**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.2(1.0)    | Introduced on the Z9500.    |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information**

To configure the switch as an SCP server, use the `ip ssh server` command.

**Related Commands**

- `ip ssh server` — enables the SSH and SCP server on the switch.

## ip ssh authentication-retries

Configure the maximum number of attempts that should be used to authenticate a user.

**Syntax** `ip ssh authentication-retries 1-10`

**Parameters** `1-10` Enter the number of maximum retries to authenticate a user. The range is from 1 to 10. The default is **3**.

**Defaults** **3**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000–ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

| Version            | Description                 |
|--------------------|-----------------------------|
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

**Usage Information**

This command specifies the maximum number of attempts to authenticate a user on an SSH connection with the remote host for password authentication. SSH disconnects when the number of password failures exceeds authentication-retries.

## ip ssh challenge-response-authentication

Enable challenge response authentication for SSHv2.

**Syntax** `ip ssh challenge-response-authentication enable`  
 To disable the challenge response authentication, use the `no ip ssh challenge-response-authentication enable` command.

**Parameters** **enable** Enter the keyword `enable` to enable the challenge response authentication for SSHv2.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S4810, S4820T, S3048-ON, S3100 Series, S4048-ON, S5000, S6000, S6000-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON, S4048T-ON, C9000, and MXL. |

**Usage Information**

If both the challenge response authentication and password authentication methods are configured, the challenge response authentication takes priority.

## ip ssh connection-rate-limit

Configure the maximum number of incoming SSH connections per minute.

**Syntax** `ip ssh connection-rate-limit 1-60`

**Parameters** **1-60** Enter the number of maximum numbers of incoming SSH connections allowed per minute. The range is from 1 to 60 per minute. The default is **10 per minute**.

**Defaults** **10 per minute**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.11(0.0)</b> | Increased the SSH rate-limit range.       |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| <b>Version</b>     | <b>Description</b>          |
|--------------------|-----------------------------|
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON. |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON. |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON. |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.    |
| <b>9.0.2.0</b>     | Introduced on the S6000.    |
| <b>8.3.19.0</b>    | Introduced on the S4820T.   |
| <b>8.3.11.1</b>    | Introduced on the Z9000.    |
| <b>8.3.7.0</b>     | Introduced on the S4810.    |
| <b>7.6.1.0</b>     | Introduced on the S-Series. |
| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

## ip ssh hostbased-authentication

Enable hostbased-authentication for the SSHv2 server.

**Syntax** `ip ssh hostbased-authentication enable`  
 To disable hostbased-authentication for SSHv2 server, use the `no ip ssh hostbased-authentication enable` command.

**Parameters** **enable** Enter the keyword `enable` to enable hostbased-authentication for SSHv2 server.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.1.1.0 | Introduced on the E-Series. |

#### Usage Information

If you enable this command, clients can log in without a password prompt. This command provides two levels of authentication:

- rhost-authentication is done with the file specified in the `ip ssh rhostfile` command.
- checking client host-keys is done with the file specified in the `ip ssh pub-key-file` command.

 **NOTE:** Administrators must specify the two files (`rhosts` and `pub-key-file`) to configure host-based authentication.

#### Related Commands

- [ip ssh pub-key-file](#) — public keys of trusted hosts from a file.
- [ip ssh rhostsfile](#) — trusted hosts and users for rhost authentication.

## ip ssh key-size

Configure the size of the server-generated RSA SSHv1 key.

**Syntax** `ip ssh key-size 512-869`

**Parameters** **512-869** Enter the key-size number for the server-generated RSA SSHv1 key. The range is from 512 to 869. The default is **768**.

**Defaults** Key size **768**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| pre-6.1.1.0       | Introduced on the E-Series.               |

#### Usage Information

The server-generated key is used for SSHv1 key-exchange.

## ip ssh password-authentication

Enable password authentication for the SSH server.

|                        |                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ssh password-authentication enable</code><br>To disable password-authentication, use the <code>no ip ssh password-authentication enable</code> command. |
| <b>Parameters</b>      | <b>enable</b> Enter the keyword <code>enable</code> to enable password-authentication for the SSH server.                                                        |
| <b>Defaults</b>        | Enabled                                                                                                                                                          |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .    |

| <b>Version</b>     | <b>Description</b>                        |
|--------------------|-------------------------------------------|
| <b>9.10(0.1)</b>   | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>   | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>   | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>     | Introduced on the S6000.                  |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>     | Introduced on the S4810.                  |
| <b>7.6.1.0</b>     | Introduced on the S-Series.               |
| <b>7.5.1.0</b>     | Introduced on the C-Series.               |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.               |

|                          |                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | With password authentication enabled, you can authenticate using the local, RADIUS, or TACACS+ password fallback order as configured. |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------|

## ip ssh rekey

Configures the time `rekey-interval` or volume `rekey-limit` threshold at which to re-generate the SSH key during an SSH session.

|                   |                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>ip ssh rekey [time <i>rekey-interval</i>] [volume <i>rekey-limit</i>]</code><br>To reset to the default, use <code>no ip ssh rekey [time <i>rekey-interval</i>] [volume <i>rekey-limit</i>]</code> command.                                                                                                                                                      |
| <b>Parameters</b> | <b>time <i>minutes</i></b> Enter the keywords <code>time</code> then the amount of time in minutes. The range is from 10 to 1440 minutes. The default is <b>60</b> minutes<br><b>volume <i>rekey-limit</i></b> Enter the keywords <b>volume</b> then the amount of volume in megabytes. The range is from 1 to 4096 to megabytes. The default is <b>1024 megabytes</b> |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | The default time is <b>60</b> minutes. The default volume is <b>1024</b> megabytes.                                                                           |
| <b>Command Modes</b>   | CONFIGURATION mode                                                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>Version</b>    | <b>Description</b>                                 |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |

| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                        |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                           |
| <b>9.5(0.0)</b>   | Introduced on the Z9000, S6000, S4820T, S4810, MXL |

## ip ssh pub-key-file

Specify the file used for host-based authentication.

|                        |                                                                                                                                                               |                                                        |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ssh pub-key-file {WORD}</code>                                                                                                                       |                                                        |
| <b>Parameters</b>      | <b>WORD</b>                                                                                                                                                   | Enter the file name for the host-based authentication. |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                        |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                 |                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                        |

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |

| Version     | Description                 |
|-------------|-----------------------------|
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

This command specifies the file used for the host-based authentication. The `creates/` file overwrites the `flash://ADMIN_DIR/ssh/knownhosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

The file contains the OpenSSH-compatible public keys of the host for which host-based authentication is allowed. An example known host file format:

```
poclab4,123.12.1.123 ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAox/
QQp8xYhzOxn07yh4VGPAoUfgKoieTHO9G4sNV+ui
+DWEc3cgYAcU5Lai1MU2ODrzhCwyDNp05tKBU3t ReG1o8AxLi6+S4hyEMqHzkzBFNVqHzpQc
+Rs4p2urzV0F4pRKnaXdhf3Lk4D460HZRhhVrxqeNxpDpEn WIMPJi0ds= ashwani@poclab4
```

 **NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the chassis.

### Example

```
DellEMC# conf
DellEMC(conf)# ip ssh pub-key-file flash://knownhosts
DellEMC(conf)#
```

### Related Commands

- [show ip ssh client-pub-keys](#) — displays the client-public keys used for the host-based authentication.

## ip ssh rhostfile

Specify the rhost file used for host-based authorization.

**Syntax** `ip ssh rhostfile {WORD}`

**Parameters** **WORD** Enter the rhost file name for the host-based authentication.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Example

```
DellEMC#conf
DellEMC(conf)# ip ssh rhostsfile flash://shosts
DellEMC(conf)#
```

### Usage Information

This command specifies the rhost file used for host-based authentication. This `creates/` file overwrites the `flash:/ADMIN_DIR/ssh/shosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

This file contains hostnames and usernames, for which hosts and users, rhost-authentication can be allowed.

 **NOTE:** For `rhostsfile` and `pub-key-file`, the administrator must FTP the file to the switch.

## ip ssh rsa-authentication (Config)

Enable RSA authentication for the SSHv2 server.

### Syntax

```
ip ssh rsa-authentication enable
```

To disable RSA authentication, use the `no ip ssh rsa-authentication enable` command.

### Parameters

**enable** Enter the keyword `enable` to enable RSA authentication for the SSHv2 server.

### Defaults

Disabled.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version     | Description                 |
|-------------|-----------------------------|
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

Enabling RSA authentication allows the user to log in without being prompted for a password. In addition, the OpenSSH compatible SSHv2 RSA public key must be added to the list of authorized keys (`ip ssh rsa-authentication my-authorized-keys device://filename` command).

## ip ssh server

### Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version 2]
```

To disable SSH server functions, use the `no ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm]` command.

### Parameters

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>                     | Enter the key word <code>enable</code> to start the SSH server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ciphers <i>cipher-list</i></b> | <p>Enter the keyword <code>ciphers</code> and then a space-delimited list of ciphers that the SSH server supports. The following ciphers are available.</p> <ul style="list-style-type: none"> <li>• 3des-cbc</li> <li>• aes128-cbc</li> <li>• aes192-cbc</li> <li>• aes256-cbc</li> <li>• aes128-ctr</li> <li>• aes192-ctr</li> <li>• aes256-ctr</li> </ul> <p>The default cipher list is used.</p> <ul style="list-style-type: none"> <li>• 3des-cbc</li> <li>• aes128-cbc</li> <li>• aes192-cbc</li> <li>• aes256-cbc</li> <li>• aes128-ctr</li> <li>• aes192-ctr</li> <li>• aes256-ctr</li> </ul> |
| <b>mac <i>hmac-algorithm</i></b>  | <p>Enter the keyword <code>mac</code> then a space-delimited list of hash message authentication code (HMAC) algorithms supported by the SSH server for keying hashing for the message authentication.</p> <p>The following HMAC algorithms are available:</p> <ul style="list-style-type: none"> <li>• hmac-sha1</li> </ul>                                                                                                                                                                                                                                                                          |

- `hmac-sha1-96`
- `hmac-sha2-256`

When FIPS is enabled, the default HMAC algorithm is `hmac-sha1-96`.

When FIPS is not enabled, the default HMAC algorithms are the following:

- `hmac-md5`
- `hmac-md5-96`
- `hmac-sha1`
- `hmac-sha1-96`
- `hmac-sha2-256`

***kex key-exchange-algorithm***

Enter the keyword `kex` and then a space-delimited list of key exchange algorithms supported by the SSH server.

The following key exchange algorithms are available:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1`
- `diffie-hellman-group14-sha1`

When FIPS is enabled, the default key-exchange-algorithm is `diffie-hellman-group14-sha1`.

When FIPS is not enabled, the default key-exchange-algorithms are the following:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1,`
- `diffie-hellman-group14-sha1`

**port *port-number*** (OPTIONAL) Enter the keyword `port` then the port number of the listening port of the SSH server. The range is from 1 to 65535. The default is **22**.

**[version 2]** (OPTIONAL) Enter the keyword `version` then the SSH version 2, to specify SSHv2.

**Defaults**

- Default listening port is **22**.
- Default cipher list is `3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr`.
- When FIPS is enabled, the default is `hmac-sha1-96`.
- When FIPS is not enabled, the default is `hmac-md5,hmac-md5-96,hmac-sha1,hmac-sha1-96,hmac-sha2-256`.
- *When FIPS is enabled, the default is `diffie-hellman-group14-sha1`.*
- When FIPS is not enabled, the default is `diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1`.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                   |
|------------------|-----------------------------------------------|
| <b>9.12(0.0)</b> | Removed support for SSHv1 from all platforms. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.     |

| Version     | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| 9.10(0.0)   | Introduced on the S3148.                                                                |
| 9.10(0.0)   | Removed the support for hmac-sha2-256-96 algorithm.                                     |
| 9.8(2.0)    | Introduced on the S3100 series.                                                         |
| 9.8(1.0)    | Introduced on the Z9100-ON.                                                             |
| 9.8(0.0P5)  | Introduced on the S4048-ON.                                                             |
| 9.8(0.0P2)  | Introduced on the S3048-ON.                                                             |
| 9.7(0.0)    | Introduced on the S6000-ON.                                                             |
| 9.5(0.1)    | Introduced the cipher , kex and mac options on the Z9500.                               |
| 9.5(0.0)    | Introduced the cipher, kex and mac options on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0)    | Introduced on the Z9500.                                                                |
| 9.0.2.0     | Introduced on the S6000.                                                                |
| 8.3.19.0    | Introduced on the S4820T.                                                               |
| 8.3.11.1    | Introduced on the Z9000.                                                                |
| 8.3.7.0     | Introduced on the S4810.                                                                |
| 7.6.1.0     | Introduced on the S-Series.                                                             |
| 7.5.1.0     | Introduced on the C-Series.                                                             |
| pre-6.1.1.0 | Introduced on the E-Series.                                                             |

#### Usage Information

This command enables the SSH server and begins listening on a port. If a port is not specified, listening is on SSH default port 22.

 **NOTE:** Starting with Dell EMC Networking OS Release 9.2(0.0), SSH server is enabled by default.

#### Example

