                                                                                                                                                                         |
| <b>ip-protocol-number</b>   | Enter a number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                             |
| <b>protocol-type</b>        | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"> <li>• <code>icmp</code> for internet control message protocol</li> <li>• <code>ip</code> for any internet protocol</li> <li>• <code>tcp</code> for transmission control protocol</li> <li>• <code>udp</code> for user datagram protocol</li> </ul> |
| <b>bit</b>                  | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:                                                                                                                                                                                                                                               |

- `ack` = acknowledgement
- `fin` = finish (no more data from the user)
- `psh` = push function
- `rst` = reset the connection
- `syn` = synchronize sequence number
- `urg` = urgent field

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>source</i></b>          | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>mask</i></b>            | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>any</i></b>             | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                                              |
| <b><i>host ip-address</i></b> | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>destination</i></b>     | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>operator</i></b>        | (OPTIONAL) For TCP and UDP parameters only. Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command parameter.)</li> </ul> |

**Defaults** None

**Command Modes** REDIRECT-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                     |
|-------------------|------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                               |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                            |
| <b>9.7(0.0)</b>   | Added support for the track-id on the S4810, S4820T, S6000, and Z9000. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                               |
| <b>9.4(0.0)</b>   | Introduced on the S4810, S4820T, S6000, and Z9000.                     |
| <b>8.4.2.1</b>    | Introduced on the C-Series and S-Series.                               |
| <b>8.4.2.0</b>    | Introduced on the E-Series.                                            |
| <b>7.7.1.0</b>    | Introduced on the E-Series.                                            |

# seq

Configure a filter with an assigned sequence number for the redirect list.

## Syntax

```
seq sequence-number {permit | redirect {ip-address | tunnel tunnel-id}
[track <obj-id>] }} {ip-protocol-number | protocol-type} {source mask | any
| host ip-address} {destination mask | any | host ip-address} [bit]
[operator]{source-port source-port| source-port-range start-port - end-
port} {destination-port destination-port| destination-port-range start-port
- end-port}
```

To delete a filter, use the `no seq sequence-number` command.

## Parameters

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sequence-number</i></b>      | Enter a number from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>permit</i></b>               | Enter the keyword <code>permit</code> assign the sequence to the permit list.                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>redirect</i></b>             | Enter the keyword <code>redirect</code> to assign the sequence to the redirect list.                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>ip-address</i></b>           | Enter the keyword <code>IP address</code> of the forwarding router.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>tunnel</i></b>               | Enter the keyword <code>tunnel</code> to configure the tunnel setting.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>tunnel-id</i></b>            | Enter the keyword <code>tunnel-id</code> to redirect the traffic.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>track</i></b>                | Enter the keyword <code>track</code> to enable the tracking.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>track &lt;obj-id&gt;</i></b> | Enter the keyword <code>track &lt;obj-id&gt;</code> to track object-id.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>ip-protocol-number</i></b>   | Enter the keyword <code>ip-protocol-number</code> then the number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                  |
| <b><i>protocol-type</i></b>        | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"><li>• <code>icmp</code> for internet control message protocol</li><li>• <code>ip</code> for any internet protocol</li><li>• <code>tcp</code> for transmission control protocol</li><li>• <code>udp</code> for user datagram protocol</li></ul>                                                                                                              |
| <b><i>source</i></b>               | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>mask</i></b>                 | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>any</i></b>                  | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>host ip-address</i></b>      | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>destination</i></b>          | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>bit</i></b>                  | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags: <ul style="list-style-type: none"><li>• <code>ack</code> = acknowledgement</li><li>• <code>fin</code> = finish (no more data from the user)</li><li>• <code>psh</code> = push function</li><li>• <code>rst</code> = reset the connection</li><li>• <code>syn</code> = synchronize sequence number</li><li>• <code>urg</code> = urgent field</li></ul> |
| <b><i>operator</i></b>             | (OPTIONAL) For the TCP and UDP parameters only. Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li></ul>                                                                                                                                                                                             |

- `lt=` less than
- `range` = inclusive range of ports (you must specify two ports for the port command parameter.)

|                                      |                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>source port</i></b>            | Enter the keywords <code>source-port</code> then the port number to be matched in the ACL rule in the ICAP rule                                     |
| <b><i>destination-port</i></b>       | Enter the keywords <code>destination-port</code> then the port number to be matched in the ACL rule in the ICAP rule.                               |
| <b><i>source-port-range</i></b>      | Enter the keywords <code>source-port-range</code> then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.      |
| <b><i>destination-port-range</i></b> | Enter the keywords <code>destination-port-range</code> then the range of the start port to end port to be matched in the ACL rule in the ICAP rule. |

**Defaults** none

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                               |
|-------------------|----------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                         |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                  |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                      |
| <b>9.7(0.0)</b>   | Added support for the track-id on the S4810, S4820T, S6000, S6000-ON, and Z9000. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                         |
| <b>9.4(0.0)</b>   | Introduced on the S4810, S4820T, S6000, and Z9000.                               |

## show cam pbr

Display the PBR CAM content.

**Syntax** `show cam pbr {interface interface | stack-unit slot-number port-set number [pipeline number]} [summary]`

|                   |                                                    |                                                                                      |
|-------------------|----------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>interface</i></b><br><b><i>interface</i></b> | Enter the keyword <code>interface</code> then the name of the interface.             |
|                   | <b><i>stack-unit</i></b><br><b><i>number</i></b>   | Enter the keyword <code>stack-unit</code> then the slot number.                      |
|                   | <b><i>port-set</i></b> <b><i>number</i></b>        | Enter the keywords <code>port-set</code> then the port-pipe number.                  |
|                   | <b><i>summary</i></b>                              | Enter the keyword <code>summary</code> to view only the total number of CAM entries. |

**Defaults** none

**Command Modes** EXEC

## Command History

| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

## Usage Information

The `show cam pbr` command displays the PBR CAM content.

## Example

```
DellEMC# show cam pbr stack-unit 1 port-set 0
TCP Flag: Bit 5 - URG, Bit 4 - ACK, Bit 3 - PSH, Bit 2 - RST,
Bit 1 - SYN, Bit 0 - FIN

Cam Index Port VlanID Proto Tep Src Dst SrcIp DstIp Next-hop Egress
 Port Port Flag Port Port Port MAC

00000 5 N/A IP 0x0 0 0 22.22.2.22/32 33.33.3.0/24 00:01:e8:8a:fd:76 0/0

## Related Commands

- [ip redirect-group](#) – applies a redirect group to an interface.
- [show ip redirect-list](#) – displays the redirect-list configuration.

# show ip redirect-list

View the redirect list configuration and the interfaces it is applied to.

## Syntax

```
show ip redirect-list redirect-list-name
```

## Parameters

***redirect-list-name*** Enter the name of a configured Redirect list.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

## Example

```
DellEMC# show ip redirect-list explicit_tunnel
IP redirect-list explicit_tunnel:
Defined as:
seq 5 redirect tunnel 1 track 1 tcp 155.55.2.0/24 222.22.2.0/24, Track 1 [up],
Next-hop reachable (via Te 1/32/1)
seq 10 redirect tunnel 1 track 1 tcp any any, Track 1 [up],
Next-hop reachable (via Te 1/32/1)
seq 15 redirect tunnel 2 udp 155.55.0.0/16 host 144.144.144.144, Track 1 [up],
Next-hop reachable (via Te 1/32/1)
seq 35 redirect 155.1.1.2 track 5 ip 7.7.7.0/24 8.8.8.0/24, Track 5 [up],
Next-hop reachable (via Po 5)
seq 30 redirect 155.1.1.2 track 6 icmp host 8.8.8.8 any, Track 5 [up],
Next-hop reachable (via Po 5)
seq 35 redirect 42.1.1.2 icmp host 8.8.8.8 any, Next-hop reachable (via Vl 20)
seq 40 redirect 43.1.1.2 tcp 155.55.2.0/24 222.22.2.0/24,
Next-hop reachable (via Vl 30)
seq 45 redirect 31.1.1.2 track 200 ip 12.0.0.0 255.0.0.197 13.0.0.0 255.0.0.197,
Track 200 [up], Next-hop reachable (via Te 1/32/1)

, Track 200 [up], Next-hop reachable (via Vl 20)

, Track 200 [up], Next-hop reachable (via Po 5)

, Track 200 [up], Next-hop reachable (via Po 7)

, Track 200 [up], Next-hop reachable (via Te 2/18/1)

, Track 200 [up], Next-hop reachable (via Te 2/19/1)
DellEMC#
```

# PIM-Sparse Mode (PIM-SM)

The protocol-independent multicast (PIM) commands are supported by the Dell EMC Networking operating software on the platform.

The following describes the IPv4 PIM-SM commands.

## Topics:

- [IPv4 PIM-Sparse Mode Commands](#)
- [IPv6 PIM-Sparse Mode Commands](#)

## IPv4 PIM-Sparse Mode Commands

The following describes the IPv4 PIM-sparse mode (PIM-SM) commands.

### clear ip pim rp-mapping

The bootstrap router (BSR) feature uses this command to remove all or particular rendezvous point (RP) advertisement.

|                        |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip pim [vrf vrf-name] rp-mapping [rp-address]</code>                                                                                              |                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>      | <b>vrf vrf-name</b>                                                                                                                                           | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
|                        | <b>rp-address</b>                                                                                                                                             | (OPTIONAL) Enter the RP address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                 |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                |                                                                                                                                                                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                                                                                     |

| Version           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                           |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 8.1.1.0 | Introduced on the E-Series. |
| 7.8.1.0 | Introduced on the S-Series. |

**Usage Information**

This command re-applies the RP mapping logic for all the groups learnt by the node. Any stale information corresponding to the existing mapping configuration is updated. The existing BSR cache and the \*,G's are deleted only if these entries are stale.

## clear ip pim tib

Clear PIM tree information from the PIM database.

**Syntax** `clear ip pim [vrf vrf-name] tib [group]`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group** (OPTIONAL) Enter the multicast group address in dotted decimal format (A.B.C.D).

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.3.7.0    | Introduced on the S4810.                           |
| 8.1.1.0    | Introduced on the E-Series.                        |
| 7.8.1.0    | Introduced on the S-Series.                        |

**Usage Information**

If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.

If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

## debug ip pim

View IP PIM debugging messages.

### Syntax

```
debug ip pim [vrf vrf-name] [bsr | events | group | packet [in | out] | register | state | timer [assert | hello | joinprune | register]]
```

To disable PIM debugging, use the `no debug ip pim [vrf vrf-name]` command or use the `undebug all` to disable all debugging command.

### Parameters

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                                  | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                                                                                   |
| <b>bsr</b>                                           | (OPTIONAL) Enter the keyword <code>bsr</code> to view PIM Candidate RP/BSR activities.                                                                                                                                                                                                                                                                                                                                                    |
| <b>events</b>                                        | (OPTIONAL) Enter the keyword <code>group</code> to view PIM messages for a specific group.                                                                                                                                                                                                                                                                                                                                                |
| <b>group</b>                                         | (OPTIONAL) Enter the keyword <code>group</code> to view PIM messages for a specific group.                                                                                                                                                                                                                                                                                                                                                |
| <b>packet [in   out]</b>                             | (OPTIONAL) Enter the keyword <code>packet</code> to view PIM packets. Enter one of the optional parameters: <ul style="list-style-type: none"><li>• <code>in</code>: to view incoming packets</li><li>• <code>out</code>: to view outgoing packets</li></ul>                                                                                                                                                                              |
| <b>register</b>                                      | (OPTIONAL) Enter the keyword <code>register</code> to view PIM register address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                       |
| <b>state</b>                                         | (OPTIONAL) Enter the keyword <code>state</code> to view PIM state changes.                                                                                                                                                                                                                                                                                                                                                                |
| <b>timer [assert   hello   joinprune   register]</b> | (OPTIONAL) Enter the keyword <code>timer</code> to view PIM timers. Enter one of the optional parameters: <ul style="list-style-type: none"><li>• <code>assert</code>: to view the assertion timer</li><li>• <code>hello</code>: to view the PIM neighbor keepalive timer</li><li>• <code>joinprune</code>: to view the expiry timer (join/prune timer)</li><li>• <code>register</code>: to view the register suppression timer</li></ul> |

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.1.1.0  | Introduced on the E-Series.                        |
| 7.8.1.0  | Introduced on the S-Series.                        |

## ip pim bsr-border

Define the border of PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

**Syntax** `ip pim bsr-border`

To return to the default value, use the `no ip pim bsr-border` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.8.1.0    | Introduced on the S-Series.               |

**Usage Information** This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out. To clean the candidate RP advertisements, use the `clear ip pim rp-mapping` command.

## ip pim bsr-candidate

To join the Bootstrap election process, configure the PIM router.

**Syntax** `ip pim [vrf vrf-name] bsr-candidate interface [hash-mask-length] [priority]`  
To return to the default value, use the `no ip pim bsr-candidate [vrf vrf-name]` command.

**Parameters**

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>     | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure the PIM router on a VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>interface</b>        | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |
| <b>hash-mask-length</b> | (OPTIONAL) Enter the hash mask length. The range is from four (4) to 32. The default is <b>four (4)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>priority</b>         | (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. The default is <b>zero (0)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                           |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                        |
| <b>6.1.1.0</b>    | Added support for the VLAN interface.              |

## ip pim dr-priority

Change the designated router (DR) priority for the interface.

**Syntax** `ip pim dr-priority priority-value`

To remove the DR priority value assigned, use the `no ip pim dr-priority` command.

**Parameters** ***priority-value*** Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1.

**Defaults** 1

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                   |
|------------|---------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                     |
| 9.10(0.0)  | Introduced on the S3148.                                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                                   |
| 9.8(2.0)   | Introduced on the S3100 series.                               |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                   |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                   |
| 9.7(0.0)   | Introduced on the S6000-ON.                                   |
| 9.5(0.1)   | Introduced on the Z9500.                                      |
| 9.0.2.0    | Introduced on the S6000.                                      |
| 8.3.19.0   | Introduced on the S4820T.                                     |
| 8.3.11.1   | Introduced on the Z9000.                                      |
| 8.3.7.0    | Introduced on the S4810.                                      |
| 8.1.1.0    | Introduced on the E-Series.                                   |
| 7.8.1.0    | Introduced on the C-Series on port-channels and the S-Series. |

**Usage Information** The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.

## ip pim join-filter

Permit or deny PIM Join/Prune messages on an interface using an extended IP access list. This command prevents the PIM-SM router from creating state based on multicast source and/or group.

**Syntax** `ip pim join-filter ext-access-list [in | out]`

To remove the access list, use the `no ip pim join-filter ext-access-list` command.

**Parameters** ***ext-access-list*** Enter the name of an extended access list.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                        |
|------------|--------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                          |
| 9.10(0.0)  | Introduced on the S3148.                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                        |
| 9.7(0.0)   | Removed the in and out parameters. Introduced on the S6000-ON.     |
| 9.5(0.1)   | Introduced on the Z9500.                                           |
| 9.0.2.0    | Introduced on the S6000.                                           |
| 8.3.19.0   | Introduced on the S4820T.                                          |
| 8.3.11.1   | Introduced on the Z9000.                                           |
| 8.3.7.0    | Introduced on the S4810.                                           |
| 8.1.1.0    | Introduced on the E-Series.                                        |
| 7.8.1.0    | Introduced on the C-Series for the port-channels and the S-Series. |
| 7.7.1.0    | Introduced on the E-Series.                                        |

#### Usage Information

When you configure a join filter, it is applicable for both ingress and egress flows. There is no option to specify in or out parameters while configuring a join filter.

#### Example

```
DelleMC(conf)# ip access-list extended iptv-channels
DelleMC(config-ext-nacl)# permit ip 10.1.2.3/24 225.1.1.0/24
DelleMC(config-ext-nacl)# permit ip any 232.1.1.0/24
DelleMC(config-ext-nacl)# permit ip 100.1.1.0/16 any
DelleMC(config-if-te-1/1)# ip pim join-filter iptv-channels
DelleMC(config-if-te-1/1)# ip pim join-filter iptv-channels
```

#### Related Commands

- [ip access-list extended](#) — configure an access list based on IP addresses or protocols.

## ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

#### Syntax

```
ip pim [vrf vrf-name] neighbor-filter {access-list}
```

To remove the restriction, use the `no ip pim [vrf vrf-name] neighbor-filter {access-list}` command.

#### Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to prevent that VRF from participating in PIM.
-  **NOTE:** Applies to specific VRF if input is provided, else applies to default VRF.
- access-list*** Enter the name of a standard access list. Maximum 16 characters.

#### Defaults

none

| 7.8.1.0    | Introduced on the C-Series and S-Series.           |
| 7.6.1.0    | Introduced on the E-Series.                        |

## Usage Information

Do not enter this command before creating the access-list.

## ip pim query-interval

Change the frequency of PIM Router-Query messages.

### Syntax

```
ip pim query-interval seconds
```

To return to the default value, use the `no ip pim query-interval seconds` command.

### Parameters

***seconds***

Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is **30 seconds**.

### Defaults

**30 seconds**

| 7.8.1.0  | Introduced on the C-Series for the port-channels and the S-Series. |

## ip pim register-filter

To prevent a PIM source DR from sending register packets to an RP for the specified multicast source and group, use this feature.

### Syntax

```
ip pim [vrf vrf-name] register-filter access-list
```

To return to the default, use the `no ip pim [vrf vrf-name] register-filter access-list` command.

### Parameters

|                     |                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>access-list</b>  | Enter the name of an extended access list. Maximum 16 characters.                                                                                                                                                                                             |

### Defaults

Not configured.

| 7.8.1.0    | Introduced on the C-Series and S-Series.           |

| Version | Description |
|---------|-------------|
| 7.6.1.0 | Introduced  |

**Usage Information**

The access name is an extended IP access list that denies PIM register packets to RP at the source DR based on the multicast and group addresses. Do not enter this command before creating the access-list.

## ip pim rp-address

Configure a static PIM rendezvous point (RP) address for a group or access-list.

**Syntax** `ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]`

To remove an RP address, use the `no ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]` command.

**Parameters**

|                                         |                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>                     | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                           |
| <b>address</b>                          | Enter the RP address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                              |
| <b>group-address group-address mask</b> | Enter the keywords <code>group-address</code> then a group-address mask, in dotted decimal format (/xx), to assign that group address to the RP.                                                                                                                                                                      |
| <b>override</b>                         | Enter the keyword <code>override</code> to override the BSR updates with static RP. The <code>override</code> takes effect immediately during enable/disable.<br> <b>NOTE:</b> This option is applicable to multicast group range. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |

| 8.1.1.0    | Introduced on the E-Series.                        |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.8.1.0      | Introduced on the S-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

### Usage Information

First-hop routers use this address by to send register packets on behalf of source multicast hosts. The RP addresses are stored in the order in which they are entered. The RP is chosen based on a longer prefix match for a group. The RP selection does not depend on dynamic or static RP assignments.

## ip pim rp-candidate

Configure a PIM router to send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR.

**Syntax** `ip pim [vrf vrf-name] rp-candidate {interface [priority] [acl-name]}`

To return to the default value, use the `no ip pim [vrf vrf-name] rp-candidate {interface [priority]}` command.

### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>priority</b>     | (OPTIONAL) Enter the priority used in Bootstrap election process. The range is zero (0) to 255. The default is <b>192</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>acl-name</b>     | (OPTIONAL) Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                        |
|-----------|----------------------------------------------------|
| 9.11(0.0) | Introduced the <code>acl-name</code> parameter.    |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0) | Introduced on the S3148.                           |
| 9.10(0.0) | Introduced on the S6100-ON.                        |
| 9.8(1.0)  | Introduced on the Z9100-ON.                        |
| 9.7(0.0)  | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)  | Introduced on the Z9500.                           |
| 9.0.2.0   | Introduced on the S6000.                           |
| 8.3.19.0  | Introduced on the S4820T.                          |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 8.1.1.0      | Introduced on the E-Series. |
| 7.8.1.0      | Introduced on the S-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information**

Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.

## ip pim sparse-mode

Enable PIM sparse mode and IGMP on the interface.

**Syntax** `ip pim sparse-mode`  
 To disable PIM sparse mode and IGMP, use the `no ip pim sparse-mode` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                        |
|------------|--------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                          |
| 9.10(0.0)  | Introduced on the S3148.                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                        |
| 9.5(0.1)   | Introduced on the Z9500.                                           |
| 9.0.2.0    | Introduced on the S6000.                                           |
| 8.3.19.0   | Introduced on the S4820T.                                          |
| 8.3.11.1   | Introduced on the Z9000.                                           |
| 8.3.7.0    | Introduced on the S4810.                                           |
| 8.1.1.0    | Introduced on the E-Series.                                        |
| 7.8.1.0    | Introduced on the C-Series for the port-channels and the S-Series. |

**Usage Information**

The interface must be enabled (the `no shutdown` command) and not have the `switchport` command configured. Multicast must also be enabled globally (using the `ip multicast-lag-hashing` command). PIM is supported on the port-channel interface.

# ip pim sparse-mode sg-expiry-timer

Enable expiry timers globally for all sources.

**Syntax** `ip pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds [access-list-name]`

To disable configured timers and return to default mode, use the `no ip pim [vrf vrf-name] sparse-mode sg-expiry-timer` command.

## Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable expiry timer for all sources on that VRF.
-  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- seconds** Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.
- access-list-name** (OPTIONAL) Enter the name of a previously configured Extended ACL to enable the expiry time to specified S,G entries.

**Defaults** Disabled. The default expiry timer (with no times configured) is 210 sec.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                     |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                                                                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                                                                   |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                                                                               |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                                                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                                                                   |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                                                                   |
| 9.7(0.0)   | Added support for VRF. Removed the <code>acl-access-list</code> parameter. Modified the max value of S, G entry second range from 86400 to 65535. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                                                                                                                                                      |
| 9.0.2.0    | Introduced on the S6000.                                                                                                                                                      |
| 8.3.19.0   | Introduced on the S4820T.                                                                                                                                                     |
| 8.3.11.1   | Introduced on the Z9000.                                                                                                                                                      |
| 8.3.7.0    | Introduced on the S4810.                                                                                                                                                      |
| 8.1.1.0    | Introduced on the E-Series.                                                                                                                                                   |
| 7.8.1.0    | Introduced on the C-Series for the port-channels and the S-Series.                                                                                                            |
| 7.7.1.1    | Introduced                                                                                                                                                                    |

**Usage Information** This command configures an expiration timer for all S,G entries, unless they are assigned to an Extended ACL.

Even though the FHR nodes act as RPs, these nodes still send *Register encap* messages to themselves and expect to receive a *Register stop* message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

## ip pim ssm-range

Specify the SSM group range using an access list.

**Syntax** `ip pim [vrf vrf-name] ssm-range {access_list_name}`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to specify the SSM group range for that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**access\_list\_name** Enter the name of the access list.

**Defaults** Default SSM range is 232/8 and ff3x/32

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                              |
| 9.10(0.0)  | Introduced on the S3148.                                                                               |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                            |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                            |
| 9.7(0.0)   | Introduced on the S6000-ON. Added support for VRF on S6000, S4810, S4820T, Z9000, Z9500, and S6000-ON. |
| 9.7(0.0)   | Added support for VRF.                                                                                 |
| 9.5(0.1)   | Introduced on the Z9500.                                                                               |
| 9.0.2.0    | Introduced on the S6000.                                                                               |
| 8.3.19.0   | Introduced on the S4820T.                                                                              |
| 8.3.11.1   | Introduced on the Z9000.                                                                               |
| 8.3.7.1    | Introduced on the S4810.                                                                               |
| 8.1.1.0    | Introduced on the E-Series.                                                                            |
| 7.8.1.0    | Introduced on the S-Series.                                                                            |
| 7.7.1.0    | Introduced on the C-Series.                                                                            |
| 7.5.1.0    | Introduced on the E-Series.                                                                            |

**Usage Information** Dell EMC Networking OS supports standard access lists for the SSM range. You cannot use extended ACLs for configuring the SSM range. If you configure an extended ACL and then used in the `ip pim ssm-range {access list name}` configuration, an error is reported.

However, if you configure `ip pim ssm-range {access list name}` first and then you configure the ACL as an Extended ACL, an error is not reported and the ACL is not applied to the SSM range.

Dell EMC Networking OS-recommended best-practices are to configure the standard ACL, and then apply the ACL to the SSM range. After the SSM range is applied, the changes are applied internally without requiring clearing of the tree information base (TIB).

When the ACL rules change, the ACL and protocol-independent multicast (PIM) modules apply the new rules automatically.

When you configure the SSM range, Dell EMC Networking OS supports SSM for configured group range as well as the default SSM range.

When you remove the SSM ACL, PIM SSM is supported for the default SSM range only.

## ip pim spt-threshold

To switch to the shortest path tree when the traffic reaches the specified threshold value, configure the PIM router.

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |              |                                                                                                                                                                |                     |                                                                                                                                                                                                                                                                                                     |                 |                                                                                        |

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.12.0</b>   | Introduced on the S4810.                           |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                        |

**Usage Information** This command is applicable to last hop routers on the shared tree towards the rendezvous point (RP).

# show ip pim bsr-router

View information on the Bootstrap router.

## S6000-ON

**Syntax** `show ip pim [vrf vrf-name] bsr-router`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.3.7.0    | Introduced on the S4810.                           |
| 8.1.1.0    | Introduced on the E-Series.                        |
| 7.8.1.0    | Introduced on the S-Series.                        |

### Example

```
DellEMC# show ip pim bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (v2)
 BSR address: 7.7.7.7 (?)
 BSR Priority: 0, Hash mask length: 30
 Next bootstrap message in 00:00:08

This system is a candidate BSR
 Candidate BSR address: 7.7.7.7, priority: 0, hash mask length: 30
DellEMC#
```

# show ip pim interface

View information on the interfaces with IP PIM enabled.

## S6000-ON

**Syntax** `show ip pim [vrf vrf-name] interface`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on this VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.1.1.0    | Introduced on the E-Series.                        |
| 7.8.1.0    | Introduced on the S-Series.                        |

**Usage Information** The following describes the `show ip pim interface` command shown in the following example.

| Field              | Description                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Address</b>     | Lists the IP addresses of the interfaces participating in PIM.                                                                                                                       |
| <b>Interface</b>   | List the interface type, with either slot/port information or ID (VLAN or Port Channel), of the interfaces participating in PIM.                                                     |
| <b>Ver/Mode</b>    | Displays the PIM version number and mode for each interface participating in PIM: <ul style="list-style-type: none"><li>• v2 = PIM version 2</li><li>• S = PIM Sparse mode</li></ul> |
| <b>Nbr Count</b>   | Displays the number of PIM neighbors discovered over this interface.                                                                                                                 |
| <b>Query Intvl</b> | Displays the query interval for Router Query messages on that interface (configured with <code>ip pim query-interval</code> command).                                                |

| Field          | Description                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>DR Prio</b> | Displays the Designated Router priority value configured on the interface (use the <code>ip pim dr-priority</code> command). |
| <b>DR</b>      | Displays the IP address of the Designated Router for that interface.                                                         |

The `show ip pim interface` command does not display information corresponding to the loop-back interfaces.

### Example

```
DellEMC# show ip pim interface
Address Interface Ver/ Nbr Query DR DR
 Mode Count Intvl Prio
165.87.34.5 Te 1/10/1 v2/S 0 30 1 165.87.34.5
10.1.1.2 Vl 10 v2/S 1 30 1 10.1.1.2
20.1.1.5 Vl 20 v2/S 1 30 1 20.1.1.5
165.87.31.200 Vl 30 v2/S 1 30 1 165.87.31.201
DellEMC#
```

## show ip pim neighbor

View PIM neighbors.

### S6000-ON

**Syntax** `show ip pim [vrf vrf-name] neighbor`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |

| <b>9.0.2.0</b>    | Introduced on the S6000.                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                          |
| <b>8.3.12.0</b>   | Introduced on the S4810.                           |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                           |

| Version | Description                 |
|---------|-----------------------------|
| 8.1.1.0 | Introduced on the E-Series. |
| 7.8.1.0 | Introduced on the S-Series. |

### Usage Information

The following describes the `show ip pim neighbor` command shown in the following example.

| Field                   | Description                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor address</b> | Displays the IP address of the PIM neighbor.                                                                                                                                                                                                              |
| <b>Interface</b>        | List the interface type, with either slot/port information or ID (VLAN or Port Channel), on which the PIM neighbor was found.                                                                                                                             |
| <b>Uptime/expires</b>   | Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).                                                              |
| <b>Ver</b>              | Displays the PIM version number. <ul style="list-style-type: none"> <li>v2 = PIM version 2</li> </ul>                                                                                                                                                     |
| <b>DR prio/Mode</b>     | Displays the Designated Router priority and the mode. <ul style="list-style-type: none"> <li>1 = default Designated Router priority (use the <code>ip pim dr-priority</code> command)</li> <li>DR = Designated Router</li> <li>S = Sparse mode</li> </ul> |

### Example

```
DellEMC# show ip pim neighbor
Neighbor Interface Uptime/Expires Ver DR
Address
127.87.3.4 Te 1/16/1 09:44:58/00:01:24 v2 1 / S
DellEMC#
```

## show ip pim rp

View all multicast groups-to-RP mappings.

### S6000-ON

**Syntax** `show ip pim [vrf vrf-name] rp [mapping | group-address]`

| Parameters           | Description                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>  | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.                 |
| <b>mapping</b>       | (OPTIONAL) Enter the keyword <code>mapping</code> to display the multicast groups-to-RP mapping and information on how RP is learnt. |
| <b>group-address</b> | (OPTIONAL) Enter the multicast group address mask in dotted decimal format to view RP for a specific group.                          |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.1.1.0    | Introduced on the E-Series.                        |
| 7.8.1.0    | Introduced on the S-Series.                        |

#### Example

```
DellEMC# show ip pim rp
Group RP
224.2.197.115 165.87.20.4
224.2.217.146 165.87.20.4
224.3.3.3 165.87.20.4
225.1.2.1 165.87.20.4
225.1.2.2 165.87.20.4
229.1.2.1 165.87.20.4
229.1.2.2 165.87.20.4
DellEMC#
```

#### Example (Mapping)

```
DellEMC# show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
 RP: 50.40.4.4, v2
DellEMC#
```

#### Example (Address)

```
DellEMC# show ip pim rp 229.1.2.1
Group RP
229.1.2.1 165.87.20.4
DellEMC#
```

## show ip pim ssm-range

Display the non-default groups added using the SSM range feature.

### S6000-ON

**Syntax** `show ip pim [vrf vrf-name] ssm-range`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**Defaults** none

**Command Modes** ● EXEC

- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                               |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. Added support for VRF on S6000, S4810, S4820T, Z9000, Z9500, and S6000-ON. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                               |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                              |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                               |
| <b>8.3.7.1</b>    | Introduced on the S4810.                                                                               |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                                                            |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                                                                            |
| <b>7.7.1.0</b>    | Introduced on the C-Series.                                                                            |
| <b>7.5.1.0</b>    | Introduced on the E-Series.                                                                            |

#### Example

```
Group Address / MaskLen
```

## show ip pim summary

View information about PIM-SM operation.

### S6000-ON

**Syntax** `show ip pim [vrf vrf-name] summary`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| <b>Version</b>    | <b>Description</b>                                                       |
|-------------------|--------------------------------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                 |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                              |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                          |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                              |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                              |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                              |
| <b>9.7(0.0)</b>   | Added support for VRF. Introduced on the S6000-ON.                       |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                 |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                |
| <b>8.3.12.0</b>   | Introduced on the S4810.                                                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                 |
| <b>8.4.1.1</b>    | Support for the display of PIM-SM snooping status was added on E-Series. |
| <b>8.1.1.0</b>    | Introduced on the E-Series.                                              |
| <b>7.8.1.0</b>    | Introduced on the S-Series.                                              |

### Example

```

DellEMC# show ip pim summary

DellEMC#

```

# show ip pim tib

View the PIM tree information base (TIB).

## S6000-ON

**Syntax** `show ip pim [vrf vrf-name] tib [group-address [source-address]]`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address** (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D).

**source-address** (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D).

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.0.2.0    | Introduced on the S6000.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.12.0   | Introduced on the S4810.                           |
| 8.3.11.1   | Introduced on the Z9000.                           |
| 8.1.1.0    | Introduced on the E-Series.                        |
| 7.8.1.0    | Introduced on the S-Series.                        |

**Usage Information** The following describes the `show ip pim tib` command shown in the following example.

| Field   | Description                                                                                              |
|---------|----------------------------------------------------------------------------------------------------------|
| (S, G)  | Displays the entry in the multicast PIM database.                                                        |
| uptime  | Displays the amount of time the entry has been in the PIM route table.                                   |
| expires | Displays the amount of time until the entry expires and is removed from the database.                    |
| RP      | Displays the IP address of the RP/source for this entry.                                                 |
| flags   | List the flags to define the entries: <ul style="list-style-type: none"><li>D = PIM Dense Mode</li></ul> |

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | <ul style="list-style-type: none"> <li>• S = PIM Sparse Mode</li> <li>• C = directly connected</li> <li>• L = local to the multicast group</li> <li>• P = route was pruned</li> <li>• R = the forwarding entry is pointing toward the RP</li> <li>• F = Dell EMC Networking OS is registering this entry for a multicast source</li> <li>• T = packets were received via Shortest Tree Path</li> <li>• J = first packet from the last hop router is received and the entry is ready to switch to SPT</li> <li>• K = acknowledge pending state</li> </ul> |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RPF neighbor</b>             | Displays the next hop from this interface towards the RP/source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following criteria: <ul style="list-style-type: none"> <li>• a directly connect member of the Group</li> <li>• statically configured member of the Group</li> <li>• received a (*,G) Join message</li> </ul>                                                                                                                                                                                                                                                                                                   |

### Example

```

DellEMC# do show ip pim tib

PIM Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned,
 R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT,
 M - MSDP created entry, A - Candidate for MSDP Advertisement
 K - Ack-Pending State
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:40:16, expires 00:00:00, RP 20.40.4.4, flags:
SCJ

## IPv6 PIM-Sparse Mode Commands

The following describes the IPv6 PIM-sparse mode (PIM-SM) commands.

## clear ipv6 pim tib

Clear the IPv6 PIM multicast-routing database (tree information base—TIB).

**Syntax** `clear ipv6 pim [vrf vrf-name] tib [group-address]`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x::x` format.  
**NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History**

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Related Commands** `show ipv6 pim tib` – displays the IPv6 PIM tree information base (TIB)

## debug ipv6 pim

Invoke IPv6 PIM debugging.

**Syntax** `debug ipv6 pim [vrf vrf-name] [bsr | events | group [group] | packet [in | out] | register [group] | state | timer [assert | hello | joinprune | register]]`

To disable IPv6 PIM debugging, use the `no debug ipv6 pim [vrf vrf-name]` command.

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.  
**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**bsr** (OPTIONAL) Enter the keyword `bsr` to invoke debugging of IPv6 PIM Candidate RP/BSR activities.

**events** (OPTIONAL) Enter the keyword `events` to invoke debugging of IPv6 PIM events.

**group [group]** (OPTIONAL) Enter the keyword `group` followed by the group address to invoke debugging on that specific group.

**packet** (OPTIONAL) Enter the keyword `packet` to invoke debugging of IPv6 PIM packets.

**register [group]** (OPTIONAL) Enter the keyword `register` and optionally the group address to invoke debugging of IPv6 PIM register messages for a particular group.

**state** (OPTIONAL) Enter the keyword `state` to view IPv6 PIM state changes.

**timer [assert | hello | joinprune | register]** (OPTIONAL) Enter the keyword `timer` to view IPv6 PIM timers. Enter one of the optional parameters:

- `assert`: to view the assertion timer
- `hello`: to view the IPv6 PIM neighbor keepalive timer
- `joinprune`: to view the expiry timer (join/prune timer)
- `register`: to view the register suppression timer

**Defaults** Disabled.

**Command Modes** EXEC Privilege

| <b>Command History</b> | <b>Version</b>  | <b>Description</b>                                                                                         |
|------------------------|-----------------|------------------------------------------------------------------------------------------------------------|
|                        | <b>9.11.3.0</b> | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

## ipv6 pim bsr-border

Define the border of IPv6 PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

|                          |                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>ipv6 pim bsr-border</code><br>To return to the default value, use the <code>no ipv6 pim bsr-border</code> command.                                                                                                                                                                            |
| <b>Defaults</b>          | Disabled.                                                                                                                                                                                                                                                                                           |
| <b>Command Modes</b>     | INTERFACE                                                                                                                                                                                                                                                                                           |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .<br><br><b>9.14(1.0)</b> Introduced on the C9010, S3048-ON, S3100 Series, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON. |
| <b>Usage Information</b> | This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out.                                                                                                                                                                                          |

## ipv6 pim dr-priority

Change the designated router (DR) priority for the IPv6 interface.

| <b>Syntax</b>            | <code>ipv6 pim dr-priority <i>priority-value</i></code><br>To remove the DR priority value assigned, use the <code>no ipv6 pim dr-priority</code> command.                                                                                                                                                                                                                                                                                                                                                                |                |                    |                 |                                                                                                            |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|--------------------|-----------------|------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>        | <b><i>priority-value</i></b> Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                    |                |                    |                 |                                                                                                            |
| <b>Defaults</b>          | <b>1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                    |                 |                                                                                                            |
| <b>Command Modes</b>     | INTERFACE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                    |                 |                                                                                                            |
| <b>Command History</b>   | This guide is platform-specific. | <b>Usage Information</b> | The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.                                                                                                                                                                                                                                                                         |                |                    |                 |                                                                                                            |

## ipv6 pim query-interval

Change the frequency of IPv6 PIM router-query messages.

|               |                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ipv6 pim query-interval <i>seconds</i></code><br>To return to the default value, use the <code>no ipv6 pim query-interval <i>seconds</i></code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                                                                                                                                                |                                                                                                                                         |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                 | Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is <b>30 seconds</b> . |
| <b>Defaults</b>        | <b>30 seconds</b>                                                                                                                                              |                                                                                                                                         |

## ipv6 pim rp-address

Configure a static PIM rendezvous point (RP) address for a group. First-hop routers use this address to send register packets on behalf of the source multicast host.

**Syntax**

```
ipv6 pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]
```

To remove an RP address, use the `no ipv6 pim re-address address group-address mask [override]` command.

|                   |                                         |                                                                                                                                                                                                                                                                                                      |
|-------------------|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf vrf-name</b>                     | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.<br><b>i</b> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                       |
|                   | <b>address</b>                          | Enter the IPv6 RP address in the <code>x:x:x::x</code> format.<br><b>i</b> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                |
|                   | <b>group-address group-address mask</b> | Enter the keywords <code>group-address</code> then the group address in the <code>x:x:x::x</code> format and then the mask in <code>/nn</code> format to assign that group address to the RP.<br><b>i</b> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero. |
|                   | <b>override</b>                         | (OPTIONAL) Enter the keyword <code>override</code> to override the BSR updates with static RP. The override takes effect immediately during enable/disable.<br><b>i</b> <b>NOTE:</b> This option is applicable to multicast group range.                                                             |

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |

|                        | <b>Description</b>                                                                                                                                             |
|                        | <b>9.11.3.0</b>                                                                                                                                                |
|                        | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010.                                                     |

**Usage Information**

The device selects the RP based on the longest prefix match of the configured group address when both static and dynamic RPs are configured.

The `override` option allow you to use statically configured RP instead of the longest prefix match of the configured group address associated with a dynamic RP.

## ipv6 pim rp-candidate

Configure an IPv6 PIM router to send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR.

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>ipv6 pim [vrf vrf-name] rp-candidate {interface [priority] [acl-name]}</code><br>To return to the default value, use the <code>no ipv6 pim [vrf vrf-name] rp-candidate {interface [priority]}</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>vrf vrf-name</b>      | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF.<br><b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>interface</b>         | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li><li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>priority</b>          | (OPTIONAL) Enter the priority used in RP election process. The range is zero (0) to 255. The default is <b>192</b> . In the RP election process, the RP with the lower priority takes the precedence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>acl-name</b>          | (OPTIONAL) Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.<br><b>NOTE:</b> If you do not specify the <code>acl-name</code> , the system uses the default multicast IPv6 group range, which is <code>ff00::/8</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>9.14(1.0)</b>         | Introduced on the C9010, S3048-ON, S3100 Series, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Usage Information</b> | Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## ipv6 pim sparse-mode

Enable IPv6 PIM sparse mode and MLD on the interface.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 pim sparse-mode</code><br>To disable IPv6 PIM sparse mode and MLD on the interface, use the <code>no ipv6 pim sparse-mode</code> command.           |
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information**

Enable the interface (use the `no shutdown` command) and not have the `switchport` command configured. Also enable Multicast globally. PIM is supported on the port-channel interface.

## ipv6 pim sparse-mode sg-expiry-timer

Enable expiry timers globally for all sources.

**Syntax**

```
ipv6 pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds
```

To disable configured timers and return to default mode, use the `no ipv6 pim sparse-mode sg-expiry-timer` command.

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable expiry timer for all sources on that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>seconds</b>      | Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.                                                                                                                                                                                                                     |

**Defaults**

Disabled. The default expiry timer (with no times configured) is 210 sec.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information**

This command configures an expiration timer for all S.G entries, unless they are assigned to an Extended ACL.

Even though the FHR nodes act as RPs, these nodes still send *Register encap* messages to themselves and expect to receive a *Register stop* message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

## ipv6 pim spt-threshold

Specifies when a PIM leaf router should join the shortest path tree.

**Syntax**

```
ipv6 pim [vrf vrf-name] spt-threshold {infinity}
```

To return to the default value, use the `no ipv6 pim spt-threshold` command.

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>infinity</b>     | Enter the keyword <code>infinity</code> to have all sources for the specified group use the shared tree and never join shortest path tree (SPT).                                                                                                                                                                          |

**Defaults**

Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information** PIM leaf routers join the shortest path tree immediately after the first packet arrives from a new source.

## show ipv6 pim bsr-router

View information on the bootstrap router.

**Syntax** `show ipv6 pim [vrf vrf-name] bsr-router`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the C9010, S3048-ON, S3100 Series, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON. |

### Example

```
DellEMC#show ipv6 pim bsr-router
PIMv2 Bootstrap information
 BSR address: 200::1 (?)
 BSR Priority: 0, Hash mask length: 126
 Expires: 00:01:43

This system is a candidate BSR
 Candidate BSR address: 100::1, priority: 0, hash mask length: 126

Next Cand_RP_advertisement in 00:00:25
 RP: 100::1(Lo 0)
DellEMC#
```

## show ipv6 pim interface

Display IPv6 PIM enabled interfaces.

**Syntax** `show ipv6 pim [vrf vrf-name] interface`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

## Example

```
DellEMC#show ipv6 pim interface
Interface Ver/ Nbr Query DR
 Mode Count Intvl Prio
Fo 1/10/1 v2/S 1 30 101
Address : fe80::4e76:25ff:fee5:32c2
DR : this router

Fo 1/1/1 v2/S 1 30 100
Address : fe80::4e76:25ff:fee5:32c2
DR : this router

Fo 1/2/1 v2/S 0 30 1
Address : fe80::4e76:25ff:fee5:32c2
DR : this router
```

## show ipv6 pim neighbor

Displays IPv6 PIM neighbor information.

**Syntax** `show ipv6 pim [vrf vrf-name] neighbor [detail]`

### Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.
-  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- detail** (OPTIONAL) Enter the keyword `detail` to displayed PIM neighbor detailed information.

- Command Modes**
- EXEC
  - EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

## Example

```
DellEMC#show ipv6 pim neighbor
Neighbor Interface Uptime/Expires Ver DR
Address Prio/Mode
fe80::201:e8ff:fe02:140f Fo 1/10/1 01:44:59/00:01:16 v2 1 / S
fe80::201:e8ff:fe00:6265 Fo 1/12/1 01:45:00/00:01:16 v2 1 / DR
DellEMC#
```

## show ipv6 pim rp

View all IPv6 multicast groups-to-rendezvous point (RP) mappings.

**Syntax** `show ipv6 pim [vrf vrf-name] rp [mapping | group-address]`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.
- mapping** (OPTIONAL) Enter the keyword `mapping` to display the multicast groups-to-RP mapping and information on how RP is learned.
- group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x:x` format to view RP mappings for a specific group.  
 **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```
DellEMC#show ipv6 pim rp
Group RP
ff0e::225:1:1:1 150::1
ff0e::225:1:1:2 150::1
ff0e::225:1:1:4 150::1
ff0e::225:1:1:5 150::1
DellEMC#show run pim
!
ip pim bsr-candidate Loopback 0
ip pim vrf red bsr-candidate Loopback 1
ip pim vrf blue bsr-candidate Loopback 2
ip pim vrf red rp-candidate Loopback 1
ip pim vrf blue rp-candidate Loopback 2
ipv6 pim bsr-candidate Loopback 0
ipv6 pim vrf red bsr-candidate Loopback 1
ipv6 pim vrf blue bsr-candidate Loopback 2
ipv6 pim rp-candidate Loopback 0 100 def_vrf_acl
ipv6 pim vrf red rp-candidate Loopback 1 100 def_vrf_acl
ipv6 pim vrf blue rp-candidate Loopback 2 60 blue_vrf_acl_dut
DellEMC#
```

### Example (Mapping)

```
DellEMC#show ipv6 pim rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e::225:1:1:1/128
 RP: 100::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:50
 RP: 150::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:50
 RP: 200::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:57
Group(s): ff0e::225:1:1:2/128
 RP: 100::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:50
```

```

RP: 150::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:50
RP: 200::1, v2
 Info source: 200::1, via bootstrap, priority 100
 expires: 00:01:57
Group(s): ff0e::225:1:1:4/128
 RP: 100::1, v2
DellEMC#

```

## show ipv6 pim summary

View information about PIM-SM operation.

**Syntax** `show ipv6 pim [vrf vrf-name] summary`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```

Dell# show ipv6 pim summary

PIM TIB version 1480
Uptime 5d4h
Entries in PIM-TIB/MFC : 105/81

Active Modes :
 PIM-SM

Interface summary:
 3 active PIM interfaces
 0 passive PIM interfaces
 2 active PIM neighbors

TIB summary:
 12/12 (*,G) entries in PIM-TIB/MFC
 69/69 (S,G) entries in PIM-TIB/MFC
 24/0 (S,G,Rpt) entries in PIM-TIB/MFC

 8 PIM nexthops
 1 RPs
 7 sources
 30 Register states

Message summary:
 47132/53793 Joins/Prunes sent/received
 0/0 Candidate-RP advertisements sent/received
 0/0 BSR messages sent/received
 0/0 MSDP updates sent/received
 243746/0 Null Register messages sent/received
 0/973809 Register-stop messages sent/received

Data path event summary:
 222 no-cache messages received

```

```

281 last-hop switchover messages received
26260/2958 pim-assert messages sent/received
0/0 register messages sent/received
Dell#

```

## show ipv6 pim tib

View the IPv6 PIM multicast-routing database (tree information base — tib).

**Syntax** `show ipv6 pim [vrf vrf-name] tib [group-address [source-address]]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.  
i **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
  - group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x::x` format to view RP mappings for a specific group.  
i **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.
  - source-address** (OPTIONAL) Enter the source address in the `x:x:x::x` format.  
i **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```

Dell#show ipv6 pim tib

PIM Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned,
 R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT,
 M - MSDP created entry, A - Candidate for MSDP Advertisement
 K - Ack-Pending State
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(25::1, ff0e::225:1:2:1), uptime 00:09:53, expires 00:00:00, flags: CJ

### Related Commands

[clear ipv6 pim tib](#) – clears the IPv6 PIM tree information base (TIB)

## IPv6 PIM-Sparse Mode Commands

The following describes the IPv6 PIM-sparse mode (PIM-SM) commands.

### clear ipv6 pim tib

Clear the IPv6 PIM multicast-routing database (tree information base—TIB).

**Syntax** `clear ipv6 pim [vrf vrf-name] tib [group-address]`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address** (OPTIONAL) Enter the multicast group address in the x:x:x:x format.  
 **NOTE:** The :: notation specifies successive hexadecimal fields of zero.

**Defaults** none

**Command Modes** EXEC Privilege

#### Command History

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Related Commands

[show ipv6 pim tib](#) – displays the IPv6 PIM tree information base (TIB)

### debug ipv6 pim

Invoke IPv6 PIM debugging.

**Syntax** `debug ipv6 pim [vrf vrf-name] [bsr | events | group [group] | packet [in | out] | register [group] | state | timer [assert | hello | joinprune | register]]`

To disable IPv6 PIM debugging, use the `no debug ipv6 pim [vrf vrf-name]` command.

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**bsr** (OPTIONAL) Enter the keyword `bsr` to invoke debugging of IPv6 PIM Candidate RP/BSR activities.

**events** (OPTIONAL) Enter the keyword `events` to invoke debugging of IPv6 PIM events.

**group [group]** (OPTIONAL) Enter the keyword `group` followed by the group address to invoke debugging on that specific group.

**packet** (OPTIONAL) Enter the keyword `packet` to invoke debugging of IPv6 PIM packets.

|                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>register</b> [ <i>group</i> ]                                                   | (OPTIONAL) Enter the keyword <code>register</code> and optionally the group address to invoke debugging of IPv6 PIM register messages for a particular group.                                                                                                                                                                                                                                                                                            |
| <b>state</b>                                                                       | (OPTIONAL) Enter the keyword <code>state</code> to view IPv6 PIM state changes.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>timer</b> [ <b>assert</b>   <b>hello</b>   <b>joinprune</b>   <b>register</b> ] | (OPTIONAL) Enter the keyword <code>timer</code> to view IPv6 PIM timers. Enter one of the optional parameters: <ul style="list-style-type: none"> <li>• <code>assert</code>: to view the assertion timer</li> <li>• <code>hello</code>: to view the IPv6 PIM neighbor keepalive timer</li> <li>• <code>joinprune</code>: to view the expiry timer (join/prune timer)</li> <li>• <code>register</code>: to view the register suppression timer</li> </ul> |

**Defaults** Disabled.

**Command Modes** EXEC Privilege

| Command History | Version         | Description                                                                                                |
|-----------------|-----------------|------------------------------------------------------------------------------------------------------------|
|                 | <b>9.11.3.0</b> | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

## ipv6 pim bsr-border

Define the border of IPv6 PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

**Syntax** `ipv6 pim bsr-border`  
To return to the default value, use the `no ipv6 pim bsr-border` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|                  |                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the C9010, S3048-ON, S3100 Series, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON. |
|------------------|---------------------------------------------------------------------------------------------------------------|

**Usage Information** This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out.

## ipv6 pim bsr-candidate

To join the Bootstrap election process, configure the PIM router as a bsr-candidate.

**Syntax** `ipv6 pim [vrf vrf-name] bsr-candidate interface [hash-mask-length] [priority]`  
To return to the default value, use the `no ipv6 pim bsr-candidate [vrf vrf-name]` command.

| Parameters                 |                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>vrf</b> <i>vrf-name</i> | (OPTIONAL) Enter the keyword <code>vrf</code> then the name of the VRF to configure the PIM router on a VRF.                                                                                                                                                                                                                                                                                                         |  |
| <b>interface</b>           | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |  |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**hash-mask-length** (OPTIONAL) Enter the hash mask length. The range is from eight (8) to 128. The default is **126**.

**priority** (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. In the BSR election process, the BSR with the higher priority takes the precedence. If the priority values are equal, the router with the higher IP address becomes the BSR. The default is **0**.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the C9010, S3048-ON, S3100 Series, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON. |

## ipv6 pim dr-priority

Change the designated router (DR) priority for the IPv6 interface.

**Syntax** `ipv6 pim dr-priority priority-value`  
 To remove the DR priority value assigned, use the `no ipv6 pim dr-priority` command.

**Parameters** **priority-value** Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is **1**.

**Defaults** **1**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------|
| <b>9.11.3.0</b> | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information** The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.

## ipv6 pim query-interval

Change the frequency of IPv6 PIM router-query messages.

**Syntax** `ipv6 pim query-interval seconds`  
 To return to the default value, use the `no ipv6 pim query-interval seconds` command.

|                        |                   |                                                                                                                                                                                                                                                       |
|------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>seconds</b>    | Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is <b>30 seconds</b> .                                                                                                               |
| <b>Defaults</b>        | <b>30 seconds</b> |                                                                                                                                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE         |                                                                                                                                                                                                                                                       |
| <b>Command History</b> |                   | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |
|                        | <b>Version</b>    | <b>Description</b>                                                                                                                                                                                                                                    |
|                        | <b>9.11.3.0</b>   | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010.                                                                                                                                            |

## ipv6 pim rp-address

Configure a static PIM rendezvous point (RP) address for a group. First-hop routers use this address to send register packets on behalf of the source multicast host.

**Syntax** `ipv6 pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]`

To remove an RP address, use the `no ipv6 pim re-address address group-address mask [override]` command.

|                   |                                                                      |                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf <i>vrf-name</i></b>                                           | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                       |
|                   | <b><i>address</i></b>                                                | Enter the IPv6 RP address in the <code>x:x:x::x</code> format.<br> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                |
|                   | <b><i>group-address</i><br/><i>group-address</i><br/><i>mask</i></b> | Enter the keywords <code>group-address</code> then the group address in the <code>x:x:x::x</code> format and then the mask in <code>/nn</code> format to assign that group address to the RP.<br> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero. |
|                   | <b>override</b>                                                      | (OPTIONAL) Enter the keyword <code>override</code> to override the BSR updates with static RP. The override takes effect immediately during enable/disable.<br> <b>NOTE:</b> This option is applicable to multicast group range.                                                             |

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none                                                                                                                                                                                                                                                  |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br>The following is a list of the Dell Networking OS version history for this command. |
|                        | <b>Version</b>                                                                                                                                                                                                                                        |
|                        | <b>Description</b>                                                                                                                                                                                                                                    |
|                        | <b>9.11.3.0</b>                                                                                                                                                                                                                                       |
|                        | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010.                                                                                                                                            |

**Usage Information**

The device selects the RP based on the longest prefix match of the configured group address when both static and dynamic RPs are configured.

The `override` option allow you to use statically configured RP instead of the longest prefix match of the configured group address associated with a dynamic RP.

## ipv6 pim rp-candidate

Configure an IPv6 PIM router to send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR.

| <b>Syntax</b>            | <code>ipv6 pim [vrf vrf-name] rp-candidate {interface [priority] [acl-name]}</code><br>To return to the default value, use the <code>no ipv6 pim [vrf vrf-name] rp-candidate {interface [priority]}</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                  |                                                                                                               |

| <b>Parameters</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                  |                                                                                                               |
| <b>vrf vrf-name</b>      | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                  |                                                                                                               |
| <b>interface</b>         | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li><li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |         |             |                  |                                                                                                               |
| <b>priority</b>          | (OPTIONAL) Enter the priority used in RP election process. The range is zero (0) to 255. The default is <b>192</b> . In the RP election process, the RP with the lower priority takes the precedence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                  |                                                                                                               |
| <b>acl-name</b>          | (OPTIONAL) Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.<br> <b>NOTE:</b> If you do not specify the <code>acl-name</code> , the system uses the default multicast IPv6 group range, which is <code>ff00::/8</code> .                                                                                                                                                                                                                                                                                    |         |             |                  |                                                                                                               |
| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                  |                                                                                                               |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                  |                                                                                                               |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                  |                                                                                                               |

| <b>Usage Information</b> | Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |                  |                                                                                                               |

## ipv6 pim sparse-mode

Enable IPv6 PIM sparse mode and MLD on the interface.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ipv6 pim sparse-mode</code><br>To disable IPv6 PIM sparse mode and MLD on the interface, use the <code>no ipv6 pim sparse-mode</code> command.           |
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information**

Enable the interface (use the `no shutdown` command) and not have the `switchport` command configured. Also enable Multicast globally. PIM is supported on the port-channel interface.

## ipv6 pim sparse-mode sg-expiry-timer

Enable expiry timers globally for all sources.

**Syntax**

```
ipv6 pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds
```

To disable configured timers and return to default mode, use the `no ipv6 pim sparse-mode sg-expiry-timer` command.

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable expiry timer for all sources on that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>seconds</b>      | Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.                                                                                                                                                                                                                     |

**Defaults**

Disabled. The default expiry timer (with no times configured) is 210 sec.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information**

This command configures an expiration timer for all S.G entries, unless they are assigned to an Extended ACL.

Even though the FHR nodes act as RPs, these nodes still send *Register encap* messages to themselves and expect to receive a *Register stop* message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

## ipv6 pim spt-threshold

Specifies when a PIM leaf router should join the shortest path tree.

**Syntax**

```
ipv6 pim [vrf vrf-name] spt-threshold {infinity}
```

To return to the default value, use the `no ipv6 pim spt-threshold` command.

**Parameters**

|                     |                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.<br> <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
| <b>infinity</b>     | Enter the keyword <code>infinity</code> to have all sources for the specified group use the shared tree and never join shortest path tree (SPT).                                                                                                                                                                          |

**Defaults**

Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Usage Information** PIM leaf routers join the shortest path tree immediately after the first packet arrives from a new source.

## show ipv6 pim interface

Display IPv6 PIM enabled interfaces.

**Syntax** `show ipv6 pim [vrf vrf-name] interface`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```
DelleMC#show ipv6 pim interface
Interface Ver/ Nbr Query DR
 Mode Count Intvl Prio
Fo 1/10/1 v2/S 1 30 101
Address : fe80::4e76:25ff:fee5:32c2
DR : this router

Fo 1/1/1 v2/S 1 30 100
Address : fe80::4e76:25ff:fee5:32c2
DR : this router

Fo 1/2/1 v2/S 0 30 1
Address : fe80::4e76:25ff:fee5:32c2
DR : this router
```

## show ipv6 pim neighbor

Displays IPv6 PIM neighbor information.

**Syntax** `show ipv6 pim [vrf vrf-name] neighbor [detail]`

**Parameters** **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**detail** (OPTIONAL) Enter the keyword `detail` to displayed PIM neighbor detailed information.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Example**

```
DellEMC#show ipv6 pim neighbor
Neighbor Address Interface Uptime/Expires Ver DR
Prio/Mode
fe80::201:e8ff:fe02:140f Fo 1/10/1 01:44:59/00:01:16 v2 1 / S
fe80::201:e8ff:fe00:6265 Fo 1/12/1 01:45:00/00:01:16 v2 1 / DR
DellEMC#
```

## show ipv6 pim rp

View all IPv6 multicast groups-to-rendezvous point (RP) mappings.

**Syntax** `show ipv6 pim [vrf vrf-name] rp [mapping | group-address]`

- Parameters**
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.
  - mapping** (OPTIONAL) Enter the keyword `mapping` to display the multicast groups-to-RP mapping and information on how RP is learned.
  - group-address** (OPTIONAL) Enter the multicast group address in the `x:x:x:x` format to view RP mappings for a specific group.
-  **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

**Example**

```

## show ipv6 pim summary

View information about PIM-SM operation.

**Syntax** `show ipv6 pim [vrf vrf-name] summary`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```
Dell# show ipv6 pim summary
```

```

PIM TIB version 1480
Uptime 5d4h
Entries in PIM-TIB/MFC : 105/81

Active Modes :
 PIM-SM

Interface summary:
 3 active PIM interfaces
 0 passive PIM interfaces
 2 active PIM neighbors

TIB summary:
 12/12 (*,G) entries in PIM-TIB/MFC
 69/69 (S,G) entries in PIM-TIB/MFC
 24/0 (S,G,Rpt) entries in PIM-TIB/MFC

 8 PIM nexthops
 1 RPs
 7 sources
 30 Register states

Message summary:
 47132/53793 Joins/Prunes sent/received
 0/0 Candidate-RP advertisements sent/received
 0/0 BSR messages sent/received
 0/0 MSDP updates sent/received
 243746/0 Null Register messages sent/received
 0/973809 Register-stop messages sent/received

Data path event summary:
 222 no-cache messages received
 281 last-hop switchover messages received
 26260/2958 pim-assert messages sent/received
 0/0 register messages sent/received

Dell#

```

## show ipv6 pim tib

View the IPv6 PIM multicast-routing database (tree information base — tib).

**Syntax** `show ipv6 pim [vrf vrf-name] tib [group-address [source-address]]`

**Parameters**

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.  
 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- group-address** (OPTIONAL) Enter the multicast group address in the x:x:x:x format to view RP mappings for a specific group.  
 **NOTE:** The :: notation specifies successive hexadecimal fields of zero.
- source-address** (OPTIONAL) Enter the source address in the x:x:x:x format.  
 **NOTE:** The :: notation specifies successive hexadecimal fields of zero.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------|
| 9.11.3.0 | Introduced on the Z9100-ON, S4048-ON, S6000-ON, S6100-ON, S4048T-ON, S3100, S6010-ON, S3048-ON, and C9010. |

### Example

```
Dell#show ipv6 pim tib

PIM Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned,

# Port Monitoring

The port monitoring feature allows you to monitor network traffic by forwarding a copy of each incoming or outgoing packet from one port to another port.

## Important Points to Remember

- Port monitoring is supported on physical ports and logical interfaces, such as port channels and virtual local area networks (VLANs).
- The monitoring (destination, “MG”) and monitored (source, “MD”) ports must be on the same switch.
- In general, a monitoring port should have `no ip address` and `no shutdown` as the only configuration; Dell EMC Networking OS permits a limited set of commands for monitoring ports; display them using the `?` command. A monitoring port also may not be a member of a VLAN.
- A total of 4 MG may be configured in a single port-pipe.
- MG and MD ports can be reside anywhere across a port-pipe.
- The Dell EMC Networking OS supports multiple source ports to be monitored by a single destination port in one monitor session.
- One monitor session can have only one MG port.

 **NOTE:** The monitoring port should not be a part of any other configuration.

### Topics:

- [erpm](#)
- [monitor multicast-queue](#)
- [monitor session](#)
- [rate-limit](#)
- [show config](#)
- [show monitor session](#)
- [show running-config monitor session](#)
- [source \(port monitoring\)](#)

## description

Enter a description of this monitoring session.

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

**Parameters** **description** Enter a description regarding this session (80 characters maximum).

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version     | Description                     |
|-------------|---------------------------------|
| 9.10(0.0)   | Introduced on the S3148.        |
| 9.10(0.0)   | Introduced on the S6100-ON.     |
| 9.8(2.0)    | Introduced on the S3100 series. |
| 9.8(1.0)    | Introduced on the Z9100-ON.     |
| 9.8(0.0P5)  | Introduced on the S4048-ON.     |
| 9.8(0.0P2)  | Introduced on the S3048-ON.     |
| 9.7(0.0)    | Introduced on the S6000-ON.     |
| 9.5(0.1)    | Introduced on the Z9500.        |
| 9.5(0.0)    | Introduced on the Z9500.        |
| 9.0.2.0     | Introduced on the S6000.        |
| 8.3.19.0    | Introduced on the S4820T.       |
| 8.3.11.1    | Introduced on the Z9000.        |
| 8.3.7.0     | Introduced on the S4810.        |
| 8.1.1.0     | Introduced on the E-Series.     |
| 7.7.1.0     | Introduced on the S-Series.     |
| 7.5.1.0     | Introduced on the C-Series.     |
| pre-7.7.1.0 | Introduced on the E-Series.     |

#### Related Commands

- [monitor session](#) — enables a monitoring session.

## erpm

Configure the source and destination IP address for ERPM traffic.

**Syntax** `erpm source-ip ip-address dest-ip ip-address [gre-protocol value]`  
 To remove the configuration, use the `no erpm source-ip IP-address dest-ip IP-address [gre-protocol value]` command.

**Parameters**

|                                         |                                                                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source-ip <i>ip-address</i></b>      | Enter the keywords <code>source-ip</code> then the source IP address in dotted decimal format.                                                    |
| <b>destination-ip <i>ip-address</i></b> | Enter the keywords <code>dest-ip</code> then the destination IP address in dotted decimal format.                                                 |
| <b>gre-protocol <i>value</i></b>        | (OPTIONAL) Enter the keywords <code>gre-protocol</code> then the protocol type value for ERPM type monitor session. The range is from 1 to 65535. |

**Command Modes** MONITOR SESSION (`conf-mon- sess-session-ID`)

**Example**

```
DellEMC(conf-mon-sess-10)#erpm source-ip 10.10.10.1 dest-ip 5.1.1.2 gre-protocol 1111
```

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                      |
|-----------|----------------------------------|
| 9.11(0.0) | Introduced GRE protocol support. |

# monitor multicast-queue

Configure monitor QoS multicast queue ID.

**Syntax** `monitor multicast-queue queue-id`  
To remove the configuration, use the `no monitor multicast-queue` command.

**Parameters** `queue-id` Enter the QoS multicast queue ID. The range is from 0 to 9.

**Defaults** `queue-id: 0`  
Enable status: Disabled

**Command Modes** CONFIGURATION

**Example**

```
DellEMC(conf)#monitor multicast-queue 7
```

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.8(0.0)   | Introduced on the S6000, Z9500, S6000-ON. |

**Related Commands** [show running-config monitor session](#) — displays information about monitor configurations.

# monitor session

Create a session for monitoring traffic with port monitoring.

**Syntax** `monitor session session-ID [type { rpm | erpm [set ip dscp dscp_value | set ip ttl ttl_value] }] [drop]`  
To delete a session, use the `no monitor session session-ID` command.  
To delete all monitor sessions, use the `no monitor session all` command.

**Parameters**

- `session-ID` Enter a session identification number. The range is from 0 to 65535.
- `type` Specifies one of the following type:
  - rpm
  - erpm
- `rpm` Creates a remote port monitoring (rpm) session.
- `erpm` Creates an encapsulated remote port monitoring (erpm) session.

|                    |                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>set ip dscp</b> | Configures the Differentiated Services Code Point (DSCP) value of the packets in the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default value, use the no form of this command. |
| <b>dscp_value</b>  | DSCP value of the packets in the ERSPAN traffic. The range is from 0 to 63. The default value is 0.                                                                                                                |
| <b>set ip ttl</b>  | Configures the IP time-to-live (TTL) value of the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default configuration, use the no form of this command.                            |
| <b>ttl_value</b>   | IP TTL value of the ERSPAN traffic. The range is from 1 to 255. The default value is 255.                                                                                                                          |
| <b>drop</b>        | Monitors only the dropped packets in the Ingress.                                                                                                                                                                  |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                   |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                    |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                 |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                             |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                 |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                 |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                 |
| <b>9.8(0.0)</b>   | Added the drop parameter.                                                                                   |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. Introduced the <code>set ip dscp</code> and <code>set ip ttl</code> parameters. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                                    |
| <b>9.4(0.0)</b>   | Introduced on the S4810, S4820T, S6000, and Z9000.                                                          |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                    |
| <b>9.0.2.0</b>    | Introduced on the MXL.                                                                                      |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                    |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                    |

**Usage Information** The `monitor` command is saved in the running configuration at Monitor Session mode level and can be restored after a chassis reload.

**Example**

```
DelleMC# show monitor session
 SessID Source Destination Dir Mode Source IP Dest IP
 DSCP TTL

 0 0 Te 1/12/1 remote-ip rx Flow 1.1.1.1 7.1.1.2
 0 255

### Example

```
DellEMC(conf-mon-sess-1)# show config
!
monitor session 1
source TenGigabitEthernet 1/1/1 destination Port-channel 1 direction rx
```

## show monitor session

Display information about monitoring sessions.

**Syntax** `show monitor session {session-ID} [access-list]`

To display monitoring information for all sessions, use the `show monitor session` command.

**Parameters**

- session-ID*** (OPTIONAL) Enter a session identification number. The range is from 0 to 65535.
- [*access-list*]** (OPTIONAL) Enter the `access-list` keyword to display the ACLs applied to monitor sessions.

**Defaults** none

**Command Modes**

- EXEC
- as
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0)  | Updated to display the IPv6 ACLs applied to monitor session on the S6000, S6000-ON, S5048F-ON, S6100-ON, and Z9100-ON.                        |
| 9.12(0.0)  | Introduced the <code>access-list</code> optional keyword to display the ACLs applied to monitor sessions on the S6000, S6100-ON and Z9100-ON. |
| 9.11(0.0)  | Introduced the support for GRE Protocol and FC Monitor in the command output.                                                                 |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                                                     |
| 9.10(0.0)  | Introduced on the S3148.                                                                                                                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                                                   |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                                               |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                                                   |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                                                   |

| Version  | Description                       |
|----------|-----------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.       |
| 9.5(0.1) | Introduced on the Z9500.          |
| 9.4.0.0  | Added support for the RPM / ERPM. |
| 9.0.2.0  | Introduced on the S6000.          |
| 8.3.19.0 | Introduced on the S4820T.         |
| 8.3.7.0  | Introduced on the S4810.          |
| 8.3.11.1 | Introduced on the Z9000.          |
| 8.1.1.0  | Introduced on the E-Series.       |
| 7.7.1.0  | Introduced on the S-Series.       |
| 7.5.1.0  | Introduced on the C-Series.       |
| 7.4.1.0  | Introduced on the E-Series.       |

### Example

```
DellEMC# show monitor session 1
SessID Source Destination Dir Mode Source IP
Dest IP DSCP TTL Drop Rate Gre-Protocol FcMonitor

1 Te 1/2/1 remote-ip rx Port 0.0.0.0
0.0.0.0 0 0 No N/A N/A yes
DellEMC#

DellEMC# show monitor session
SessID Source Destination Dir Mode Source IP
Dest IP DSCP TTL Drop Rate Gre-Protocol FcMonitor

1 Te 1/2/1 remote-ip rx Port 0.0.0.0
0.0.0.0 0 0 No N/A N/A yes
DellEMC#
```

### Example (show monitor session access-list)

The following is an example output of the `show monitor session access-list` command.