```
DellEMC# conf
DellEMC(conf)# ip ssh server port 45
DellEMC(conf)# ip ssh server enable
DellEMC#
```

## ip ssh server dns enable

Enable or disable the DNS in SSH server configuration to resolve hostname for host-based authentication.

#### Syntax

```
ip ssh server dns enable
```

To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.13.0.1 | Introduced on the MXL, C9010, S3048-ON, S3100 series, S4810, S4820T, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6100-ON, S6010-ON, Z9500, Z9100-ON and FN-IOM. |

#### Usage Information

To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.

## ip ssh server vrf

Configure an SSH server on either a specific VRF or a management VRF.

### Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
ip ssh server vrf {any | management | vrf-name}
```

To disable the SSH server configuration, use the `no ip ssh server vrf {management | vrf-name}` command.

### Parameters

- |                       |                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>            | Enter the keyword <code>any</code> to enable access to the server from any VRF.                                                    |
| <b>vrf management</b> | Enter the keyword <code>vrf</code> followed by the keyword <code>management</code> to configure an SSH server on a management VRF. |
| <b>vrf vrf-name</b>   | Enter the keyword <code>vrf</code> followed by the VRF name to configure an SSH server on that VRF.                                |

### Defaults

None

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                  |
| <b>9.4(0.0)</b>   | Introduced on the S-Series and Z9000.     |

### Usage Information

You can enable the SSH server on either a management VRF or a user defined VRF but not both. If no VRF is specified, then the SSH server is enabled on the default VRF.

If the SSH server is enabled on a VRF with name `vrf1`, then use the following command to restart the SSH server on a VRF with name `vrf2`: `ip ssh server vrf vrf2`. If the SSH server is enabled on a VRF with name `vrf1`, then use the following command to restart the SSH server on the default VRF: `ip ssh server vrf`.

### Example

```
• DelleMC(conf)# ip ssh server vrf any
• DelleMC(conf)# no ip ssh server vrf
• DelleMC(conf)# ip ssh server vrf vrf1
• DelleMC(conf)# no ip ssh server vrf
• DelleMC(conf)# ip ssh server vrf management
• DelleMC(conf)# no ip ssh server vrf
```

### Related Commands

- [show ip ssh](#) — displays the ssh information.

## ip ssh source-interface

Specifies an interface's IP address as the source IP address for an outgoing SSH connections.

**Syntax** `ip ssh source-interface interface`

To delete a source interface, use the `no ip ssh source-interface` command.

**Parameters** **interface** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.5(0.0)   | Introduced on the Z9500.                  |
| 9.4(0.0)   | Introduced on the S-Series and Z9000.     |

**Usage Information** The `source-interface interface` attribute is applicable for both the SSH `client` as well as the `COPY (SCP)` commands. Using these attributes the client session tags an error to the user during run time, in case there is a mismatch between this command and the `ip ssh vrf` command.

**Example**

```
DelleMC(conf)#ip ssh source-interface tengigabitethernet 1/30/1
DelleMC(conf)#do ssh 10.10.10.2 -l admin
DelleMC(conf)#no ip ssh source-interface
```

## ip ssh vrf

Specify a VRF for an outgoing SSH connections.

**Syntax** `ip ssh vrf vrf-name`

To delete a VRF for an outgoing SSH connection, use the `no ip ssh vrf vrf-name` command.

**Parameters**      **vrf vrf-name**      Enter the keyword `vrf` and then the name of the VRF to configure that VRF for an outgoing SSH session.

**Defaults**      Not configured.

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.4(0.0)   | Introduced on the S-Series and Z9000.     |

**Usage Information**      If you configure a VRF for an SSH session, then you need not explicitly mention the same VRF for the SSH client sessions intended for that VRF. The `vrf` attribute in the `ip ssh vrf` command is applicable for both the SSH client as well as the COPY (SCP) commands.

**Example**

```
DellEMC(conf)#ip ssh vrf vrf1
DellEMC(conf)#do ssh 10.10.10.2 -l admin
DellEMC(conf)#no ip ssh vrf vrf1
```

## show crypto

Display the public part of the SSH host-keys.

**Syntax**       **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
show crypto key mypubkey {rsa}
```

**Parameters**

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| <b>Key</b>      | Enter the keyword <code>key</code> to display the host public key.           |
| <b>mypubkey</b> | Enter the keyword <code>mypubkey</code> to display the host public key.      |
| <b>rsa</b>      | Enter the keyword <code>rsa</code> to display the host SSHv2 RSA public key. |

**Defaults**      none

**Command Modes**      EXEC

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                       |
|-----------|---------------------------------------------------|
| 9.12(0.0) | Removed support for rsa1 keys from all platforms. |

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

### Usage Information

This command is useful if the remote SSH client implements Strict Host Key Checking. You can copy the host key to your list of known hosts.

### Example

```
DellEMC# show crypto key mypubkey rsa
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQGC9IYgcUcc8wQm+5KUQgW/
zAs8V5STalGq4/+S+6H9axpQnA+A0xweeo5iR5hvPP6Vc+HS+uWoQH+
VOJ8H5Jxsm347XnYv/gpSqhggjZ/C5UwFiucVkVfYu8RDcJVIuQhLv
PEebIF5Q+sD8K89MXU90MAS/UdoiJZSOI1baCuSTW1Q==

DellEMC#
```

### Related Commands

- [crypto key generate](#) — generates the SSH keys.

## show ip ssh

Display information about established SSH sessions.

### Syntax

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
show ip ssh
```

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| 9.12(1.0) | Introduced on the S5048F-ON.                                            |
| 9.11(0.0) | Updated the output to include challenge-response-authentication option. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                               |

## show ip ssh rsa-authentication

Display the authorized-keys for the RSA authentication.

**Syntax** `show ip ssh rsa-authentication {my-authorized-keys}`

**Parameters**

|                           |                                  |
|---------------------------|----------------------------------|
| <b>my-authorized-keys</b> | Display the RSA authorized keys. |
|---------------------------|----------------------------------|

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.10(0.1)   | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)   | Introduced on the S3148.                  |
| 9.10(0.0)   | Introduced on the S6100-ON.               |
| 9.8(2.0)    | Introduced on the S3100 series.           |
| 9.8(1.0)    | Introduced on the Z9100-ON.               |
| 9.8(0.0P5)  | Introduced on the S4048-ON.               |
| 9.8(0.0P2)  | Introduced on the S3048-ON.               |
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.2(1.0)    | Introduced on the Z9500.                  |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

#### Usage Information

This command displays the contents of the `flash:/ADMIN_DIR/ssh/authorized-keys.username` file.

#### Example

```
DellEMC# show ip ssh rsa-authentication my-authorized-keys
ssh-rsa
AAAAB3NzaC1yc2EAAAABIwAAAIEAyB17l4gFp4r2DRHIVMc1VZ
d0Sg5GQxRV1y1X1JOMeO6Nd0WuYyzrQMM

U9tMwhS8vy8AVxdH4x4km3c3t5Jvc=
freedom@poclabb4

DellEMC#
```

#### Related Commands

- [ip ssh rsa-authentication \(Config\)](#) — configures the RSA authorized keys.

## ssh

Open an SSH connection specifying the hostname, username, encryption cipher, HMAC algorithm, port number, and version of the SSH client.

#### Syntax

**i** **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

```
ssh [vrf vrf-name] {hostname | ipv4 address | ipv6 address} [-c encryption
cipher | -l username | -m HMAC algorithm | -p port-number | -v 2]
```

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to specify the VRF used with the SSH session.

**i** **NOTE:** The VRF configured using this command has a higher precedence than the VRF configured using the `ip ssh vrf vrf-name` command. If you do not configure a VRF using this command, then the SSH client uses the configured VRF (if any). If there is a mismatch between VRFs that are

configured using the `ip ssh source-interface` command and the `ssh vrf vrf-name` command, then an error is reported.

|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hostname</b>                   | (OPTIONAL) Enter the IP address or the host name of the remote device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>vrf instance</b>               | (OPTIONAL) E-Series Only: Enter the keyword <code>vrf</code> then the VRF Instance name to open an SSH connection to that instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ipv4 address</b>               | (OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ipv6-address prefix-length</b> | (OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.<br><b>(i) NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>-c encryption cipher</b>       | Enable the "FIPS mode enable", this mode will support the v2 client.<br>"no fips mode enable"(disable) will support v1 & v2 client. This comment is applicable for both ciphers & HMAC algorithms: <ul style="list-style-type: none"><li>• <code>3des-cbc</code>: Force ssh to use 3des-cbc encryption cipher.</li><li>• <code>aes128-cbc</code> : Force ssh to use aes128-cbc encryption cipher</li><li>• <code>aes192-cbc</code> : Force ssh to use aes192-cbc encryption cipher</li><li>• <code>aes256-cbc</code> : Force ssh to use aes256-cbc encryption cipher</li><li>• <code>aes128-ctr</code> : Force ssh to use aes128-ctr encryption cipher</li><li>• <code>aes192-ctr</code> : Force ssh to use aes192-ctr encryption cipher</li><li>• <code>aes256-ctr</code> : Force ssh to use aes256-ctr encryption cipher</li></ul> |
| <b>-l username</b>                | (OPTIONAL) Enter the keyword <code>-l</code> then the user name used in this SSH session. The default is the user name of the user associated with the terminal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>-m HMAC algorithm</b>          | Enter one of the following HMAC algorithms to use:<br>"no fips mode enable"(disable) will support v1 & v2 client. <ul style="list-style-type: none"><li>• <code>hmac-md5</code>: Force ssh to use hmac-md5 HMAC algorithm.</li><li>• <code>hmac-md5-96</code>: Force ssh to use hmac-md5-96 HMAC algorithm.</li><li>• <code>hmac-sha1</code>: Force ssh to use hmac-sha1 HMAC algorithm.</li><li>• <code>hmac-sha1-96</code> : Force ssh to use hmac-sha1-96 HMAC algorithm.</li><li>• <code>hmac-sha2-256</code> : Force ssh to use hmac-sha2-256 HMAC algorithm.</li></ul>                                                                                                                                                                                                                                                         |
| <b>-p port-number</b>             | (OPTIONAL) Enter the keyword <code>-p</code> then the port number. The range is from 1 to 65535. The default is <b>22</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>-v 2</b>                       | (OPTIONAL) Enter the keyword <code>-v</code> then the SSH version 2. The default is the version from the protocol negotiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Defaults** As shown in the *Parameters* section.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                  |
|------------------|-----------------------------------------------------|
| <b>9.14(1.0)</b> | Version 1 is deprecated.                            |
| <b>9.12(1.0)</b> | Introduced on the S5048F-ON.                        |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.           |
| <b>9.10(0.0)</b> | Introduced on the S3148.                            |
| <b>9.10(0.0)</b> | Removed the support for hmac-sha2-256-96 algorithm. |