```
DellEMC#sho monitor session 13 access-list
Monitor session - 13
Interface Direction Mirror-access-list

Te 1/1/1 rx mtacl
mtv6acl(ipv6)
```

### Related Commands

- [monitor session](#) — creates a monitoring session.

## show running-config monitor session

Display the running configuration of all monitor sessions or a specific session.

**Syntax** `show running-config monitor session {session-ID}`

To display the running configuration for all monitor sessions, use the `show running-config monitor session` command.

**Parameters** *session-ID* (OPTIONAL) Enter a session identification number. The range from 0 to 65535.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.1.1.0    | Introduced on the E-Series.               |
| 7.7.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

**Usage Information**

The `monitoring` command is saved in the running configuration at the Monitor Session mode level and can be restored after a chassis reload.

**Example**

```
DelleMC# show running-config monitor session
!
monitor session 1
source TenGigabitEthernet 1/1/1 destination TenGigabitEthernet 1/2/1
direction rx
!
monitor multicast-queue 7
DelleMC#
```

**Related Commands**

- [monitor session](#) — creates a monitoring session.
- [show monitor session](#) — displays a monitoring session.

## source (port monitoring)

Configure a port monitor source.

**Syntax**

```
source {interface | range | any} destination interface direction {rx | tx | both}
```

To disable a monitor source, use the `no source interface destination interface direction {rx | tx | both}` command.

**Parameters**

**source interface** Enter one of the following keywords and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface enter the keyword `VLAN` followed by a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

**range** Enter the keyword `range` to specify the list of interfaces.

**any** Enter the keyword `any` to specify all interfaces.

 **NOTE:** This option is applicable only with drop monitor session.

**destination** Enter the keyword `destination` to specify the destination interface.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**interface** Enter one of the following keywords and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

**direction {rx | tx | both}** Enter the keyword `direction` then one of the packet directional indicators.

- `rx`: to monitor receiving packets only.
- `tx`: to monitor transmitting packets only.
- `both`: to monitor both transmitting and receiving packets.

**Defaults** none

**Command Modes** MONITOR SESSION (conf-mon- sess-session-ID)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Example**

```
DellEMC# monitor session 0
source Port-channel 10 destination TenGigabitEthernet 1/3/1 direction tx
DellEMC#
```

# Private VLAN (PVLAN)

The private VLAN (PVLAN) feature of the Dell EMC Networking OS is supported on the platforms.

Private VLANs extend the Dell EMC Networking OS security suite by providing Layer 2 isolation between ports within the same private VLAN. A private VLAN partitions a traditional VLAN into subdomains identified by a primary and secondary VLAN pair. The Dell EMC Networking OS private VLAN implementation is based on RFC 3069.

For more information, see the following commands. The command output is augmented in Dell EMC Networking OS version 7.8.1.0 at later to provide PVLAN data:

- [show arp](#)
- [show vlan](#)

## Private VLAN Concepts

### Primary VLAN:

The primary VLAN is the base VLAN and can have multiple secondary VLANs. There are two types of secondary VLAN — community VLAN and isolated VLAN:

- A primary VLAN can have any number of community VLANs and isolated VLANs.
- Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports or trunk ports.

### Community VLAN:

A community VLAN is a secondary VLAN of the primary VLAN:

- Ports in a community VLAN can talk to each other. Also, all ports in a community VLAN can talk to all promiscuous ports in the primary VLAN and vice versa.
- Devices on a community VLAN can communicate with each other using member ports, while devices in an isolated VLAN cannot.

### Isolated VLAN:

An isolated VLAN is a secondary VLAN of the primary VLAN:

- Ports in an isolated VLAN cannot talk to each other. Servers would be mostly connected to isolated VLAN ports.
- Isolated ports can talk to promiscuous ports in the primary VLAN, and vice versa.

### Port Types:

- *Community port* — a community port is a port that belongs to a community VLAN and is allowed to communicate with other ports in the same community VLAN and with promiscuous ports.
- *Isolated port* — an isolated port is a port that, in Layer 2, can only communicate with promiscuous ports that are in the same PVLAN.
- *Promiscuous port* — a promiscuous port is a port that is allowed to communicate with any other port type.
- *Trunk port* — a trunk port carries VLAN traffic across switches:
  - A trunk port in a PVLAN is always tagged.
  - A trunk port in Tagged mode carries primary or secondary VLAN traffic. The tag on the packet helps identify the VLAN to which the packet belongs.
  - A trunk port can also belong to a regular VLAN (non-private VLAN).

### Topics:

- [switchport mode private-vlan](#)

# ip local-proxy-arp

Enable/disable Layer 3 communication between secondary VLANs in a private VLAN.

## S6000–ON

### Syntax

```
[no] ip local-proxy-arp
```

To disable Layer 3 communication between secondary VLANs in a private VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the primary VLAN.

To disable Layer 3 communication in a particular secondary VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the selected secondary VLAN.

**NOTE:** Even after you disable `ip-local-proxy-arp` (use `no ip-local-proxy-arp`) in a secondary VLAN, Layer 3 communication may happen between some secondary VLAN hosts, until the address resolution protocol (ARP) timeout happens on those secondary VLAN hosts.

### Defaults

Layer 3 communication is disabled between secondary VLANs in a private VLAN.

### Command Modes

INTERFACE VLAN

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the C-Series and S-Series.  |

### Related Commands

- [private-vlan mode](#) — sets the mode of the selected VLAN to community, isolated, or primary.
- [private-vlan mapping secondary-vlan](#) — maps secondary VLANs to the selected primary VLAN.
- [show arp](#) — displays the ARP table.
- [switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

# private-vlan mode

Set PVLAN mode of the selected VLAN to community, isolated, or primary.

## S6000–ON

**Syntax** `[no] private-vlan mode {community | isolated | primary}`  
To remove the PVLAN configuration, use the `no private-vlan mode {community | isolated | primary}` command syntax.

**Parameters**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <b>community</b> | Enter the keyword <code>community</code> to set the VLAN as a community VLAN.      |
| <b>isolated</b>  | Enter the keyword <code>isolated</code> to configure the VLAN as an isolated VLAN. |
| <b>primary</b>   | Enter the keyword <code>primary</code> to configure the VLAN as a primary VLAN.    |

**Defaults** none

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the C-Series and S-Series.  |

**Usage Information** The VLAN:

- can be in only one mode, either `community`, `isolated`, or `primary`.
- mode to `community` or `isolated` even before associating it to a primary VLAN. This secondary VLAN continues to work normally as a normal VLAN even though it is not associated to a primary VLAN. (A syslog message indicates this.)
- must not have a port in it when VLAN mode is being set.

Only ports (and port channels) configured as promiscuous, host, or PVLAN trunk ports (as previously described) can be added to the PVLAN. No other regular ports can be added to the PVLAN.

After using this command to configure a VLAN as a primary VLAN, use the `private-vlan mapping secondary-vlan` command to map secondary VLANs to this VLAN.

**Related Commands**

- [private-vlan mapping secondary-vlan](#) — maps secondary VLANs to the selected primary VLAN.
- [switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

# private-vlan mapping secondary-vlan

Map secondary VLANs to the selected primary VLAN.

|                        |                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>[no] private-vlan mapping secondary-vlan <i>vlan-list</i></code><br>To remove specific secondary VLANs from the configuration, use the <code>no private-vlan mapping secondary-vlan <i>vlan-list</i></code> command syntax. |
| <b>Parameters</b>      | <b><i>vlan-list</i></b> Enter the list of secondary VLANs to associate with the selected primary VLAN. The list can be in comma-delimited or hyphenated-range format, following the convention for the range input.               |
| <b>Defaults</b>        | none                                                                                                                                                                                                                              |
| <b>Command Modes</b>   | INTERFACE VLAN                                                                                                                                                                                                                    |

|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The list of secondary VLANs can be: <ul style="list-style-type: none"><li>Specified in comma-delimited or hyphenated-range format.</li><li>Specified with this command even before they have been created.</li><li>Amended by specifying the new secondary VLAN to be added to the list.</li></ul> |
| <b>Related Commands</b>  | <ul style="list-style-type: none"><li><a href="#">private-vlan mode</a> — sets the mode of the selected VLAN to community, isolated, or primary.</li><li><a href="#">switchport mode private-vlan</a> — sets PVLAN mode of the selected port.</li></ul>                                            |

# switchport mode private-vlan

Set PVLAN mode of the selected port.

## S6000-ON

|               |                                                                             |
|---------------|-----------------------------------------------------------------------------|
| <b>Syntax</b> | <code>[no] switchport mode private-vlan {host   promiscuous   trunk}</code> |
|---------------|-----------------------------------------------------------------------------|

To remove PVLAN mode from the selected port, use the `no switchport mode private-vlan` command.

#### Parameters

|                    |                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>host</b>        | Enter the keyword <code>host</code> to configure the selected port or port channel as an isolated interface in a PVLAN. |
| <b>promiscuous</b> | Enter the keyword <code>promiscuous</code> to configure the selected port or port channel as a promiscuous interface.   |
| <b>trunk</b>       | Enter the keyword <code>trunk</code> to configure the selected port or port channel as a trunk port in a PVLAN.         |

#### Defaults

Disabled.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.8.1.0</b>    | Introduced on the C-Series and S-Series.  |

#### Usage Information

The assignment of the various PVLAN port types to port and port channel (LAG) interfaces is shown in the following example.

#### Example

```
DelleMC# conf
DelleMC(conf)# interface TenGigabitEthernet 1/1/1
DelleMC(conf-if-te-1/1/1)# switchport mode private-vlan promiscuous

DelleMC(conf)# interface TenGigabitEthernet 1/2/1
DelleMC(conf-if-te-1/2/1)# switchport mode private-vlan host

DelleMC(conf)# interface TenGigabitEthernet 1/3/1
DelleMC(conf-if-te-1/3/1)# switchport mode private-vlan trunk

DelleMC(conf)# interface port-channel 10
DelleMC(conf-if-te-1/3/1)# switchport mode private-vlan promiscuous
DelleMC(conf-if-te-1/3/1)#
```

#### Related Commands

- [private-vlan mode](#) — sets the mode of the selected VLAN to community, isolated, or primary.
- [private-vlan mapping secondary-vlan](#) — sets the mode of the selected VLAN to primary and then associates the secondary VLANs to it.

# Per-VLAN Spanning Tree Plus (PVST+)

The Dell EMC Networking OS implementation of per-VLAN spanning tree plus (PVST+) is based on the IEEE 802.1w standard spanning tree protocol.

Dell EMC Networking OS supports PVST+ on the S6000–ON platform.

**i** **NOTE:** For easier command line entry, the plus (+) sign is not used at the command line.

## Topics:

- [tc-flush-standard](#)
- [vlan bridge-priority](#)
- [vlan forward-delay](#)
- [vlan hello-time](#)
- [vlan max-age](#)

## description

Enter a description of the PVST+.

## S6000–ON

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

**Parameters** ***description*** Enter a description to identify the spanning tree (80 characters maximum).

**Defaults** none

**Command Modes** SPANNING TREE PVST+ (The prompt is “config-pvst”.)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.6.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

## Related Commands

- [protocol spanning-tree pvst](#) — enter PVST+ mode.

# extend system-id

To augment the Bridge ID with a VLAN ID so that PVST+ differentiate between BPDUs for each VLAN, use extend system ID. If the VLAN receives a BPDU meant for another VLAN, PVST+ does not detect a loop, and both ports can remain in Forwarding state.

## S6000-ON

**Syntax** extend system-id

**Defaults** Disabled

**Command Modes** PROTOCOL PVST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version | Description                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------|
| 8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.                                                                 |
| 8.4.2.1 | Support for the optional <code>guard</code> keyword was added on the C-Series, S-Series, and E-Series.                   |
| 7.6.1.0 | Introduced on the S-Series.                                                                                              |
| 7.5.1.0 | Introduced on the C-Series.                                                                                              |
| 6.4.1.0 | Expanded to display port error disable state (EDS) caused by loopback BPDU inconsistency and Port VLAN ID inconsistency. |
| 6.2.1.1 | Introduced.                                                                                                              |

### Usage Information

The following describes the `show spanning-tree pvst` command shown in the following examples.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | PVST interface.                                                                                                         |
| <b>Instance</b>       | PVST instance.                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

### Example (Brief)

```
DelleMC# show spanning-tree pvst vlan 3 brief
VLAN 3
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 4096, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 16384, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15

Interface Designated
Name PortID Prio Cost Sts Cost Bridge ID PortID

Te 1/0/1 128.130 128 20000 FWD 20000 4096 0001.e801.6aa8 128.426

### Example

```
DelleMC# show spanning-tree pvst vlan 2
VLAN 2
Root Identifier has priority 4096, Address 0001.e805.e306
Root Bridge hello time 2, max age 20, forward delay 15
Bridge Identifier has priority 4096, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15
We are the root of VLAN 2
Current root has priority 4096, Address 0001.e805.e306
Number of topology changes 3, last change occurred 00:57:00

Port 130 (TenGigabitEthernet 1/2/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.130
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.130, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 3
```

```

The port is not in the Edge port mode

Port 131 (TenGigabitEthernet 1/1/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.131
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.131, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 0
The port is not in the Edge port mode

Port 146 (TenGigabitEthernet 1/16/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.146
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.146, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1578, received 0
The port is in the Edge port mode

Port 147 (TenGigabitEthernet 1/17/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.147
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.147, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1579, received 0
The port is in the Edge port mode

```

**Example (EDS/LBK)**

```
DelleMC# show spanning-tree pvst vlan 2 interface tengigabitethernet 1/1/1
```

**TenGigabitEthernet 1/1/1 of VLAN 2 is LBK\_INC discarding**

```

Edge port:no (default) port guard :none (default)
Link type: point-to-point (auto) bpdu filter:disable (default)
Bpdu guard :disable (default)
Bpdus sent 152, received 27562

```

```

Te 1/1/1 5 INCON(Root) Rootguard
Te 1/2/1 5 FWD Loopguard
Te 1/3/1 5 EDS(Shut) Bpduguard
DelleMC#

```

## Related Commands

- [spanning-tree pvst](#) — configure PVST+ on an interface.

# spanning-tree pvst

Configure a PVST+ interface with one of these settings: edge port with optional bridge port data unit (BPDU) guard, port disablement if an error condition occurs, port priority or cost for a VLAN range, loop guard, or root guard.

## S6000-ON

### Syntax

```
spanning-tree pvst {edge-port [bpduguard [shutdown-on-violation]] | err-disable | vlan vlan-range {cost number | priority value} | loopguard | rootguard}
```

### Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>edge-port</b>              | Enter the keywords <code>edge-port</code> to configure the interface as a PVST+ edge port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>bpduguard</b>              | Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.<br><br>Enter the keyword <code>bpduguard</code> to disable the port when it receives a BPDU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>shutdown-on-violation</b>  | (OPTIONAL) Enter the keywords <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>err-disable</b>            | Enter the keywords <code>err-disable</code> to enable the port to be put into the error-disable state (EDS) if an error condition occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>vlan <i>vlan-range</i></b> | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>cost <i>number</i></b>     | Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000.<br><br>Defaults: <ul style="list-style-type: none"><li>• 100 Mb/s Ethernet interface = <b>200000</b>.</li><li>• 1-Gigabit Ethernet interface = <b>20000</b>.</li><li>• 10-Gigabit Ethernet interface = <b>2000</b>.</li><li>• Port Channel interface with one 100 Mb/s Ethernet = <b>200000</b>.</li><li>• Port Channel interface with one 1 Gigabit Ethernet = <b>20000</b>.</li><li>• Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b>.</li><li>• Port Channel with two 1 Gigabit Ethernet = <b>18000</b>.</li><li>• Port Channel with two 10 Gigabit Ethernet = <b>1800</b>.</li><li>• Port Channel with two 100 Mbps Ethernet = <b>180000</b>.</li></ul> |
| <b>priority <i>value</i></b>  | Enter the keyword <code>priority</code> then the Port priority value in increments of 16. The range is from 0 to 240. The default is <b>128</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>loopguard</b>              | (C-, S-, and E-Series only) Enter the keyword <code>loopguard</code> to enable loop guard on a PVST+ port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>rootguard</b>              | (C-, S-, and E-Series only) Enter the keyword <code>rootguard</code> to enable root guard on a PVST+ port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |

| Version    | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                       |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                   |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                       |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                       |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                       |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                          |
| 9.0.2.0    | Introduced on the S6000.                                                                                          |
| 8.3.19.0   | Introduced on the S4820T.                                                                                         |
| 8.3.11.1   | Introduced on the Z9000.                                                                                          |
| 8.4.2.1    | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series, C-Series, and S-Series. |
| 8.3.7.0    | Introduced on the S4810.                                                                                          |
| 8.2.1.0    | Introduced the hardware <code>shutdown-on-violation</code> option.                                                |
| 7.6.1.0    | Introduced on the S-Series.                                                                                       |
| 7.5.1.0    | Introduced on the C-Series.                                                                                       |
| 7.4.1.0    | Added the optional Bridge Port Data Unit (BPDU) guard.                                                            |
| 6.2.1.1    | Introduced.                                                                                                       |

## Usage Information

The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into the Error Disable state if a BPDU appears, and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on a PVST switch, immediately transitions to the forwarding state. Only ports connected to end-hosts should be configured as an edge port. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the route process module (RPM) CPU.

You cannot enable `root guard` and `loop guard` at the same time on a port. For example, if you configure `loop guard` on a port on which `root guard` is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

When used in a PVST+ network, `loop guard` is performed per-port or per-port channel at a VLAN level. If no BPDUs are received on a VLAN interface, the port or port-channel transitions to a Loop-Inconsistent (blocking) state only for this VLAN.

Enabling Portfast BPDU guard and `loop guard` at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and `loop guard` are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, `loop guard` places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

## Example

```
DelleMC(conf-if-te-1/1/1)# spanning-tree pvst vlan 3 cost 1800
DelleMC(conf-if-te-1/1/1)# end
DelleMC(conf-if-te-1/1/1)# show config
!
interface TenGigabitEthernet 1/1/1
```

```
no ip address
switchport
spanning-tree pvst vlan 3 cost 18000
no shutdown
DellEMC(conf-if-te-1/1/1)# end

DellEMC#
```

#### Related Commands

## spanning-tree pvst err-disable

Place ports in an Err-Disabled state if they receive a PVST+ BPDU when they are members an untagged VLAN.

### S6000-ON

#### Syntax

```
spanning-tree pvst err-disable cause invalid-pvst-bpdu
```

#### Defaults

Enabled; ports are placed in the Err-Disabled state if they receive a PVST+ BPDU when they are members of an untagged VLAN.

**Command Modes** INTERFACE

#### Command History

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.2.1.0</b>    | Introduced.                               |

#### Usage Information

Some non-Dell EMC Networking systems which have hybrid ports participating in PVST+ transmit two kinds of BPDUs: an 802.1D BPDU and an untagged PVST+ BPDU.

Dell EMC Networking systems do not expect PVST+ BPDU on an untagged port. If this happens, Dell EMC Networking OS places the port in the Error-Disable state. This behavior might result in the network not converging. To prevent Dell EMC Networking OS from executing this action, use the `no spanning-tree pvst err-disable` command `cause invalid-pvst-bpdu`.

#### Related Commands

- [show spanning-tree pvst](#) — views the PVST+ configuration.

# tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

## S6000–ON

**Syntax** `tc-flush-standard`

To disable, use the `no tc-flush-standard` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.  |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.2(1.0)  | Introduced on the Z9500.                  |
| 9.0.2.0   | Introduced on the S6000.                  |
| 8.3.19.0  | Introduced on the S4820T.                 |
| 8.3.11.1  | Introduced on the Z9000.                  |
| 8.3.7.0   | Introduced on the S4810.                  |
| 7.6.1.0   | Introduced on the S-Series.               |
| 7.5.1.0   | Introduced on the C-Series.               |
| 6.5.1.0   | Introduced.                               |

**Usage Information** By default, Dell EMC Networking OS implements an optimized flush mechanism for PVST+. This implementation helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn this *knob* command on to enable flushing MAC addresses after receiving every topology change notification.

# vlan bridge-priority

Set the PVST+ bridge-priority for a VLAN or a set of VLANs.

## S6000–ON

**Syntax** `vlan vlan-range bridge-priority value`

To return to the default value, use the `no vlan bridge-priority` command.

**Parameters** **vlan *vlan-range*** Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

**bridge-priority**  
**value** Enter the keywords `bridge-priority` then the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is **32768**.

**Defaults** **32768**

**Command Modes** CONFIGURATION (conf-pvst)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## vlan forward-delay

Set the amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

### S6000-ON

**Syntax** `vlan vlan-range forward-delay seconds`

To return to the default setting, use the `no vlan forward-delay` command.

**Parameters**

**vlan *vlan-range*** Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

**forward-delay *seconds*** Enter the keywords `forward-delay` then the time interval, in seconds, that Dell EMC Networking OS waits before transitioning PVST+ to the forwarding state. The range is from 4 to 30 seconds. The default is **15 seconds**.

|                        |                                                                                                                                                               |

#### Related Commands

- [vlan bridge-priority](#) — sets the bridge-priority value.
- [vlan forward-delay](#) — changes the time interval before Dell EMC Networking OS transitions to the forwarding state.
- [vlan max-age](#) — changes the time interval before PVST+ refreshes.
- [show spanning-tree pvst](#) — displays the PVST+ configuration.

## vlan max-age

To maintain configuration information before refreshing that information, set the time interval for the PVST+ bridge.

### S6000–ON

#### Syntax

```
vlan vlan-range max-age seconds
```

To return to the default, use the `no vlan max-age` command.

#### Parameters

- vlan *vlan-range*** Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- max-age *seconds*** Enter the keywords `max-age` then the time interval, in seconds, that Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

#### Defaults

**20 seconds**

- [show spanning-tree pvst](#) — displays the PVST+ configuration.

# Quality of Service (QoS)

The Dell EMC Networking OS commands for quality of service (QoS) include traffic conditioning and congestion control. QoS commands are not universally supported on all Dell EMC Networking products.

## Topics:

- [Global Configuration Commands](#)
- [Per-Port QoS Commands](#)
- [Policy-Based QoS Commands](#)
- [DSCP Color Map Commands](#)

## Global Configuration Commands

There is only one global configuration QoS command.

### qos-rate-adjust

By default, while rate limiting, policing, and shaping, Dell EMC Networking OS does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations. You can optionally include overhead fields in rate metering calculations by enabling QoS Rate Adjustment.

|                        |                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>qos-rate-adjustment</code> <i>overhead-bytes</i>                                                                                                                          |
| <b>Parameters</b>      | <b><i>overhead-bytes</i></b> Include a specified number of bytes of packet overhead to include in rate limiting, policing, and shaping calculations. The range is from 1 to 31. |
| <b>Defaults</b>        | QoS rate adjustment is disabled by default.                                                                                                                                     |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                   |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.0 | Introduced on the S4810. |
| 8.3.1.0 | Introduced.              |

**Usage Information**

By default, when rate policing and shaping, the system does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations.

## service-class bandwidth-percentage

Specify a minimum bandwidth for queues.

### S6000-ON

**Syntax** `service-class bandwidth-percentage queue0 number queue1 number queue2 number queue3 number queue4 number queue5 number queue6 number queue7 number`

**Parameters** *number* Enter the bandwidth-weight, as a percentage.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History**

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.  |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.2(1.0)  | Introduced on the Z9500.                  |
| 9.0.2.0   | Introduced on the S6000.                  |
| 8.3.19.0  | Introduced on the S4820T.                 |
| 8.3.11.1  | Introduced on the Z9000.                  |
| 8.3.7.1   | Introduced on the S4810.                  |
| 8.2.1.0   | Introduced on the C-Series and S-Series.  |

**Usage Information**

Guarantee a minimum bandwidth to different queues globally using the `service-class bandwidth-percentage` command from CONFIGURATION mode. The command is applied in the same way as the `bandwidth-percentage` command in an output QoS policy. The `bandwidth-percentage` command in QOS-POLICY-OUT mode supersedes the `service-class bandwidth-percentage` command.

## service-class dot1p-mapping

Configure a service-class criterion based on a dot1p value.

### S6000–ON

**Syntax** `service-class dot1p-mapping {dot1p0 queue | dot1p1 queue | dot1p2 queue | dot1p3 queue | dot1p4 queue | dot1p5 queue | dot1p6 queue | dot1p7 queue}`

**Parameters** **queue** Enter a value from 0 to 7.

**Defaults** For each dot1p Priority, the default CoS queue value is:

- Dot1p Priority : 0 1 2 3 4 5 6 7
- Queue : 2 0 1 3 4 5 6 7

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

**Usage Information** To apply dot1p-queue-mapping, use the `service-class dynamic dot1p` command.

**Related Commands**

- [show qos dot1p-queue-mapping](#) — displays the dot1p priority to queue mapping on the switch.

## show qos dot1p-queue-mapping

Displays the dot1p priority to queue mapping on the switch.

**Syntax** `show qos dot1p-queue-mapping`

**Defaults**

- dot1p Priority: 0 1 2 3 4 5 6 7
- Queue: 2 0 1 3 4 5 6 7

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |

**Usage Information**

trust dot1p, do1p-priority, service-class dynamic dot1; all these features work over the mapping in this command output.

**Related Commands**

- [service-class dot1p-mapping](#) — Identifies the class map.

## strict-priority unicast

Configure a unicast queue as a strict-priority (SP) queue.

**Syntax** `strict-priority unicast number`

**Parameters** **unicast *number*** Enter the keyword `unicast` then the queue number. The range is from 1 to 3.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.1 | Introduced on the E-Series. |

#### Usage Information

After you configure a unicast queue as strict-priority, that particular queue, on the entire chassis, is treated as a `strict-priority unicast`. Traffic for a strict priority is scheduled before any other queues are serviced. For example, if you send 100% line rate traffic over the SP queue, it starves all other queues on the ports on which this traffic is flowing.

## Per-Port QoS Commands

Per-port QoS (port-based QoS) allows you to define the QoS configuration on a per-physical-port basis.

### dot1p-priority

Assign a value to the IEEE 802.1p bits on the traffic this interface receives.

**Syntax** `dot1p-priority priority-value`

To delete the IEEE 802.1p configuration on the interface, use the `no dot1p-priority` command.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

#### Usage Information

The `dot1p-priority` command changes the priority of incoming traffic on the interface. The system places traffic marked with a priority in the correct queue and processes that traffic according to its queue.

When you set the priority for a port channel, the physical interfaces assigned to the port channel are configured with the same value. You cannot assign the `dot1p-priority` command to individual interfaces in a port channel.

## rate police

Police the incoming traffic rate on the selected interface.

**Syntax** `rate police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]] [vlan vlan-id]`

**Parameters**

- kbps** Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- committed-rate** Enter the bandwidth in Mbps. The range is from 0 to 40000.
- burst-KB** (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is **50**.
- peak peak-rate** (OPTIONAL) Enter the keyword `peak` then a number to specify the peak rate in Mbps. The range is from 0 to 40000.
- vlan vlan-id** (OPTIONAL) Enter the keyword `vlan` then a VLAN ID to police traffic to those specific VLANs. The range is from 1 to 4094.

**Defaults** Granularity for `committed-rate` and `peak-rate` is Mbps unless you use the `kbps` option.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                   |
| 9.10(0.0)  | Introduced on the S3148.                                                    |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                 |
| 9.8(2.0)   | Introduced on the S3100 series.                                             |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                 |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                    |
| 9.0.2.0    | Introduced on the S6000.                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                    |
| 8.2.1.0    | Added the <code>kbps</code> option on the C-Series, E-Series, and S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                                 |
| 7.5.1.0    | Introduced on the C-Series.                                                 |
| 6.1.1.1    | Introduced on the E-Series.                                                 |

**Usage Information**  **NOTE:** Per Port rate police is supported for Layer 2 tagged and untagged switched traffic and for Layer 3 traffic. Per VLAN rate police is supported on only tagged ports with Layer 2 switched traffic.

## S-Series

On one interface, you can configure the `rate police` command for a VLAN or you can configure the `rate police` command for an interface. For each physical interface, you can configure three `rate police` commands specifying different VLANs.

## rate-shape

Shape the traffic output on the selected interface.

**Syntax** `rate shape [kbps] rate [burst-KB]`

**Parameters**

|                 |                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>kbps</b>     | Enter the keyword <code>kbps</code> to specify the rate limit in Kilobits per second (Kbps). Enter the value in multiples of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps). |
| <b>rate</b>     | The range is from 10 to 40000.                                                                                                                                                                                           |
| <b>burst-KB</b> | (OPTIONAL) Enter the burst size in KB. The range is from 0 to 10000. The default is <b>50</b> .                                                                                                                          |

**Defaults** Granularity for rate is **Mbps** unless you use the `kbps` option.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                 |

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                    |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                    |
| <b>8.2.1.0</b>    | Added the <code>kbps</code> option on the C-Series, E-Series, and S-Series. |
| <b>7.6.1.0</b>    | Introduced on the S-Series and C-Series.                                    |
| <b>6.1.1.1</b>    | Introduced on the E-Series.                                                 |

**Usage Information** If traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

**NOTE:** When packets of size greater than 7000 bytes are expected to be received from the network, Dell EMC Networking recommends that you configure the burst value to be more than 175 KB if you configured the `rate shape`. Such a setting ensures proper bandwidth sharing across queues.

## Related Commands

- [rate-shape](#) — shapes traffic output as part of the designated policy.

## service-class dynamic dot1p

Honor all 802.1p markings on incoming switched traffic on an interface (from INTERFACE mode) or on all interfaces (from CONFIGURATION mode). A CONFIGURATION mode entry supersedes an INTERFACE mode entry.

## S6000-ON

### Syntax

```
service-class dynamic dot1p
```

To return to the default setting, use the `no service-class dynamic dot1p` command.

### Defaults

All dot1p traffic is mapped to Queue 0 unless you enable the `service-class dynamic dot1p` command. The default mapping is as follows:

| dot1p | Queue ID |
|-------|----------|
| 0     | 1        |
| 1     | 0        |
| 2     | 2        |
| 3     | 3        |
| 4     | 4        |
| 5     | 5        |
| 6     | 6        |
| 7     | 7        |

| 9.2(1.0)   | Introduced on the Z9500.                                       |
| 9.0.2.0    | Introduced on the S6000.                                       |
| 8.3.19.0   | Introduced on the S4820T.                                      |
| 8.3.11.1   | Introduced on the Z9000.                                       |
| 8.3.7.0    | Introduced on the S4810.                                       |
| 8.2.1.0    | Added the kbps option on the C-Series, E-Series, and S-Series. |

| Version | Description                                                    |
|---------|----------------------------------------------------------------|
| 7.6.1.0 | Introduced on the S-Series.                                    |
| 7.5.1.0 | Introduced on the C-Series.                                    |
| 6.5.1.0 | Expanded the command to permit configuration on port channels. |
| 6.1.1.1 | Introduced on the E-Series.                                    |

### Usage Information

To honor all incoming 802.1p markings on incoming switched traffic on the interface, enter this command. By default, this facility is not enabled (that is, the 802.1p markings on incoming traffic are not honored).

You can apply this command on both physical interfaces and port channels. When you set the `service-class dynamic` for a port channel, the physical interfaces assigned to the port channel are automatically configured; you cannot assign the `service-class dynamic dot1p` command to individual interfaces in a port channel.

- All dot1p traffic is mapped to Queue 0 unless you enable the `service-class dynamic dot1p` command on an interface or globally.
- Layer 2 or Layer 3 service policies supersede dot1p service classes.

## Policy-Based QoS Commands

Policy-based traffic classification is handled with class maps. These maps classify data traffic into eight classes. Dell EMC Networking OS enables you to match multiple class maps and specify multiple match criteria. Policy-based QoS is not supported on logical interfaces, such as port-channels, VLANs, or loopbacks.

### bandwidth-percentage

Assign a percentage of weight to the class/queue.

#### S6000-ON

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bandwidth-percentage percentage</code><br>To remove the bandwidth percentage, use the <code>no bandwidth-percentage</code> command.                     |
| <b>Parameters</b>      | <b><i>percentage</i></b> Enter the percentage assignment of bandwidth to the class/queue. The range is from 1 to 100% (granularity 1%).                       |
| <b>Defaults</b>        | none                                                                                                                                                          |
| <b>Command Modes</b>   | CONFIGURATION (conf-qos-policy-out)                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version   | Description                 |
|-----------|-----------------------------|
| 9.2(1.0)  | Introduced on the Z9500.    |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.1.9.0 | Introduced on the S4820T.   |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.3.7.0   | Introduced on the S4810.    |
| 6.2.1.1   | Introduced on the E-Series. |

**Usage Information**

The unit of bandwidth percentage is 1%. If the sum of the bandwidth percentages given to all eight classes exceeds 100%, the bandwidth percentage automatically scales down to 100%.

**Related Commands**

- [qos-policy-output](#) — creates a QoS output policy.

## buffer-stats-snapshot

Enable the buffer statistics tracking utility and enter the Buffer Statistics Snapshot configuration mode. You must enable this utility to be able to configure the parameters for buffer statistics tracking.

**Syntax**

[No] `buffer-stats-snapshot`

To disable the buffer statistics tracking utility, enter the `disable` command from the BUFFER-STATS-SNAPSHOT mode.

**Default**

By default, buffer statistics tracking is disabled.

**Command Modes**

CONFIGURATION mode

**Command History**

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.3.0.0   | Introduced on the S6000 platform          |

**Usage Information**

Only the software-based trigger for retrieving and calculating the snapshots of the statistical counters of the buffer space is supported. Collection of snapshots of buffer statistical counters based on hardware threshold settings is not supported, which can be used to specify the type of hardware threshold and the threshold profile templates.

**Example**

```
DelleMC(conf)#buffer-stats-snapshot
DelleMC(conf-buffer-stats-snapshot)#?
disable Disable buffer-stats-snapshot globally
end Exit from configuration mode
exit Exit from buffer-stats-snapshot configuration
mode
no Negate a command or set its defaults
show Show buffer-stats-snapshot configuration
DelleMC(conf-buffer-stats-snapshot)#no disable
DelleMC(conf-buffer-stats-snapshot)#show configuration
!
buffer-stats-snapshot
no disable
```

# class-map

Create/access a class map. Class maps differentiate traffic so that you can apply separate quality-of-service policies to each class.

**Syntax** `class-map {match-all | match-any} class-map-name [cpu-qos] [layer2]`

|                   |                       |                                                                                                                                                                                                                                     |
|-------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>match-all</b>      | Determines how packets are evaluated when multiple match criteria exist. Enter the keywords <code>match-all</code> to determine that the packets must meet all the match criteria in order to be a member of the class.             |
|                   | <b>match-any</b>      | Determines how packets are evaluated when multiple match criteria exist. Enter the keywords <code>match-any</code> to determine that the packets must meet at least one of the match criteria in order to be a member of the class. |
|                   | <b>class-map-name</b> | Enter a name of the class for the class map in a character format (32 character maximum).                                                                                                                                           |
|                   | <b>cpu-qos</b>        | Enter the keyword <code>cpu-qos</code> to assign this Class Map to control plane traffic only (CoPP).                                                                                                                               |
|                   | <b>layer2</b>         | Enter the keyword <code>layer2</code> to specify a Layer 2 Class Map. The default is <b>Layer 3</b> .                                                                                                                               |

**Defaults** Layer 3

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                          |
|------------|--------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                            |
| 9.10(0.0)  | Introduced on the S3148.                                                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                          |
| 9.8(2.0)   | Introduced on the S3100 series.                                                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                          |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                          |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                          |
| 9.2(1.0)   | Introduced on the Z9500.                                                             |
| 9.0.2.0    | Introduced on the S6000.                                                             |
| 8.3.19.0   | Introduced on the S4820T.                                                            |
| 8.3.11.1   | Introduced on the Z9000.                                                             |
| 8.3.7.0    | Introduced on the S4810.                                                             |
| 8.2.1.0    | Class-map names can be 32 characters. Layer2 available on the C-Series and S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                                          |
| 7.5.1.0    | Introduced on the C-Series.                                                          |
| 7.4.1.0    | E-Series Only: Expanded to add support for Layer 2.                                  |

**Usage Information** Packets arriving at the input interface are checked against the match criteria and configured using this command to determine if the packet belongs to that class. This command accesses CLASS-MAP mode, where the configuration commands include the `match ip` and `match mac` options.

When you create a class map to filter protocol traffic for CoPP, you must enter the keyword `cpu-qos`.

## Related Commands

- [ip access-list extended](#) — configures an extended IP ACL.
- [ip access-list standard](#) — configures a standard IP ACL.
- [match ip access-group](#) — configures the match criteria based on the access control list (ACL).
- [match ip precedence](#) — identifies the IP precedence values as match criteria.
- [match ip dscp](#) — configures the match criteria based on the DSCP value.
- [match mac access-group](#) — configures a match criterion for a class map based on the contents of the designated MAC ACL.
- [match mac dot1p](#) — configures a match criterion for a class map based on a dot1p value.
- [match mac vlan](#) — configures a match criterion for a class map based on VLAN ID.
- [service-queue](#) — assigns a class map and QoS policy to different queues.
- [show qos class-map](#) — views the current class map information.

## clear qos statistics

Clear qos statistics clears statistics from show qos statistics.

## S6000–ON

**Syntax** `clear qos statistics interface-name`

**Parameters** ***interface-name*** Enter one of the following keywords:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

# match ip access-group

Configure match criteria for a class map, based on the access control list (ACL).

**NOTE:** IPv6 class-maps and IP-any class-maps do not match. This condition is true for IPv6 and IP-any class-maps on both ACLs as well as VLANs.

**Syntax** `[seq sequence number] match ip access-group access-group-name [set-ip-dscp value | set-color value]`

To remove ACL match criteria from a class map, use the `no [seq sequence number] match ip access-group access-group-name [set-ip-dscp value | set-color value]` command.

**Parameters**

- seq sequence number** (OPTIONAL) Enter the keyword `seq` then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.
- access-group-name** Enter the ACL name whose contents are used as the match criteria in determining if packets belong to the class the class-map specifies.
- set-ip-dscp value** (OPTIONAL) Enter the keywords `set-ip-dscp` then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.
- set-color value** (Optional) Enter the keyword `set-color` followed by a color value. Traffic that fulfills the match criteria is marked with the color value that you specify. The default value is Yellow.

**Defaults** none

**Command Modes** CLASS-MAP CONFIGURATION (config-class-map)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0)  | Introduced the <code>seq</code> option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                                                           |
| 8.3.19.0   | Introduced on the S4820T.                                                                                          |
| 8.3.11.1   | Introduced on the Z9000.                                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                                           |
| 8.3.7.0    | Introduced on the S4810.                                                                                           |
| 7.7.1.0    | Added the DSCP Marking option support on the S-Series.                                                             |
| 7.6.1.0    | Introduced on the S-Series.                                                                                        |
| 7.5.1.0    | Introduced on the C-Series; added support for the DSCP Marking option.                                             |
| 6.1.1.1    | Introduced on the E-Series.                                                                                        |

## Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria. For `class-map match-any`, a maximum of five ACL match criteria are allowed. For `class-map match-all`, only one ACL match criteria is allowed.

## Related Commands

- `class-map` — identifies the class map.

## match ip dscp

Use a differentiated services code point (DSCP) value as a match criteria.

### Syntax

```
[seq sequence number] match {ip | ipv6 | ip-any} dscp dscp-list [set-ip-dscp value]
```

To remove a DSCP value as a match criteria, use the `no [seq sequence number] match {ip | ipv6 | ip-any} dscp dscp-list [[multicast] set-ip-dscp value]` command.

### Parameters

|                            |                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seq sequence number</b> | (OPTIONAL) Enter the keyword <code>seq</code> then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.                          |
| <b>ip</b>                  | Enter the keyword <code>ip</code> to support IPv4 traffic.                                                                                                                                      |
| <b>ipv6</b>                | Enter the keyword <code>ipv6</code> to support IPv6 traffic.                                                                                                                                    |
| <b>ip-any</b>              | Enter the keyword <code>ip-any</code> to support IPv4 and IPv6 traffic.                                                                                                                         |
| <b>dscp-list</b>           | Enter the IP DSCP values that is to be the match criteria. Separate values by commas — no spaces ( 1,2,3 ) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 63. |
| <b>set-ip-dscp value</b>   | (OPTIONAL) Enter the keywords <code>set-ip-dscp</code> then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.                                    |

### Defaults

none

### Command Modes

CLASS-MAP CONFIGURATION (config-class-map)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>9.12(0.0)</b>  | Introduced the <code>seq</code> option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                        |
| <b>9.5(0.0)</b>   | Added the <b>ipv6</b> and <b>ip-any</b> options on the Z9000, S6000, S4820T, S4810, MXL.                           |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                           |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                                           |

| Version | Description                                                                                       |
|---------|---------------------------------------------------------------------------------------------------|
| 7.7.1.0 | Added the keyword <code>multicast</code> ; added the DSCP Marking option support on the S-Series. |
| 7.6.1.0 | Introduced on the S-Series.                                                                       |
| 7.5.1.0 | Introduced on the C-Series; added support for the DSCP Marking option.                            |
| 6.2.1.1 | Introduced on the E-Series.                                                                       |

### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip dscp` and `match ip precedence` commands are mutually exclusive.

Up to 64 IP DSCP values can be matched in one match statement. For example, to indicate IP DSCP values 0 1 2 3 4 5 6 7, enter either the `match ip dscp 0,1,2,3,4,5,6,7` or `match ip dscp 0-7` command.

**NOTE:** Only one of the IP DSCP values must be a successful match criterion, not all of the specified IP DSCP values must match.

### Related Commands

- `class-map` — identifies the class map.

## match ip precedence

Use IP precedence values as a match criteria.

**Syntax** `[seq sequence number] match {ip | ipv6 | ip-any} precedence ip-precedence-list [set-ip-dscp value]`

To remove IP precedence as a match criteria, use the `no match {ip | ipv6 | ip-any} precedence ip-precedence-list [[multicast] set-ip-dscp value]` command.

### Parameters

|                            |                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seq sequence number</b> | (OPTIONAL) Enter the keyword <code>seq</code> then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.                      |
| <b>ip</b>                  | Enter the keyword <code>ip</code> to support IPv4 traffic.                                                                                                                                  |
| <b>ipv6</b>                | Enter the keyword <code>ipv6</code> to support IPv6 traffic.                                                                                                                                |
| <b>ip-any</b>              | Enter the keyword <code>ip-any</code> to support IPv4 and IPv6 traffic.                                                                                                                     |
| <b>ip-precedence-list</b>  | Enter the IP precedence value(s) as the match criteria. Separate values by commas — no spaces ( 1,2,3 ) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 7. |
| <b>set-ip-dscp value</b>   | (OPTIONAL) Enter the keywords <code>set-ip-dscp</code> then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.                                |

**Defaults** none

**Command Modes** CLASS-MAP CONFIGURATION (config-class-map)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0) | Introduced the <code>seq</code> option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| 9.10(0.0) | Introduced on the S3148.                                                                                           |
| 9.10(0.0) | Introduced on the S6100-ON.                                                                                        |

| 9.8(1.0)   | Introduced on the Z9100-ON.                                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                               |
| 9.5(0.1)   | Introduced on the Z9500.                                                                  |
| 9.5(0.0)   | Added support for the ipv6 and ip-any options on the Z9000, S6000, S4820T, S4810, MXL.    |
| 9.2(1.0)   | Introduced on the Z9500.                                                                  |
| 9.0.2.0    | Introduced on the S6000.                                                                  |
| 8.3.19.0   | Introduced on the S4820T.                                                                 |
| 8.3.11.1   | Introduced on the Z9000.                                                                  |
| 8.3.7.0    | Introduced on the S4810.                                                                  |
| 7.7.1.0    | Added the keyword multicast . Added support for the DSCP Marking option for the S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                                               |
| 7.5.1.0    | Introduced on the C-Series. Added support for the DSCP Marking option.                    |
| 6.1.1.1    | Introduced on the E-Series.                                                               |

### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip precedence` command and the `match ip dscp` command are mutually exclusive.

Up to eight precedence values can be matched in one match statement. For example, to indicate the IP precedence values 0 1 2 3, enter either the `match ip precedence 0-3` or `match ip precedence 0,1,2,3` command.

 **NOTE:** Only one of the IP precedence values must be a successful match criterion, not all of the specified IP precedence values must match.

### Related Commands

- `class-map` — identifies the class map.

## match mac access-group

Configure a match criterion for a class map, based on the contents of the designated MAC ACL.

**Syntax** `[seq sequence number] match mac access-group {mac-acl-name}`

**Parameters** **mac-acl-name** Enter a MAC ACL name. Its contents is used as the match criteria in the class map.

**Defaults** none

**Command Modes** CLASS-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| 9.12(0.0) | Introduced the seq option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |

| Version    | Description                                |
|------------|--------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0)  | Introduced on the S3148.                   |
| 9.10(0.0)  | Introduced on the S6100-ON.                |
| 9.8(2.0)   | Introduced on the S3100 series.            |
| 9.8(1.0)   | Introduced on the Z9100-ON.                |
| 9.8(0.0P5) | Introduced on the S4048-ON.                |
| 9.8(0.0P2) | Introduced on the S3048-ON.                |
| 9.7(0.0)   | Introduced on the S6000-ON.                |
| 9.2(1.0)   | Introduced on the Z9500.                   |
| 9.0.2.0    | Introduced on the S6000.                   |
| 8.3.19.0   | Introduced on the S4820T.                  |
| 8.3.11.1   | Introduced on the Z9000.                   |
| 8.3.7.0    | Introduced on the S4810.                   |
| 8.2.1.0    | Available on the C-Series and S-Series.    |
| 7.5.1.0    | Added support for the DSCP Marking option. |
| 7.4.1.0    | Introduced on the E-Series.                |

**Usage Information**

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

**Related Commands**

- `class-map` — identifies the class map.

## match mac dot1p

Configure a match criterion for a class map based on a dot1p value.

**Syntax** `[seq sequence number] match mac dot1p {dot1p-list}`

**Parameters**

|                            |                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seq sequence number</b> | (OPTIONAL) Enter the keyword <code>seq</code> then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five. |
| <b>dot1p-list</b>          | Enter a dot1p value. The range is from 0 to 7.                                                                                                                         |

**Defaults** none

**Command Modes** CLASS-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0) | Introduced the <code>seq</code> option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| 9.10(0.0) | Introduced on the S3148.                                                                                           |
| 9.10(0.0) | Introduced on the S6100-ON.                                                                                        |
| 9.8(2.0)  | Introduced on the S3100 series.                                                                                    |
| 9.8(1.0)  | Introduced on the Z9100-ON.                                                                                        |

| Version    | Description                                |
|------------|--------------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.                |
| 9.8(0.0P2) | Introduced on the S3048-ON.                |
| 9.7(0.0)   | Introduced on the S6000-ON.                |
| 9.2(1.0)   | Introduced on the Z9500.                   |
| 9.0.2.0    | Introduced on the S6000.                   |

| 8.2.1.0    | Available on the C-Series and S-Series.    |
| 7.5.1.0    | Added support for the DSCP Marking option. |
| 7.4.1.0    | Introduced on the E-Series.                |

**Usage Information**

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

**Related Commands**

- `class-map` — identifies the class map.

## match mac vlan

Configure a match criterion for a class map based on VLAN ID.

**Syntax** `[seq sequence number] match mac vlan number`

**Parameters**

|                        |                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seq</b>             | (OPTIONAL) Enter the keyword <code>seq</code> then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five. |
| <b>sequence number</b> |                                                                                                                                                                        |
| <b>number</b>          | Enter the VLAN ID. The range is from 1 to 4094.                                                                                                                        |

**Defaults** none

**Command Modes** CLASS-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0)  | Introduced the <code>seq</code> option for the <code>class-map</code> on all the Dell EMC Networking OS platforms. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                                                           |

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.2.1.0  | Introduced.               |

**Usage Information**

To access this command, enter the `class-map` command. You can match against only one VLAN ID.

**Related Commands**

- `class-map` — identifies the class map.

## policy-aggregate

Allow an aggregate method of configuring per-port QoS via policy maps. An aggregate QoS policy is part of the policy map (output) applied on an interface.

### S6000-ON

**Syntax**

`policy-aggregate qos-policy-name`

To remove a policy aggregate configuration, use the `no policy-aggregate qos-policy-name` command.

**Parameters**

***qos-policy-name*** Enter the name of the policy map in character format (32 characters maximum).

**Defaults**

none

**Command Modes**

CONFIGURATION (policy-map-input and policy-map-output)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.            |
| 9.10(0.0)  | Introduced on the S3148.                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                          |
| 9.8(2.0)   | Introduced on the S3100 series.                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                          |
| 9.8(0.0P2) | Introduced on the S3048-ON.                          |
| 9.7(0.0)   | Introduced on the S6000-ON.                          |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 9.0.2.0    | Introduced on the S6000.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.3.7.0    | Introduced on the S4810.                             |
| 8.2.1.0    | Policy name character limit increased from 16 to 32. |
| 7.6.1.0    | Introduced on the S-Series.                          |
| 7.5.1.0    | Introduced on the C-Series.                          |

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.1 | Introduced on the E-Series. |

**Usage Information**

An aggregate output QoS policy applies to all outbound port traffic. An aggregate output QoS policy can coexist with per-queue output QoS policies. If the rate shape exists in both aggregate and per-queue qos-policy, minimum of 2 take effect. Some of all Queue-rate will not exceed aggregate.

**Related Commands**

- [policy-map-input](#) — creates an input policy map.
- [policy-map-output](#) — creates an output policy map.

## policy-map-input

Create an input policy map.

### S6000-ON

**Syntax**

```
policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos]
```

To remove an input policy map, use the `no policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos]` command.

**Parameters**

- policy-map-name*** Enter the name of the `policy map` in character format (32 characters maximum).
- cpu-qos*** Enter the `cpu-qos` keyword to assign this ACL to control plane traffic only.
- layer2*** (OPTIONAL) Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is **Layer 3**.
- cpu-qos*** (OPTIONAL) Enter the keyword `cpu-qos` to create an input policy to be used to rate-limit control-plane traffic (CoPP).

**Defaults**

**Layer 3**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version | Description                                          |
|---------|------------------------------------------------------|
| 8.2.1.0 | Policy name character limit increased from 16 to 32. |
| 7.6.1.0 | Introduced on the S-Series.                          |
| 7.5.1.0 | Introduced on the C-Series.                          |
| 7.4.1.0 | Expanded to add support for Layer 2.                 |
| 6.1.1.1 | Introduced on the E-Series.                          |

**Usage Information**

The input policy map is used to classify incoming traffic to different flows using class-map, QoS policy, or incoming packets DSCP. This command enables Policy-Map-Input Configuration mode (conf-policy-map-in). When you configure an input policy map for CoPP, you must enter the keyword `cpu-qos`.

**Related Commands**

- [service-queue](#) — assigns a class map and QoS policy to different queues.
- [service-policy input](#) — applies an input policy map to the selected interface.

## policy-map-output

Create an output policy map.

### S6000–ON

**Syntax**

`policy-map-output policy-map-name`

To remove a policy map, use the `no policy-map-output policy-map-name` command.

**Parameters**

***policy-map-name*** Enter the name for the policy map in character format (32 characters maximum).

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.            |
| 9.10(0.0)  | Introduced on the S3148.                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                          |
| 9.8(2.0)   | Introduced on the S3100 series.                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                          |
| 9.8(0.0P2) | Introduced on the S3048-ON.                          |
| 9.7(0.0)   | Introduced on the S6000-ON.                          |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 9.0.2.0    | Introduced on the S6000.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.3.7.0    | Introduced on the S4810.                             |
| 8.2.1.0    | Policy name character limit increased from 16 to 32. |
| 7.6.1.0    | Introduced on the C-Series and S-Series.             |

| Version | Description                 |
|---------|-----------------------------|
| 6.1.1.1 | Introduced on the E-Series. |

**Usage Information**

To assign traffic to different flows using QoS policy, use the Output Policy map. This command enables Policy-Map-Output Configuration mode (conf-policy-map-out).

**Related Commands**

- [service-queue](#) — assigns a class map and QoS policy to different queues.
- [policy-aggregate](#) — allows an aggregate method of configuring per-port QoS using policy maps.
- [service-policy output](#) — applies an output policy map to the selected interface.

## qos-policy-input

Create a QoS input policy on the router.

**Syntax**

```
qos-policy-input qos-policy-name cpu-qos | layer2
```

To remove an existing input QoS policy from the router, use the `no qos-policy-input qos-policy-name cpu-qos | layer2` command.

**Parameters**

- qos-policy-name** Enter the name for the policy map in character format (32 characters maximum).
- cpu-qos** (OPTIONAL) Enter the keyword `cpu-qos` keyword to assign this ACL to control plane traffic only.
- layer2** (OPTIONAL) Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is **Layer 3**.

**Defaults**

**Layer 3**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                          |
|------------|------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.            |
| 9.10(0.0)  | Introduced on the S3148.                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                          |
| 9.8(2.0)   | Introduced on the S3100 series.                      |
| 9.8(1.0)   | Introduced on the Z9100-ON.                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                          |

| 9.7(0.0)   | Introduced on the S6000-ON.                          |
| 9.2(1.0)   | Introduced on the Z9500.                             |
| 9.0.2.0    | Introduced on the S6000.                             |
| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.3.7.0    | Introduced on the S4810.                             |
| 8.2.1.0    | Policy name character limit increased from 16 to 32. |
| 7.6.1.0    | Introduced on the C-Series and S-Series.             |
| 7.5.1.0    | Introduced on the C-Series.                          |
| 6.1.1.1    | Introduced on the E-Series.                          |

## Usage Information

Use this command to specify the name of the input QoS policy. Once input policy is specified, rate-police can be defined. This command enables the qos-policy-input configuration mode— (conf-qos-policy-in).

When changing a Service-Queue configuration in a QoS policy map, all QoS rules are deleted and re-added automatically to ensure that the order of the rules is maintained. As a result, the Matched Packets value shown in the `show qos statistics` command is reset.

If you create create a QoS input policy to be used for CoPP, you must enter the keyword `cpu-qos` .

## Related Commands

- [rate police](#) — incoming traffic policing function.

# qos-policy-output

Create a QoS output policy.

## Syntax

```
qos-policy-output qos-policy-name
```

To remove an existing output QoS policy, use the `no qos-policy-output qos-policy-name` command.

## Parameters

***qos-policy-name*** Enter your output QoS policy name in character format (32 characters maximum).

## Defaults

none

| 8.3.7.0    | Introduced on the S4810.                             |
| 8.2.1.0    | Policy name character limit increased from 16 to 32. |
| 7.6.1.0    | Introduced on the C-Series and S-Series.             |
| 6.1.1.1    | Introduced on the E-Series.                          |

## Usage Information

Use this command to specify the name of the output QoS policy. Once output policy is specified, rate-shape, scheduler strict, bandwidth-percentage, and WRED can be defined. This command enables the qos-policy-output configuration mode—(conf-qos-policy-out).

## Related Commands

- [bandwidth-percentage](#) — assigns percentage of bandwidth to the class/queue.
- [wred](#) — assigns yellow or green drop precedence.

# rate-police

Specify the policing functionality on incoming traffic.

**Syntax** `rate-police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]]`

**Parameters**

- kbps** Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- committed-rate** Enter the bandwidth in Mbps. The range is from 0 to 40000.
- burst-KB** (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is **100**.
- peak peak-rate** (OPTIONAL) Enter the keyword `peak` then a number to specify the peak rate in Mbps. The range is from 0 to 40000. The default is the same as designated for `committed-rate`.

**Defaults** Burst size is 100KB. `peak-rate` is by default the same as `committed-rate`. Granularity for `committed-rate` and `peak-rate` is Mbps unless you use the `kbps` option.

**Command Modes** QOS-POLICY-IN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|------------|-----------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                   |
| 9.10(0.0)  | Introduced on the S3148.                                                    |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                 |
| 9.8(2.0)   | Introduced on the S3100 series.                                             |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                 |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                    |
| 9.0.2.0    | Introduced on the S6000.                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                    |
| 8.2.1.0    | Added the <code>kbps</code> option on the C-Series, E-Series, and S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                                 |
| 7.5.1.0    | Introduced on the C-Series.                                                 |
| 6.1.1.1    | Introduced on the E-Series.                                                 |

**Usage Information** The default burst size is 100Kb. If a different value is required, you must configure the burst size to the required value.

**Related Commands**

- [rate police](#) — specifies traffic policing on the selected interface.
- [qos-policy-input](#) — creates a QoS output policy.

# rate-shape

Shape traffic output as part of the designated policy.

**Syntax** `rate-shape [kbps | pps] peak-rate [burst-kbps | burst-packets] committed [kbps | pps] committed-rate [burst-kbps | burst-packets]`

**Parameters**

- pps** Enter the keyword `pps` to specify the rate limit in packets per second (pps).
- kbps** Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- burst-kbps** (OPTIONAL) Enter the burst size in KB. The range is from 0 to 40000. The default is **100**.
- burst-packets** Enter the peak rate or committed rate burst size in packets per seconds.

**Defaults** Burst size is 10KB. Granularity for rate is Mbps unless you use the `kbps` option.

**Command Modes** QOS-POLICY-OUT

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                   |
| 9.10(0.0)  | Introduced on the S3148.                                                    |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                 |
| 9.8(2.0)   | Introduced on the S3100 series.                                             |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                 |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                    |
| 9.0.2.0    | Introduced on the S6000.                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                    |
| 8.2.1.0    | Added the <code>kbps</code> option on the C-Series, E-Series, and S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                                 |
| 7.5.1.0    | Introduced on the C-Series.                                                 |
| 6.1.1.1    | Introduced on the E-Series.                                                 |

**Usage Information** On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured. You must configure the peak rate and peak burst size using the same value: kilobits or packets per second. Similarly, you must configure the committed rate and committed burst size with the same measurement. Peak rate refers to the maximum rate for traffic arriving or exiting an interface under normal traffic conditions. Peak burst size indicates the maximum size of unused peak bandwidth that is aggregated. This aggregated bandwidth enables brief durations of burst traffic that exceeds the peak rate and committed burst. Committed rate refers to the guaranteed bandwidth for traffic entering or leaving the interface under normal network conditions. When traffic propagates at an average rate that is less than or equal to the committed rate, it is considered to be green-colored or coded. When the transmitted traffic falls below the committed rate, the bandwidth, which is not used by any traffic that is traversing the network, is aggregated to form the committed burst

size. Traffic is considered to be green-colored up to the point at which the unused bandwidth does not exceed the committed burst size.

**Related  
Commands**

- [rate shape](#) — shapes traffic output as part of the designated policy.
- [qos-policy-output](#) — creates a QoS output policy.

## service-policy input

Apply an input policy map to the selected interface.

### S6000-ON

**Syntax**

```
service-policy input policy-map-name [layer2]
```

To remove the input policy map from the interface, use the `no service-policy input policy-map-name [layer2]` command.

**Parameters**

***policy-map-name*** Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.

**layer2** (OPTIONAL) Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is **Layer 3**.

**Defaults**

**Layer 3**

**Command Modes**

INTERFACE

**Command  
History**

| Version    | Description                                         |
|------------|-----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.           |
| 9.10(0.0)  | Introduced on the S3148.                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                         |
| 9.8(2.0)   | Introduced on the S3100 series.                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                         |
| 9.2(1.0)   | Introduced on the Z9500.                            |
| 9.0.2.0    | Introduced on the S6000.                            |
| 8.3.19.0   | Introduced on the S4820T.                           |
| 8.3.11.1   | Introduced on the Z9000.                            |
| 8.3.7.0    | Introduced on the S4810.                            |
| 7.6.1.0    | Introduced on the S-Series.                         |
| 7.5.1.0    | Introduced on the C-Series.                         |
| 7.4.1.0    | E-Series Only: Expanded to add support for Layer 2. |
| 6.1.1.1    | Introduced on the E-Series.                         |

**Usage  
Information**

You can attach a single policy-map to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

**i** **NOTE:** The `service-policy` commands are not allowed on a port channel. The `service-policy input policy-map-name` command and the `service-class dynamic dot1p` command are not allowed simultaneously on an interface. However, the `service-policy input` command (without the `policy-map-name` option) and the `service-class dynamic dot1p` command are allowed on an interface.

#### Related Commands

- [policy-map-input](#) — creates an input policy map.

## service-policy output

Apply an output policy map to the selected interface.

### S6000–ON

#### Syntax

```
service-policy output policy-map-name
```

To remove the output policy map from the interface, use the `no service-policy output policy-map-name` command.

#### Parameters

***policy-map-name*** Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.

#### Defaults

none

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the C-Series and S-Series.  |
| <b>6.1.1.1</b>    | Introduced on the E-Series.               |

#### Usage Information

A single policy-map can be attached to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

#### Related Commands

- [policy-map-output](#) — creates an output policy map.

# service-queue

Assign a class map and QoS policy to different queues.

## S6000–ON

**Syntax** `service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]`

To remove the queue assignment, use the `no service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]` command.

**Parameters**

|                                   |                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>queue-id</b>                   | Enter the value used to identify a queue. The range is from 0 to 7.                                                                                                                                                                                                                                            |
| <b>class-map class-map-name</b>   | (OPTIONAL) Enter the keyword <code>class-map</code> then the class map name assigned to the queue in character format (32 character maximum).<br><b>NOTE:</b> This option is available under <code>policy-map-input</code> only.                                                                               |
| <b>qos-policy qos-policy-name</b> | (OPTIONAL) Enter the keywords <code>qos-policy</code> then the QoS policy name assigned to the queue in text format (32 characters maximum). This specifies the input QoS policy assigned to the queue under <code>policy-map-input</code> and output QoS policy under <code>policy-map-output</code> context. |

**Defaults** none

**Command Modes** CONFIGURATION (`conf-policy-map-in` and `conf-policy-map-out`)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.1    | Introduced on the E-Series.               |

**Usage Information** There are eight queues per interface on the S6000 and four queues on the S-Series. This command assigns a class map or QoS policy to different queues.

**Related Commands**

- `class-map` — identifies the class map.
- `service-policy input` — applies an input policy map to the selected interface.

- [service-policy output](#) — applies an output policy map to the selected interface.

## set

Mark outgoing traffic with a differentiated service code point (DSCP) or dot1p value.

### S6000-ON

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>set {ip-dscp value   mac-dot1p value}</code>                                                                                                                                                                                                        |
| <b>Parameters</b>      | <p><b>ip-dscp value</b> (OPTIONAL) Enter the keywords <code>ip-dscp</code> then the IP DSCP value. The range is from 0 to 63.</p> <p><b>mac-dot1p value</b> Enter the keywords <code>mac-dot1p</code> then the dot1p value. The range is from 0 to 7.</p> |
| <b>Defaults</b>        | none                                                                                                                                                                                                                                                      |

| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                   |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                   |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                   |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                   |
| <b>8.2.1.0</b>    | Added <code>mac-dot1p</code> on the C-Series and S-Series. |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                |
| <b>7.4.1.0</b>    | E-Series Only: Added support for <code>mac-dot1p</code> .  |
| <b>6.1.1.1</b>    | Introduced on the E-Series.                                |

**Usage Information** After the IP DSCP bit is set, other QoS services can then operate on the bit settings.

## show qos class-map

View the current class map information.

**Syntax** `show qos class-map [class-name]`

**Parameters** *class-name* (Optional) Enter the name of a configured class map.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| 9.12(0.0)  | Introduced the <code>seq</code> option on all the Dell EMC Networking OS platforms. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                            |
| 7.6.1.0    | Introduced on the S-Series.                                                         |
| 7.5.1.0    | Introduced on the C-Series.                                                         |
| 6.1.1.1    | Introduced on the E-Series.                                                         |

### Example

```
DelleMC# show qos class-map
Class-map match-any CM
 seq 5 Match ip access-group ACL
DelleMC#
```

- Related Commands**
- `class-map` — identifies the class map.

## show qos policy-map

View the QoS policy map information.

### S6000-ON

**Syntax** `show qos policy-map {summary [interface] | detail}`

- Parameters**
- 9.8(0.0P5) Introduced on the S4048-ON.
  - 9.8(0.0P2) Introduced on the S3048-ON.

**summary  
interface**

To view a policy map interface summary, enter the keyword `summary` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**detail**

To view a policy map interface in detail, enter the keyword `detail` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.2(1.0)   | Introduced on the Z9500.                                |
| 9.0.2.0    | Introduced on the S6000.                                |
| 8.3.19.0   | Introduced on the S4820T.                               |
| 8.3.11.1   | Introduced on the Z9000.                                |
| 8.3.7.0    | Introduced on the S4810.                                |
| 7.6.1.0    | Introduced on the S-Series.                             |
| 7.5.1.0    | Introduced on the C-Series.                             |
| 7.4.1.0    | E-Series only: Added <code>trust IPv6 diffserv</code> . |
| 6.2.1.1    | Introduced on the E-Series.                             |

**Example (IPv4)**

```
DellEMC# show qos policy-map detail tengigabitethernet 1/1/1
Interface TenGigabitEthernet 4/1/1
Policy-map-input policy
Queue# Class-map-name Qos-policy-name
0 - q0
1 CM1 q1
2 CM2 q2
3 CM3 q3
4 CM4 q4
5 CM5 q5
```

```

6 CM6 q6
7 CM7 q7
DellEMC#

```

### Example (IPv6)

```

DellEMC# show qos policy-map detail Tengigabitethernet 1/1/1

Interface TeGigabitEthernet 4/1/1

Policy-map-input pmap1

Queue# Class-map-name Qos-policy-name
0 c0 q0
1 c1 q1
2 c2 q2
3 c3 q3
4 c4 q4
5 c5 -
6 c6 q6
7 c7 q7
DellEMC#

```

### Example (Summary IPv4)

```

DellEMC# show qos policy-map summary

Interface policy-map-input policy-map-output
Te 4/1/1 PM1 -
Te 4/2/1 PM2 PMOut
DellEMC#

```

## show qos policy-map-input

View the input QoS policy map details.

### S6000-ON

#### Syntax

```
show qos policy-map-input [policy-map-name] [class class-map-name] [qos-policy-input qos-policy-name]
```

#### Parameters

- policy-map-name*** Enter the policy map name.
- class class-map-name*** Enter the keyword `class` then the class map name.
- qos-policy-input qos-policy-name*** Enter the keyword `qos-policy-input` then the QoS policy name.

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | E-Series Only: Added Trust IPv6 diffserv. |
| 6.1.1.1    | Introduced on the E-Series.               |

#### Example

```
DellEMC# show qos policy-map-input

Policy-map-input PolicyMapInput
Aggregate Qos-policy-name AggPolicyIn
Queue# Class-map-name Qos-policy-name
0 ClassMap1 qosPolicyInput
DellEMC#
```

#### Example

```
DellEMC# show qos policy-map-input

Policy-map-input pmap1
Trust ipv6-diffserv
Queue# Class-map-name Qos-policy-name
0 c0 q0
1 c1 q1
2 c2 q2
3 c3 q3
4 c4 q4
5 c5 -
6 c6 q6
7 c7 q7
DellEMC#
```

## show qos policy-map-output

View the output QoS policy map details.

### S6000-ON

#### Syntax

```
show qos policy-map-output [policy-map-name] [qos-policy-output qos-policy-name]
```

#### Parameters

***policy-map-name*** Enter the policy map name.

***qos-policy-output qos-policy-name*** Enter the keyword *qos-policy-output* then the QoS policy name.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.1    | Introduced on the E-Series.               |

### Example

```
DellEMC# show qos qos-policy-input

Qos-policy-input QosInput
 Rate-police 100 50 peak 100 50
 Dscp 32
DellEMC#
```

## show qos qos-policy-output

View the output QoS policy details.

### S6000-ON

**Syntax** `show qos qos-policy-output [qos-policy-name]`

**Parameters** ***qos-policy-name*** Enter the QoS policy name.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| Version    | Description                              |
|------------|------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100-ON.              |
| 9.8(0.0P5) | Introduced on the S4048-ON.              |
| 9.8(0.0P2) | Introduced on the S3048-ON.              |
| 9.7(0.0)   | Introduced on the S6000-ON.              |
| 9.2(1.0)   | Introduced on the Z9500.                 |
| 9.0.2.0    | Introduced on the S6000.                 |
| 8.3.19.0   | Introduced on the S4820T.                |
| 8.3.11.1   | Introduced on the Z9000.                 |
| 8.3.7.0    | Introduced on the S4810.                 |
| 7.6.1.0    | Introduced on the C-Series and S-Series. |
| 6.1.1.1    | Introduced on the E-Series.              |

### Example

```
DellEMC# show qos qos-policy-output

Qos-policy-output qosOut
 Rate-limit 50 50 peak 50 50
 Wred yellow 1
 Wred green 1
DellEMC#
```

## show qos statistics

View QoS statistics.

### Syntax

```
show qos statistics {egress-queue [interface]} | {wred-profile [interface]} |
[interface]
```

### Parameters

#### **egress-queue** **interface**

Enter the keyword `egress-queue` to display the egress-queue statistics and optionally one of the following keywords and slot/port or number information.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

#### **wred-profile** **interface**

Enter the keywords `wred-profile` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

#### **interface**

Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

### Defaults

none

### Command Modes

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network OS Command Line Reference Guide*.

| Version    | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| 9.12(0.0)  | Modified to display the global WRED state.                                                                        |
| 9.11(0.0)  | Updated the <code>show qos statistics egress-queue</code> output to reflect per queue per port tx and drop rates. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                         |
| 9.10(0.0)  | Introduced on the S3148.                                                                                          |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                       |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                   |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                       |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                       |
| 9.8(0.0)   | Added the <code>egress-queue</code> keyword.                                                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                       |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                          |
| 9.0.2.0    | Introduced on the S6000.                                                                                          |
| 8.3.19.0   | Introduced on the S4820T.                                                                                         |
| 8.3.11.1   | Introduced on the Z9000.                                                                                          |
| 8.3.7.0    | Introduced on the S4810.                                                                                          |
| 7.7.1.1    | Introduced on the S-Series.                                                                                       |
| 7.5.1.0    | Introduced on the C-Series.                                                                                       |
| 6.1.1.1    | Introduced on the E-Series.                                                                                       |

**Example of show qos statistics egress-queue with per queue per port tx and drop rates**

```
DellEMC#show qos statistics egress-queue tengigabitethernet 1/4/1

Interface Te 1/4/1

DellEMC#
```

**Example of show qos statistics wred-profile**

```
DellEMC(conf)#do show qos statistics wred-profile
Global Wred State : Enabled
Interface Te 1/11/1
Drop-statistic Dropped Pkts
Green 0
Yellow 6730113
Out of Profile 0
```

## Usage Information

In a dual homing setup, you can use this command only from the primary VLT peer.

The following list describes output of the `show qos statistics` command in the example:

- **Queue #** — Queue Number.
- **Queued Bytes** — Snapshot of the byte count in that queue.
- **Queued Pkts** — Cumulative packet count in that queue.
- **Matched Pkts** — The number of packets that matched the class-map criteria.  
 **NOTE:** When you configure `trust`, matched packet counters are not incremented in this field.
- **Matched Bytes** — The number of bytes that matched the class-map criteria.  
 **NOTE:** When you configure `trust`, matched byte counters are not incremented in this field.
- **Dropped Pkts** — The total of the number of packets dropped for green, yellow and out-of-profile.

## show qos wred-profile

View the WRED profile details.

**Syntax** `show qos wred-profile wred-profile-name`

**Parameters** **wred-profile-name** Enter the WRED profile name to view the profile details.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                |
|------------|--------------------------------------------|
| 9.12(0.0)  | Modified to display the global WRED state. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.  |
| 9.10(0.0)  | Introduced on the S3148.                   |
| 9.10(0.0)  | Introduced on the S6100-ON.                |
| 9.8(2.0)   | Introduced on the S3100 series.            |
| 9.8(1.0)   | Introduced on the Z9100-ON.                |
| 9.8(0.0P5) | Introduced on the S4048-ON.                |
| 9.8(0.0P2) | Introduced on the S3048-ON.                |
| 9.7(0.0)   | Introduced on the S6000-ON.                |
| 9.2(1.0)   | Introduced on the Z9500.                   |
| 9.0.2.0    | Introduced on the S6000.                   |
| 8.3.19.0   | Introduced on the S4820T.                  |
| 8.3.11.1   | Introduced on the Z9000.                   |
| 8.3.7.0    | Introduced on the S4810.                   |
| 6.1.1.1    | Introduced on the E-Series.                |

## Example

```
DellEMC# show qos wred-profile
Global Wred State: Disabled
Wred-profile-name min-threshold max-threshold max-drop-rate
```

```

wred_drop 0 0 100
wred_teng_y 467 4671 100
wred_teng_g 467 4671 50
wred_fortyg_y 467 4671 50
wred_fortyg_g 467 4671 25
DellEMC#

```

## service-class buffer shared-threshold-weight

Create a service class and associate the threshold weight of the shared buffer with each of the queues per port in the egress direction.

**Syntax** `[No] Service-class buffer shared-threshold-weight {[queue0 number] || [queue1 number] || [queue2 number] || [queue3 number] || [queue4 number] || [queue5 number] || [queue6 number] || [queue7 number]}`

**Parameters**

- buffer** Define the shared buffer settings
- shared-threshold-weight** Specify the weight of a queue for the shared buffer space
- queue 0 to queue 7** To apply the shared-threshold weight, specify the queue number
- number** Enter a weight for the queue on the shared buffer as a number in the range of 1 to 11.

**Default** The default threshold weight on the shared buffer for each queue is 9. Therefore, each queue can consume up to 66.67 percent of available shared buffer by default.

**Command Modes** INTERFACE mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                  |
|-----------|--------------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                    |
| 9.10(0.0) | Introduced on the S6100-ON.                                  |
| 9.8(1.0)  | Introduced on the Z9100-ON.                                  |
| 9.9(0.0)  | Introduced on the Z9500, S4810, S4820T, S5000, and S4048-ON. |
| 9.7(0.0)  | Introduced on the S6000-ON.                                  |
| 9.3(0.0)  | Introduced on the S6000.                                     |

**Usage Information** You can configure all the data queues. You can configure queues 0-7.

The following table describes the mapping between the threshold weight of the shared buffer on the queue. It also shows the percentage of the available shared buffer used by the queues for each of the corresponding threshold weights of the shared buffer:

| shared-threshold-weight on the queue | % of available shared buffer that can be consumed by the queue |
|--------------------------------------|----------------------------------------------------------------|
| 0                                    | No dynamic sharing; shared buffer = 0.                         |
| 1                                    | 0.77%                                                          |
| 2                                    | 1.54%                                                          |
| 3                                    | 3.03%                                                          |

| shared-threshold-weight on the queue | % of available shared buffer that can be consumed by the queue |
|--------------------------------------|----------------------------------------------------------------|
| 4                                    | 5.88%                                                          |
| 5                                    | 11.11%                                                         |
| 6                                    | 20%                                                            |
| 7                                    | 33.33%                                                         |
| 8                                    | 50%                                                            |
| 9                                    | 66.67%                                                         |
| 10                                   | 80%                                                            |
| 11                                   | 88.89%                                                         |

### Example

```
DellEMC(conf-if-te-1/8/1)# Service-class buffer shared-threshold-weight
queue5 4 queue7 6
```

## test cam-usage

Check the Input Policy Map configuration for the CAM usage.