|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.8(2.0)</b>    | Introduced on the S3100 series.                                                                                                                                                                                                                                                                                                              |
| <b>9.8(1.0)</b>    | Introduced on the Z9100-ON.                                                                                                                                                                                                                                                                                                                  |
| <b>9.8(0.0P5)</b>  | Introduced on the S4048-ON.                                                                                                                                                                                                                                                                                                                  |
| <b>9.8(0.0P2)</b>  | Introduced on the S3048-ON.                                                                                                                                                                                                                                                                                                                  |
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                  |
| <b>9.5(0.1)</b>    | Added support for the following ciphers and HMAC algorithms on the Z9000, S6000, S4820T, S4820T. S6000-ON. <ul style="list-style-type: none"> <li>● aes128-cbc</li> <li>● aes192-cbc</li> <li>● aes256-cbc</li> <li>● aes128-ctr</li> <li>● aes192-ctr</li> <li>● aes256-ctr</li> <li>● hmac-sha2-256</li> <li>● hmac-sha2-256-96</li> </ul> |
| <b>9.4.(0.0)</b>   | Added support for VRF.                                                                                                                                                                                                                                                                                                                       |
| <b>9.2(1.0)</b>    | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                     |
| <b>9.0.2.0</b>     | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                     |
| <b>8.3.19.0</b>    | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                    |
| <b>8.3.11.1</b>    | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                     |
| <b>8.3.12.0</b>    | Added support for the <code>-c</code> and <code>-m</code> parameters on the S4810.                                                                                                                                                                                                                                                           |
| <b>8.3.7.0</b>     | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                     |
| <b>7.6.1.0</b>     | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                  |
| <b>7.5.1.0</b>     | Added IPv6 support. Introduced on the C-Series.                                                                                                                                                                                                                                                                                              |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                  |

### Usage Information

Dell EMC Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

### Example

```
DellEMC#ssh 10.16.151.48 -l anvltest

Trying 10.16.151.48...
01:18:16: %STKUNIT0-M:CP %SEC-5-SSH_USAGE: Initiated SSH Client v2 (FIPS
Disabled) to anvltest@10.16.151.48 by default from console
anvltest@10.16.151.48's password:
Last login: Thu Jan 5 00:17:47 2012 from login-maa-101
[anvltest@dt-maa-linux-1 ~]# exit
logout
DellEMC#
```

# Secure DHCP Commands

DHCP as defined by RFC 2131 provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

## clear ip dhcp snooping

Clear the DHCP binding table.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Version | Description                              |
|---------|------------------------------------------|
| 7.8.1.0 | Introduced on the C-Series and S-Series. |

**Usage Information**

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP Snooping, the binding table is deleted and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

**Related Commands**

- [ip dhcp snooping vlan](#) — enable DHCP Snooping on one or more VLANs.

## ip dhcp snooping binding

Create a static entry in the DHCP binding table.

**Syntax**

```
[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address
interface type slot/port lease number
```

**Parameters**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac address</b>     | Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IP address.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>vlan-id vlan-id</b> | Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ip ip-address</b>   | Enter the keyword <code>ip</code> then the IP address that the server is leasing.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>interface type</b>  | Enter the keyword <code>interface</code> then the type of interface to which the host is connected. <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> </ul> |
| <b>slot/port</b>       | Enter the slot and port number of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>lease time</b>      | Enter the keyword <code>lease</code> then the amount of time the IP address is leased. The range is from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                   |

|----------|------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.5.1.0  | Added support for 4-port 40G line cards. |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

**Related Commands**

- [show ip dhcp snooping](#) — displays the contents of the DHCP binding table.

## ip dhcp snooping database renew

Renew the binding table.

**Syntax** `ip dhcp snooping database renew`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the C-Series and S-Series.  |

## ip dhcp snooping trust

Configure an interface as trusted.

**Syntax** `[no] ip dhcp snooping trust`

**Defaults** Untrusted

**Command Modes** INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## ip dhcp snooping vlan

Enable DHCP Snooping on one or more VLANs.

**Syntax** [no] ip dhcp snooping vlan *name*

**Parameters** *name* Enter the name of a VLAN on which to enable DHCP Snooping.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.8.1.0    | Introduced on the C-Series and S-Series.  |

**Usage Information** When enabled, the system begins creating entries in the binding table for the specified VLANs.

 **NOTE:** Learning only happens if there is a trusted port in the VLAN.

**Related Commands**

- [ip dhcp snooping trust](#) — configure an interface as trusted.

## show ip dhcp snooping

Display the contents of the DHCP binding table.

**Syntax** show ip dhcp snooping binding

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Role-Based Access Control Commands

With Role-Based Access Control (RBAC), access and authorization is controlled based on a user's role. Users are granted permissions based on their user roles, not on their individual user ID. User roles are created for job functions and through those roles they acquire the permissions to perform their associated job function.

This section describes the syntax and usage of RBAC-specific commands. You can find information on other related security commands in this chapter:

- [aaa accounting](#)
- [aaa authentication login](#)
- [aaa authorization commands](#)
- [authorization](#)
- [show accounting](#)
- [show users](#)
- [username](#)

### aaa authorization role-only

Configure authentication to use the user's role only when determining if access to commands is permitted.

|                        |                                                                                                                                                               |                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>aaa authorization role-only</code>                                                                                                                      |                                                                                                                                                             |
|                        | To return to the default setting, use the <code>no aaa authentication role-only</code> command.                                                               |                                                                                                                                                             |
| <b>Parameters</b>      | <b><i>name</i></b>                                                                                                                                            | Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator). |
|                        | <b><i>inherit existing-role-name</i></b>                                                                                                                      | Enter the <code>inherit</code> keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).        |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                                                                                                                             |

| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5(0.0)   | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

### Usage Information

By default, access to commands are determined by the user's role (if defined) or by the user's privilege level. If the `aaa authorization role-only` command is enabled, then only the user's role is used.

Before you enable role-based only AAA authorization:

1. Locally define a system administrator user role. This will give you access to login with full permissions even if network connectivity to remote authentication servers is not available.
2. Configure login authentication on the console. This ensures that all users are properly identified through authentication no matter the access point
3. Specify an authentication method (RADIUS, TACACS+, or Local).
4. Specify authorization method (RADIUS, TACACS+ or Local).
5. Verify the configuration has been applied to the console or VTY line.

### Related Commands

login authentication, password, radius-server host, tacacs-server host

## role

Changes command permissions for roles.

### Syntax

```
role mode { { addrole | deleterole } role-name } | reset } command
```

To delete access to a command, use the `no role mode role-name`

### Parameters

|                   |                                                                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mode</b>       | Enter one of the following keywords as the mode for which you are controlling access:<br>configure for CONFIGURATION mode<br>exec for EXEC mode<br>interface for INTERFACE modes<br>line for LINE mode<br>route-map for Route-map mode<br>router for Router mode |
| <b>addrole</b>    | Enter the keyword <code>addrole</code> to add permission to the command. You cannot add or delete rights for the <code>sysadmin</code> role.                                                                                                                     |
| <b>deleterole</b> | Enter the keyword <code>deleterole</code> to remove access to the command. You cannot add or delete rights for the <code>sysadmin</code> role.                                                                                                                   |
| <b>role-name</b>  | Enter a text string for the name of the user role up to 63 characters. These are 3 system defined roles you can modify: <code>secadmin</code> , <code>netadmin</code> , and <code>netoperator</code> .                                                           |
| <b>reset</b>      | Enter the keyword <code>reset</code> to reset all roles back to default for that command.                                                                                                                                                                        |
| <b>command</b>    | Enter the command's keywords to assign the command to a certain access level. You can enter one or more keywords.                                                                                                                                                |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none                                                                                                                                                          |

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.5(0.0)   | Introduced on the Z9000, S6000, S4820T, S4810, MXL |

### Examples

```
DelleMC# show role mode configure username
Role access: sysadmin

DelleMC# show role mode configure management route
Role access: netadmin, sysadmin

DelleMC# show role mode configure management crypto-policy
Role access: secadmin, sysadmin
```

### Related Commands

- [userrole](#) — create user roles.

## show userroles

Display information on all defined user roles.

**Syntax** `show userroles`

### Example

```
DelleMC# show userroles
Role Inheritance Modes
netoperator
netadmin Exec Config Interface Line Router IP
Route-map Protocol MAC
secadmin Exec Config
sysadmin Exec Config Interface Line Router IP
Route-map Protocol MAC
netoperator
testadmin netadmin Exec Config Interface Line Router IP
Route-map Protocol MAC
```

**Command Modes** EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                         |
|------------|-----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.           |
| 9.10(0.0)  | Introduced on the S3148.                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                         |
| 9.8(2.0)   | Introduced on the S3100 series.                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                         |
| 9.5(0.1)   | Introduced on the Z9500.                            |
| 9.5(0.0)   | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

## Example

```
DellEMC# show userroles
Role Inheritance Modes
netoperator
netadmin Exec
 Exec Config Interface Line Router IP
 Route-map Protocol MAC
secadmin Exec Config
sysadmin Exec Config Interface Line Router IP
 Route-map Protocol MAC
netoperator
testadmin netadmin Exec Config Interface Line Router IP
 Route-map Protocol MAC
```

## Related Commands

- [userrole](#) — create user roles.

# userrole

Create user roles for the role-based security model.

## Syntax

```
userrole name inherit existing-role-name
```

To delete a role name, use the `no userrole name` command. Note that the reserved role names may not be deleted.

## Parameters

- name*** Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator).
- inherit existing-role-name*** Enter the `inherit` keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).

## Defaults

none

## Command Modes

| 9.8(0.0P5) | Introduced on the S4048-ON.                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                         |
| 9.5(0.1)   | Introduced on the Z9500.                            |
| 9.5(0.0)   | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

## Usage Information

Instead of using the system defined user roles, you can create a new user role that best matches your organization. When you create a new user role, you first inherit permissions from one of the system defined roles. Otherwise you would have to create a user role from scratch. You then restrict commands or add commands to that role. For information about this topic, See *Modifying Command Permissions for Roles*.

 **NOTE:** You can change user role permissions on system pre-defined user roles or user-defined user roles.

### Important Points to Remember

Consider the following when creating a user role:

- Only the system administrator and user-defined roles inherited from the system administrator can create roles and usernames. Only the system administrator, security administrator, and roles inherited from these can use the `role` command to modify command permissions. The security administrator and roles inherited by security administrator can only modify permissions for commands they already have access to.
- Make sure you select the correct role you want to inherit.