### S6000-ON

#### Syntax

```
test cam-usage service-policy input policy-map stack-unit {[number port-set
portpipe number] | [all]}
```

#### Parameters

|                                                                |                                                                                                          |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>policy-map</i></b>                                       | Enter the policy map name.                                                                               |
| <b>stack-unit</b><br><b><i>number</i></b>                      | (OPTIONAL) Enter the keyword <code>stack-unit</code> then the stack-unit slot number.                    |
| <b>port-set</b> <b><i>portpipe</i></b><br><b><i>number</i></b> | Enter the keywords <code>port-set</code> then the stack-unit port pipe number. The range is from 0 or 1. |
| <b>stack-unit all</b>                                          | (OPTIONAL) Enter the keywords <code>stack-unit all</code> to indicate all stack-unit.                    |

#### Defaults

none

#### Command Modes

EXEC

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |

| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

### Usage Information

This feature allows you to determine if the CAM has enough space available before applying the configuration on an interface.

An input policy map with both Trust and Class-map configuration, the Class-map rules are ignored and only the Trust rule is programmed in the CAM. In such an instance, the Estimated CAM output column contains the size of the CAM space required for the Trust rule and not the Class-map rule.

The following describes the `test cam-usage service-policy input policy-map stack-unit` command shown in the following example.

| Field                         | Description                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit</b>             | Indicates the stack-unit slot number.                                                                                                                                                                                                                                                                                                           |
| <b>Portpipe</b>               | Indicates the portpipe number.                                                                                                                                                                                                                                                                                                                  |
| <b>CAM Partition</b>          | The CAM space where the rules are added.                                                                                                                                                                                                                                                                                                        |
| <b>Available CAM</b>          | Indicates the free CAM space, in the partition, for the classification rules.<br><i>i</i> <b>NOTE:</b> The CAM entries reserved for the default rules are not included in the Available CAM column; free entries, from the default rules space, cannot be used as a policy map for the classification rules.                                    |
| <b>Estimated CAM per Port</b> | Indicates the number of free CAM entries required (for the classification rules) to apply the input policy map on a single interface.<br><i>i</i> <b>NOTE:</b> The CAM entries for the default rule are not included in this column; a CAM entry for the default rule is always dedicated to a port and is always available for that interface. |
| <b>Status (Allowed ports)</b> | Indicates if the input policy map configuration on an interface belonging to a stack-unit/port-pipe is successful — Allowed (n) — or not successful — Exception. The allowed number (n) indicates the number of ports in that port-pipe on which the Policy Map can be applied successfully.                                                    |

*i* **NOTE:** In a Layer 2 Policy Map, IPv4/IPv6 rules are not allowed; therefore, the output contains only L2ACL CAM partition entries.

### Example

```
DellEMC# test cam-usage service-policy input pmap_l2 stack-unit all
```

For a L2 Input Policy Map pmap\_l2, the output must be as follows,

```
stack-unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port |
Status |per Port |
(Allowed ports)
0 0 L2ACL 500
200
0 1 L2ACL 100 200
Exception
1 0 L2ACL 1000 200
Allowed (5)
1 1 L2ACL 0 200
Exception
...
...
...
13 1 L2ACL 400 200 Allowed
```

(2)  
DellEMC#

## threshold

Specify the minimum and maximum threshold values for the configured WRED profiles.

### S6000-ON

**Syntax** `threshold min number max number max-drop-drop`

To remove the threshold values, use the `no threshold min number max number` command.

**Parameters**

|                                    |                                                                                                                                      |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>min <i>number</i></b>           | Enter the keyword <code>min</code> then the minimum threshold number for the WRED profile. The range is from 1 to 9360.              |
| <b>max <i>number</i></b>           | Enter the keyword <code>max</code> then the maximum threshold number for the WRED profile. The range is from 1 to 9360 KB.           |
| <b>max-drop-drop <i>number</i></b> | Enter the keyword <b>max-drop-drop</b> followed by the maximum number of packets for the WRED profile. The range is from 0 to 100 KB |

**Defaults** none

**Command Modes** CONFIGURATION (config-wred)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.8.0    | Introduced on the S4810.                  |
| 6.1.1.1    | Introduced on the E-Series.               |

**Usage Information** To configure the minimum and maximum threshold values for user-defined profiles, use this command. Additionally, to modify the minimum and maximum threshold values for the pre-defined WRED profiles, use this command. If you delete the threshold values of the pre-defined WRED profiles, the profiles revert to their original default values.

**Table 5. Threshold Values for the Pre-defined WRED Profiles**

| Pre-Defined WRED Profile Name | Minimum Threshold | Maximum Threshold | Maximum Drop Rate |
|-------------------------------|-------------------|-------------------|-------------------|
| wred_drop                     | 0                 | 0                 | 100               |
| wred_teng_y                   | 594               | 5941              | 100               |
| wred_teng_g                   | 594               | 5941              | 50                |
| wred_fortyg_y                 | 594               | 5941              | 50                |
| wred_fortyg_g                 | 594               | 5941              | 25                |

**Related Commands**

- `wred-profile` — creates a WRED profile.

## trust

Specify dynamic classification (DSCP) or dot1p to trust.

## S6000-ON

**Syntax** `trust {diffserv [fallback]| dot1p [fallback]}`

**Parameters**

- diffserv** Enter the keyword `diffserv` to specify trust of DSCP markings.
- dot1p** Enter the keyword `dot1p` to specify trust dot1p configuration.
- fallback** Enter the keyword `fallback` to classify packets according to their DSCP or dot1p value as a secondary option in case no match occurs against the configured class maps.

**Defaults** none

**Command Modes** CONFIGURATION (conf-policy-map-in)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version | Description                                            |
|---------|--------------------------------------------------------|
| 8.3.1.0 | Added <code>fallback</code> to the E-Series.           |
| 8.2.1.0 | Added <code>dot1p</code> to the C-Series and S-Series. |
| 7.6.1.0 | Introduced on the S-Series.                            |
| 7.5.1.0 | Introduced on the C-Series.                            |
| 7.4.1.0 | Added <code>dot1p</code> and <code>IPv6 DSCP</code> .  |
| 6.1.1.1 | Introduced on the E-Series.                            |

### Usage Information

When you configure `trust`, matched bytes/packets counters are not incremented in the `show qos statistics` command.

Dynamic mapping honors packets marked according to the standard definitions of DSCP. The following lists the default mapping.

**Table 6. Default Mapping**

| DSCP/CP hex Range (XXX) | DSCP Definition           | Traditional IP Precedence | S6000 Internal Queue ID | S-Series Internal Queue ID | DSCP/CP Decimal |
|-------------------------|---------------------------|---------------------------|-------------------------|----------------------------|-----------------|
| 111XXX                  |                           | Network Control           | 7                       | 3                          | 48–63           |
| 110XXX                  |                           | Internetwork Control      | 6                       | 3                          | 48–63           |
| 101XXX                  | EF (Expedited Forwarding) | CRITIC/ECP                | 5                       | 2                          | 32–47           |
| 100XXX                  | AF4 (Assured Forwarding)  | Flash Override            | 4                       | 2                          | 32–47           |
| 011XXX                  | AF3                       | Flash                     | 3                       | 1                          | 16–31           |
| 010XXX                  | AF2                       | Immediate                 | 2                       | 1                          | 16–31           |
| 001XXX                  | AF1                       | Priority                  | 1                       | 0                          | 0–15            |
| 000XXX                  | BE (Best Effort)          | Best Effort               | 0                       | 0                          | 0–15            |

## wred

Designate the WRED profile to yellow or green traffic.

## S6000-ON

**Syntax** `wred {yellow | green} profile-name`

To remove the WRED drop precedence, use the `no wred {yellow | green} [profile-name]` command.

### Parameters

**yellow | green** Enter the keyword `yellow` for yellow traffic. A DSCP value of xxx110 and xxx100, xxx101 maps to yellow.

Enter the keyword `green` for `green` traffic. A DSCP value of xxx0xx are green and DSCP 11111 are red packets.

**profile-name** Enter your WRED profile name in character format (32 character maximum). Or use one of the five pre-defined WRED profile names.

Pre-defined Profiles: wred\_drop, wred-ge\_y, wred-ge\_g, wred\_teng\_y, wred\_teng\_.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | When WRED green is applied, default WRED yellow profiles take effect and vice-versa.                                                                          |
| <b>Command Modes</b>   | CONFIGURATION (conf-qos-policy-out)                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

|                          |                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To assign drop precedence to green or yellow traffic, use this command. If there is no honoring enabled on the input, all the traffic defaults to green drop precedence.                                           |
| <b>Related Commands</b>  | <ul style="list-style-type: none"><li>• <a href="#">wred-profile</a> — creates a WRED profile and name that profile.</li><li>• <a href="#">trust</a> — defines the dynamic classification to trust DSCP.</li></ul> |

## wred ecn

To indicate network congestion, rather than dropping packets, use explicit congestion notification (ECN).

### S6000-ON

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>wred ecn</code><br>To stop marking packets, use the <code>no wred ecn</code> command.                                                                   |
| <b>Defaults</b>        | none                                                                                                                                                          |

| 8.3.19.0   | Introduced on the S4820t.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.0    | Introduced on the S4810.        |

### Usage Information

When you enable `wred ecn`, and the number of packets in the queue is below the minimum threshold, packets are transmitted per the usual WRED treatment.

When you enable `wred ecn`, and the number of packets in the queue is between the minimum threshold and the maximum threshold, one of the following two scenarios can occur:

- If the transmission endpoints are ECN-capable and traffic is congested, and the WRED algorithm determines that the packet should have been dropped based on the drop probability, the packet is transmitted and marked so the routers know the system is congested and can slow transmission rates.
- If neither endpoint is ECN-capable, the packet may be dropped based on the WRED drop probability. This behavior is the identical treatment that a packet receives when WRED is enabled without ECN configured on the router.

When you enable `wred ecn`, and the number of packets in the queue is above the maximum threshold, packets are dropped based on the drop probability. This behavior is the identical treatment a packet receives when WRED is enabled without ECN configured on the router.

### Related Commands

- [wred-profile](#) — creates a WRED profile and name that profile.

## wred weight

Configure the weight factor for computation of average-queue size. This weight value applies to front-end ports. This mechanism to configure a weight for WRED and ECN functionality for front-end ports is supported on the S6000 and Z9000 platforms.

### S6000-ON

**Syntax** `[no] wred weight number`

#### Parameters

|               |                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>weight</b> | Define the weight factor to be used for computation of the WRED average-queue size to either enable WRED to discard packets or cause ECN to mark packets that exceed the minimum threshold configured. This setting applies to front-end ports only. |
| <b>number</b> | Enter the weight as a number to be used to calculate the average-queue size. The range is 1 to 15. The default is 0.                                                                                                                                 |

**Default** The default weight is zero.

**Command Modes** QOS-POLICY-OUT mode

#### Command History

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.10(0.0) | Introduced on the S6100-ON.                 |
| 9.8(1.0)  | Introduced on the Z9100-ON.                 |
| 9.7(0.0)  | Introduced on the S6000-ON.                 |
| 9.3.0.0   | Introduced on the S6000 and Z9000 platforms |

#### Usage Information

If the average queue size is more than the maximum threshold of WRED, the packet is dropped. If the average queue size is between the minimum and maximum threshold values, the decision to drop or queue the packet is taken based on the packet drop probability. The probability that a packet is dropped depends on the minimum threshold, maximum threshold, and mark probability denominator.

#### Example

```
DellEMC(conf-qos-policy-out) # wred weight 5
```

## wred-profile

Create a WRED profile and name the profile.

### S6000-ON

#### Syntax

```
wred-profile wred-profile-name
```

To remove an existing WRED profile, use the `no wred-profile` command.

#### Parameters

***wred-profile-name*** Enter your WRED profile name in character format (32 character maximum). Or use one of the pre-defined WRED profile names. You can configure up to 26 WRED profiles plus the five pre-defined profiles, for a total of 31 WRED profiles.

Pre-defined Profiles: `wred_drop`, `wred_ge_y`, `wred_ge_g`, `wred_teng_y`, `wred_teng_g`.

#### Defaults

The five pre-defined WRED profiles. When you configure a new profile, the minimum and maximum threshold defaults to predefined `wred_ge_g` values.

If green profile is applied, default yellow also take effect and vice-versa.

**Command Modes** CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 6.1.1.1  | Introduced on the E-Series. |

### Usage Information

Use the default pre-defined profiles or configure your own profile. You cannot delete the pre-defined profiles or their default values. This command enables WRED configuration mode —(conf-wred).

### Related Commands

- [threshold](#) — specifies the minimum and maximum threshold values of the WRED profile.

## rate shape

Define the rate-shaping method to be either as a measure of bytes or packets for each of the hierarchical QoS (HQoS) nodes at the leaf level to be applied to each queue.

### Syntax

```
[no] rate-shape [kbps | pps] peak-rate [burst-KB/Packets] [committed [kbps | pps] committed-rate [burst-KB/Packets]]
```

### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>kbps</b>                  | Enter the keyword kbps to specify the committed rate limit in Kilobits per second (Kbps). Specify this value as a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).                                                                                                                                                                      |
| <b>pps</b>                   | Enter the keyword pps to specify the committed rate limit in packets per second (pps). The range is from 1 to 268000000. The default granularity is Megabits per second (Mbps).                                                                                                                                                                                                                |
| <b><i>committed-rate</i></b> | Define the committed rate, which is the guaranteed or minimum confirmed rate for the packets. Specify this value as a multiple of 64 if you specify the committed rate in Kbps. The range is from 0 to 40000000. The range is from 1 to 268000000 for pps. The range is from 0 to 40000 for Mbps (which is the default measure for rate limits if you do not explicitly configure Kbps or pps) |
| <b><i>burst-KB</i></b>       | (OPTIONAL) Enter the committed burst size in KB. The range is from 0 to 10000. The default is 50 KB. The default peak burst is regarded as the same value as the configured committed burst size.                                                                                                                                                                                              |
| <b><i>Packets</i></b>        | (OPTIONAL) Enter the committed burst size as a count of packets. The range is from 1 to 1073000. The default is 50 packets. The default peak rate is regarded as the same value as the configured committed rate.                                                                                                                                                                              |
| <b><i>peak-rate</i></b>      | Define the peak rate, which is the guaranteed or minimum confirmed rate for the packets. Specify this value as a multiple of 64 if you specify the peak rate in Kbps. The range is from 0 to 40000000 for Kbps. The range is from 1 to 268000000 for pps. The range is from 0 to 40000 for Mbps (which is the default measure for rate limits if you do not explicitly configure Kbps or pps)  |
| <b>kbps</b>                  | Enter the keyword kbps to specify the peak rate limit in Kilobits per second (Kbps). Specify this value as a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).                                                                                                                                                                           |
| <b>pps</b>                   | Enter the keyword pps to specify the peak rate limit in packets per second (pps). The range is from 1 to 268000000. The default granularity is Megabits per second (Mbps).                                                                                                                                                                                                                     |
| <b><i>peak-rate</i></b>      | Define the peak rate, which is the guaranteed or minimum confirmed rate for the packets. Specify this value as a multiple of 64 if you specify the peak rate in Kbps. The range is from 0 to 40000000 for Kbps. The range is from 1 to 268000000 for pps. The range is from 0 to 40000 for Mbps (which is the default measure for rate limits if you do not explicitly configure Kbps or pps)  |
| <b><i>burst-KB</i></b>       | (OPTIONAL) Enter the peak burst size in KB. The range is from 0 to 10000. The default is 50 KB.                                                                                                                                                                                                                                                                                                |

**Packets** (OPTIONAL) Enter the peak burst size as a count of packets. The range is from 1 to 1073000. The default is 50 packets. The default peak rate is regarded as the same value as the configured peak rate.

**Default** Granularity for rate is Mbps unless you use the kbps option.

**Command Modes** CONFIGURATION

**Command History**

| Version   | Description                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                                              |
| 9.10(0.0) | Introduced on the S6100-ON.                                                                                            |
| 9.8(1.0)  | Introduced on the Z9100-ON.                                                                                            |
| 9.7(0.0)  | Introduced on the S6000-ON.                                                                                            |
| 9.3(0.0)  | Added support for committed rate and committed burst size, and for configuration of rate limits on the S6000 platform. |

**Usage Information**

If you specify the pps keyword after the rate-shape command, the peak rate, peak burst, committed rate and committed burst are all considered to be values as a measure of packets. If you do not specify the pps or kbps keyword, the peak and committed rate settings are considered to be values in Mbps. Similarly, if you enter the kbps keyword, the peak and committed rate settings are treated as values in Kbps.

You cannot configure the committed rate settings to use a different metric or unit from the metric that is set for peak rate attributes because when you use the `rate-shape kbps` command, it denotes the metric for peak and committed rate attributes). Similarly, if you use the `rate-shape pps` option, it denotes the metric for peak rate and committed rate attributes.

If you attempt to define the committed rate to be less than the peak rate, an error message is displayed stating that the peak rate cannot be lower than the committed rate. You can configure all the rate shaping parameters to be either in bytes or packets measure for each queue. The rate and burst parameters for both minimum and maximum settings for a queue can be either in packets or bytes. You cannot configure some of rate shaping attributes to be in bytes measure and the remaining rate shaping attributes to be in packets measure; all the rate shaping attributes must contain the same metric or unit of measure.

**Example**

```
DellEMC(conf-qos-policy-out) #rate-shape pps 100 100 peak pps 1000 200
DellEMC(conf-qos-policy-out) #rate-shape kbps 1024 100 peak kbps 102400 75
DellEMC(conf-qos-policy-out) # rate-shape 100 100 peak 1000 750
DellEMC(conf-qos-policy-in)#rate-police 100 25 peak 80 500
% Error: Peak rate cannot be less than committed rate.
```

## service-pool wred

A global buffer pool that is a shared buffer pool accessed by multiple queues when the minimum guaranteed buffers for the queue are consumed can be configured on the S6000 and Z9000 platforms.

Create a global buffer pool that is a shared buffer pool accessed by multiple queues when the minimum guaranteed buffers for the queue are consumed. S4810, S4820T, S6000, and Z9000 platforms support four global service-pools in the egress direction. Two service pools are used—one for lossy queues and the other for lossless (priority-based flow control (PFC)) queues. You can enable WRED and ECN configuration on the global service-pools. You can define WRED profiles and weight on each of the global service-pools for both lossy and lossless (PFC) service-pools.

**Syntax** [No] service-pool wred {green | weight | yellow} {pool0 number/string| pool1 number/string}

**Parameters** **service-pool** Define the mapping between the service class and policy-based QoS or routing.

|               |                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>wred</b>   | Specify WRED curve parameters for a queue.                                                                                                                                                                                                                             |
| <b>green</b>  | Specify green (low) drop precedence to a queue.                                                                                                                                                                                                                        |
| <b>weight</b> | Specify a weight factor to a queue.                                                                                                                                                                                                                                    |
| <b>yellow</b> | Specify yellow (medium) drop precedence to a queue.                                                                                                                                                                                                                    |
| <b>pool0</b>  | Service-pool buffer 1 (default service-pool for PFC traffic) .                                                                                                                                                                                                         |
| <b>pool1</b>  | Service-pool buffer 0 (default service-pool for both lossy and lossless traffic. traffic).                                                                                                                                                                             |
| <b>number</b> | Enter a weight for the queue as a number in the range of 1 to 15. This parameter applies only if you specify the green or yellow drop precedence.                                                                                                                      |
| <b>string</b> | Enter the WRED profile name. It is a string of up to 32 characters. Or use one of the five pre-defined WRED profile names. Pre-defined Profiles: wred_drop, wred_ge_y, wred_ge_g, wred_teng_y, wred_teng_. This parameter applies only if you specify a weight factor. |

**Default** All queues on backplane ports operate in tail-drop (best-effort traffic) mode by default. There is no default WRED green or yellow profile. The default weight is 0.

**Command Modes** CONFIGURATION mode

**Command History**

| <b>Version</b>   | <b>Description</b>                          |
|------------------|---------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.   |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                 |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.                 |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON.                 |
| <b>9.3.0.0</b>   | Introduced on the S6000 and Z9000 platforms |

**Usage Information**

You can configure only service pools 0 and 1 because the Dell EMC Networking OS uses only these two service pools. The pool, service0, is used for lossy queues and the pool, service1, is used for lossless (PFC) queues in all the platforms.

You can configure the weight for the WRED average queue size for service1, which is the only the platform in which PFC is supported for this service pool.

A WRED profile contains a set of attributes, such as the minimum and maximum threshold values, and the maximum drop rate for the received packets. You can add or remove WRED parameter configurations for one or more shared service pools using a single command. The `service-pool wred` command is similar in usage and working to the `service-class bandwidth-percentage queue-id` command.

**Example**

```
DelleMC(conf-wred) #wred thresh-1
DelleMC(conf-wred) #threshold min 100 max 200 max-drop-rate 40

DelleMC(conf-wred) #wred thresh-2
DelleMC(conf-wred) #threshold min 300 max 400 max-drop-rate 80

DelleMC(conf) #service-pool wred green pool0 thresh-1 pool1 thresh-2
DelleMC(conf) #service-pool wred yellow pool0 thresh-3 pool1 thresh-4
DelleMC(conf) #service-pool wred weight pool0 11 pool1 4
```

# DSCP Color Map Commands

The DSCP color map allows you to set the number of specific DSCP values to yellow or red. Traffic marked as yellow delivers traffic to the egress queue which will either transmit the packet if it has available bandwidth or drop the packet due to no ability to send. Traffic marked as red (high drop precedence) is dropped.

## dscp

Sets the number of specific DSCP values for a color map profile to yellow or red.

**Syntax** `dscp {yellow | red} [list-dscp-values]`  
To remove a color policy map profile, use the `no dscp {yellow | red} [dscp-list]` command.

**Parameters**

|                  |                                                                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Yellow</b>    | Enter the <code>yellow</code> keyword. Traffic marked as yellow delivers traffic to the egress queue which either transmits the packet if it has available bandwidth or drops the packet due to no ability to send.                                                                               |
| <b>Red</b>       | Enter the <code>red</code> keyword. Traffic marked as red is dropped.                                                                                                                                                                                                                             |
| <b>dscp-list</b> | Enter a list of IP DSCP values. The <code>dscp-list</code> parameter specifies the full list of IP DSCP value(s) for the specified color. Each DSCP value in a list is separate values by commas – no spaces (1,2,3) or indicates a list of values separated by a hyphen (1-3). Range is 0 to 63. |

**Defaults** **None**

**Command Modes** CONFIG-COLOR-MAP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5(0.1)   | Introduced on the Z9500.                                |
| 9.5.0.0    | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information** If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

The default setting for each DSCP value (0-63) is green (low drop precedence). This command allows setting the number of specific DSCP values to yellow or red.

### Important Points to Remember

- All DSCP values that are not specified as yellow or red are colored green.
- A DSCP value cannot be in both the yellow and red lists. Setting the red or yellow list with any DSCP value that is already in the other list results in an error and no update to that list is made.
- Each color map can only have one list of DSCP values for each color; any DSCP values previously listed for that color that are not in the new DSCP list are colored green.

## Example

```
DellEMC(conf-dscp-color-map)# dscp yellow 9,10,11,13,15,16
```

## Related Commands

- [qos dscp-color-map](#) — configures the DSCP color map.
- [qos dscp-color-policy](#) — configures a DSCP color policy.

# qos dscp-color-map

Configure the DSCP color map.

## Syntax

```
qos dscp-color-map map-name
```

To remove a color map, use the `no qos dscp-color-map map-name` command.

## Parameters

**map-name** Enter the name of the DSCP color map. The map name can have a maximum of 32 characters.

## Defaults

None

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.5(0.1)   | Introduced on the Z9500.                                |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5.0.0    | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

## Usage Information

A color map outlines the codepoint mappings to the appropriate color mapping (green, yellow, red) for the traffic. The system uses this information use to handle the traffic on the interface based on the traffic priority and places it into the appropriate shaping queue. You cannot delete a DSCP color map when it is configured on an interface. If you do, all the DSCP values are set to green (low drop precedence). To delete the DSCP color map that is being used by one or more interfaces, remove the DSCP map from each interface.

## Example

```
DellEMC(conf)# qos dscp-color-map mymap
```

## Related Commands

- [qos dscp-color-map](#) — associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map.
- [dscp](#) — sets the number of specific DSCP values for color map profile to yellow or red.

# qos dscp-color-policy

Associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map.

## Syntax

```
dscp-color-policy color-map-profile-name
```

To remove a color policy map profile, use the `no dscp-color-policy color-map-profile-name` command.

**Parameters**      ***color-map-profile-name***      Enter the color map profile name. The name can have a maximum of 32 characters.

**Defaults**      **None**

**Command Modes**      CONFIG-INTERFACE

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>         | <b>Description</b>                                      |
|------------------------|---------------------------------------------------------|
| <b>9.10(0.1)</b>       | Introduced on the S6010-ON and S4048T-ON.               |
| <b>9.10(0.0)</b>       | Introduced on the S3148.                                |
| <b>9.10(0.0)</b>       | Introduced on the S6100-ON.                             |
| <b>9.8(2.0)</b>        | Introduced on the S3100 series.                         |
| <b>9.8(1.0)</b>        | Introduced on the Z9100-ON.                             |
| <b>9.8(0.0P5)</b>      | Introduced on the S4048-ON.                             |
| <b>9.8(0.0P2)</b>      | Introduced on the S3048-ON.                             |
| <b>9.7(0.0)</b>        | Introduced on the S6000-ON.                             |
| <b>9.5(0.1)</b>        | Introduced on the Z9500.                                |
| <b>Version 9.5.0.0</b> | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information**      If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

**Example**      The following example assigns the color map, **bat-enclave-map**, to interface **1/11/1**.

```
DellEMC(conf)# int te 1/11/1
DellEMC(conf-if-te-1/11/1)# qos dscp-color-policy bat-enclave-map
DellEMC(conf-if-te-1/11/1)#
```

**Related Commands**

- `dscp`— sets the number of specific DSCP values for color map profile to yellow or red.
- `qos dscp-color-map`— configures the DSCP color map.

## show qos dscp-color-policy

Display DSCP color policy configuration for one or all interfaces.

**Syntax**      `show qos dscp-color-policy {summary [interface] | detail {interface}}`

**Parameters**

**summary**      Enter the `summary` keyword to display summary information about a color policy on one or more interfaces.

**Detail**      Enter the `detail` keyword to display detailed information about a color policy on one or more interfaces.

**interface**      Enter the name of the interface that has color policy configured.

**Defaults**      **None**

**Command Modes**      EXEC

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5.0.0    | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

### Example

```

Display summary information about a color policy on one or more
interfaces.

DelleMC# show qos dscp-color-policy summary

Interface dscp-color-map
TE 1/10/1 mapONE
TE 1/11/1 mapTWO

Display summary information about a color policy on a specific interface.

DelleMC# show qos dscp-color-policy summary te 1/10/1
Interface dscp-color-map
TE 1/10/1 mapONE

Displayed detailed color policy information on an interface.

DelleMC# show qos dscp-color-policy detail te 1/10/1
Interface TenGigabitEthernet 1/10/1

Dscp-color-map mapONE
 yellow 4,7
 red 20,30

```

### Related Commands

- [show qos dscp-color-map](#) — displays DSCP color maps.

## show qos dscp-color-map

Display the DSCP color map for one or all interfaces.

**Syntax** `show qos dscp-color-map map-name`

**Parameters** `map-name` Enter the name of the color map.

**Defaults** `None`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| <b>9.5.0.0</b>    | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

### Example

Display all DSCP color maps.

```
DelleMC# show qos dscp-color-map
Dscp-color-map mapONE
 yellow 4,7
 red 20,30
Dscp-color-map mapTWO
 yellow 16,55
```

Display a specific DSCP color map.

```
DelleMC# show qos dscp-color-map mapTWO
Dscp-color-map mapTWO
 yellow 16,55
DelleMC#
```

# Routing Information Protocol (RIP)

Routing information protocol (RIP) is a distance vector routing protocol. The Dell EMC Networking OS supports both RIP version 1 (RIPv1) and RIP version 2 (RIPv2).

The Dell EMC Networking OS implementation of RIP is based on IETF RFCs 2453 and RFC 1058. For more information about configuring RIP, see the *Dell EMC Networking OS Configuration Guide*.

## auto-summary

Restore the default behavior of automatic summarization of subnet routes into network routes. This command applies only to RIP version 2.

**Syntax** `auto-summary`

To send sub-prefix routing information, use the `no auto-summary` command.

**Defaults** Enabled.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|

| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

### Usage Information

This command triggers updates of the main RIP routing tables.

## debug ip rip

Examine RIP routing information for troubleshooting.

### S6000-ON

#### Syntax

```
debug ip rip [interface | database | events [interface] | trigger]
```

To turn off debugging output, use the `no debug ip rip` command.

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | (OPTIONAL) Enter the interface type and ID as one of the following: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>database</b>         | (OPTIONAL) Enter the keyword <code>database</code> to display messages when there is a change to the RIP database.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>events</b>           | (OPTIONAL) Enter the keyword <code>events</code> to debug only RIP protocol changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>trigger</b>          | (OPTIONAL) Enter the keyword <code>trigger</code> to debug only RIP trigger extensions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Command Modes** EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version      | Description                              |
|--------------|------------------------------------------|
| 8.3.19.0     | Introduced on the S4820T.                |
| 8.3.11.1     | Introduced on the Z9000.                 |
| 8.5.1.0      | Added support for 4-port 40G line cards. |
| 8.3.7.0      | Introduced on the S4810.                 |
| 7.8.1.0      | Introduced on the S-Series.              |
| 7.6.1.0      | Introduced on the C-Series.              |
| pre- 6.2.1.1 | Introduced on the E-Series.              |

## default-information originate

Generate a default route for the RIP traffic.

### S6000-ON

**Syntax** `default-information originate [always] [metric metric-value] [route-map map-name]`

To return to the default values, use the `no default-information originate` command.

**Parameters**

- always** (OPTIONAL) Enter the keyword `always` to enable the switch software to always advertise the default route.
- metric *metric-value*** (OPTIONAL) Enter the keyword `metric` then a number as the metric value. The range is from 1 to 16. The default is **1**.
- route-map *map-name*** (OPTIONAL) Enter the keywords `route-map` then the name of a configured route-map.

**Defaults** Disabled. Metric: **1**.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

The default route must be present in the switch routing table for the `default-information originate` command to take effect.

## default-metric

Change the default metric for routes. To ensure that all redistributed routes use the same metric value, use this command with the `redistribute` command.

### S6000-ON

**Syntax**

`default-metric number`

To return the default metric to the original values, use the `no default-metric` command.

**Parameters**

**number** Specify a number. The range is from 1 to 16. The default is **1**.

**Defaults**

**1**

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |

| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Introduced on the S-Series.               |
| 7.6.1.0      | Introduced on the C-Series.               |
| pre- 6.2.1.1 | Introduced on the E-Series.               |

**Usage Information**

This command ensures that route information being redistributed is converted to the same metric value.

## Related Commands

- [redistribute](#) — allows you to redistribute routes learned by other methods.

# description

Enter a description of the RIP routing protocol.

## S6000–ON

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

**Parameters** **description** Enter a description to identify the RIP protocol (80 characters maximum).

**Defaults** none

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 7.7.1.0</b> | Introduced on the E-Series.               |

## Related Commands

- [router rip](#) — enters ROUTER mode on the switch.

# distance

Assign a weight (for prioritization) to all routes in the RIP routing table or to a specific route. Lower weights (“administrative distance”) are preferred.

## S6000–ON

**Syntax** `distance weight [ip-address mask [prefix-name]]`

To return to the default values, use the `no distance weight [ip-address mask]` command.

|                   |                           |                                                                                                                                 |
|-------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>weight</i></b>      | Enter a number from 1 to 255 for the weight (for prioritization). The default is <b>120</b> .                                   |
|                   | <b><i>ip-address</i></b>  | (OPTIONAL) Enter the IP address, in dotted decimal format (A.B.C.D), of the host or network to receive the new distance metric. |
|                   | <b><i>mask</i></b>        | If you enter an IP address, also enter a mask for that IP address, in either dotted decimal format or /prefix format (/x).      |
|                   | <b><i>prefix-name</i></b> | (OPTIONAL) Enter a configured prefix list name.                                                                                 |

**Defaults** weight = **120**

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Related Commands**

- `default-metric` — assigns one distance metric to all routes learned using the `redistribute` command.

## distribute-list in

Configure a filter for incoming routing updates.

### S6000-ON

**Syntax** `distribute-list prefix-list-name in [interface]`

To delete the filter, use the `no distribute-list prefix-list-name in` command.

**Parameters**

|                                |                                                                             |
|--------------------------------|-----------------------------------------------------------------------------|
| <b><i>prefix-list-name</i></b> | Enter the name of a configured prefix list.                                 |
| <b><i>interface</i></b>        | (OPTIONAL) Identifies the interface type slot/port as one of the following: |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |
|---------------------|-------------------------------------------|

| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Related Commands**

- `ip prefix-list` — enters PREFIX-LIST mode and configures a prefix list.

## distribute-list out

Configure a filter for outgoing routing updates.

### S6000-ON

**Syntax** `distribute-list prefix-list-name out [interface | bgp | connected | isis | ospf | static]`

To delete the filter, use the `no distribute-list prefix-list-name out` command.

**Parameters** **prefix-list-name** Enter the name of a configured prefix list.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b> | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>connected</b> | (OPTIONAL) Enter the keyword <code>connected</code> to filter only directly connected routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>isis</b>      | (OPTIONAL) Enter the keyword <code>isis</code> to filter only IS-IS routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ospf</b>      | (OPTIONAL) Enter the keyword <code>ospf</code> to filter all OSPF routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>static</b>    | (OPTIONAL) Enter the keyword <code>static</code> to filter manually configured routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                                              |
|---------------------|----------------------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON.                |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                                 |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.                              |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.                          |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.                              |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.                              |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.                              |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                              |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                                 |
| <b>9.0.2.0</b>      | Introduced on the S6000.                                 |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                                |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                                 |
| <b>8.5.1.0</b>      | Added support for 4-port 40G line cards on the E-Series. |
| <b>8.3.7.0</b>      | Introduced on the S4810.                                 |
| <b>7.8.1.0</b>      | Introduced on the S-Series.                              |
| <b>7.6.1.0</b>      | Introduced on the C-Series.                              |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.                              |

**Related Commands**

- [ip prefix-list](#) — enters PREFIX-LIST mode and configures a prefix list.

# ip poison-reverse

Set the prefix of the RIP routing updates to the RIP infinity value.

## S6000–ON

**Syntax** `ip poison-reverse`

To disable poison reverse, use the `no ip poison-reverse` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |

| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Related Commands**

- [ip split-horizon](#) — sets the RIP routing updates to exclude routing prefixes.

# ip rip receive version

To receive specific versions of RIP, set the interface. The RIP version you set on the interface overrides the version command in ROUTER RIP mode.

## S6000–ON

**Syntax** `ip rip receive version [1] [2]`

To return to the default, use the `no ip rip receive version` command.

**Parameters** **1** (OPTIONAL) Enter the number 1 for RIP version 1.

**2** (OPTIONAL) Enter the number 2 for RIP version 2.

**Defaults** **RIPv1** and **RIPv2**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information** If you want the interface to receive both versions of RIP, use the `ip rip receive version 1 2` command.

**Related Commands**

- [ip rip send version](#) — sets the RIP version for sending RIP traffic on an interface.
- [version](#) — sets the RIP version the switch software uses.