**NOTE:** If you inherit a user role, you cannot modify or delete the inheritance. If you want to change or remove the inheritance, delete the user role and create it again. If the user role is in use, you cannot delete the user role.

`role mode { { { addrole | deleterole } role-name } | reset } command` – Modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

### Related Commands

- `role mode { { { addrole | deleterole } role-name } | reset } command` — modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

## ICMP Vulnerabilities

The internet control message protocol (ICMP) is a network-layer internet protocol that provides message packets to report errors and other information regarding IP packet processing back to the source. Dell EMC Networking OS mainly addresses the following ICMP vulnerabilities:

- ICMP Mask Reply
- ICMP Timestamp Request
- ICMP Replies
- IP ID Values Randomness

You can configure the Dell EMC Networking OS to drop ICMP reply messages. When you configure the `drop icmp` command, the system drops the ICMP reply messages from the front end and management interfaces. By default, the Dell EMC Networking OS responds to all the ICMP messages. You can configure the Dell EMC Networking OS to suppress the following ICMPv4 and ICMPv6 message types:

**Table 7. Suppressed ICMPv4 message types**

| ICMPv4 Message Types                         |
|----------------------------------------------|
| Echo reply (0)                               |
| All sub types of destination unreachable (3) |
| Source quench (4)                            |
| Redirect (5)                                 |
| Router advertisement (9)                     |
| Router solicitation (10)                     |
| Time exceeded (11)                           |
| IP header bad (12)                           |
| Timestamp request (13)                       |
| Timestamp reply (14)                         |
| Information request (15)                     |
| Information reply (16)                       |
| Address mask request (17)                    |

**Table 7. Suppressed ICMPv4 message types (continued)**

| ICMPv4 Message Types    |
|-------------------------|
| Address mask reply (18) |

**NOTE:** The Dell EMC Networking OS does not suppress the ICMPv4 message type `Echo request (8)`.

**Table 8. Suppressed ICMPv6 message types**

| ICMPv6 Message Types        |
|-----------------------------|
| Destination unreachable (1) |
| Time exceeded (3)           |
| IPv6 header bad (4)         |
| Echo reply (129)            |
| Who are you request (139)   |
| Who are you reply (140)     |
| Mtrace response (200)       |
| Mtrace messages (201)       |

**NOTE:**

The Dell EMC Networking OS does not suppress the following ICMPv6 message types:

- Packet too big (2)
- Echo request (128)
- Multicast listener query (130)
- Multicast listener report (131)
- Multicast listener done (132)
- Router solicitation (133)
- Router advertisement (134)
- Neighbor solicitation (135)
- Neighbor advertisement (136)
- Redirect (137)
- Router renumbering (138)
- MLD v2 listener report (143)
- Duplicate Address Request (157)
- Duplicate Address Confirmation (158)

## drop icmp

Drops the ICMPv4 and ICMPv6 packets.

**Syntax** `drop {icmp | icmp6}`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other Platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version  | Description                                                                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.11.0.0 | Introduced on the S4810, S4820T, S3048-ON, S3100 Series, S4048-ON, S5000, S6000, S6000-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON, S4048T-ON, C9000, and MXL. |

## Usage Information

When the `drop icmp` feature is configured, the system drops the ICMP reply messages on the front end and management interfaces. By default, the Dell EMC Networking OS responds to all the ICMP messages.

 **NOTE:** There is no separate CLI to enable IP ID randomness. By default, the IP ID in the kernel is randomized.

For more information on the ICMP message types, see the [ICMP Commands](#) section.

# System Security Commands

The following section lists the system security commands.

## boot-access password

Set a password for the boot loader.

### Syntax

```
boot-access password [encryption-type] boot-password
```

To remove the GRUB access password, use the `no boot-access password` command.

### Parameters

**encryption-type** (OPTIONAL) Enter an encryption type for the boot password.

- 0 directs the system to store the password as clear text.
- 7 directs the system to store the password with a dynamic salt.

**boot-password** Enter the boot access password.

### Defaults

None

### Command Modes

CONFIGURATION.

### Command History

| Version   | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                          |
| 9.14(0.0) | Introduced on the S5048F-ON.                                                                 |
| 9.13(0.0) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

## Usage Information

If you enable the boot access password, the system prompts for a password when you access any option on the boot screen.

When you configure the boot access password, ensure that your password meets the following criteria:

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !"#%&'()\*+,-./:;<=>@[\\]^\_`{|}~")

If your password does not meet the criteria, the system does not accept your password.

When you upgrade the Dell EMC Networking OS image, ensure that you upgrade the boot loader.

 **CAUTION:** After configuring the boot access password, save it to a secure location. If you forget it, you will not be able to access the options in the startup menu. If you forget both the boot access password and the enable password, the system may become inaccessible.

### Example

```
DellEMC(conf) #boot-access password 7 Hg$7^5HMoiY%

```

```

 * Warning - boot-access password will enable password protection
in *
 * GRUB. Keep it safe. Forgetting this password and the CLI
password *
 * may result in switch becoming
inaccessible. *

Do you want to configure boot-access password? Proceed [yes/no]:yes
DellEMC(conf)#

```

## generate hash

Generate a hash checksum for the given file or the startup configuration using the MD5, SHA1, or SHA256 algorithm.

|                          |                                                                                                                                                                                      |                                                                                                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            | <code>generate hash {md5   sha1   sha256} {flash://filename   startup-config}</code>                                                                                                 |                                                                                                                                                                      |
| <b>Parameters</b>        | <b>md5   sha1   sha256</b>                                                                                                                                                           | Enter the keyword <code>md5</code> , <code>sha1</code> , or <code>sha256</code> to generate .                                                                        |
|                          | <b>flash://filename</b>                                                                                                                                                              | Enter the keyword <code>flash:</code> and enter the filename to generate the hash checksum for any file in the flash drive using the MD5, SHA1, or SHA256 algorithm. |
|                          | <b>startup-config</b>                                                                                                                                                                | Enter the keyword <code>shartup-config</code> to generate the hash checksum for the startup configuration using the MD5, SHA1, or SHA256 algorithm.                  |
| <b>Defaults</b>          | None                                                                                                                                                                                 |                                                                                                                                                                      |
| <b>Command Modes</b>     | EXEC Privilege                                                                                                                                                                       |                                                                                                                                                                      |
| <b>Command History</b>   | <b>Version</b>                                                                                                                                                                       | <b>Description</b>                                                                                                                                                   |
|                          | <b>9.14(1.0)</b>                                                                                                                                                                     | Introduced on the S4810 and S4820T.                                                                                                                                  |
|                          | <b>9.14(0.0)</b>                                                                                                                                                                     | Introduced on the S5048F-ON.                                                                                                                                         |
|                          | <b>9.13(0.0)</b>                                                                                                                                                                     | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM.                  |
| <b>Usage Information</b> | Use the <code>generate hash</code> command to generate a hash checksum for your startup configuration, and use the hash to verify using the <code>verified boot hash</code> command. |                                                                                                                                                                      |

### Example

```

DellEMC#generate hash md5 startup-config
MD5SUM(/f10/flash/startup-config) : f81812a64eea202c5b2ef782639bafc3

```

## root-access password

Configure the root access password.

|               |                                                                                         |
|---------------|-----------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>root-access password [encryption-type] root-password</code>                       |
|               | To reset to the default password, use the <code>no root-access password</code> command. |

|                   |                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>encryption-type</b> (OPTIONAL) Enter an encryption type for the root password that you enter.                                                                                                                                                                                                                          |
|                   | <ul style="list-style-type: none"> <li>• 0 directs the system to store the password as clear text.</li> <li>• 7 directs the system to store the password with a dynamic salt.</li> <li>• 9 directs the system to encrypt the clear text password and store the encrypted password in an inaccessible location.</li> </ul> |

**root-password** Enter the root password.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History**

| Version   | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                                 |
| 9.14(0.0) | Introduced on the S5048F-ON.                                                                                                                        |
| 9.13(0.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM. |

**Usage Information**

If you configure the `secure-cli` command on the system, the Dell EMC Networking OS resets any previously-configured root access password to the default root password without displaying any warning message. With the `secure-cli` command enabled on the system, the CONFIGURATION mode does not display the `root access password` option.

When you configure the root access password, ensure that your password meets the following criteria:

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !"#\$\$%&'()\*+,-./:;<=>@[\\]^\_`{|}~")

If your password does not meet the criteria, the system does not accept your password.

If you use encryption type 9, the system stores the clear text password in an inaccessible location on the system. The `show running-configuration` command does not display the password. This configuration is not portable between different systems.

**Example**

```
DellEMC)# show running-config | g root
root-access password 7
f4dc0cb9787722dd1084d17f417f164cc7f730d4f03d4f0215294cbd899614e3
```

## verified boot

Enable OS image hash validation during system startup.

**Syntax** `verified boot`

To disable OS image hash validation, use the `no verified boot` command.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History**

| Version   | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                   |
| 9.14(0.0) | Introduced on the S5048F-ON.                                                                                                          |
| 9.13(0.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, MXL, and FN-IOM. |

**Usage Information**

When you reboot the system using the `reload` command, the system performs OS image verification on the primary boot image. You can enable boot image hash validation only for images on local flash partitions such as A: or B:.

## Example

```
DellEMC(config)# verified boot
```

## verified boot hash

Verify and store the hash value of the startup configuration.

**Syntax** `verified boot hash {system-image {A: | B:} | startup-config} hash value`

**Parameters**

**system-image {A: | B:}** Enter the keyword `system-image` and `A:` or `B:`, depending on where the image is stored and then the hash value that is present on the iSupport page for your image.

**startup-config** Enter the keyword `startup-config` and then the hash value for the startup configuration. You can get the hash value for the startup configuration using the `generate hash` command.

**hash value** Enter the MD5, SHA1, or SHA256 hash.

**Defaults** None

**Command Modes** EXEC Privilege

### Command History

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                                 |
| 9.14(0.0) | Introduced on the S5048F-ON.                                                                                                                        |
| 9.13(0.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM. |

**Usage Information** Dell EMC Networking OS supports MD5, SHA1, and SHA256.

## Example

```
DellEMC# verified boot hash system-image A:
619A8C1B7A2BC9692A221E2151B9DA9E
```

## verified startup-config

Enable hash validation for the startup configuration during system startup.

**Syntax** `verified startup-config`

To disable hash validation for the startup configuration, use the `no verified startup-config` command.

**Defaults** Not configured

**Command Modes** CONFIGURATION

| Version   | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                                 |
| 9.14(0.0) | Introduced on the S5048F-ON.                                                                                                                        |
| 9.13(0.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM. |

**Example**

```
DellEMC(config)# verified startup-config
```

# Service Provider Bridging

Service provider bridging is composed of virtual local area network (VLAN) Stacking, Layer 2 Protocol Tunneling, and Provider Backbone Bridging as described in the *Dell EMC Networking OS Configuration Guide Service Provider Bridging* section.

This section includes command line information (CLI) for the Dell EMC Networking OS Layer 2 Protocol Tunneling (L2PT). L2PT enables protocols to tunnel through an 802.1q tunnel.

Dell EMC Networking OS supports L2PT on Dell EMC Networking OS.

For more information, see [VLAN Stacking](#), [Spanning Tree Protocol \(STP\)](#), and [GARP VLAN Registration \(GVRP\)](#).

## Important Points to Remember

- L2PT is enabled at the interface VLAN-Stack VLAN level. For more information about Stackable VLAN (VLAN-Stacking) commands, see [VLAN Stacking](#).
- The default behavior is to disable protocol packet tunneling through the 802.1q tunnel.
- Rate-limiting is required to protect against bridge protocol data units (BPDU) attacks.
- A port channel (including through link aggregation control protocol [LACP]) can be configured as a VLAN-Stack access or trunk port.
- Address resolution protocol (ARP) packets work as expected across the tunnel.
- Far-end failure detection (FEFD) works the same as with Layer 2 links.
- Protocols that use Multicast MAC addresses (for example, open shortest path first [OSPF]) work as expected and carry over to the other end of the VLAN-Stack VLAN.

## debug protocol-tunnel

Enable debugging to ensure incoming packets are received and rewritten to a new MAC address.

**Syntax** `debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]`

To disable debugging, use the `no debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]` command.

### Parameters

#### interface

Enter one of the following interfaces and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

|                            |                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>in   out   both</b>     | Enter the keyword <code>in</code> , <code>out</code> , or <code>both</code> to debug incoming interfaces, outgoing interfaces, or both incoming and outgoing interfaces. |
| <b>vlan <i>vlan-id</i></b> | Enter the keyword <code>vlan</code> then the VLAN ID. The range is from 1 to 4094.                                                                                       |
| <b>count <i>value</i></b>  | Enter the keyword <code>count</code> then the number of debug outputs. The range is from 1 to 100.                                                                       |

**Defaults** Debug disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.5.1.0</b>    | Added support for 4-port 40G line cards.  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.2.1.0</b>    | Introduced on the C-Series, and E-Series. |
| <b>7.4.1.0</b>    | Introduced                                |

## protocol-tunnel

Enable protocol tunneling on a stacked (Q-in-Q) VLAN for specified protocol packets.

**Syntax** `protocol-tunnel {rate-limit rate | stp}`

To disable protocol tunneling for a Layer 2 protocol, use the `no protocol-tunnel` command.

**Parameters**

|                               |                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rate-limit <i>rate</i></b> | Enter the keyword <code>rate-limit</code> followed by a number for the rate-limit for tunneled packets on the VMAN. The range is from 64 to 320. |
| <b>stp</b>                    | Enter the keyword <code>stp</code> to enable protocol tunneling on a spanning tree, including STP, MSTP, RSTP, and PVST.                         |

**Defaults** none

**Command Modes** CONF-IF-VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                              |
| 9.10(0.0)  | Introduced on the S3148.                                                                                               |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                            |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                            |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                            |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                               |
| 9.0.2.0    | Introduced on the S6000.                                                                                               |
| 8.3.11.1   | Introduced on the Z9000.                                                                                               |
| 8.5.1.1    | Added support for 802.1X, E-LMI, GMRP, GVRP, LLDP, LACP, MMRP, MVRP, and OAM 802.3ah protocol traffic to the E-Series. |
| 8.2.1.0    | Introduced on the C-Series, E-Series, and E-Series.                                                                    |
| 7.4.1.0    | Introduced                                                                                                             |

### Example

```
DelleMC# conf
DelleMC(conf)#interface vlan 2
DelleMC(conf-if-vl-2)#vlan-stack compatible
DelleMC(conf-if-vl-2)#member Te 1/2/1-3
DelleMC(conf-if-vl-2)#protocol-tunnel stp
DelleMC(conf-if-vl-2)#protocol-tunnel enable
```

### Related Command

- [show protocol-tunnel](#) — displays tunneling information for all VLANs.

## protocol-tunnel destination-mac

Overwrite the BPDU destination MAC address with a specific value.

**Syntax** `protocol-tunnel destination-mac xstp address`

**Parameters** **stp** Change the default destination MAC address used for L2PT to another value.

**Defaults** The default destination MAC is 01:01:e8:00:00:00.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.               |
| 9.2(1.0) | Introduced on the Z9500.                  |
| 9.0.2.0  | Introduced on the S6000.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 8.2.1.0  | Introduced on the C-Series, and S-Series. |
| 7.4.1.0  | Introduced                                |

**Usage Information**

When you enable VLAN-Stacking, no protocol packets are tunneled.

**Related Command**

- [show protocol-tunnel](#) — displays tunneling information for all VLANs.

## protocol-tunnel enable

Enable protocol tunneling globally on the system.

**Syntax**

`protocol-tunnel enable`

To disable protocol tunneling, use the `no protocol-tunnel enable` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.4.1.0    | Introduced                                |

**Usage Information**

Dell EMC Networking OS must have the default CAM profile with the default microcode before you enable L2PT.

# protocol-tunnel rate-limit

Enable traffic rate limiting per box.

**Syntax** `protocol-tunnel rate-limit rate`  
To reset the rate limit to the default, use the `no protocol-tunnel rate-limit rate` command.

**Parameters** *rate* Enter the rate in frames per second. The range is from 75 to 3000. The default is **75**.

**Defaults** 75 frames per second.

**Command Modes** CONF-IF-VLAN-STACK

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.0)  | Introduced on the S3148.                                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                                           |
| 8.3.19.0   | Introduced on the S4820T.                                                                          |
| 8.3.11.1   | Introduced on the Z9000.                                                                           |
| 8.3.7.0    | Introduced on the S4810.                                                                           |
| 8.2.1.0    | Introduced on the C-Series and E-Series. Maximum rate limit on E-Series reduced from 4000 to 3000. |
| 7.4.1.0    | Introduced                                                                                         |

## Example

```
DellEMC(conf-if-vl-2)# vlan-stack compatible
DellEMC(conf-if-vl-2-stack)#protocol-tunnle rate-limit 100 <<<<<<<< VLAN
stack mode
DellEMC(conf-if-vl-2-stack)#show config
!
interface Vlan 2
 no ip address
 mtu 1000
 vlan-stack compatible
 protocol-tunnel rate-limit 100
 shutdown
```

- Related Commands**
- [show protocol-tunnel](#) — displays tunneling information for all VLANs.
  - [show running-config](#) — displays the current configuration.

# show protocol-tunnel

Display protocol tunnel information for all or a specified VLAN-Stack VLAN.

|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show protocol-tunnel [vlan <i>vlan-id</i>]</code>                                                                                                       |                                                                                                                                       |
| <b>Parameters</b>      | <b>vlan <i>vlan-id</i></b>                                                                                                                                    | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display information for the one VLAN. The range is from 1 to 4094. |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                                                                                                       |
| <b>Command Modes</b>   | EXEC                                                                                                                                                          |                                                                                                                                       |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                                                       |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.2.1.0</b>    | Introduced on the C-Series, and E-Series. |
| <b>7.4.1.0</b>    | Introduced                                |

## Example

```
DellEMC# show protocol-tunnel
System Rate-Limit: 75 frames/second
VLAN Protocols Interface
1000 STP,PVST Te 5/7/1,Te 5/6/1
1001 LLDP,GVRP Te 5/7/1,Te 5/6/1
1002 MMRP,MVRP Te 5/7/1,Te 5/6/1
1003 LACP,DOT1X Te 5/7/1,Te 5/6/1
1004 OAM,PAUSE Te 5/7/1,Te 5/6/1
1005 E-LMI Te 5/7/1,Te 5/6/1
```

## Example (Specific VLAN)

```
DellEMC# show protocol-tunnel vlan 2
System Rate-Limit: 1000 Frames/second
Interface Vlan Protocol(s)
Te1/2/1 2 STP, PVST
DellEMC#
```

## Related Commands

- [show running-config](#) — displays the current configuration.

The Dell EMC Networking OS supports sFlow commands.

The Dell EMC Networking OS sFlow monitoring system includes an sFlow Agent and an sFlow Collector.

- The sFlow Agent combines the flow samples and interface counters into sFlow datagrams and forwards them to the sFlow Collector.
- The sFlow Collector analyses the sFlow Datagrams received from the different devices and produces a network-wide view of traffic flows.

## Important Points to Remember

- Dell EMC Networking recommends that the sFlow Collector be connected to the Dell EMC Networking chassis through a line card port rather than the route processor module (RPM) Management Ethernet port.
- Dell EMC Networking OS exports all sFlow packets to the sFlow Collector. A small sampling rate can equate to many exported packets. A backoff mechanism is automatically applied to reduce this amount. Some sampled packets may be dropped when the exported packet rate is high and the backoff mechanism is about to or is starting to take effect. The dropEvent counter, in the sFlow packet, is always zero.
- sFlow sampling is done on a per-port basis.
- Community list and local preference fields are not filled up in the extended gateway element in the sFlow datagram.
- The 802.1P source priority field is not filled up in the extended switch element in the sFlow datagram.
- Only Destination and Destination Peer AS numbers are packed in the dst-as-path field in the extended gateway element.
- If the packet being sampled is redirected using policy-based routing (PBR), the sFlow datagram may contain incorrect extended gateway/router information.
- sFlow does not support packing extended information for IPv6 packets. Only the first 128 bytes of the IPv6 packet is shipped in the datagram.
- The source virtual local area network (VLAN) field in the extended switch element is not packed if there is a routed packet.
- The destination VLAN field in the extended switch element is not packed if there is a multicast packet.
- The maximum number of packets that can be sampled and processed per second is:
  - 7500 packets when no extended information packing is enabled.
  - 7500 packets when only extended-switch information packing is enabled (see [sflow extended-switch enable](#)).

# sflow collector

Configure a collector device to which sFlow datagrams are forwarded.

**Syntax** `sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]`

To delete a configured collector, use the `no sflow collector {ip-address | ipv6-address} agent-addr {ipv4-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]` command.

|                   |                                                  |                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>sflow collector ip-address   ipv6-address</b> | Enter the IP address of the collector in dotted decimal format for IPv4 or x:x:x:x format for IPv6.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.                                            |
|                   | <b>agent-addr ip-address   ipv6-address</b>      | Enter the keyword <code>agent-addr</code> followed by the sFlow agent IP address in dotted decimal format for IPv4 or x:x:x:x format for IPv6.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros. |
|                   | <b>number</b>                                    | (OPTIONAL) Enter the user datagram protocol (UDP) port number. The range is from 0 to 65535. The default is 6343.                                                                                                                                                                                                  |
|                   | <b>max-datagram-size number</b>                  | (OPTIONAL) Enter the keyword <code>max-datagram-size</code> then the size number in bytes. The range is from 400 to 1500. The default is <b>1400</b> .                                                                                                                                                             |
|                   | <b>vrf management</b>                            | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the keyword <code>management</code> to configure the collector device corresponding to the default VRF and the management VRF respectively.                                                                                                              |

**Defaults** Not configured.

| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                 |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                                                      |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                    |
| <b>8.4.2.3</b>    | Added support for IPv6 sFlow collectors and agents on the E-series, C-Series, and S-Series. |
| <b>8.4.1.1</b>    | Added support for IPv6 sFlow collectors and agents on the E-series.                         |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                    |

| Version | Description                                                                              |
|---------|------------------------------------------------------------------------------------------|
| 8.2.1.0 | Introduced S-Series Stacking.                                                            |
| 8.1.1.0 | Introduced on the E-Series.                                                              |
| 7.7.1.0 | Introduced on the S-Series.                                                              |
| 7.6.1.0 | Introduced on the C-Series.                                                              |
| 6.5.1.0 | Expanded the <code>no</code> form of the command to mirror the syntax used to configure. |
| 6.2.1.1 | Introduced on the E-Series.                                                              |

### Usage Information

You can configure up to two sFlow collectors (IPv4 or IPv6). If two collectors are configured, traffic samples are sent to both.