## ip rip send version

To send a specific version of RIP, set the interface. The version you set on the interface overrides the version command in ROUTER RIP mode.

### S6000-ON

**Syntax** `ip rip send version [1] [2]`

To return to the default value, use the `no ip rip send version` command.

**Parameters**

**1** (OPTIONAL) Enter the number 1 for RIP version 1. The default is RIP version 1.

**2** (OPTIONAL) Enter the number 2 for RIP version 2.

**Defaults** **RIPv1**

**Command Modes** INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information**

To enable the interface to send both version of RIP packets, use the `ip rip send version 1 2` command.

**Related Commands**

- [ip rip receive version](#) — sets the RIP version for the interface to receive traffic.
- [version](#) — sets the RIP version for the switch software.

## ip split-horizon

Enable split-horizon for RIP data on the interface. As described in RFC 2453, the split-horizon scheme prevents any routes learned over a specific interface to be sent back out that interface.

### S6000–ON

**Syntax**

```
ip split-horizon
```

To disable split-horizon, use the `no ip split-horizon` command.

**Defaults**

Enabled

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Related Commands

- [ip poison-reverse](#) — sets the prefix for RIP routing updates.

## maximum-paths

Set RIP to forward packets over multiple paths.

### S6000–ON

#### Syntax

`maximum-paths number`

To return to the default values, use the `no maximum-paths` commands.

#### Parameters

**number**

Enter the number of paths. The range is from 1 to 16. The default is **4** paths.

#### Defaults

**4**

#### Command Modes

ROUTER RIP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

RIP supports a maximum of 16 ECMP paths.

## neighbor

Define a neighbor router with which to exchange RIP information.

### S6000–ON

**Syntax**

`neighbor ip-address`

To delete a neighbor setting, use the `no neighbor ip-address` command.

**Parameters**

**ip-address** Enter the IP address, in dotted decimal format, of a router with which to exchange information.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |

| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Introduced on the S-Series.               |
| 7.6.1.0      | Introduced on the C-Series.               |
| pre- 6.2.1.1 | Introduced on the E-Series.               |

### Usage Information

When a neighbor router is identified, unicast data exchanges occur. Multiple neighbor routers are possible. To ensure that only specific interfaces are receiving and sending data, use the `passive-interface` command with the `neighbor` command.

### Related Commands

- [passive-interface](#) — sets the interface to only listen to RIP broadcasts.

## network

Enable RIP for a specified network. To enable RIP on all networks connected to the switch, use this command.

## S6000-ON

### Syntax

```
network ip-address
```

To disable RIP for a network, use the `no network ip-address` command.

### Parameters

***ip-address*** Specify an IP network address in dotted decimal format. You cannot specify a subnet.

### Defaults

No RIP network is configured.

**Command Modes** ROUTER RIP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

### Usage Information

You can enable an unlimited number of RIP networks.

RIP operates over interfaces configured with any address the `network` command specifies.

# offset-list

Specify a number to add to the incoming or outgoing route metrics learned using RIP.

| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.5.1.0      | Added support for 4-port 40G line cards.  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Introduced on the S-Series.               |
| 7.6.1.0      | Introduced on the C-Series.               |
| pre- 6.2.1.1 | Introduced on the E-Series.               |

**Usage Information**

When the offset metric is applied to an interface, that value takes precedence over an offset value that is not extended to an interface.

**Related Commands**

- [ip prefix-list](#) — enters PREFIX-LIST mode and configure a prefix list.

## output-delay

Set the interpacket delay of successive packets to the same neighbor.

### S6000–ON

**Syntax**

`output-delay delay`

To return to the switch software defaults for interpacket delay, use the `no output-delay` command.

**Parameters**

**delay**

Specify a number of milliseconds as the delay interval. The range is from 8 to 50.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information**

This command is intended for low-speed interfaces.

# passive-interface

Suppress routing updates on a specified interface.

## S6000–ON

**Syntax** `passive-interface interface`

To delete a passive interface, use the `no passive-interface interface` command.

**Parameters** *interface* Enter the following information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                              |
|--------------|----------------------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)    | Introduced on the S3148.                                 |
| 9.10(0.0)    | Introduced on the S6100-ON.                              |
| 9.8(2.0)     | Introduced on the S3100 series.                          |
| 9.8(1.0)     | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5)   | Introduced on the S4048-ON.                              |
| 9.8(0.0P2)   | Introduced on the S3048-ON.                              |
| 9.7(0.0)     | Introduced on the S6000-ON.                              |
| 9.2(1.0)     | Introduced on the Z9500.                                 |
| 9.0.2.0      | Introduced on the S6000.                                 |
| 8.3.19.0     | Introduced on the S4820T.                                |
| 8.3.11.1     | Introduced on the Z9000.                                 |
| 8.5.1.0      | Added support for 4-port 40G line cards on the E-Series. |
| 8.3.7.0      | Introduced on the S4810.                                 |
| 7.8.1.0      | Introduced on the S-Series.                              |
| 7.6.1.0      | Introduced on the C-Series.                              |
| pre- 6.2.1.1 | Introduced on the E-Series.                              |

**Usage Information** Although the passive interface does not send or receive routing updates, the network on that interface still includes in RIP updates sent using other interfaces.

**Related Commands**

- [neighbor](#) — enables RIP for a specified network.
- [network](#) — defines a neighbor.

# redistribute

Redistribute information from other routing instances.

| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

## redistribute ospf

Redistribute routing information from an OSPF process.

**Syntax** `redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]`

To disable redistribution, use the `no redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]` command.

|                   |                               |                                                                                                                                                                    |
|-------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>process-id</i></b>      | Enter a number that corresponds to the OSPF process ID to redistribute. The range is from 1 to 65355.                                                              |
|                   | <b>match external {1   2}</b> | (OPTIONAL) Enter the keywords <code>match external</code> then the numbers 1 or 2 to indicate that external 1 routes or external 2 routes should be redistributed. |
|                   | <b>match internal</b>         | (OPTIONAL) Enter the keywords <code>match internal</code> to indicate that internal routes should be redistributed.                                                |

**metric *metric-value*** (OPTIONAL) Enter the keyword `metric` then a number as the metric value. The range is from 0 to 16.

**route-map *map-name*** (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S3148.                  |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.8(2.0)     | Introduced on the S3100 series.           |
| 9.8(1.0)     | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)   | Introduced on the S4048-ON.               |
| 9.8(0.0P2)   | Introduced on the S3048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Introduced on the S-Series.               |
| 7.6.1.0      | Introduced on the C-Series.               |
| pre- 6.2.1.1 | Introduced on the E-Series.               |

## router rip

To configure and enable RIP, enter ROUTER RIP mode.

**Syntax** `router rip`  
To disable RIP, use the `no router rip` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version             | Description                 |
|---------------------|-----------------------------|
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.    |
| <b>9.0.2.0</b>      | Introduced on the S6000.    |
| <b>8.3.19.0</b>     | Introduced on the S4820T.   |
| <b>8.3.11.1</b>     | Introduced on the Z9000.    |
| <b>8.3.7.0</b>      | Introduced on the S4810.    |
| <b>7.8.1.0</b>      | Introduced on the S-Series. |
| <b>7.6.1.0</b>      | Introduced on the C-Series. |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series. |

**Usage Information**

To enable RIP, assign a network address using the `network` command.

**Example**

```
DellEMC(conf)# router rip
DellEMC(conf-router_rip)#
```

**Related Commands**

- [network](#) — enables RIP.
- [exit](#) — returns to CONFIGURATION mode.

## show config

Display the changes you made to the RIP configuration. The default values are not shown.

### S6000-ON

**Syntax** `show config`

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

### Example

```
DellEMC(conf-router_rip)# show config
!
router rip
 network 172.31.0.0
 passive-interface TenGigabitEthernet 1/1/1
DellEMC(conf-router_rip)#
```

## show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

### S6000-ON

**Syntax** `show ip rip database [ip-address mask]`

**Parameters**

***ip-address*** (OPTIONAL) Specify an IP address in dotted decimal format to view RIP information on that network only. If you enter an IP address, also enter a mask for that IP address.

***mask*** (OPTIONAL) Specify a mask, in /network format, for the IP address.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the S-Series.               |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

### Usage Information

The following describes the `show ip rip database` command shown in the following example.

| Field                                         | Description                                                   |
|-----------------------------------------------|---------------------------------------------------------------|
| <b>Total number of routes in RIP database</b> | Displays the number of RIP routes stored in the RIP database. |
| <b>100.10.10.0/24 directly connected</b>      | Lists the routes directly connected.                          |
| <b>150.100.0.0 redistributed</b>              | Lists the routes learned through redistribution.              |
| <b>209.9.16.0/24...</b>                       | Lists the routes and the sources advertising those routes.    |

### Example

```
DellEMC# show ip rip database
Total number of routes in RIP database: 1624
204.250.54.0/24
 [50/1] via 192.14.1.3, 00:00:12, TenGigabitEthernet 1/15/1
204.250.54.0/24
 auto-summary
203.250.49.0/24
 [50/1] via 192.13.1.3, 00:00:12, TenGigabitEthernet 1/14/1
203.250.49.0/24
 auto-summary
210.250.40.0/24
 [50/2] via 1.1.18.2, 00:00:14, Vlan 18
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
210.250.40.0/24
 auto-summary
207.250.53.0/24
 [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
 [50/2] via 1.1.10.2, 00:00:18, Vlan 10
207.250.53.0/24
 auto-summary
208.250.42.0/24
 [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
 [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
 [50/2] via 1.1.10.2, 00:00:18, Vlan 10
208.250.42.0/24
 auto-summary
DellEMC#
```

## show running-config rip

Display the current RIP configuration.

### S6000-ON

**Syntax** `show running-config rip`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                     |
|------------|---------------------------------|
| 9.10(0.0)  | Introduced on the S3148.        |
| 9.10(0.0)  | Introduced on the S6100-ON.     |
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.0    | Introduced on the S4810.        |
| 7.8.1.0    | Introduced on the S-Series.     |
| 7.7.1.0    | Introduced on the C-Series.     |
| 7.6.1.0    | Introduced on the E-Series.     |

#### Example

```
DelleMC# show running-config rip
!
router rip
 distribute-list Test1 in
 distribute-list Test21 out
 network 10.0.0.0
 passive-interface TenGigabitEthernet 2/1/1
 neighbor 20.20.20.20
 redistribute ospf 999
 version 2
DelleMC#
```

## timers basic

Manipulate the RIP timers for routing updates, invalid, holddown times, and flush time.

### S6000–ON

#### Syntax

```
timers basic update invalid holddown flush
```

To return to the default settings, use the `no timers basic` command.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>update</i></b>   | Enter the number of seconds to specify the rate at which RIP routing updates are sent. The range is from zero (0) to 4294967295. The default is <b>30 seconds</b> .                                                                                                                           |
| <b><i>invalid</i></b>  | Enter the number of seconds to specify the time interval before routing updates are declared invalid or expired. The invalid value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> .                       |
| <b><i>holddown</i></b> | Enter the number of seconds to specify a time interval during which the route is marked as unreachable but still sending RIP packets. The holddown value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> . |

**flush** Enter the number of seconds to specify the time interval during which the route is advertised as unreachable. When this interval expires, the route is flushed from the routing table. The flush value should be greater than the update value. The range is from zero (0) to 4294967295. The default is **240 seconds**.

- Defaults**
- update = **30 seconds**
  - invalid = **180 seconds**
  - holddown = **180 seconds**
  - flush = **240 seconds**

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>     | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>     | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>   | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>   | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>     | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>      | Introduced on the S4810.                  |
| <b>7.8.1.0</b>      | Introduced on the S-Series.               |
| <b>7.6.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.               |

**Usage Information** If you change the timers on one router, also synchronize the timers on all routers in the RIP domain.

## version

Specify either RIP version 1 or RIP version 2.

## S6000–ON

**Syntax** `version {1 | 2}`  
To return to the default version setting, use the `no version` command.

**Parameters**

- 1** Enter the keyword 1 to specify RIP version 1.
- 2** Enter the keyword 2 to specify RIP version 2.

**Defaults** The Dell EMC Networking OS sends RIPv1 and receives RIPv1 and RIPv2.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>      | <b>Description</b>                        |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |

# Remote Monitoring (RMON)

Dell EMC Networking OS RMON is based on IEEE standards, providing both 32-bit and 64-bit monitoring and long-term statistics collection. Dell EMC Networking OS RMON supports the following RMON groups, as defined in RFC-2819, RFC-3273, RFC-3434, and RFC-4502:

- Ethernet Statistics Table; RFC-2819
- Ethernet Statistics High-Capacity Table; RFC-3273, 64bits
- Ethernet History Control Table; RFC-2819
- Ethernet History Table; RFC-2819
- Ethernet History High-Capacity Table; RFC-3273, 64bits
- Alarm Table; RFC-2819
- High-Capacity Alarm Table (64bits); RFC-3434, 64bits
- Event Table; RFC-2819
- Log Table; RFC-2819
- User History; RFC-4502
- Probe Configuration (Capabilities, SoftwareRev, HardwareRev, DateTime and ResetControl); RFC-4502

Dell EMC Networking OS RMON does not support the following statistics:

- etherStatsCollisions
- etherHistoryCollisions
- etherHistoryUtilization

**NOTE:** Only SNMP GET/GETNEXT access is supported. Configure RMON using the RMON commands. Collected data is lost during a chassis reboot.

## rmon alarm

Set an alarm on any MIB object.

**Syntax** `rmon alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]`

To disable the alarm, use the `no rmon alarm number` command.

**Parameters** *number* Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>variable</i></b>                             | Enter the MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3. The object type must be a 32-bit integer.                                                                                                                                                                                                                                     |
| <b><i>interval</i></b>                             | Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.                                                                                                                                                                                                                                         |
| <b><i>delta</i></b>                                | Enter the keyword <code>delta</code> to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.                                                                                                                                                                                                                                                       |
| <b><i>absolute</i></b>                             | Enter the keyword <code>absolute</code> to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.                                                                                                                                                                                                                                                          |
| <b><i>rising-threshold value event-number</i></b>  | Enter the keywords <code>rising-threshold</code> then the value (32 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.          |
| <b><i>falling-threshold value event-number</i></b> | Enter the keywords <code>falling-threshold</code> then the value (32 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero. |
| <b><i>owner string</i></b>                         | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.                                                                                                                                                                                                                   |

# rmon collection history

Enable the RMON MIB history group of statistics collection on an interface.

**Syntax** `rmon collection history {controlEntry integer} [owner name] [buckets number] [interval seconds]`

To remove a specified RMON history group of statistics collection, use the `no rmon collection history {controlEntry integer}` command.

|                   |                                    |                                                                                                                                                                                                                                                                  |
|-------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>controlEntry <i>integer</i></b> | Enter the keyword <code>controlEntry</code> to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON group of statistics. The integer value must be a unique index in the RMON history table. |
|                   | <b>owner <i>name</i></b>           | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to record the owner of the RMON group of statistics.                                                                                                                                         |
|                   | <b>buckets <i>number</i></b>       | (OPTIONAL) Enter the keyword <code>buckets</code> then the number of buckets for the RMON collection history group of statistics. The bucket range is from 1 to 1000. The default is <b>50</b> .                                                                 |
|                   | <b>interval <i>seconds</i></b>     | (OPTIONAL) Enter the keyword <code>interval</code> then the number of seconds in each polling cycle. The range is from 5 to 3600 seconds. The default is <b>1800 seconds</b> .                                                                                   |

**Defaults** none

# rmon collection statistics

Enable RMON MIB statistics collection on an interface.

**Syntax** `rmon collection statistics {controlEntry integer} [owner name]`  
To remove RMON MIB statistics collection on an interface, use the `no rmon collection statistics {controlEntry integer}` command.

**Parameters**

|                             |                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>controlEntry integer</b> | Enter the keyword <code>controlEntry</code> to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON Statistic Table. The integer value must be a unique in the RMON statistic table. |
| <b>owner name</b>           | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to record the owner of the RMON group of statistics.                                                                                                                                 |

**Defaults** none

**Command Modes** CONFIGURATION INTERFACE (config-if)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 6.1.1.0    | Introduced on the E-Series.               |

# rmon event

Add an event in the RMON event table.

**Syntax** `rmon event number [log] [trap community] [description string]`  
To disable RMON on an interface, use the `no rmon event number` command.

**Parameters**

|               |                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>number</b> | Assign an event number in integer format. The range is from 1 to 65535. You must ensure that the value you enter is unique in the RMON event table. |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

|                                  |                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log</b>                       | (OPTIONAL) Enter the keyword <code>log</code> to generate an RMON event log. This option sets the <code>eventType</code> to either <code>log</code> or <code>log-and-snmptrap</code> in the RMON event table. The default is <code>None</code> .                                                                                                             |
| <b>trap <i>community</i></b>     | (OPTIONAL) Enter the keyword <code>trap</code> followed by the SNMP community string to generate SNMP traps for an RMON event entry. This option sets the <code>eventType</code> to either <code>snmptrap</code> or <code>log-and-snmptrap</code> in the RMON event table. In addition to the SNMP traps, this option also generates a <code>syslog</code> . |
| <b>description <i>string</i></b> | (OPTIONAL) Enter the keyword <code>description</code> then a string describing the event.                                                                                                                                                                                                                                                                    |
| <b>owner <i>name</i></b>         | (OPTIONAL) Enter the keyword <code>owner</code> then the name of the owner of this event.                                                                                                                                                                                                                                                                    |

**Defaults** As noted in the *Parameters* section.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |

| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.1.1.0</b>    | Introduced on the E-Series.               |

## rmon hc-alarm

Set an alarm on any MIB object.

**Syntax** `rmon hc-alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]`

To disable the alarm, use the `no rmon hc-alarm number` command.

**Parameters**

***number*** Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.

***variable*** The MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3 The object type must be a 64-bit integer.

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interval</i></b>                             | Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.                                                                                                                                                                                                                                         |
| <b><i>delta</i></b>                                | Enter the keyword <code>delta</code> to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.                                                                                                                                                                                                                                                       |
| <b><i>absolute</i></b>                             | Enter the keyword <code>absolute</code> to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.                                                                                                                                                                                                                                                          |
| <b><i>rising-threshold value event-number</i></b>  | Enter the keywords <code>rising-threshold</code> then the value (64 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.          |
| <b><i>falling-threshold value event-number</i></b> | Enter the keywords <code>falling-threshold</code> then the value (64 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero. |
| <b><i>owner string</i></b>                         | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.                                                                                                                                                                                                                   |

| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

### Example

```
DellEMC# show rmon
RMON status
 total memory used 218840 bytes.
 ether statistics table: 8 entries, 4608 bytes
 ether history table: 8 entries, 6000 bytes
 alarm table: 390 entries, 102960 bytes
 high-capacity alarm table: 5 entries, 1680 bytes
 event table: 500 entries, 206000 bytes
 log table: 2 entries, 552 bytes
DellEMC#
```

# show rmon alarms

Display the contents of the RMON alarm table.

## S6000–ON

**Syntax** `show rmon alarms [index] [brief]`

**Parameters**

- index** (OPTIONAL) Enter the table index number to display just that entry.
- brief** (OPTIONAL) Enter the keyword `brief` to display the RMON alarm table in an easy-to-read format.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

## show rmon hc-alarm

Display the contents of RMON High-Capacity alarm table.

### S6000-ON

**Syntax** `show rmon hc-alarm [index] [brief]`

**Parameters**

|              |                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>index</b> | (OPTIONAL) Enter the table index number to display just that entry.                                                      |
| <b>brief</b> | (OPTIONAL) Enter the keyword <code>brief</code> to display the RMON High-Capacity alarm table in an easy-to-read format. |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.1.1.0</b>    | Introduced on the E-Series.               |

#### Example (Index)

```
DellEMC# show rmon hc-alarm 1
RMON high-capacity alarm entry 2
 object: 1.3.6.1.2.1.2.2.1.4.2099844
 sample interval: 10
 sample type: delta value.
 value: 0, value status: positive
 alarm type: rising or falling alarm.
 alarm rising threshold value: positive.
 rising threshold: 500, RMON event index: 3
 alarm falling threshold value: positive.
```

```

 falling threshold: 300, RMON event index: 4
 alarm sampling failed 0 times.
 alarm owner:
 alarm storage type: non-volatile.
 alarm status: OK
DellEMC#

```

### Example (Brief)

```

DellEMC# show rmon hc-alarm brief
index SNMP OID

1 1.3.6.1.2.1.1.3
2 1.3.6.1.2.1.1.3
3 1.3.6.1.2.1.1.3
4 1.3.6.1.2.1.1.3
5 1.3.6.1.2.1.1.3
DellEMC#

```

## show rmon history

Display the contents of the RMON Ethernet history table.

### S6000-ON

**Syntax** `show rmon history [index] [brief]`

**Parameters**

- index*** (OPTIONAL) Enter the table index number to display just that entry.
- brief*** (OPTIONAL) Enter the keyword `brief` to display the RMON Ethernet history table in an easy-to-read format

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.0 | Introduced on the E-Series. |

#### Example (Index)

```
DellEMC# show rmon history 6001
RMON history control entry 6001
interface: ifIndex.100974631 TenGigabitEthernet 2/1/1
bucket requested: 1
bucket granted: 1
sampling interval: 5 sec
owner: 1
status: OK
DellEMC#
```

#### Example (Brief)

```
DellEMC# show rmon history brief
index ifIndex interface

6001 100974631 TenGigabitEthernet 2/2/1
6002 100974631 TenGigabitEthernet 2/2/1
6003 101236775 TenGigabitEthernet 2/1/1
6004 101236775 TenGigabitEthernet 2/1/1
9001 134529054 TenGigabitEthernet 3/2/1
9002 134529054 TenGigabitEthernet 3/2/1
9003 134791198 TenGigabitEthernet 3/1/1
9004 134791198 TenGigabitEthernet 3/1/1
DellEMC#
```

## show rmon log

Display the contents of the RMON log table.

### S6000-ON

|                        |                                                                                                                                                               |                                                                                                    |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show rmon log [ <i>index</i> ] [ <i>brief</i> ]                                                                                                               |                                                                                                    |
| <b>Parameters</b>      | <b><i>index</i></b>                                                                                                                                           | (OPTIONAL) Enter the table index number to display just that entry.                                |
|                        | <b><i>brief</i></b>                                                                                                                                           | (OPTIONAL) Enter the keyword <i>brief</i> to display the RMON log table in an easy-to-read format. |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                                                                    |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                    |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information**

The log table has a maximum of 500 entries. If the log exceeds that maximum, the oldest log entry is purged to allow room for the new entry.

**Example (Index)**

```
DellEMC# show rmon log 2
RMON log entry, alarm table index 2, log index 1
 log time: 14638 (THU AUG 12 22:10:40 2004)
 description: 2
DellEMC#
```

**Example (Brief)**

```
DellEMC# show rmon log br
eventIndex description

2 2
4 4
DellEMC#
```

## show rmon statistics

Display the contents of RMON Ethernet statistics table.

### S6000-ON

**Syntax** `show rmon statistics [index] [brief]`

**Parameters**

- index** (OPTIONAL) Enter the table index number to display just that entry.
- brief** (OPTIONAL) Enter the keyword `brief` to display the RMON Ethernet statistics table in an easy-to-read format.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

# Rapid Spanning Tree Protocol (RSTP)

The Dell EMC Networking OS implementation of rapid spanning tree protocol (RSTP) is based on the IEEE 802.1w standard spanning-tree protocol. The RSTP algorithm configures connectivity throughout a bridged local area network (LAN) that is comprised of LANs interconnected by bridges.

Dell EMC Networking OS supports RSTP.

## Topics:

- [bridge-priority](#)
- [debug spanning-tree rstp](#)
- [description](#)
- [disable](#)
- [forward-delay](#)
- [hello-time](#)
- [max-age](#)
- [protocol spanning-tree rstp](#)
- [show config](#)
- [show spanning-tree rstp](#)
- [spanning-tree rstp](#)
- [tc-flush-standard](#)

## bridge-priority

Set the bridge priority for RSTP.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bridge-priority <i>priority-value</i></code>                                                                                                            |
|                        | To return to the default value, use the <code>no bridge-priority</code> command.                                                                              |
| <b>Parameters</b>      | <b><i>priority-value</i></b> Enter a number as the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is <b>32768</b> .   |
| <b>Defaults</b>        | <b>32768</b>                                                                                                                                                  |
| <b>Command Modes</b>   | CONFIGURATION RSTP (conf-rstp)                                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                               |

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

#### Related Commands

- [protocol spanning-tree rstp](#) — enters rapid spanning tree mode.

## debug spanning-tree rstp

Enable debugging of RSTP and view information on the protocol.

**Syntax** `debug spanning-tree rstp [all | bpdu interface {in | out} | events]`

To disable debugging, use the `no debug spanning-tree rstp` command.

#### Parameters

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                              | (OPTIONAL) Enter the keyword <code>all</code> to debug all spanning tree operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>bpdu <i>interface</i> {in   out}</b> | (OPTIONAL) Enter the keyword <code>bpdu</code> to debug the bridge protocol data units.<br>(OPTIONAL) Enter the keyword <code>interface</code> along with the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li> </ul> Optionally, enter an <code>in</code> or <code>out</code> parameter with the optional interface: <ul style="list-style-type: none"> <li>• For Receive, enter <code>in</code>.</li> <li>• For Transmit, enter <code>out</code>.</li> </ul> |
| <b>events</b>                           | (OPTIONAL) Enter the keyword <code>events</code> to debug RSTP events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Command Modes** EXEC Privilege

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version  | Description                              |
|----------|------------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.                 |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.5.1.0  | Added support for 4-port 40G line cards. |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the S-Series.              |
| 7.5.1.0  | Introduced on the C-Series.              |
| 6.2.1.1  | Introduced on the E-Series.              |

### Example

```
DellEMC# debug spanning-tree rstp bpdu gigabitethernet 2/1/1 ?
in Receive (in)
out Transmit (out)
```

## description

Enter a description of the rapid spanning tree.

### Syntax

```
description {description}
```

To remove the description, use the `no description {description}` command.

### Parameters

**description** Enter a description to identify the rapid spanning tree (80 characters maximum).

### Defaults

none

**Command Modes** SPANNING TREE (The prompt is “config-rstp”.)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Related Commands

- [protocol spanning-tree rstp](#) — enters SPANNING TREE mode on the switch.

# forward-delay

Configure the amount of time the interface waits in the Listening State and the Learning State before transitioning to the Forwarding State.

**Syntax** `forward-delay seconds`

To return to the default setting, use the `no forward-delay` command.

**Parameters** **seconds** Enter the number of seconds that Dell EMC Networking OS waits before transitioning RSTP to the forwarding state. The range is from 4 to 30. The default is **15 seconds**.

**Defaults** **15 seconds**

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Related Commands**

- [hello-time](#) — changes the time interval between BPDUs.
- [max-age](#) — changes the wait time before RSTP refreshes the protocol configuration information.

## hello-time

Set the time interval between the generation of the RSTP bridge protocol data units (BPDUs).

**Syntax** `hello-time [milli-second] seconds`

To return to the default value, use the `no hello-time` command.

**Parameters**

|                     |                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>      | Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10 seconds. The default is <b>2 seconds</b> .       |
| <b>milli-second</b> | Enter the keywords <code>milli-second</code> to configure a hello time on the order of milliseconds. The range is from 50 to 950 milliseconds |

**Defaults** **2 seconds**

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| 8.3.1.0    | Added the <code>milli-second</code> option to the S-Series. |
| 7.6.1.0    | Introduced on the S-Series.                                 |
| 7.5.1.0    | Introduced on the C-Series.                                 |
| 6.2.1.1    | Introduced on the E-Series.                                 |

#### Usage Information

The hello time is encoded in BPDUs in increments of 1/256ths of a second. The standard minimum hello time in seconds is 1 second, which is encoded as 256. Millisecond hello times are encoded using values less than 256; the millisecond hello time equals  $(x/1000)*256$ .

When you configure millisecond hellos, the default hello interval of 2 seconds is still used for edge ports; the millisecond hello interval is not used.

#### Related Commands

- [forward-delay](#) — changes the wait time before RSTP transitions to the Forwarding state.
- [max-age](#) — changes the wait time before RSTP refreshes the protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the RSTP bridge.

**Syntax** `max-age seconds`

To return to the default values, use the `no max-age` command.

**Parameters** `max-age` Enter a number of seconds the Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

**Defaults** **20 seconds**

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version           | Description                 |
|-------------------|-----------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.    |
| <b>9.0.2.0</b>    | Introduced on the S6000.    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.    |
| <b>8.3.7.0</b>    | Introduced on the S4810.    |
| <b>7.6.1.0</b>    | Introduced on the S-Series. |
| <b>7.5.1.0</b>    | Introduced on the C-Series. |
| <b>6.2.1.1</b>    | Introduced on the E-Series. |

**Related Commands**

- [forward-delay](#) — changes the wait time before RSTP transitions to the Forwarding state.
- [hello-time](#) — changes the time interval between BPDUs.

## protocol spanning-tree rstp

To configure RSTP, enter RSTP mode.

**Syntax** `protocol spanning-tree rstp`  
 To exit RSTP mode, use the `exit` command.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

**Usage Information**

RSTP is not enabled when you enter RSTP mode. To enable RSTP globally on the system, use the `no disable` command from RSTP mode.

**Example**

```
DellEMC(conf)# protocol spanning-tree rstp
DellEMC(config-rstp)# no disable
```

**Related Commands**

- `disable` — disables RSTP globally on the system.

## show config

View the current configuration for the mode. Only non-default values are displayed.

**Syntax** `show config`

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

**Example**

```
DellEMC(conf-rstp)# show config
!
protocol spanning-tree rstp
no disable
bridge-priority 16384
```

## show spanning-tree rstp

Display the RSTP configuration.

**Syntax** `show spanning-tree rstp [brief] [guard]`

|                   |              |                                                                                                                                       |
|-------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>brief</b> | (OPTIONAL) Enter the keyword <code>brief</code> to view a synopsis of the RSTP configuration information.                             |
|                   | <b>guard</b> | (OPTIONAL) Enter the keyword <code>guard</code> to display the type of guard enabled on an RSTP interface and the current port state. |

- Command Modes**

| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                        |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                           |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                           |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                          |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                           |
| <b>8.4.2.1</b>    | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series. |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                           |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                        |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                        |
| <b>6.4.1.0</b>    | Expanded to display the port error disable state (EDS) caused by loopback BPDU inconsistency.      |
| <b>6.2.1.1</b>    | Introduced on the E-Series.                                                                        |

**Usage Information** The following describes the `show spanning-tree rstp guard` command shown in the following example.

| Field                 | Description                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | RSTP interface.                                                                                                                         |
| <b>Instance</b>       | RSTP instance.                                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), disabled (DIS), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Types of STP guard configured (Root, Loop, or BPDU guard)                                                                               |

| Version  | Description                                                                                        |
|----------|----------------------------------------------------------------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                                                                          |
| 8.3.11.1 | Introduced on the Z9000.                                                                           |
| 8.4.2.1  | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series. |
| 8.3.7.0  | Introduced on the S4810.                                                                           |
| 8.2.1.0  | Introduced the <code>hardware shutdown-on-violation</code> options.                                |
| 7.6.1.0  | Introduced on the S-Series.                                                                        |
| 7.5.1.0  | Introduced on the C-Series.                                                                        |
| 7.4.1.0  | Added the optional bridge port data unit (BPDU) guard.                                             |
| 6.2.1.1  | Introduced on the E-Series.                                                                        |

### Usage Information

The `BPDU guard` option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into an Error Disable state if a BPDU appears and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on an RSTP switch, immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with a `spanning-tree portfast` enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

You cannot enable STP root guard and loop guard at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message displays: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

### Example

```
DellEMC(conf)# interface tengigabitethernet 1/1/1
DellEMC(conf-if-te-1/1/1)# spanning-tree rstp edge-port
DellEMC(conf-if-te-1/1/1)# show config
!
interface TenGigabitEthernet 1/1/1
 no ip address
 switchport
 spanning-tree rstp edge-port
 no shutdown
DellEMC#
```

## tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

|                      |                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>tc-flush-standard</code><br>To disable, use the <code>no tc-flush-standard</code> command. |
| <b>Defaults</b>      | Disabled                                                                                         |
| <b>Command Modes</b> | CONFIGURATION (conf-rstp)                                                                        |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.5.1.0</b>    | Introduced on the E-Series.               |

## Usage Information

By default, Dell EMC Networking OS implements an optimized flush mechanism for RSTP. This implementation helps in flushing MAC addresses only when necessary (and less often), allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn on this *knob* command to enable flushing MAC addresses after receiving every topology change notification.

# Security

The commands in this chapter are available on Dell EMC Networking OS.

For configuration details, see the *Security* section in the *Dell EMC Networking OS Configuration Guide*.

**NOTE:** Dell EMC Networking OS implements LEAP with MSCHAP v2 supplicant.

## AAA Accounting Commands

AAA Accounting enables tracking of services that users are accessing and the amount of network resources being consumed by those services. When you enable AAA Accounting, the network server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record is comprised of accounting AV pairs and is stored on the access control server.

As with authentication and authorization, you must configure AAA Accounting by defining a named list of accounting methods, and then applying that list to various interfaces.

### aaa accounting

Enable AAA Accounting and create a record for monitoring the accounting function.

#### Syntax

```
aaa accounting {commands {level | role role-name | dot1x | exec | rest |
suppress | system} {name | default} {start-stop | wait-start | stop-only}
{radius | tacacs+}}
```

To disable AAA Accounting, use the `no aaa accounting {commands {level | role role-name | dot1x | exec | rest | suppress | system} {name | default} {start-stop | wait-start | stop-only} {radius | tacacs+} command`.

#### Parameters

##### system

Enter the keyword `system` to send accounting information of any other AAA configuration.

|                                          |                                                                                                                                                                                                                                                         |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>exec</b>                              | Enter the keyword <code>exec</code> to send accounting information when a user has logged in to EXEC mode.                                                                                                                                              |
| <b>dot1x</b>                             | Enter the keyword <code>dot1x</code> to send accounting information when a dot1x user has logged in.                                                                                                                                                    |
| <b>commands {level   role role-name}</b> | Enter the keyword <code>commands</code> then a privilege level for accounting of commands executed at that privilege level or enter the keyword <code>role</code> then the role name for accounting of commands executed by a user with that user role. |
| <b>name   default</b>                    | Enter one of the following: <ul style="list-style-type: none"> <li>• For <code>name</code>, enter a user-defined name of a list of accounting methods.</li> <li>• For <code>default</code>, the default accounting methods used.</li> </ul>             |
| <b>start-stop</b>                        | Enter the keywords <code>start-stop</code> to send a “start accounting” notice at the beginning of the requested event and a “stop accounting” notice at the end of the event.                                                                          |
| <b>wait-start</b>                        | Enter the keywords <code>wait-start</code> to ensure that the TACACS+ security server acknowledges the start notice before granting the user’s process request.                                                                                         |
| <b>stop-only</b>                         | Enter the keywords <code>stop-only</code> to instruct the TACACS+ security server to send a “stop record accounting” notice at the end of the requested user process.                                                                                   |
| <b>radius</b>                            | Enter the keyword <code>radius</code> to use RADIUS service for <code>exec</code> and <code>dot1x</code> accounting.                                                                                                                                    |
| <b>tacacs+</b>                           | Enter the keyword <code>tacacs+</code> to use TACACS+ service for accounting.                                                                                                                                                                           |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                   |
|-------------------|----------------------------------------------------------------------|
| <b>9.14(1.5)</b>  | Added support for RADIUS accounting.                                 |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                            |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                             |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                          |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                      |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                          |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                          |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                          |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                          |
| <b>9.5(0.0)</b>   | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                             |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                             |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                            |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                             |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                             |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                          |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                          |
| <b>6.3.1.0</b>    | Introduced on the E-Series.                                          |

## Usage Information

In the example below, TACACS+ accounting is used to track all usage of EXEC command and commands on privilege level 15.

Privilege level 15 is the default. If you want to track usage at privilege level 1 for example, use the `aaa accounting command 1` command.

## Example (TACACS+)

```
DellEMC(conf)# aaa accounting exec default start-stop tacacs+
DellEMC(conf)# aaa accounting command 15 default start-stop tacacs+
DellEMC(conf)# aaa accounting command role secaadmin default start-stop tacacs+
```

## Example (RADIUS)

```
DellEMC(conf)# aaa accounting dot1x default start-stop radius
DellEMC(conf)# aaa accounting dot1x default stop-only radius
```

## Related Commands

- [enable password](#) — changes the password for the `enable` command.
- [login authentication](#) — enables AAA login authentication on the terminal lines.
- [password](#) — creates a password.
- [tacacs-server host](#) — specifies a TACACS+ server host.

# aaa accounting suppress

Prevent the generation of accounting records of users with the user name value of NULL.

## Syntax

```
aaa accounting suppress null-username
```

To permit accounting records to users with user name value of NULL, use the `no aaa accounting suppress null-username` command.

## Defaults

Accounting records are recorded for all users.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.3.1.0</b>    | Introduced on the E-Series.               |

## Usage Information

Dell EMC Networking OS issues accounting records for all users on the system, including users whose username string, due to protocol translation, is NULL. For example, a user who comes on line with the `aaa authentication login method-list none` command is applied. To prevent the accounting records from being generated for sessions that do not have user names associated to them, use the `aaa accounting suppress` command.

## accounting

Apply an accounting method list to terminal lines.

**Syntax** `accounting {exec | commands {level | role role-name} method-list`

**Parameters**

|                                                 |                                                                                                                                                                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>exec</i></b>                              | Enter the keyword <code>exec</code> to apply an EXEC level accounting method list.                                                                                                                                                              |
| <b><i>commands {level   role role-name}</i></b> | Enter the keywords <code>commands level</code> to apply an EXEC and CONFIGURATION level accounting method list or enter the keyword <code>role</code> and then the role name for accounting of commands executed by a user with that user role. |
| <b><i>method-list</i></b>                       | Enter a method list that you defined using the <code>aaa accounting exec</code> or <code>aaa accounting commands</code> .                                                                                                                       |

**Defaults** none

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                      |

| 9.2(1.0)   | Introduced on the Z9500.                                         |
| 9.0.2.0    | Introduced on the S6000.                                         |
| 8.3.19.0   | Introduced on the S4820T.                                        |
| 8.3.11.1   | Introduced on the Z9000.                                         |
| 8.3.7.0    | Introduced on the S4810.                                         |
| 7.6.1.0    | Introduced on the S-Series.                                      |
| 7.5.1.0    | Introduced on the C-Series.                                      |
| 6.3.1.0    | Introduced on the E-Series.                                      |

## Related Commands

- [aaa accounting](#) — enables AAA Accounting and creates a record for monitoring the accounting function.

## aaa radius group

Configure the RADIUS server group that is used for Authentication, Authorization and Accounting.

**Syntax** `aaa radius group group-name`  
To remove the RADIUS group configuration, use the `no aaa radius group group-name` command.

**Parameters** **group-name** Enter the name of the RADIUS server group.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>  | Introduced on the S-Series and Z-Series.  |

**Usage Information** You can use this command to configure the group of Radius servers used for Authentication, Authorization, and Accounting purposes.

If the RADIUS group is not configured for Authentication, Authorization, and Accounting, then globally configured Radius servers are used for the purposes.

When the RADIUS group is removed, the AAA configuration is also removed.

### Example

```
DelleMC(conf)# radius-server group group1
DelleMC(conf-radius-group)# radius-server host 1.1.1.1 key secret
DelleMC(conf-radius-group)# radius-server host 2.2.2.2 key secret
DelleMC(conf-radius-group)# radius-server vrf vrf1 source-interface
tengigabitethernet 1/24/1
DelleMC(conf)# exit
DelleMC(conf)# aaa radius group group1
```

## show accounting

Display the active accounting sessions for each online user.

**Syntax** `show accounting`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                                                      |
|------------|------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                      |
| 9.5(0.1)   | Added support for roles on the Z9500.                            |
| 9.5(0.0)   | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL. |
| 9.2(1.0)   | Introduced on the Z9500.                                         |
| 9.0.2.0    | Introduced on the S6000.                                         |
| 8.3.19.0   | Introduced on the S4820T.                                        |
| 8.3.11.1   | Introduced on the Z9000.                                         |
| 8.3.7.0    | Introduced on the S4810.                                         |
| 7.6.1.0    | Introduced on the S-Series.                                      |
| 7.5.1.0    | Introduced on the C-Series.                                      |
| 6.3.1.0    | Introduced on the E-Series.                                      |

#### Usage Information

This command steps through all active sessions and then displays the accounting records for the active account functions.

#### Example

```
DelleMC# show accounting
Active accounted actions on tty2, User admin Priv 1 Role
 Task ID 2, EXEC Accounting record, 00:02:03 Elapsed, service=shell
Active accounted actions on tty3, User ad Priv 15 Role
 Task ID 7, EXEC Accounting record, 00:01:22 Elapsed, service=shell
Active accounted actions on tty4, User ad Priv 15 Role
 Task ID 11, EXEC Accounting record, 00:00:35 Elapsed, service=shell
Active accounted actions on tty5, User ad1 Priv 1 Role sysadmin
 Task ID 16, EXEC Accounting record, 00:00:04 Elapsed, service=shell
DelleMC#
```

#### Related Commands

- [aaa accounting](#) — enables AAA Accounting and creates a record for monitoring the accounting function.

## Authorization and Privilege Commands

To set command line authorization and privilege levels, use the following commands.

### authorization

Apply an authorization method list to terminal lines.

#### Syntax

```
authorization {exec | commands {level | role role-name}} method-list
```

#### Parameters

**exec** Enter the keyword `exec` to apply an EXEC level authorization method list.

**commands {level | role role-name}** Enter the keyword `commands` followed by either a privilege level for accounting of commands executed at that privilege level, or enter the keyword `role` then the role name for authorization of commands executed by a user with that user role.

**method-list** Enter a method list that you defined using the `aaa accounting exec` or `aaa accounting` commands.

**Defaults** none

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                          |
|------------|----------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                            |
| 9.10(0.0)  | Introduced on the S3148.                                             |
| 9.10(0.0)  | Introduced on the S6100-ON.                                          |

| 9.8(1.0)   | Introduced on the Z9100-ON.                                          |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                          |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                          |
| 9.7(0.0)   | Introduced on the S6000-ON.                                          |
| 9.5(0.0)   | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0)   | Introduced on the Z9500.                                             |
| 9.0.2.0    | Introduced on the S6000.                                             |
| 8.3.19.0   | Introduced on the S4820T.                                            |
| 8.3.11.1   | Introduced on the Z9000.                                             |
| 8.3.7.0    | Introduced on the S4810.                                             |
| 7.6.1.0    | Introduced on the S-Series.                                          |
| 7.5.1.0    | Introduced on the C-Series.                                          |
| 6.3.1.0    | Introduced on the E-Series.                                          |

**Related Commands**

- [aaa authorization commands](#) — sets the parameters that restrict (or permit) a user's access to EXEC and CONFIGURATION level commands.
- [aaa authorization exec](#) — sets the parameters that restrict (or permit) a user's access to EXEC level commands.

## aaa authorization commands

Set parameters that restrict (or permit) a user's access to EXEC and CONFIGURATION level commands.

**Syntax** `aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none}`

Undo a configuration with the `no aaa authorization commands {level | role role-name} {name|default} {local | tacacs+ | none} command`.

**Parameters**

**commands level** Enter the keyword `commands` then the command privilege level for command level authorization.

**role role-name** Enter the keyword `role` then the role name.

**name** Define a name for the list of authorization methods.

|                |                                                                          |
|----------------|--------------------------------------------------------------------------|
| <b>default</b> | Define the default list of authorization methods.                        |
| <b>local</b>   | Use the authorization parameters on the system to perform authorization. |
| <b>tacacs+</b> | Use the TACACS+ protocol to perform authorization.                       |
| <b>none</b>    | Enter the keyword <code>none</code> to apply no authorization.           |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                     |

| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                       |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                        |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                     |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                 |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                     |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                     |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                     |
| <b>9.5(0.0)</b>   | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                        |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                        |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                       |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                        |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                        |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                     |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                     |
| <b>6.1.1.0</b>    | Added support for RADIUS.                                       |

**Usage Information** Certain TACACS+ servers do not authenticate the device if you use the `aaa authorization` commands `level default local tacacs+` command. To resolve the issue, use the `aaa authorization` commands `level default tacacs+ local` command.

## aaa authorization config-commands

Set parameters that restrict (or permit) a user's access to EXEC level commands.

**Syntax** `aaa authorization config-commands`  
 Disable authorization checking for CONFIGURATION level commands using the `no aaa authorization config-commands` command.

**Defaults** Enabled when you configure `aaa authorization commands` command.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the E-Series.               |

**Usage Information**

By default, the `aaa authorization commands` command configures the system to check both EXEC level and CONFIGURATION level commands. Use the command `no aaa authorization config-commands` to enable only EXEC-level command checking.

## aaa authorization exec

Set parameters that restrict (or permit) a user's access to EXEC-level commands.

**Syntax**

```
aaa authorization exec {name | default} {local || tacacs+ || if-
authenticated || none}
```

To disable authorization checking for EXEC level commands, use the `no aaa authorization exec` command.

**Parameters**

- name** Define a name for the list of authorization methods.
- default** Define the default list of authorization methods.
- local** Use the authorization parameters on the system to perform authorization.
- tacacs+** Use the TACACS+ protocol to perform authorization.
- none** Enter the keyword `none` to apply no authorization.

**Defaults**

none

**Command Modes**

| 7.5.1.0    | Introduced on the C-Series. |
| 6.1.1.0    | Added support for RADIUS.   |

## privilege level (CONFIGURATION mode)

Change the access or privilege level of one or more commands.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>privilege mode {level level command   reset command}</code><br>To delete access to a level and command, use the <code>no privilege mode level level command</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>      | <p><b>mode</b> Enter one of the following keywords as the mode for which you are controlling access:</p> <ul style="list-style-type: none"> <li>• <code>configure</code> for CONFIGURATION mode</li> <li>• <code>exec</code> for EXEC mode</li> <li>• <code>interface</code> for INTERFACE modes</li> <li>• <code>line</code> for LINE mode</li> <li>• <code>route-map</code> for ROUTE-MAP mode</li> <li>• <code>router</code> for ROUTER OSPF, ROUTER RIP, ROUTER ISIS and ROUTER BGP modes</li> </ul> <p><b>level level</b> Enter the keyword <code>level</code> then a number for the access level. The range is from 0 to 15.<br/>Level 1 is EXEC mode and Level 15 allows access to all CLI modes and commands.</p> <p><b>reset</b> Enter the keyword <code>reset</code> to return the security level to the default setting.</p> <p><b>command</b> Enter the command's keywords to assign the command to a certain access level. You can enter one or all of the keywords.</p> |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version     | Description                     |
|-------------|---------------------------------|
| 9.10(0.0)   | Introduced on the S6100-ON.     |
| 9.8(2.0)    | Introduced on the S3100 series. |
| 9.8(1.0)    | Introduced on the Z9100-ON.     |
| 9.8(0.0P5)  | Introduced on the S4048-ON.     |
| 9.8(0.0P2)  | Introduced on the S3048-ON.     |
| 9.7(0.0)    | Introduced on the S6000-ON.     |
| 9.2(1.0)    | Introduced on the Z9500.        |
| 9.0.2.0     | Introduced on the S6000.        |
| 8.3.19.0    | Introduced on the S4820T.       |
| 8.3.11.1    | Introduced on the Z9000.        |
| 8.3.7.0     | Introduced on the S4810.        |
| 7.6.1.0     | Introduced on the S-Series.     |
| 7.5.1.0     | Introduced on the C-Series.     |
| pre-6.1.1.0 | Introduced on the E-Series.     |

**Usage Information**

To define a password for the level to which you are assigning privilege or access, use the `enable password` command.

## privilege level (LINE mode)

Change the access level for users on the terminal lines.

**Syntax** `privilege level level`

To delete access to a terminal line, use the `no privilege level level` command.

**Parameters** `level level` Enter the keyword `level` then a number for the access level. The range is from 0 to 15.  
Level 1 is EXEC mode and Level 15 allows access to all CLI modes.

**Defaults** `level = 15`

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Obscure Password Commands

To enable the obscure password, use the following commands.

### service obscure-passwords

Enable the obscuring of passwords and keys.

|                        |                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>service obscure-passwords</code><br>Enable the obscuring of passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication, use the <code>service obscure-passwords</code> command. |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                         |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                     |

| Version    | Description                                                      |
|------------|------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                        |
| 9.10(0.0)  | Introduced on the S3148.                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                      |

| 9.8(0.0P5) | Introduced on the S4048-ON.                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                      |
| 9.6(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, Z9000, Z9500, MXL |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | By default, the <code>service password-encryption</code> command stores encrypted passwords. For greater security, you can also use the <code>service obscure-passwords</code> command to prevent a user from reading the passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication by obscuring this information. Passwords and keys are stored encrypted in the configuration file and by default are displayed in the encrypted form when the configuration is displayed. Enabling the <code>service obscure-passwords</code> command displays asterisks instead of the encrypted passwords and keys. This command prevents a user from reading these passwords and keys by obscuring this information with asterisks. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Password obscuring masks the password and keys for display only but does not change the contents of the file. The string of asterisks is the same length as the encrypted string for that line of configuration. To

verify that you have successfully obscured passwords and keys, use the `show running-config` command or `show startup-config` command.

If you are using role-based access control (RBAC), only the system administrator and security administrator roles can enable the `service obscure-password` command.

#### Related Commands

- [show running-config](#)— Display the current configuration and display changes from the default values.
- [service password-encryption](#)— Encrypts all passwords configured in the system.

## Authentication and Password Commands

To manage access to the system, use the following the commands.

### aaa authentication enable

Configure AAA Authentication method lists for user access to EXEC privilege mode (the “Enable” access).

**Syntax** `aaa authentication enable {default | method-list-name} method [... method2]`

To return to the default setting, use the `no aaa authentication enable {default | method-list-name} method [... method2]` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>                 | Enter the keyword <code>default</code> then the authentication methods to use as the default sequence of methods for the Enable login. The default is <code>default enable</code> .                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>method-list-name</i></b> | Enter a text string (up to 16 characters long) to name the list of enabled authentication methods activated at login.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>method</i></b>           | Enter one of the following methods: <ul style="list-style-type: none"><li>• <code>enable</code>: use the password the <code>enable password</code> command defines in CONFIGURATION mode.</li><li>• <code>line</code>: use the password the <code>password</code> command defines in LINE mode.</li><li>• <code>none</code>: no authentication.</li><li>• <code>radius</code>: use the RADIUS servers configured with the <code>radius-server host</code> command.</li><li>• <code>tacacs+</code>: use the TACACS+ server(s) configured with the <code>tacacs-server host</code> command.</li></ul> |
| <b><i>... method2</i></b>      | (OPTIONAL) In the event of a “no response” from the first method, Dell EMC Networking OS applies the next configured method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Defaults** Use the `enable` password.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

### Usage Information

By default, the `Enable` password is used. If you configure `aaa authentication enable default`, Dell EMC Networking OS uses the methods defined for `Enable` access instead.

Methods configured with the `aaa authentication enable` command are evaluated in the order they are configured. If authentication fails using the primary method, Dell EMC Networking OS employs the second method (or third method, if necessary) automatically. The fallback to the second method would happen only if the authentication failure is due to a non-reachable server or invalid TACACS server key. The fallback would not occur if the authentication failure is due to invalid credentials. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell EMC Networking OS proceeds to the next authentication method.

### Related Commands

- [enable password](#) — changes the password for the `enable` command.
- [login authentication](#) — enables AAA login authentication on the terminal lines.
- [password](#) — creates a password.
- [radius-server host](#) — specifies a RADIUS server host.
- [tacacs-server host](#) — specifies a TACACS+ server host.

## aaa authentication login

Configure AAA Authentication method lists for user access to EXEC mode (`Enable log-in`).

### Syntax

```
aaa authentication login {method-list-name | default} method [... method4]
```

To return to the default setting, use the `no aaa authentication login {method-list-name | default}` command.

### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>method-list-name</i></b> | Enter a text string (up to 16 characters long) as the name of a user-configured method list that can be applied to different lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>default</i></b>          | Enter the keyword <code>default</code> to specify that the method list specified is the default method for all terminal lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>method</i></b>           | Enter one of the following methods: <ul style="list-style-type: none"> <li>• <code>enable</code>: use the password the <code>enable password</code> command defines in CONFIGURATION mode. Not available if <code>role-only</code> is in use.</li> <li>• <code>line</code>: use the password the <code>password</code> command defines in LINE mode. Not available if <code>role-only</code> is in use.</li> <li>• <code>local</code>: use the password for the <code>userid</code> contained in the local password database.</li> <li>• <code>none</code>: no authentication. Not available if <code>role-only</code> is in use.</li> </ul> |

- `radius`: use the RADIUS servers configured with the `radius-server host` command.
- `tacacs+`: use the TACACS+ servers configured with the `tacacs-server host` command.

**... method4** (OPTIONAL) Enter up to four additional methods. In the event of a “no response” from the first method, the system applies the next configured method (up to four configured methods).

**Defaults** Not configured (that is, no authentication is performed).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b>   | Included a prompt to force the users to re-authenticate, when re-authentication is enabled. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                                                   |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                                                    |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                                                                 |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                             |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                 |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                 |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                 |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                 |
| <b>9.5(0.1)</b>    | Added support for roles Z9500.                                                              |
| <b>9.5(0.0)</b>    | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL                             |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                    |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                    |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                   |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                    |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                    |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                 |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                                                 |
| <b>pre-6.2.1.0</b> | Introduced on the E-Series.                                                                 |

**Usage Information** By default, the locally configured username password is used. If you configure `aaa authentication login default`, Dell EMC Networking OS uses the methods this command defines for login instead.

Methods configured with the `aaa authentication login` command are evaluated in the order they are configured. If users encounter an error with the first method listed, Dell EMC Networking OS applies the next method configured. If users fail the first method listed, no other methods are applied. The only exception is the local method. If the user’s name is not listed in the local database, the next method is applied. If the correct user name/password combination is not entered, the user is not allowed access to the switch.

**i NOTE:** If authentication fails using the primary method, Dell EMC Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell EMC Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

After configuring the `aaa authentication login` command, configure the `login authentication` command to enable the authentication scheme on terminal lines.

Connections to the SSH server work with the following login mechanisms: local, radius, and tacacs.

#### Related Commands

- [login authentication](#) — enables AAA login authentication on the terminal lines.
- [password](#) — creates a password.
- [radius-server host](#) — specifies a RADIUS server host.
- [tacacs-server host](#) — specifies a TACACS+ server host.

## aaa reauthenticate enable

Enable re-authentication of user whenever there is a change in the authenticators.

**Syntax** `aaa reauthenticate enable`  
To disable the re-authentication option, use the `no aaa reauthenticate enable` command.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description              |
|-----------|--------------------------|
| 9.11(0.0) | Introduced this command. |

#### Usage Information

When an operating system enables to change the user authenticators, the users might access resources and perform tasks that they do not have authorization.

Once re-authentication is enabled, Dell EMC Networking OS prompts the users to re-authenticate whenever there is a change in authenticators.

The change in authentication happens when:

- Add or remove an authentication server (RADIUS/TACACS+)
- Modify an AAA authentication/authorization list
- Change to role-only (RBAC) mode

The re-authentication is also applicable for authenticated 802.1x devices. When there is a change in the authentication servers, the supplicants connected to all the ports are forced to re-authenticate.

#### Example

```
DelleMC(config)#aaa reauthenticate enable
```

```
DelleMC(config)#aaa authentication login vty_auth_list radius
Force all logged-in users to re-authenticate (y/n)?
```

```
DelleMC(config)#radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?
```

## access-class

Restrict incoming connections to a particular IP address in a defined IP access control list (ACL).

**Syntax** `access-class access-list-name`  
To delete a setting, use the `no access-class` command.

**Parameters** ***access-list-name*** Enter the name of an established IP Standard ACL.

**Defaults** Not configured.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>     | <b>Description</b>                        |
|--------------------|-------------------------------------------|

| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.               |

**Related Commands**

- [line](#) — applies an authentication method list to the designated terminal lines.
- [ip access-list standard](#) — names (or selects) a standard access list to filter based on the IP address.
- [ip access-list extended](#) — names (or selects) an extended access list based on the IP addresses or protocols.

## enable password

Change the password for the `enable` command.

**Syntax** `enable password [level level] [encryption-type] password`

To delete a password, use the `no enable password [encryption-type] password [level level]` command.

**Parameters**

|                        |                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level level</b>     | (OPTIONAL) Enter the keyword <code>level</code> then a number as the level of access. The range is from 1 to 15.                                                                                                                                                                                                                                                           |
| <b>encryption-type</b> | (OPTIONAL) Enter the number 7 or 0 as the encryption type.<br><br>Enter a 7 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.<br><br>Use this parameter only with a password that you copied from the <code>show running-config</code> file of another Dell EMC Networking router. |
| <b>password</b>        | Enter a text string, up to 96 characters long, as the clear text password.                                                                                                                                                                                                                                                                                                 |

**Defaults** No password is configured. `level = 15`.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                               |

| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                               |

## Usage Information

To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use `CNTL + v` prior to entering regular expression. For example, to create the password `abcd]e`, you type `"abcd CNTL v ]e"`. When the password is created, you do not use the `CNTL + v` key combination and enter `"abcd]e"`.

 **NOTE:** The question mark (?) is not a supported character.

## Related Commands

- [show running-config](#) — views the current configuration.
- [privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

## enable restricted

Allows Dell EMC Networking technical support to access restricted commands.

### Syntax

```
enable restricted [encryption-type] password
```

To disallow access to restricted commands, use the `no enable restricted` command.

### Parameters

***encryption-type*** (OPTIONAL) Enter the number 7 as the encryption type.  
Enter 7 followed a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.  
Use this parameter only with a password that you copied from the `show running-config` file of another Dell EMC Networking router.

**password** Enter a text string, up to 32 characters long, as the clear text password.

**Defaults**

Not configured.

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>pre-6.1.1.0</b> | Introduced on the E-Series.               |

**Usage Information**

Only Dell EMC Networking Technical Support staff use this command.

## enable secret

Change the password for the `enable` command.

**Syntax**

```
enable secret [level level] [encryption-type] password
```

To delete a password, use the `no enable secret [encryption-type] password [level level]` command.

**Parameters**

**level *level*** (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.

***encryption-type*** (OPTIONAL) Enter the number 5 or 0 as the encryption type.  
Enter a 5 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.  
Use this parameter only with a password that you copied from the `show running-config` file of another Dell EMC Networking router.

***password*** Enter a text string, up to 32 characters long, as the clear text password.

**Defaults**

No password is configured. `level = 15`.

**Command Modes**

- [show running-config](#) — views the current configuration.
- [privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

# login authentication

To configure authentication for console or remote access, apply an authentication method list.

## Syntax

```
login authentication {method-list-name | default}
```

To use the local user/password database for login authentication, use the `no login authentication` command.

## Parameters

- |                                |                                                                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>method-list-name</i></b> | Enter the keywords <code>method-list-name</code> to specify that method list, created in the <code>aaa authentication login</code> command, to be applied to the designated terminal line. |
| <b>default</b>                 | Enter the keyword <code>default</code> to specify that the default method list, created in the <code>aaa authentication login</code> command, is applied to the terminal line.             |

**Defaults** No authentication is performed on the console lines. Local authentication is performed on the virtual terminal and auxiliary lines.

**Command Modes** LINE

| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                            |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                            |
| <b>9.6.0.0</b>     | Revised introductory and usage guidelines description. |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                               |
| <b>9.0.2.0</b>     | Introduced on the S6000.                               |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                              |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                               |
| <b>8.3.7.0</b>     | Introduced on the S4810.                               |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                            |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                            |
| <b>pre-6.2.1.0</b> | Introduced on the E-Series.                            |

**Usage Information** If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

When configuring authentication, consider the following:

- If you configure the default authentication list using the `default` keyword, the list applies it to all the local and remote connections globally, unless you have specified some another authentication list for a specific connection.
  - If you configure an authentication lists other than default, you must apply those authentication lists to each connection.
  - If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.
- Related Commands**
- [aaa authentication login](#) — selects the login authentication methods.

## password

Specify a password for users on terminal lines.

**Syntax** `password [encryption-type] password`

To delete a password, use the `no password password` command.

**Parameters** **encryption-type** (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the password entered. The options are

- 0 is the default and means the password is not encrypted and stored as clear text.
- 7 means that the password is encrypted and hidden.

**password** Enter a text string up to 96 characters long. The first character of the password must be a letter. You cannot use spaces in the password.

**Defaults** No password is configured.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                               |
|-------------|-----------------------------------------------------------|
| 9.13(0.0)   | Changed the maximum length of the password from 32 to 96. |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                 |
| 9.10(0.0)   | Introduced on the S3148.                                  |
| 9.10(0.0)   | Introduced on the S6100-ON.                               |
| 9.8(2.0)    | Introduced on the S3100 series.                           |
| 9.8(1.0)    | Introduced on the Z9100-ON.                               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                               |
| 9.7(0.0)    | Introduced on the S6000-ON.                               |
| 9.2(1.0)    | Introduced on the Z9500.                                  |
| 9.0.2.0     | Introduced on the S6000.                                  |
| 8.3.19.0    | Introduced on the S4820T.                                 |
| 8.3.11.1    | Introduced on the Z9000.                                  |
| 8.3.7.0     | Introduced on the S4810.                                  |
| 7.6.1.0     | Introduced on the S-Series.                               |
| 7.5.1.0     | Introduced on the C-Series.                               |
| pre-6.1.1.0 | Introduced on the E-Series.                               |

**Usage Information** Dell EMC Networking OS prompts users for these passwords when the method for authentication or authorization used is "line".

- Related Commands**
- [enable password](#) — sets the password for the `enable` command.
  - [login authentication](#) — configures an authentication method to log in to the switch.
  - [service password-encryption](#) — encrypts all passwords configured in Dell EMC Networking OS.
  - [radius-server key](#) — configures a key for all RADIUS communications between the switch and the RADIUS host server.
  - [tacacs-server key](#) — configures a key for communication between a TACACS+ server and client.
  - [username](#) — establishes an authentication system based on user names.

## password-attributes

Configure the password attributes (strong password).

**Syntax** `password-attributes [min-length number] [max-retry number] [lockout-period minutes] [user-lockout-period minutes][character-restriction [upper number] [lower number] [numeric number] [special-char number]]`

To return to the default, use the `no password-attributes [min-length number] [max-retry number] [lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]]` command.

## Parameters

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>min-length <i>number</i></b>           | (OPTIONAL) Enter the keywords <code>min-length</code> then the number of characters. The range is from 0 to 32 characters.                                                                                                                                                                                                                                                                                                                        |
| <b>max-retry <i>number</i></b>            | (OPTIONAL) Enter the keywords <code>max-retry</code> then the number of maximum password retries. The range is from 0 to 16.                                                                                                                                                                                                                                                                                                                      |
| <b>lockout-period <i>minutes</i></b>      | (OPTIONAL) Enter the keyword <code>lockout-period</code> then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out sessions on the Telnet or SSH sessions for which there has been a consecutive failed login attempts. The console is not locked out.                                                   |
| <b>user-lockout-period <i>minutes</i></b> | (OPTIONAL) Enter the keyword <code>user-lockout-period</code> then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out the local user account if there are more number of unsuccessful login attempts than what is configured using the <code>max-retry</code> parameter. The default value is 3 times. |
| <b>character-restriction</b>              | (OPTIONAL) Enter the keywords <code>character-restriction</code> to indicate a character restriction for the password.                                                                                                                                                                                                                                                                                                                            |
| <b>upper <i>number</i></b>                | (OPTIONAL) Enter the keyword <code>upper</code> then the upper number. The range is from 0 to 31.                                                                                                                                                                                                                                                                                                                                                 |
| <b>lower <i>number</i></b>                | (OPTIONAL) Enter the keyword <code>lower</code> then the lower number. The range is from 0 to 31.                                                                                                                                                                                                                                                                                                                                                 |
| <b>numeric <i>number</i></b>              | (OPTIONAL) Enter the keyword <code>numeric</code> then the numeric number. The range is from 0 to 31.                                                                                                                                                                                                                                                                                                                                             |
| <b>special-char <i>number</i></b>         | (OPTIONAL) Enter the keywords <code>special-char</code> then the number of special characters permitted. The range is from 0 to 31.<br><br>The following special characters are supported:<br>! " # % & ' ( ) ; < = > ? [ \ ] * + , - . / : ^ _ {   } ~ @ \$                                                                                                                                                                                      |

| Version           | Description                                                                                |
|-------------------|--------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                  |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                   |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                            |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                |
| <b>9.5(0.1)</b>   | Introduced lockout-period option on the Z9500.                                             |
| <b>9.5(0.0)</b>   | Introduced <code>lockout-period</code> option on the Z9000, S6000, S4820T, S4810, and MXL. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.3.1.0  | Introduced on the E-Series. |

### Example

In the following example, after 5 un-successful login attempts, the session (SSH/TELNET) goes into a locked state for 5 minutes. If all the 10 sessions are locked out with 5 un-successful attempts in each session, no users can login during the lockout-period.

```
DellEMC(conf)# password-attributes max-retry 5 lockout-period 5
```

### Related Commands

- [password](#) — specifies a password for users on terminal lines.

## secure-cli enable

Enable the secured CLI mode.

**Syntax** `secure-cli enable`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description              |
|-----------|--------------------------|
| 9.11(0.0) | Introduced this command. |

### Usage Information

The secured CLI mode prevents the users from enhancing the permissions or promoting the privilege levels. After entering the command, save the running-configuration.

Once you save the running-configuration, the secured CLI mode is enabled. If you do not want to enter the secured mode, do not save the running-configuration.

Once saved, to disable the secured CLI mode, you need to manually edit the startup-configuration file and reboot the system.

## service password-encryption

Encrypt all passwords configured in Dell EMC Networking OS.

**Syntax** `service password-encryption`

To store new passwords as clear text, use the `no service password-encryption` command.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

#### Usage Information

**CAUTION:** Encrypting passwords with this command does not provide a high level of security. When the passwords are encrypted, you cannot return them to plain text unless you re-configure them. To remove an encrypted password, use the `no password password` command.

To keep unauthorized people from viewing passwords in the switch configuration file, use the `service password-encryption` command. This command encrypts the clear-text passwords created for user name passwords, authentication key passwords, the privileged command password, and console and virtual terminal line access passwords.

To view passwords, use the `show running-config` command.

## show privilege

View your access level.

**Syntax** `show privilege`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version            | Description                 |
|--------------------|-----------------------------|
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.    |
| <b>9.0.2.0</b>     | Introduced on the S6000.    |
| <b>8.3.19.0</b>    | Introduced on the S4820T.   |
| <b>8.3.11.1</b>    | Introduced on the Z9000.    |
| <b>8.3.7.0</b>     | Introduced on the S4810.    |
| <b>7.6.1.0</b>     | Introduced on the S-Series. |
| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

### Example

```
DellEMC# show privilege
Current privilege level is 15.
DellEMC#

DellEMC# show privilege
Current privilege level is 14.
DellEMC#
DellEMC# show privilege
Current privilege level is 10.
DellEMC#
```

### Related Commands

- [privilege level \(CONFIGURATION mode\)](#) — assign access control to different command modes.

## show users

Allows you to view information on all users logged in to the switch.

**Syntax** `show users [all]`

**Parameters** **all** (OPTIONAL) Enter the keyword `all` to view all terminal lines in the switch.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                      |
|-------------------|------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                         |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                      |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                  |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                      |
| <b>9.5(0.1)</b>   | Added support for roles on the Z9500.                            |
| <b>9.5(0.0)</b>   | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL. |

| Version     | Description                 |
|-------------|-----------------------------|
| 9.2(1.0)    | Introduced on the Z9500.    |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

The following describes the `show user` command shown in the following example.

| Field      | Description                                                       |
|------------|-------------------------------------------------------------------|
| (untitled) | Indicates with an asterisk (*) which terminal line you are using. |
| Line       | Displays the terminal lines currently in use.                     |
| User       | Displays the user name of all users logged in.                    |
| Host(s)    | Displays the terminal line status.                                |
| Location   | Displays the IP address of the user.                              |

### Example

```
DellEMC# show users
Authorization Mode: role or privilege
 Line Location User Role Priv
Host(s)
* 0 console 0 unassigned 1
idle
 2 vty 0 admin unassigned 1
idle 10.16.127.35
 3 vty 1 ad unassigned 15
idle 10.16.127.145
 4 vty 2 ad1 sysadmin
1 idle 10.16.127.141
 5 vty 3 ad1 sysadmin
1 idle 10.16.127.145
 6 vty 4 admin unassigned 1
idle 10.16.127.141
 7 vty 5 ad unassigned 15
idle 10.16.127.141
DellEMC#
```

### Related Commands

- `username` — enables a user.

## timeout login response

Specify how long the software waits for the login input (for example, the user name and password) before timing out.

### Syntax

```
timeout login response seconds
```

To return to the default values, use the `no timeout login response` command.

### Parameters

#### *seconds*

Enter a number of seconds the software waits before logging you out. The range is:

- VTY — range is from 1 to 30 seconds, the default is **30 seconds**.
- Console — range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).

- AUX — range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).

**Defaults** See *Parameters*.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

**Usage Information** The software measures the period of inactivity defined in this command as the period between consecutive keystrokes. For example, if your password is “password” you can enter “p” and wait 29 seconds to enter the next letter.

## username

Establish an authentication system based on user names.

**Syntax** `username name [access-class access-list-name] [nopassword | {password | secret | sha256-password} [encryption-type] password [dynamic-salt]] [privilege level] [role role-name]`

If you do not want a specific user to enter a password, use the `nopassword` option.

To delete authentication for a user, use the `no username name` command.

| Parameters                                     |                                                                                                                                                               |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>                                    | Enter a text string for the name of the user up to 63 characters.                                                                                             |
| <b>access-class</b><br><b>access-list-name</b> | Enter the keywords <code>access-class</code> then the name of a configured access control list (either an IP access control list or MAC access control list). |
| <b>nopassword</b>                              | Enter the keyword <code>nopassword</code> to specify that the user should not enter a password.                                                               |
| <b>password</b>                                | Enter the keyword <code>password</code> then the <code>encryption-type</code> or the password.                                                                |
| <b>encryption-type</b>                         | Enter an encryption type for the password that you enter.                                                                                                     |

- 0 directs the system to store the password as clear text. It is the default encryption type when using the `password` option.
- 8 to indicate that a password encrypted using a sha256 hashing algorithm follows. This encryption type is available with the `sha256-password` option only, and is the default encryption type for this option.
- 7 to indicate that a password encrypted using a DES hashing algorithm follows. This encryption type is available with the `password` option only.
- 5 to indicate that a password encrypted using an MD5 hashing algorithm follows. This encryption type is available with the `secret` option only, and is the default encryption type for this option.

|                               |                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b><i>password</i></b>        | Enter a string up to 32 characters long.                                                                           |
| <b><i>dynamic-salt</i></b>    | Enter the keyword <code>dynamic-salt</code> to have an additional random input in the password encryption process. |
| <b><i>privilege level</i></b> | Enter the keyword <code>privilege</code> then a number from zero (0) to 15.                                        |
| <b><i>role role-name</i></b>  | Enter the keyword <code>role</code> followed by the role name to associate with that user ID.                      |
| <b><i>secret</i></b>          | Enter the keyword <code>secret</code> then the encryption type.                                                    |
| <b><i>sha256-password</i></b> | Enter the keyword <code>sha256-password</code> then the <code>encryption-type</code> or the password.              |

**Defaults** The default encryption type for `password` option is **0**. The default encryption type for `secret` option is **5**. The default encryption type for `sha256-password` option is **8**. The default value of `privilege level` is **1**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                                                                                                                                                                                               |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b>  | Introduced <code>dynamic-salt</code> option on the S4810 and S4820T.                                                                                                                                                                             |
| <b>9.13.0.0</b>   | Enhanced to display a warning message when a weak password is used. Introduced the <code>dynamic-salt</code> option on the MXL, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON. |
| <b>9.12(1.0)</b>  | Introduced on the S5048F-ON.                                                                                                                                                                                                                     |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                                                                                                                                        |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                                                                                                                                         |
| <b>9.10(0.0)</b>  | Added support for the <code>sha256-password</code> option for S3100, S3048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, Z9100-ON, MXL, and Z9500.                                                                                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                                                                                                                                  |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                                                                                                                                      |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                                                                                                                                      |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                                                                                                                                      |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                                                                                                                                      |
| <b>9.5(0.0)</b>   | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL.                                                                                                                                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                                                                                                                                         |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                                                                                                                                         |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                                                                                                                                                                        |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                                                                                                                                         |

| Version     | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| 8.3.7.0     | Introduced on the S4810.                                                                                                      |
| 7.7.1.0     | Added support for the <code>secret</code> option and the MD5 password encryption. Extended the name from 25 to 63 characters. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                                   |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                   |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                                                   |

#### Usage Information

To view the defined user names, use the `show running-config user` command. You can use the `dynamic-salt` option only under the `secret` and the `password` options.