The sFlow agent address is carried in a field in SFlow packets and is used by the collector to identify the sFlow agent.

In sFlow, the agent address is a single invariant IPv4 or IPv6 address used to identify the agent to the collector. It is usually assigned the address of a loopback interface on the agent, which provides invariance. The agent address is carried as a field in the payload of the sFlow packets.

As part of the sFlow-MIB, if the SNMP request originates from a configured collector, Dell EMC Networking OS returns the corresponding configured agent IP in the MIB requests. Dell EMC Networking OS checks to ensure that two entries are not configured for the same collector IP with a different agent IP. Should that happen, Dell EMC Networking OS generates the following error: `%Error: Different agent-addr attempted for an existing collector.`

### Example

```
DellEMC(conf)# sflow collector 10.1.1.25 agent-addr 10.1.1.10 vrf
management
```

## sflow enable (Global)

Enable sFlow globally.

**Syntax** `sflow enable`  
To disable sFlow, use the `no sflow enable` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version  | Description                   |
|----------|-------------------------------|
| 8.3.19.0 | Introduced on the S4820T.     |
| 8.3.11.1 | Introduced on the Z9000.      |
| 8.3.7.0  | Introduced on the S4810.      |
| 8.2.1.0  | Introduced S-Series Stacking. |
| 8.1.1.0  | Introduced on the E-Series.   |
| 7.7.1.0  | Introduced on the S-Series.   |
| 7.6.1.0  | Introduced on the C-Series.   |
| 6.2.1.1  | Introduced on the E-Series.   |

**Usage Information**

sFlow is disabled by default. In addition to this command, sFlow needs to be enable on individual interfaces where sFlow sampling is desired.

**Related Commands**

- [sflow enable \(Interface\)](#) — enable sFlow on interfaces.

## sflow enable (Interface)

Enable sFlow egress on interfaces.

**Syntax** `sflow enable`  
 To disable sFlow, use the `no sflow enable` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                  |
|-----------|------------------------------|
| 9.11(0.0) | Introduced on all platforms. |

**Usage Information** sFlow is disabled by default.

## sflow ingress-enable

Enable sFlow ingress on interfaces.

**Syntax** `sflow ingress-enable`  
 To disable sFlow, use the `no sflow ingress enable` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|------------|-------------------------------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series.                       |
| 9.8(1.0)   | Introduced on the Z9100-ON.                           |
| 9.8(0.0P5) | Introduced on the S4048-ON.                           |
| 9.8(0.0P2) | Introduced on the S3048-ON.                           |
| 9.7(0.0)   | Introduced on the S6000-ON.                           |
| 9.7(0.0)   | Introduced on the S-Series, Z-Series, and MXL switch. |
| 9.2(1.0)   | Introduced on the Z9500.                              |

**Usage Information**

When you enable ingress sFlow on an interface, flow sampling is done on any incoming traffic.   
 **NOTE:** After a physical port is a member of a LAG, it inherits the sFlow configuration from the LAG port.

**Related Commands**

- [sflow enable \(Global\)](#) — turn sFlow globally.

## sflow extended-switch enable

Enable packing information on a switch only.

**Syntax** `sflow extended-switch enable`  
 To disable packing information, use the `no sflow extended-switch [enable]` command.

**Parameters** **enable** Enter the keyword `enable` to enable global extended information.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.2.1.0    | Introduced on S-Series Stacking.          |
| 8.1.1.0    | Introduced on the E-Series.               |

| Version | Description                 |
|---------|-----------------------------|
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

**Usage Information**

Dell EMC Networking OS enhances the sflow implementation for real time traffic analysis on the E-Series to provide extended gateway information in cases where the destination IP addresses are learned by different routing protocols and for cases where the destination is reachable over ECMP.

**Related Commands**

- [show sflow](#) — displays the sFlow configuration.

## sflow max-header-size extended

Set the maximum header size of a packet to 256 bytes.

**Syntax** `sflow max-header-size extended`  
 To reset the maximum header size of a packet, use the `[no] sflow max-header-size extended` command.

**Parameters** **extended** Enter the keyword `extended` to copy 256 bytes from the sample packets to sFlow datagram.

**Defaults** 128 bytes

**Command Modes** CONFIGURATION  
 INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                       |
|------------|---------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.         |
| 9.10(0.0)  | Introduced on the S3148.                          |
| 9.10(0.0)  | Introduced on the S6100-ON.                       |
| 9.8(2.0)   | Introduced on the S3100 series.                   |
| 9.8(1.0)   | Introduced on the Z9100-ON.                       |
| 9.8(0.0P5) | Introduced on the S4048-ON.                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                       |
| 9.7(0.0)   | Introduced on the S6000-ON.                       |
| 9.7(0.0)   | Introduced on the S Series and Z Series switches. |

**Example**

```
DellEMC(conf)# sflow max-header-size extended
```

## sflow polling-interval (Global)

Set the sFlow polling interval at a global level.

**Syntax** `sflow polling-interval interval value`  
 To return to the default, use the `no sflow polling-interval interval` command.

**Parameters** *interval value* Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is **20 seconds**.

**Defaults** **20 seconds**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.2.1.0</b>    | Introduced on S-Series Stacking.          |
| <b>8.1.1.0</b>    | Introduced on the E-Series.               |
| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.6.1.0</b>    | Introduced on the C-Series.               |
| <b>7.4.1.0</b>    | Introduced on the E-Series.               |

**Usage Information** The polling interval for an interface is the maximum number of seconds between successive samples of counters sent to the collector. This command changes the global default counter polling (20 seconds) interval. You can configure an interface to use a different polling interval.

**Related Commands**

- [sflow polling-interval \(Interface\)](#) — sets the polling interval for an interface.

## sflow polling-interval (Interface)

Set the sFlow polling interval at an interface (overrides the global-level setting.)

**Syntax** `sflow polling-interval interval value`  
To return to the default, use the `no sflow polling-interval interval` command.

**Parameters** *interval value* Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is **the global counter polling interval**.

**Defaults** The same value as the current global default counter polling interval.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 7.6.1.0    | Introduced on the C-Series.               |
| 7.4.1.0    | Introduced on the E-Series.               |

#### Usage Information

This command sets the counter polling interval for an interface.

#### Related Commands

- [sflow polling-interval \(Global\)](#) — globally sets the polling interval.

## sflow sample-rate (Global)

Change the global default sampling rate.

#### Syntax

```
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

#### Parameters

**value** Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, and so on. The default is **32768 packets**.

#### Defaults

**32768 packets**

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |

| <b>8.3.7.0</b>    | Introduced on the S4810.         |
| <b>8.2.1.0</b>    | Introduced on S-Series Stacking. |
| <b>8.1.1.0</b>    | Introduced on the E-Series.      |
| <b>7.7.1.0</b>    | Introduced on the S-Series.      |
| <b>7.6.1.0</b>    | Introduced on the C-Series.      |
| <b>7.4.1.0</b>    | Introduced on the E-Series.      |

#### Usage Information

Sample-rate is the average number of packets skipped before the sample is taken. This command changes the global default sampling rate. You can configure an interface to use a different sampling rate than the global sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power of 2 value. Select one of these two packet numbers and re-enter the command.

#### Related Commands

- [sflow sample-rate \(Interface\)](#) — changes the interface sampling rate.

## sflow sample-rate (Interface)

Change the interface default sampling rate.

#### Syntax

```
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

#### Parameters

**value** Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, etc. The default is **32768** packets.

#### Defaults

The Global default sampling.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |

| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version    | Description                      |
|------------|----------------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON.      |
| 9.7(0.0)   | Introduced on the S6000-ON.      |
| 9.2(1.0)   | Introduced on the Z9500.         |
| 9.0.2.0    | Introduced on the S6000.         |
| 8.3.19.0   | Introduced on the S4820T.        |
| 8.3.11.1   | Introduced on the Z9000.         |
| 8.3.7.0    | Introduced on the S4810.         |
| 8.2.1.0    | Introduced on S-Series Stacking. |
| 8.1.1.0    | Introduced on the E-Series.      |
| 7.7.1.0    | Introduced on the S-Series.      |
| 7.6.1.0    | Introduced on the C-Series.      |
| 6.2.1.1    | Introduced on the E-Series.      |

### Usage Information

This command changes the sampling rate for an interface. By default, the sampling rate of an interface is set to the same value as the current global default sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power-of-2 value. Select one of these two number and re-enter the command.

### Related Commands

- [sflow sample-rate \(Global\)](#) — changes the sampling rate globally.

## show sflow

Display the current sFlow configuration.

**Syntax** `show sflow [interface]`

### Parameters

- interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface on the, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

- Command Modes**
- EXEC
  - EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

| <b>7.6.1.0</b>    | Introduced on the C-Series.      |
| <b>6.2.1.1</b>    | Introduced on the E-Series.      |

### Usage Information

The dropEvent counter (sFlow samples dropped due to sub-sampling) shown in the following example always displays a value of zero.

### Example

```
DellEMC#show sflow
sFlow services are enabled
Egress Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collectors configured
Collector IP addr: 100.1.1.1, Agent IP addr: 1.1.1.2, UDP port: 6343
VRF: Default
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected

stack-unit 1 Port set 1
 Te 1/1/1: configured rate 16384, actual rate 16384 <<< sampling rate
based on line speed if global sampling rate is default
DellEMC#
```

# Simple Network Management Protocol (SNMP) and Syslog

This section contains commands to configure and monitor the simple network management protocol (SNMP) v1/v2/v3 and Syslog. Both features are supported on Dell EMC Networking OS.

## Topics:

- [SNMP Commands](#)
- [Syslog Commands](#)

## SNMP Commands

The following SNMP commands are available in the Dell EMC Networking OS.

The simple network management protocol (SNMP) is used to communicate management information between the network management stations and the agents in the network elements. Dell EMC Networking OS supports SNMP versions 1, 2c, and 3, supporting both read-only and read-write modes. Dell EMC Networking OS sends SNMP traps, which are messages informing an SNMP management system about the network. Dell EMC Networking OS supports up to 16 SNMP trap receivers.

## Important Points to Remember

- Typically, 5-second timeout and 3-second retry values on an SNMP server are sufficient for both LAN and WAN applications. If you experience a timeout with these values, the recommended best practice on Dell EMC Networking switches (to accommodate their high port density) is to increase the timeout and retry values on your SNMP server to the following:
  - SNMP Timeout — greater than 3 seconds.
  - SNMP Retry count — greater than 2 seconds.
- If you want to query an E-Series switch using SNMP v1/v2/v3 with an IPv6 address, configure the IPv6 address on a non-management port on the switch.
- If you want to send SNMP v1/v2/v3 traps from an E-Series using an IPv6 address, use a non-management port.
- SNMP v3 informs are not currently supported with IPv6 addresses.
- If you are using access control lists (ACLs) in an SNMP v3 configuration, group ACL overrides user ACL if the user is part of that group.
- SNMP operations are not supported on a virtual local area network (VLAN).

## show snmp

Display the status of SNMP network elements.

**Syntax**                    `show snmp`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**                    This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version    | Description                     |
|------------|---------------------------------|

| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.0    | Introduced on the S4810.        |
| 7.6.1.0    | Introduced on the S-Series.     |
| 7.5.1.0    | Introduced on the C-Series.     |

#### E-Series legacy command

#### Example

```
DellEMC# show snmp
 32685 SNMP packets input
 0 Bad SNMP version errors
 0 Unknown community name
 0 Illegal operation for community name supplied
 0 Encoding errors
 96988 Number of requested variables
 0 Number of altered variables
 31681 Get-request PDUs
 968 Get-next PDUs
 0 Set-request PDUs
 61727 SNMP packets output
 0 Too big errors (Maximum packet size 1500)
 9 No such name errors
 0 Bad values errors
 0 General errors
 32649 Response PDUs
 29078 Trap PDUs
DellEMC#
```

#### Related Commands

- [snmp-server community](#) — enables the SNMP and set community string.

## show snmp engineID

Display the identification of the local SNMP engine and all remote engines that are configured on the router.

**Syntax** `show snmp engineID`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                     |
|------------|---------------------------------|
| 9.10(0.0)  | Introduced on the S3148.        |
| 9.10(0.0)  | Introduced on the S6100-ON.     |
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.2(1.0)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.11.1   | Introduced on the Z9000.        |
| 8.3.7.0    | Introduced on the S4810.        |
| 7.6.1.0    | Introduced on the S-Series.     |
| 7.5.1.0    | Introduced on the C-Series.     |

### Example

```
DellEMC# show snmp engineID
Local SNMP engineID: 0000178B02000001E80214A8
Remote Engine ID IP-addr Port
80001F88043132333435 172.31.1.3 5009
80001F88043938373635 172.31.1.3 5008
DellEMC#
```

### Related Commands

- [snmp-server engineID](#) — configures local and remote SNMP engines on the router.

## show snmp group

Display the group name, security model, status, and storage type of each group.

**Syntax** `show snmp group`

- Command Modes**
- EXEC
  - EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy command**

**Usage Information**

The following Example displays a group named *ngroup*. The *ngroup* has a security model of version 3 (v3) with authentication (*auth*), the read and notify name is *nview* with no write view name specified, and finally the row status is active.

**Example**

```
DellEMC# show snmp group
groupname: vlv2creadg security model: v1
readview : vlv2cdefault writeview: no write view specified
notifyview: vlv2cdefault context: no context specified
row status: active
DellEMC#
```

**Related Commands**

- [snmp-server group](#) — configures an SNMP server group.

## show snmp supported-mibs

Display the list of SNMP MIBs supported by the platform.

**Syntax** `show snmp supported-mibs`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0) | Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S3100, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON and Z9100-ON. |

| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

### E-Series legacy command

## Example

```
DellEMC#show snmp user
 User name: vlv2creadu
 Engine ID: 0000178B02000001E80214A8
 storage-type: nonvolatile active
 Authentication Protocol: None
 Privacy Protocol: None

DellEMC#
```

## snmp context

Enables you to map a BGP VRF instance within an SNMP context through community mapping in SNMPv2c and SNMPv3.

**Syntax** [no] snmp context [*context name*]

**Parameters** *context name* Enter a unique name for the context.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                       |
|-----------|-----------------------------------|
| 9.14.1.0  | Introduced on S4810 and S4820T.   |
| 9.13(0.0) | Introduced on all DNOS platforms. |

**Usage Information** Use this command to map SNMP context to a VRF instance within a community in SNMPv2c and SNMPv3. The no version of this command turns off this feature.

## snmp context

Configure SNMPv3 context name to map multiple OSPFv3 VRF instances.

**Syntax** `snmp context {context-name}`  
To clear snmp context, use the `no snmp context {context-name}` command.

**Parameters** **context-name** Enter the SNMP context name. The maximum length is 32 alphanumeric characters.

**Defaults** None.

**Command Modes** IPv6 ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6010-ON, S6100-ON, Z9100-ON, Z9500, S6000-ON, C9010, MXL, and FN IOM. |

**Usage Information** Use SNMPv3 context configuration to distinguish between various OSPFv3 VRF instances.

### Example

```
DellEMC(conf-ipv6-router_ospf)#snmp context ospf1
```

```
DellEMC>show runnig-config ospf
!
ipv6 router ospf 10
 router-id 10.10.10.1
 snmp context ospf1
!
DellEMC>
```

## snmp ifmib ifalias long

Display the entire description string through the Interface MIB, which would be truncated otherwise to 63 characters.

**Syntax** `snmp ifmib ifalias long`

**Defaults** Interface description truncated beyond 63 characters.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |

| Version    | Description                 |
|------------|-----------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON. |
| 9.8(0.0P2) | Introduced on the S3048-ON. |
| 9.7(0.0)   | Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.    |
| 9.0.2.0    | Introduced on the S6000.    |
| 8.3.19.0   | Introduced on the S4820T.   |
| 8.3.11.1   | Introduced on the Z9000.    |
| 8.3.7.0    | Introduced on the S4810.    |
| 7.6.1.0    | Introduced on the S-Series. |
| 7.5.1.0    | Introduced on the C-Series. |
| unknown    | Introduced on the E-Series. |

### Example

```
DelleMC#config!-----command run on host connected to switch:
-----!
> snmpwalk -c public 10.10.10.130 .1.3.6.1.2.1.31 | grep -i alias | more
IF-MIB::ifAlias.134530304 = STRING: This is a port connected to Router2.

This is a
port connected to Router2. This is a port connected to Router2.
IF-MIB::ifAlias.134792448 = STRING:
DelleMC#config
```

## snmp-server community

Configure a new community string access for SNMPv1 v2 and v3.

### Syntax

```
snmp-server community community-name {ro | rw} [ipv6 ipv6-access-list-name
[ipv6 ipv6-access-list-name | access-list-name | security-name name] |
security-name name [ipv6 ipv6-access-list-name | access-list-name |
security-name name] | access-list-name [ipv6 ipv6-access-list-name |
access-list-name | security-name name]]]
```

To remove access to a community, use the `no snmp-server community community-string {ro | rw} [security-name name [access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]]` command.

### Parameters

- community-name*** Enter a text string (up to 20 characters long) to act as a password for SNMP.
- ro** Enter the keyword `ro` to specify read-only permission.
- rw** Enter the keyword `rw` to specify read-write permission.
- ipv6 access-list-name*** (Optional) Enter the keyword `ipv6` then an IPv6 ACL name (a string up to 16 characters long).

**security-name name** (Optional) Enter the keywords `security-name` then the security name as defined by the community MIB.

**access-list-name** (Optional) Enter a standard IPv4 access list name (a string up to 16 characters long).

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

**Usage Information** The following example configures a community named `public` that is mapped to the security named `guestuser` with Read Only (`ro`) permissions.

The `security-name` parameter maps the community string to an SNMPv3 user/security name as defined by the community MIB.

If a community string is configured without a `security-name` (for example, `snmp-server community public ro`), the community is mapped to a default security-name/group:

- `v1v2creadu / v1v2creadg` — maps to a community with `ro` (read-only) permissions.
- `v1v2cwriteu/ v1v2cwriteg` — maps to a community with `rw` (read-write) permissions.

The `community-name` parameter indexes this command.

If you do not configure the `snmp-server community` command, you cannot query SNMP data. Only Standard IPv4 ACL and IPv6 ACL is supported in the optional `access-list-name`.

The command options `ipv6`, `security-name`, and `access-list-name` are recursive. In other words, each option can, in turn, accept any of the three options as a sub-option, and each of those sub-options can accept any of the three sub-options as a sub-option, and so forth. The second Example shows the creation of a standard IPv4 ACL called `snmp-ro-acl` and then assigning it to the SNMP community `guest`.

**NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP; TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs, port rules are not valid for SNMP.

## Example

```
DelleMC# config
DelleMC(conf)# snmp-server community public ro
DelleMC(conf)# snmp-server community guest ro security-name guestuser
DelleMC(conf)#
```

## Example

```
DelleMC(conf)# ip access-list standard snmp-ro-acl
DelleMC(config-std-nacl)#seq 5 permit host 10.10.10.224
DelleMC(config-std-nacl)#seq 10 deny any count
!
DelleMC(conf)# snmp-server community guest ro snmp-ro-acl
DelleMC(conf)#
```

## Related Commands

- [ip access-list standard](#) — names (or selects) a standard access list to filter based on IP address.
- [ipv6 access-list](#) — configures an access list based on IPv6 addresses or protocols.
- [show running-config](#) — displays the current SNMP configuration and defaults.

## snmp-server contact

Configure contact information for troubleshooting this SNMP node.

### Syntax

```
snmp-server contact text
```

To delete the SNMP server contact information, use the `no snmp-server contact` command.

### Parameters

***text*** Enter an alphanumeric text string, up to 55 characters long.

### Defaults

none

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |

### E-Series legacy command

## snmp-server enable traps

Enable SNMP traps.

**Syntax** `snmp-server enable traps [notification-type] [notification-option]`

To disable traps, use the `no snmp-server enable traps [notification-type] [notification-option]` command.

### Parameters

**notification-type** Enter the type of notification from the following list:

- `bgp` — Enable BGP state change traps.
- `config` — Enable `copy-config` trap.
- `ecfm` — Enable ECFM state change traps.
- `ecmp` — Enable ECMP traps.
- `entity` — Enable entity change traps.
- `envmon` — Enable SNMP environmental monitor traps.
- `ets` — Enable ETS traps.
- `fips` — Enable FIP Snooping state change traps.
- `isis` — Enable ISIS adjacency change traps.
- `lACP` — Enable LACP state change traps.
- `mac` — Enable MAC address notification traps.
- `pfc` — Enable PFC traps.
- `snmp` — Enable SNMP traps.
- `stack` — Enable stacking role change traps.
- `stp` — Enable 802.1d state change traps.
- `vlt` — Enable VLT traps.
- `vrrp` — Enable VRRP state change traps.
- `xstp` — Enable 802.1s, 802.1w, and PVST+ state change traps.

### notification-option

For the `envmon` notification-type, enter one of the following optional parameters:

- `cam-utilization`
- `fan`
- `supply`
- `temperature`

For the `snmp` notification-type, enter one of the following optional parameters:

- `authentication`
- `coldstart`
- `linkdown`
- `linkup`
- `syslog-reachable`
- `syslog-unreachable`

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                            |
|-----------|----------------------------------------------------------------------------------------|
| 9.12(0.0) | Introduced MAC address notification traps on all the Dell EMC Networking OS platforms. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                              |
| 9.10(0.0) | Introduced on the S3148.                                                               |
| 9.10(0.0) | Introduced on the S6100-ON.                                                            |

| Version                        | Description                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------|
| 9.8(2.0)                       | Introduced on the S3100 series.                                                                                        |
| 9.8(1.0)                       | Introduced on the Z9100-ON.                                                                                            |
| 9.8(0.0P5)                     | Introduced on the S4048-ON.                                                                                            |
| 9.8(0.0P2)                     | Introduced on the S3048-ON.                                                                                            |
| 9.8(0.0)                       | Added the following two SNMP notification options: <code>syslog-reachable</code> and <code>syslog-unreachable</code> . |
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                                            |
| 9.2(1.0)                       | Introduced on the Z9500.                                                                                               |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.                    |
| 9.0.2.0                        | Introduced on the S6000.                                                                                               |
| 9.1(0.0)                       | Added support for copy-config and ECMP traps.                                                                          |
| 8.3.19.0                       | Introduced on the S4820T.                                                                                              |
| 8.3.11.1                       | Introduced on the Z9000.                                                                                               |
| 8.3.7.0                        | Introduced on the S4810.                                                                                               |
| 8.4.1.0                        | Added support for VRRP traps.                                                                                          |
| 7.6.1.0                        | Added support for STP and xSTP traps. Introduced on the S-Series.                                                      |
| 7.5.1.0                        | Introduced on the C-Series.                                                                                            |
| <b>E-Series legacy command</b> |                                                                                                                        |

#### Usage Information

Dell EMC Networking OS supports up to 16 SNMP trap receivers.