When you configure the password, the system alerts if your password does not match the following criteria. The system accepts your password even if these conditions are not met. Dell EMC Networking recommends selecting a strong password for enhanced security.

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !"#\$\$%&'()\*+,-./:;<=>?@[\\]^\_`{|}~")

#### Related Commands

- [password](#) — specifies a password for users on terminal lines.
- [show running-config](#) — views the current configuration.

## RADIUS Commands

The following RADIUS commands are supported by Dell EMC Networking OS.

### aaa radius auth-method

Configure the authentication method to use with RADIUS for user access.

#### Syntax

```
aaa radius auth-method {pap | mschapv2}
```

To undo the RADIUS authentication method configuration, use the `no aaa radius auth-method` command.

#### Parameters

|                 |                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pap</b>      | Enter the keyword <code>pap</code> to use the Password Authentication Protocol (PAP) for RADIUS authentication. This protocol uses the <code>username</code> and <code>password</code> attributes in the access-request message sent to the RADIUS server.                                |
| <b>mschapv2</b> | Enter the keyword <code>mschapv2</code> to use the Microsoft Challenge-Handshake Authentication Protocol (MS-CHAPv2) for RADIUS authentication. This protocol is considered to be more secure than PAP and uses mutual authentication based on a random challenge and challenge response. |

#### Defaults

PAP

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                                     |
|-------------|-----------------------------------------------------------------|
| 9.11(2.0P1) | Introduced the command on all Dell EMC Networking OS platforms. |

#### Usage Information

If an authentication method is not configured using this command, then PAP is used for authentication with the RADIUS server.

You can configure the RADIUS authentication method to access the switch using the following applications: Console, Telnet, SSH, REST, and OMI.

## client

Configures trusted DAC clients.

**Syntax** `client {ipv4-addr | ipv6-addr | hostname} [vrf vrf-name] [key [encryption-type] key]`

To undo the DAC client configuration, enter the `no client host` command.

**Defaults** If VRF is not configured, default VRF is considered.

**Parameters**

|                        |                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4-addr</b>       | Enter the keyword <code>ipv4-addr</code> to specify the IPv4 address of the DAC.                                                                                                                                                                                                   |
| <b>ipv6-addr</b>       | Enter the keyword <code>ipv6-addr</code> to specify the IPv6 address of the DAC.                                                                                                                                                                                                   |
| <b>hostname</b>        | Enter the keyword <code>hostname</code> to enter the name of the host.                                                                                                                                                                                                             |
| <b>vrf vrf-name</b>    | Enter the keyword <code>vrf</code> followed by the name of the VRF to associate a VRF with the client.                                                                                                                                                                             |
| <b>key</b>             | (Optional) Enter the keyword <code>key</code> to specify an encryption key.                                                                                                                                                                                                        |
| <b>encryption-type</b> | (Optional) Enter either 0 or 7 as the encryption type for the specified key. The options are: <ul style="list-style-type: none"><li>• 0 – implies that the key is not encrypted and is stored as clear text.</li><li>• 7 – implies that the key is encrypted and hidden.</li></ul> |
| <b>key</b>             | Enter a string that is the key to be exchanged between the switch and the dynamic authorization client. The key can be up to 42 characters long.                                                                                                                                   |

**Command Modes** • CONF-DYNAMIC-AUTH

**Usage Information** • It is possible to configure more than one dynamic authorization clients Duplicate (ipv4-addr or ipv6-addr or host-name) configurations are not allowed.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FM-IOM, and MXL. |

## client-key

Configures global shared key for the trusted DAC clients.

**Syntax** `client-key [encryption-type] key`

To remove the shared key configuration, enter the `no client-key` command.

**Defaults** None.

**Parameters** **encryption-type:** (OPTIONAL) Enter either 0 or 7 as the encryption type for the key entered. The options are:

- 0 — is the default and means the key is not encrypted and stored as clear text.
- 7 — means that the key is encrypted and hidden.

**key**

Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 42 characters long.

**Command Modes** • CONF-DYNAMIC-AUTH

**Usage Information** • Configure global shared key applicable for DA clients. If client configuration has shared key configured, that will take precedence.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## coa-bounce-port

Configure NAS to allow or reject the port bounce RADIUS messages from DAC.

**Syntax** `coa-bounce-port`  
To remove the port bounce configuration, enter the `no coa-bounce-port` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

**Usage Information** • Configure `no coa-bounce-port` to drop radius CoA port-bounce requests from the DAC.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## coa-disable-port

Configure NAS to reject disable-port requests from DAC.

**Syntax** `coa-disable-port`  
To undo this configuration, enter the `no coa-disable-port` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

## Usage Information

- Configure `no coa-disable-port` DAS to drop radius CoA disable-port requests from DAC.

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the S4810 and S4820T.                                                                                                          |
| <b>9.13(0.0)</b> | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## coa-reauthenticate

Configure NAS to re-authenticate dot1x user session requests from DAC.

**Syntax** `coa-reauthenticate`

To allow or reject re-authentication requests, enter the `no coa-reauthenticate` command.

**Defaults** Enabled.

**Command Modes** • CONF-DYNAMIC-AUTH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the S4810 and S4820T.                                                                                                          |
| <b>9.13(0.0)</b> | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## debug radius

View RADIUS transactions to assist with troubleshooting.

**Syntax** `debug radius`

To disable debugging of RADIUS, use the `no debug radius` command.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version     | Description                 |
|-------------|-----------------------------|
| 9.8(0.0P5)  | Introduced on the S4048-ON. |
| 9.8(0.0P2)  | Introduced on the S3048-ON. |
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.2(1.0)    | Introduced on the Z9500.    |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.0 | Introduced on the E-Series. |

## da-rsp-timeout

Configure timeout value for the back end task to respond to DAC requests.

**Syntax** `da-rsp-timeout minutes`  
 To undo the configuration, enter the `no da-rsp-timeout` command.

**Defaults** 10 Minutes.

**Parameters** *minutes* Enter the time out value.

**Command Modes** ● CONF-DYNAMIC-AUTH

**Usage Information** ● Time for DAS to wait before the back end response is received.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## disconnect-user

Configure NAS to allow or reject DM requests corresponding to AAA users-sessions coming from the DAC.

**Syntax** `disconnect-user`  
 To undo this configuration, enter the `no disconnect-user` command.

**Defaults** Enabled.

**Command Modes** ● CONF-DYNAMIC-AUTH

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## dynamic-auth-enable

Configure NAS to receive and process dynamic authorization messages.

|                        |                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>dynamic-auth-enable</code><br><br>To stop NAS from receiving and processing dynamic authorization messages, use the <code>no dynamic-auth-enable</code> command. |
| <b>Defaults</b>        | Disabled.                                                                                                                                                              |
| <b>Command Modes</b>   | <ul style="list-style-type: none"><li>CONF-DYNAMIC-AUTH</li></ul>                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .          |

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

|                          |                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If this configuration is not enabled, then dynamic authorization messages are not handled by the NAS. |
|--------------------------|-------------------------------------------------------------------------------------------------------|

## ip radius source-interface

Specify an interface's IP address as the source IP address for RADIUS connections.

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ip radius source-interface interface</code><br><br>To delete a source interface, use the <code>no ip radius source-interface</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>    | <p><b><i>interface</i></b> Enter the following keywords and the interface information:</p> <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>Defaults</b>      | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.5.1.0     | Added support for 4-port 40G line cards.  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.2.1.0 | Introduced on the E-Series.               |

## port

Configures NAS port number to accept CoA or DM requests.

### Syntax

```
port port-number
```

To remove the NAS port configuration, enter the `no port` command.

### Defaults

3799

### Parameters

***port-number*** Enter the NAS port number to accept CoA and DM requests. The range is from 1 to 65535.

### Command Modes

- CONF-DYNAMIC-AUTH

### Usage Information

- Optionally specify dynamic authorization port number. Default port is 3799.

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## radius dynamic-auth

Enters a new sub-mode, RADIUS-DYNAMIC-AUTH, which enables you to modify dynamic authorization settings.

**Syntax** `radius dynamic-auth`  
To remove the dynamic authorization method for RADIUS users, enter the `no radius dynamic-auth` command.

**Defaults** Disabled.

**Command Modes** ● CONFIGURATION

**Usage Information** ● All dynamic authorization commands are configured by entering this mode.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version          | Description                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the S4810 and S4820T.                                                                                                          |
| <b>9.13(0.0)</b> | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## radius-server deadtime

Configure a time interval during which non-responsive RADIUS servers to authentication requests are skipped.

**Syntax** `radius-server deadtime seconds`  
To disable this function or return to the default value, use the `no radius-server deadtime` command.

**Parameters** **seconds** Enter a number of seconds during which non-responsive RADIUS servers are skipped. The range is from 0 to 2147483647 seconds. The default is **0 seconds**.

**Defaults** **0 seconds**

**Command Modes** CONFIGURATION

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

## radius-server group

Creates or deletes a group of radius servers.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>radius-server group group-name</code>                                                                                                                   |
| <b>Parameters</b>      | <b>group-name</b> Enter the group name that denotes the group of RADIUS servers.                                                                              |
| <b>Defaults</b>        | Not configured.                                                                                                                                               |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4.(0.0)  | Introduced on the S-Series and Z-Series.  |

### Example

```
DellEMC(conf)# radius-server group group1
DellEMC(conf-radius-group)# radius-server host 1.1.1.1 key secret
DellEMC(conf-radius-group)# radius-server host 2.2.2.2 key secret
DellEMC(conf-radius-group)# radius-server vrf vrf1 source-interface
tengigabitethernet 1/3/1
DellEMC(conf-radius-group)# show config
!
radius-server group group1
radius-server vrf vrf1 source-interface TenGigabitEthernet 1/3/1
radius-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
radius-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
DellEMC(conf-radius-group)#
```

### Related Commands

- [login authentication](#) — sets the database to be checked when a user logs in.
- [radius-server key](#) — sets an authentication key for RADIUS communications.
- [radius-server retransmit](#) — sets the number of times the RADIUS server attempts to send information.
- [radius-server timeout](#) — sets the time interval before the RADIUS server times out.

# radius-server host

Configure a RADIUS server host.

**Syntax** `radius-server host {hostname | ipv4-address | ipv6-address} [auth-port port-number] [acct-port port-number] [retransmit retries] [timeout seconds] [key [encryption-type] key]`

**Parameters**

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hostname</b>                    | Enter the name of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ipv4-address   ipv6-address</b> | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X::X) of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>auth-port port-number</b>       | (OPTIONAL) Enter the keywords <code>auth-port</code> then a number as the port number. The range is from zero (0) to 65535. The default port-number is <b>1812</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>acct-port port-number</b>       | (OPTIONAL) Enter the keywords <code>acct-port</code> then a number as the port number. The range is from 1 to 65535. The default port-number is <b>1813</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>retransmit retries</b>          | (OPTIONAL) Enter the keyword <code>retransmit</code> then a number as the number of attempts. This parameter overwrites the <code>radius-server retransmit</code> command. The range is from zero (0) to 100. The default is <b>3 attempts</b> .                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>timeout seconds</b>             | (OPTIONAL) Enter the keyword <code>timeout</code> then the seconds the time interval the switch waits for a reply from the RADIUS server. This parameter overwrites the <code>radius-server timeout</code> command. The range is from 0 to 1000. The default is <b>5 seconds</b> .                                                                                                                                                                                                                                                                                                                                                              |
| <b>key [encryption-type] key</b>   | (OPTIONAL) Enter the keyword <code>key</code> then an optional encryption-type and a string up to 42 characters long as the authentication key. The RADIUS host server uses this authentication key and the RADIUS daemon operating on this switch.<br><br>For the encryption-type, enter either zero (0) or 7 as the encryption type for the key entered. The options are: <ul style="list-style-type: none"><li>• 0 is the default and means the password is not encrypted and stored as clear text.</li><li>• 7 means that the password is encrypted and hidden.</li></ul> Configure this parameter last because leading spaces are ignored. |

**Defaults** Not configured.

**Command Modes**

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------|
| 9.14(1.5)  | Added support for RADIUS accounting.                                                                      |
| 9.11(0.0)  | Included a prompt to force the users to re-authenticate when there is a change in the RADIUS server list. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                 |
| 9.10(0.0)  | Introduced on the S3148.                                                                                  |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                               |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                               |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                               |

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 9.2(1.0)    | Introduced on the Z9500.                              |
| 9.0.2.0     | Introduced on the S6000.                              |
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.4.1.0     | Added support for IPv6.                               |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.0 | Introduced on the E-Series.                           |

### Usage Information

To configure any number of RADIUS server hosts for each server host that is configured, use this command. Dell EMC Networking OS searches for the RADIUS hosts in the order they are configured in the software.

The global default values for the `timeout`, `retransmit`, and `key` optional parameters are applied, unless those values are specified in the `radius-server host` or other commands. To return to the global default values, if you configure the `timeout`, `retransmit`, or `key` values, include those keywords when using the `no radius-server host` command syntax.

You can use duplicate host names or IP addresses among RADIUS groups. However, you cannot use duplicate host names or IP addresses within the same RADIUS group. If a VRF is not configured on the RADIUS group, then servers configured in the group are considered to be on the default VRF. RADIUS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.

You must configure the RADIUS group explicitly with the `aaa radius group` command in order for the AAA servers to use the group of RADIUS servers. The 802.1x servers use the group of RADIUS servers based on the VRF where the 802.1x request is received. As a result, it is possible that both globally configured RADIUS servers as well as the group-configured RADIUS servers (without VRF or default VRF) are used for processing the 802.1x requests that are received at the default VRF. The order in which the RADIUS servers are tried depends on the order in which the RADIUS servers are configured.

The RADIUS accounting port `acct-port port-number` is configurable.

### Example

```
DellEMC(config)#radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?
```

```
DellEMC(config)#no radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?
```

### Related Commands

- [login authentication](#) — sets the database to be checked when a user logs in.
- [radius-server key](#) — sets an authentication key for RADIUS communications.
- [radius-server retransmit](#) — sets the number of times the RADIUS server attempts to send information.
- [radius-server timeout](#) — sets the time interval before the RADIUS server times out.

## radius-server vrf

Create an association between a RADIUS server group and a VRF and source interface.

ud

### Syntax

```
radius-server vrf vrf-name [source-interface interface]
```

To delete the association between a RADIUS server group and a VRF and source interface, use the `no radius-server vrf vrf-name [source-interface interface]` command.

## Parameters

- vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to associate a RADIUS server group with that VRF.
- interface** Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

## Defaults

Not configured.

## Command Modes

RADIUS SERVER GROUP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.0)   | Introduced on the Z9500.                  |
| 9.4(0.0)   | Introduced on the S-Series and Z9000.     |

## Usage Information

You can use this command to associate a group of RADIUS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the RADIUS group, then the group is considered to be on the default VRF. It is possible to use the default VRF name; however, you cannot configure the source interface with the default VRF as such a configuration results in conflicts between the source interfaces corresponding to the 802.1x supplicants on that default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

## Example

```
DellEMC(conf)#radius-server group group1
DellEMC(conf-radius-group)#radius-server vrf vrf1 source-interface
tengigabitethernet 1/30/1

DellEMC(conf)#radius-server group group2
DellEMC(conf-radius-group)#radius-server vrf default
```

# radius-server key

Configure a key for all RADIUS communications between the switch and the RADIUS host server.

**Syntax** `radius-server key [encryption-type] key`

To delete a password, use the `no radius-server key` command.

**Parameters**

**encryption-type** (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

**key** Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 96 characters long.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                               |
|-------------|-----------------------------------------------------------|
| 9.13(0.0)   | Changed the maximum length of the password from 32 to 96. |
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.                 |
| 9.10(0.0)   | Introduced on the S3148.                                  |
| 9.10(0.0)   | Introduced on the S6100-ON.                               |
| 9.8(2.0)    | Introduced on the S3100 series.                           |
| 9.8(1.0)    | Introduced on the Z9100-ON.                               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                               |
| 9.7(0.0)    | Introduced on the S6000-ON.                               |
| 9.2(1.0)    | Introduced on the Z9500.                                  |
| 9.0.2.0     | Introduced on the S6000.                                  |
| 8.3.19.0    | Introduced on the S4820T.                                 |
| 8.3.11.1    | Introduced on the Z9000.                                  |
| 8.3.7.0     | Introduced on the S4810.                                  |
| 7.7.1.0     | Authentication key length increased to 42 characters.     |
| 7.6.1.0     | Introduced on the S-Series.                               |
| 7.5.1.0     | Introduced on the C-Series.                               |
| pre-6.2.1.0 | Introduced on the E-Series.                               |

**Usage Information** The key configured on the switch must match the key configured on the RADIUS server daemon.

If you configure the key parameter in the `radius-server host` command, the key configured with the `radius-server key` command is the default key for all RADIUS communications.

**Related Commands**

- [radius-server host](#) — configures a RADIUS host.

## radius-server retransmit

Configure the number of times the switch attempts to connect with the configured RADIUS host server before declaring the RADIUS host server unreachable.

|                        |                                                                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>radius-server retransmit <i>retries</i></code><br>To configure zero retransmit attempts, use the <code>no radius-server retransmit</code> command.<br>To return to the default setting, use the <code>radius-server retransmit 3</code> command. |
| <b>Parameters</b>      | <b><i>retries</i></b> Enter a number of attempts that the Dell OS tries to locate a RADIUS server. The range is from zero (0) to 100. The default is <b>3 retries</b> .                                                                                |
| <b>Defaults</b>        | <b>3 retries</b>                                                                                                                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                          |

**Related Commands**

- [radius-server host](#) — configure a RADIUS host.

## rate-limit

Configure NAS to allow or reject RADIUS dynamic authorization (DA) packets based on the configurable rate limit value.

**Syntax** `rate-limit packets per minute`  
To undo the configuration, enter the `no rate-limit` command.

**Defaults** 30 packets per minute.

**Parameters**

|                                 |                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b><i>packet per minute</i></b> | Enter the number of packets that you want processed per minute. The range is between 10 to 60 packets per minute. |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------|

**Command Modes**

- CONF-DYNAMIC-AUTH

**Usage Information**

- Packets are dropped after number of packets reaches the configured rate-limit.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version   | Description                         |
|-----------|-------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T. |

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## replay-protection-window

Configure replay protection window period to drop the duplicate packets.

|                          |                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>replay-protection-window minutes</code><br>To undo the configuration, enter the <code>no replay-protection-window</code> command.                                                                                                                            |
| <b>Defaults</b>          | 5 Minutes.                                                                                                                                                                                                                                                         |
| <b>Parameters</b>        | <b>minutes</b> Enter the number of minutes to drop the packets. The range is from 1 to 10 minutes.                                                                                                                                                                 |
| <b>Command Modes</b>     | <ul style="list-style-type: none"> <li>CONF-DYNAMIC-AUTH</li> </ul>                                                                                                                                                                                                |
| <b>Usage Information</b> | <ul style="list-style-type: none"> <li>Duplicate packets are dropped within replay-protection-window period if packet has same source IP address, source UDP port and identifier.</li> </ul>                                                                       |
| <b>Command History</b>   | <p>This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell EMC Networking OS version history for this command.</p> |

| Version   | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                          |
| 9.13(0.0) | Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL. |

## terminate-session

Configure NAS to reject dot1x terminate-session requests from DAC.

|                        |                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>terminate-session</code><br>To drop the DM terminate-session requests from DAC, enter the <code>no terminate-session</code> command.                                                                                                                         |
| <b>Defaults</b>        | Enabled.                                                                                                                                                                                                                                                           |

# TACACS+ Commands

Dell EMC Networking OS supports TACACS+ as an alternate method for login authentication.

## tacacs-server group

Creates a group of TACACS servers to be used for Authentication, Authorization, and Accounting..

**Syntax** `aaa tacacsgroup group-name`  
To delete a group of TACACS servers, use the `no tacacs-server group group-name` command.

**Parameters** **group-name** Enter the name of the TACACS server group.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4.(0.0)  | Introduced on the S-Series and Z-Series.  |

**Usage Information** If the TACACS group is not configured for Authentication, Authorization, and Accounting, then globally configured TACACS servers are used for the purposes. When the TACACS group is removed, the AAA configuration is also removed.

### Example

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secret
DellEMC(conf-tacacs-group)# tacacs-server host 2.2.2.2 key secret
DellEMC(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface
tengigabitethernet 1/20/1
DellEMC(conf)# exit
DellEMC(conf)# aaa tacacsgroup group1
```

**Related Commands**

- [aaa authentication login](#) — specifies the login authentication method.
- [tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

## debug tacacs+

To assist with troubleshooting, view TACACS+ transactions.

**Syntax** `debug tacacs+`  
To disable debugging of TACACS+, use the `no debug tacacs+` command.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Disabled.                                                                                                                                                     |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                |

## tacacs-server group

Creates a group of TACACS servers.

**Syntax** `tacacs-server group group-name` To delete a group of TACACS servers, use the `no tacacs-server group group-name` command.

**Parameters** `group-name` Enter the name of the TACACS server group.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.4.(0.0)  | Introduced on the S-Series and Z-Series.  |

## Usage Information

You can associate a TACACS server group with a VRF.

## Example

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secret
DellEMC(conf-tacacs-group)# tacacs-server host 2.2.2.2 key secret
DellEMC(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface
tengigabitethernet 1/30/1
DellEMC(conf-tacacs-group)# show config
!
tacacs-server group group1
tacacs-server vrf vrf1 source-interface TenGigabitEthernet 1/30/1
tacacs-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
tacacs-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
DellEMC(conf-tacacs-group)#
```

## Related Commands

- [aaa authentication login](#) — specifies the login authentication method.
- [tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

# tacacs-server host

Specify a TACACS+ host.

## Syntax

```
tacacs-server host {hostname | ipv4-address | ipv6-address} [port number]
[timeout seconds] [key key]
```

## Parameters

|                                    |                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hostname</b>                    | Enter the name of the TACACS+ server host.                                                                                                                                                                                         |
| <b>ipv4-address   ipv6-address</b> | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X) of the TACACS+ server host.                                                                                                                                             |
| <b>port number</b>                 | (OPTIONAL) Enter the keyword <code>port</code> then a number as the port to be used by the TACACS+ server. The range is from zero (0) to 65535. The default is <b>49</b> .                                                         |
| <b>timeout seconds</b>             | (OPTIONAL) Enter the keyword <code>timeout</code> then the number of seconds the switch waits for a reply from the TACACS+ server. The range is from 0 to 1000. The default is <b>10 seconds</b> .                                 |
| <b>key key</b>                     | (OPTIONAL) Enter the keyword <code>key</code> then a string up to 42 characters long as the authentication key. This authentication key must match the key specified in the <code>tacacs-server key</code> for the TACACS+ daemon. |

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 9.0.2.0     | Introduced on the S6000.                              |
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.4.1.0     | Added support for IPv6.                               |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.1 | Introduced on the E-Series.                           |

### Usage Information

To list multiple TACACS+ servers to be used by the `aaa authentication login` command, configure this command multiple times.

If you are not configuring the switch as a TACACS+ server, you do not need to configure the `port`, `timeout` and `key` optional parameters. If you do not configure a key, the key assigned in the `tacacs-server key` command is used.

You can use duplicate host names or IP addresses among TACACS groups. However, you cannot use duplicate host names or IP addresses within the same TACACS group.

If a VRF is not configured on the TACACS group, then servers configured in the group are considered to be on the default VRF. TACACS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.

For AAA servers to use a group of TACACS servers, you must explicitly configure the group using the `aaa tacacs group group-name` command. The order in which the TACACS servers are tried depends on the order in which they are configured.

### Example

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secr-et
DellEMC(conf-tacacs-group)# no tacacs-server host 1.1.1.1
DellEMC(conf-tacacs-group)#
```

### Related Commands

- [aaa authentication login](#) — specifies the login authentication method.
- [tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

## tacacs-server key

Configure a key for communication between a TACACS+ server and a client.

**Syntax** `tacacs-server key [encryption-type] key`

To delete a key, use the `no tacacs-server key key` command.

### Parameters

**encryption-type** (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

**key** Enter a text string, up to 42 characters long, as the clear text password. Leading spaces are ignored.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON.             |
| 9.10(0.0)   | Introduced on the S3148.                              |
| 9.10(0.0)   | Introduced on the S6100-ON.                           |
| 9.8(2.0)    | Introduced on the S3100 series.                       |
| 9.8(1.0)    | Introduced on the Z9100-ON.                           |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                           |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                           |
| 9.7(0.0)    | Introduced on the S6000-ON.                           |
| 9.2(1.0)    | Introduced on the Z9500.                              |
| 9.0.2.0     | Introduced on the S6000.                              |
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.1 | Introduced on the E-Series.                           |

## Usage Information

The key configured with this command must match the key configured on the TACACS+ daemon.

## tacacs-server vrf

Create an association between a TACACS server group and a VRF and source interface.

### Syntax

```
tacacs-server vrf vrf-name [source-interface interface]
```

To delete the association between a TACACS server group and a VRF and source interface, use the `no tacacs-server vrf vrf-name [source-interface interface]` command.

### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> and then the name of the VRF to associate a TACACS server group with that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>interface</b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

### Defaults

Not configured.

**Command Modes** TACACS SERVER GROUP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.4.(0.0)  | Introduced on the S-Series and Z-Series.  |

## Usage Information

You can use this command to associate a group of TACACS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the TACACS group, then the group is considered to be on the default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

## Example

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface
tengigabitethernet 1/3/1

DellEMC(conf)# tacacs-server group group2
DellEMC(conf-tacacs-group)# tacacs-server vrf default
DellEMC(conf-tacacs-group)#
```

# Port Authentication (802.1X) Commands

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

Dell EMC Networking OS supports RADIUS and Active Directory environments using 802.1X Port Authentication.

## Important Points to Remember

Dell EMC Networking OS limits network access for certain users by using VLAN assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- 802.1X is supported on Dell EMC Networking OS.
- 802.1X is not supported on the LAG or the channel members of a LAG.
- If no VLAN is supplied by the RADIUS server or if 802.1X authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If 802.1X authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If 802.1X authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If port security is enabled on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If 802.1X is disabled on the port, it is returned to the configured access VLAN.

- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

## dot1x authentication (Configuration)

Enable dot1x globally; dot1x must be enabled both globally and at the interface level.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>dot1x authentication</code><br>To disable dot1x on globally, use the <code>no dot1x authentication</code> command.                                      |
| <b>Defaults</b>        | Disabled.                                                                                                                                                     |

**Related Commands**

- [dot1x authentication \(Configuration\)](#) — enable dot1x globally.

## dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax** `dot1x auth-fail-vlan vlan-id [max-attempts number]`  
 To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

**Parameters**

|                                   |                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>             | Enter the VLAN Identifier. The range is from 1 to 4094.                                                                                                                  |
| <b><i>max-attempts number</i></b> | (OPTIONAL) Enter the keywords <code>max-attempts</code> then number of attempts desired before authentication fails. The range is from 1 to 5. The default is <b>3</b> . |

**Defaults** **3 attempts**

**Command Modes** CONFIGURATION (conf-if-interface-slot/port[/subport])

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.19.0 | Introduced on the S4820T.                           |
| 8.3.7.0  | Introduced on the S4810.                            |
| 7.6.1.0  | Introduced on the C-Series, S-Series, and E-Series. |

#### Usage Information

If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface is moved to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next re-authentication interval (`dot1x reauthentication`).

#### Related Commands

- [dot1x port-control](#) — enables port-control on an interface.
- [dot1x guest-vlan](#) — configures a guest VLAN for non-dot1x devices.
- [show dot1x interface](#) — displays the 802.1X information on an interface.

## dot1x auth-server

Configure the authentication server to RADIUS.

**Syntax** `dot1x auth-server radius`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |
| 7.4.1.0    | Introduced on the E-Series.               |

## dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

**Syntax** `dot1x guest-vlan vlan-id`

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

**Parameters** ***vlan-id*** Enter the VLAN Identifier. The range is from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION (conf-if-interface-slot/port[/subport])

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                         |
|------------|-----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.           |
| 9.10(0.0)  | Introduced on the S3148.                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                         |
| 9.8(2.0)   | Introduced on the S3100 series.                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                         |
| 9.2(1.0)   | Introduced on the Z9500.                            |
| 9.0.2.0    | Introduced on the S6000.                            |
| 8.3.19.0   | Introduced on the S4820T.                           |
| 8.3.11.1   | Introduced on the Z9000.                            |
| 8.3.7.0    | Introduced on the S4810.                            |
| 7.6.1.0    | Introduced on the C-Series, S-Series, and E-Series. |

**Usage Information** 802.1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication for the device occurs at the next re-authentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

**NOTE:** The layer 3 portion of guest VLAN and authentication fail VLANs can be created regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

### Related Commands

- [dot1x auth-fail-vlan](#) — configures a VLAN for authentication failures.
- [dot1x reauthentication](#) — enables periodic re-authentication.
- [show dot1x interface](#) — displays the 802.1X information on an interface.

## dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

**Syntax** [no] dot1x mac-auth-bypass

**Defaults** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.4   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.4.1.0    | Introduced on the C-Series and S-Series.  |

**Usage Information** To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax** dot1x max-eap-req *number*

To return to the default, use the `no dot1x max-eap-req` command.

**Parameters** *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

**Defaults** 2

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

#### Related Commands

- [interface range](#) — configure a range of interfaces.

## dot1x port-control

Enable port control on an interface.

**Syntax** `dot1x port-control {force-authorized | auto | force-unauthorized}`

**Parameters**

- force-authorized** Enter the keywords `force-authorized` to forcibly authorize a port.
- auto** Enter the keyword `auto` to authorize a port based on the 802.1X operation result.
- force-unauthorized** Enter the keywords `force-unauthorized` to forcibly de-authorize a port.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

#### Usage Information

The authenticator performs authentication only when `port-control` is set to `auto`.

## dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax** `dot1x quiet-period seconds`  
 To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters** **seconds** Enter the number of seconds. The range is from 1 to 65535. The default is **30**.

**Defaults** **30 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |
| 7.4.1.0    | Introduced on the E-Series.               |

## dot1x reauthentication

Enable periodic re-authentication of the client.

**Syntax** `dot1x reauthentication [interval seconds]`  
 To disable periodic re-authentication, use the `no dot1x reauthentication` command.

**Parameters** **interval *seconds*** (Optional) Enter the keyword `interval` then the interval time, in seconds, after which re-authentication is initiated. The range is from 1 to 31536000 (1 year). The default is **3600 (1 hour)**.

**Defaults** **3600 seconds (1 hour)**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Related Commands**

- [interface range](#) — configures a range of interfaces.

## dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

**Syntax** `dot1x reauth-max number`  
To return to the default, use the `no dot1x reauth-max` command.

**Parameters** ***number*** Enter the permitted number of re-authentications. The range is from 1 to 10. The default is **2**.

**Defaults** **2**

| 7.4.1.0    | Introduced on the E-Series.              |

## dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

**Syntax** `dot1x server-timeout seconds`

To return to the default, use the `no dot1x server-timeout` command.

**Parameters** **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |
| 7.4.1.0    | Introduced on the E-Series.               |

## show dot1x interface

Display the 802.1X information on an interface.

**Syntax** `show dot1x interface interface`

**Parameters** *interface* Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

**Defaults** none

**Command Modes**

- EXEC
- EXEC privilege

## Command History

|------------|-----------------------------------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON.                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                         |
| 9.2(1.0)   | Introduced on the Z9500.                            |
| 9.0.2.0    | Introduced on the S6000.                            |
| 8.3.19.0   | Introduced on the S4820T.                           |
| 8.3.11.1   | Introduced on the Z9000.                            |
| 8.5.1.0    | Added support for 4-port 40G line cards.            |
| 8.3.7.0    | Introduced on the S4810.                            |
| 7.6.1.0    | Introduced on the C-Series, S-Series, and E-Series. |

### Example

```

DellEMC#show dot1x interface fortyGigE 1/10

802.1x information on Fo 1/10:

Dot1x Status: Enable
Port Control: AUTO
Port Auth Status: UNAUTHORIZED
Re-Authentication: Disable
Untagged VLAN id: None
Guest VLAN: Disable
Guest VLAN id: NONE
Auth-Fail VLAN: Disable
Auth-Fail VLAN id: NONE

```

## SSH and SCP Commands

Dell EMC Networking OS supports secure shell (SSH) protocol version 2.0. SSH is a protocol for secure remote login over an insecure network. SSH sessions are encrypted and use authentication.

### crypto key generate

Generate keys for the SSH server.

#### Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
crypto key generate {rsa}
```

#### Parameters

**rsa** Enter the keyword `rsa` then the key size to generate a SSHv2 RSA host keys. The range is from 1024 to 2048 if you did not enable FIPS mode; if you enabled FIPS mode, you can only generate a 2048-bit key. The default is **1024**.

 **NOTE:** You must have a license to access the FIPS mode. For more information, contact your Dell EMC Networking representative.

#### Defaults

Key size **1024**; if you enable FIPS mode, the key size is **2048**.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version            | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <b>9.12(0.0)</b>   | Removed support for <code>rsa1</code> keys from all platforms. |
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON.                      |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                                       |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.                                    |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                    |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                    |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                    |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                    |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                       |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                       |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                      |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                       |
| <b>8.3.12.0</b>    | Added support for FIPS mode on the S4810.                      |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                       |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                    |
| <b>7.5.1.0</b>     | Introduced on the C-Series.                                    |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                    |

## Usage Information

The host keys are required for key-exchange by the SSH server. If the keys are not found when you enable the server (`ip ssh server enable`), the keys are automatically generated.

This command requires user interaction and generates a prompt prior to overwriting any existing host keys.

 **NOTE:** Only a user with superuser permissions should generate host-keys.

## Example

```
DellEMC(conf)# crypto key generate rsa
Enter key size <1024-2048>. Default<1024> :
Host key already exists. Overwrite (y/n)?y
Generating 1024-bit SSHv2 RSA key.
!!!!!!!!!!!!!!!!!!!!
DellEMC(conf)#
```

## Related Commands

- [ip ssh server](#) — enables the SSH server.
- [show crypto](#) — displays the SSH host public keys.

# crypto key zeroize rsa

Removes the generated RSA host keys and zeroize the key storage location.

**Syntax** `crypto key zeroize rsa`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

# debug ip ssh

Enables collecting SSH debug information.

**Syntax** `debug ip ssh {client | server}`  
To disable debugging, use the `no debug ip ssh {client | server}` command.

**Parameters**

|               |                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|
| <b>client</b> | Enter the keyword <code>client</code> to enable collecting debug information on the client. |
| <b>server</b> | Enter the keyword <code>server</code> to enable collecting debug information on the server. |

**Defaults** Disabled on both client and server.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>pre-6.1.1.0</b> | Introduced on the E-Series.               |

**Usage Information** Debug information includes details for key-exchange, authentication, and established session for each connection.

## ip scp topdir

Identify a location for files used in secure copy transfer.

**Syntax** `ip scp topdir directory`  
To return to the default setting, use the `no ip scp topdir` command.

**Parameters** ***directory*** Enter a directory name.

**Defaults** The internal flash (`flash:`) is the default directory.

**Command Modes** CONFIGURATION