If you do not configure this command, traps that controlled by this command are not sent. If you do not specify a `notification-type` and `notification-option`, all traps are enabled.

#### Related Commands

- [snmp-server community](#) — enables SNMP and sets the community string.

## snmp-server engineID

Configure the name for both the local and remote SNMP engines on the router.

#### Syntax

```
snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]
```

To return to the default, use the `no snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]` command.

#### Parameters

|                          |                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>local engineID</b>    | Enter the keyword <code>local</code> followed by the engine ID number that identifies the copy of the SNMP on the local device.<br><br>Format (as specified in RFC 3411): 12 octets. <ul style="list-style-type: none"> <li>• The first four octets are set to the private enterprise number.</li> <li>• The remaining eight octets are the MAC address of the chassis.</li> </ul> |
| <b>remote ip-address</b> | Enter the keyword <code>remote</code> followed by the IP address that identifies the copy of the SNMP on the remote device.                                                                                                                                                                                                                                                        |
| <b>vrf vrf-name</b>      | Enter the keyword <code>vrf</code> followed by the name of the VRF that is used to reach the device.                                                                                                                                                                                                                                                                               |

 **NOTE:** Use this attribute to specify the VRF that is used by the SNMP engine to reach the device. If no VRF is specified, then the default VRF is used.

**udp-port port-number engineID** Enter the keywords `udp-port` followed by the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is **162**.

**Defaults** As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>7.5.1.0</b>    | Introduced on the C-Series.               |

#### **E-Series legacy command**

#### **Usage Information**

Changing the value of the SNMP Engine ID has important side effects. A user's password (entered on the command line) is converted to a message digest algorithm (MD5) or secure hash algorithm (SHA) security digest. This digest is based on both the password and the local Engine ID. The command line password is then destroyed, as required by RFC 2274. Because of this deletion, if the local value of the Engine ID changes, the security digests of SNMPv3 users is invalid and the users will have to be reconfigured.

For the remote Engine ID, the host IP and UDP port are the indexes to the command that are matched to either overwrite or remove the configuration.

#### **Related Commands**

- [show snmp engineID](#) — displays the SNMP engine and all the remote engines that are configured on the router.
- [show running-config snmp](#) — displays the SNMP running configuration.

# snmp-server group

Configure a new SNMP group or a table that maps SNMP users to SNMP views.

**Syntax** `snmp-server group [group_name {1 | 2c | 3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]`

To remove a specified group, use the `no snmp-server group [group_name {v1 | v2c | v3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

## Parameters

- group\_name** Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):
- `v1v2creadg` — maps to a community/security-name with `ro` permissions.
  - `1v2cwriteg` — maps to a community/security-name `rw` permissions.
- 1 | 2c | 3** (OPTIONAL) Enter the security model version number (1, 2c, or 3):
- 1 is the least secure version.
  - 3 is the most secure of the security modes.
  - 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.
- The default is **1**.
- auth** (OPTIONAL) Enter the keyword `auth` to specify authentication of a packet without encryption.
- noauth** (OPTIONAL) Enter the keyword `noauth` to specify no authentication of a packet.
- priv** (OPTIONAL) Enter the keyword `priv` to specify both authentication and then scrambling of the packet.
- read name** (OPTIONAL) Enter the keyword `read` then a name (a string of up to 20 characters long) as the read view name. The default is **GlobalView** and is assumed to be every object belonging to the internet (1.3.6.1) OID space.
- write name** (OPTIONAL) Enter the keyword `write` then a name (a string of up to 20 characters long) as the write view name.
- notify name** (OPTIONAL) Enter the keyword `notify` then a name (a string of up to 20 characters long) as the notify view name.
- access access-list-name** (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).
- ipv6 access-list-name** (Optional) Enter the keyword `ipv6` then the IPv6 access list name (a string up to 16 characters long).
- access-list-name ipv6 access-list-name** (Optional) Enter both an IPv4 and IPv6 access list name.

**Defaults** As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version    | Description                                          |

| 8.3.19.0   | Introduced on the S4820T.                            |
| 8.3.11.1   | Introduced on the Z9000.                             |
| 8.3.10.2   | Added support for the <code>access</code> parameter. |
| 8.3.7.0    | Introduced on the S4810.                             |
| 7.6.1.0    | Introduced on the S-Series.                          |
| 7.5.1.0    | Introduced on the C-Series.                          |

#### E-Series legacy command

#### Usage Information

The following example specifies the group named *harig* as a version 3 user requiring both authentication and encryption and read access limited to the read named *rview*.

 **NOTE:** The number of configurable groups is limited to 16 groups.

#### Example

```
DellEMC# conf
DellEMC(conf)# snmp-server group harig 3 priv read rview
DellEMC#
```

#### Related Commands

- [show snmp group](#) — displays the group name, security model, view status, and storage type of each group.
- [show running-config](#) — displays the SNMP running configuration.

## snmp-server host

Configure the recipient of an SNMP trap operation.

#### Syntax

```
snmp-server host ip-address | ipv6-address [vrf vrf-name] traps | informs
[version 1 | 2c | 3] [auth | no auth | priv] [community-string] [udp-port
port-number] [notification-type]
```

To remove the SNMP host, use the `no snmp-server host ip-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | noauth | priv] [community-string] [udp-port number] [notification-type]` command.

#### Parameters

- ip-address*** Enter the keyword `host` then the IP address of the host (configurable hosts is limited to 16).
- ipv6-address*** Enter the keyword `host` then the IPv6 address of the host in the `x:x:x::x` format.  
 **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.
- vrf vrf-name*** Enter the keyword `vrf` and then the name of the VRF that the SNMP server uses to connect to the host.

**i** **NOTE:** You can use this attribute to inform the SNMP engine about the vrf instance to be used to reach the corresponding remote host to send Trap or Inform message. If no VRF is specified, then the default VRF is used.

**traps** (OPTIONAL) Enter the keyword `traps` to send trap notifications to the specified host. The default is **traps**.

**informs** (OPTIONAL) Enter the keyword `informs` to send inform notifications to the specified host. The default is **traps**.

**version 1 | 2c | 3** (OPTIONAL) Enter the keyword `version` to specify the security model then the security model version number 1, 2c, or 3:

- Version 1 is the least secure version.
- Version 3 is the most secure of the security modes.
- Version 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.

The default is version **1**.

**auth** (OPTIONAL) Enter the keyword `auth` to specify authentication of a packet without encryption.

**noauth** (OPTIONAL) Enter the keyword `noauth` to specify no authentication of a packet.

**priv** (OPTIONAL) Enter the keyword `priv` to specify both authentication and then scrambling of the packet.

**community-string** Enter a text string (up to 20 characters long) as the name of the SNMP community.

**i** **NOTE:** For version 1 and version 2c security models, this string represents the name of the SNMP community. The string can be set using this command; however, Dell EMC Networking OS recommends setting the community string using the `snmp-server community` command before executing this command. For version 3 security model, this string is the USM user security name.

**udp-port port-number** (OPTIONAL) Enter the keywords `udp-port` followed by the port number of the remote host to use. The range is from 0 to 65535. The default is **162**.

**notification-type** (OPTIONAL) Enter one of the following keywords for the type of trap to be sent to the host:

- `bgp` — Enable BGP state change traps.
- `ecfm` — Enable ECFM state change traps.
- `entity` — Enable entity change traps.
- `envmon` — Enable SNMP environmental monitor traps.
- `eoam` — Enable EOAM state change traps
- `ets` — Enable ets traps
- `fips` — Enable FIP Snooping state change traps
- `lACP` — Enable LACP state change traps.
- `mac` — Enable MAC address notification traps.
- `isis` — Enable ISIS adjacency change traps.
- `pfc` — Enable pfc traps.
- `snmp` — Enable SNMP trap.
- `stp` — Enable 802.1d state change traps.
- `vlt` — Enable VLT traps.
- `vrrp` — Enable VRRP state change traps.
- `xstp` — Enable 802.1s, 802.1w, and PVST+ state change traps.

The default is all trap types are sent to host.

## Defaults

As above.

## Command Modes CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| 9.12(0.0)  | Introduced MAC address notification traps on all the Dell EMC Networking OS platforms. |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                              |
| 9.10(0.0)  | Introduced on the S3148 and S6100-ON.                                                  |
| 9.8(2.0)   | Introduced on the S3100 series.                                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                            |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                            |
| 9.4.(0.0)  | Added support for VRF.                                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                               |
| 9.0.2.0    | Introduced on the S6000.                                                               |
| 9.1(0.0)   | Added support for config and ecmp traps.                                               |
| 8.3.19.0   | Introduced on the S4820T.                                                              |
| 8.3.11.1   | Introduced on the Z9000.                                                               |
| 8.3.7.0    | Introduced on the S4810.                                                               |
| 8.4.1.0    | Added support for VRRP traps.                                                          |
| 7.6.1.0    | Added support for STP and xSTP notification types. Introduced on the S-Series.         |
| 7.5.1.0    | Introduced on the C-Series.                                                            |

### E-Series legacy command

### Usage Information

To configure the router to send SNMP notifications, enter at least one `snmp-server host` command. If you enter the command with no keywords, all trap types are enabled for the host. If you do not enter an `snmp-server host` command, no notifications are sent.

In order to enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and type of notification (trap or inform), each succeeding command overwrites the previous command. Only the last `snmp-server host` command will be in effect. For example, if you enter an `snmp-server host inform` command for a host and then enter another `snmp-server host inform` command for the same host, the second command replaces the first command.

The `snmp-server host` command is used with the `snmp-server enable` command. Use the `snmp-server enable` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable` command and the `snmp-server host` command for that host must be enabled.

**NOTE:** For v1 / v2c trap configuration, if the community-string is not defined using the `snmp-server community` command prior to using this command, the default form of the `snmp-server community` command automatically is configured with the community-name the same as specified in the `snmp-server host` command.

**NOTE:** You must configure notify option for the SNMPv3 traps to work.

### Configuring Informs

To send an inform, use the following steps:

1. Configure a remote engine ID.
2. Configure a remote user.
3. Configure a group for this user with access rights.
4. Enable traps.
5. Configure a host to receive informs.

**Related  
Commands**

- [snmp-server enable traps](#) — enables SNMP traps.
- [snmp-server community](#) — configures a new community SNMPv1 or SNMPv2c.

## snmp-server location

Configure the location of the SNMP server.

**Syntax** `snmp-server location text`

To delete the SNMP location, use the `no snmp-server location` command.

**Parameters** `text` Enter an alpha-numeric text string, up to 55 characters long.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

**E-Series legacy  
command**

## snmp-server packetsize

Set the largest SNMP packet size permitted. When the SNMP server is receiving a request or generating a reply, use the `snmp-server packetsize` global configuration command.

**Syntax** `snmp-server packetsize byte-count`

**Parameters** ***byte-count*** Enter one of the following values 8, 16, 24 or 32. Packet sizes are 8000 bytes, 16000 bytes, 32000 bytes, and 64000 bytes.

**Defaults** **8**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version                        | Description                               |

| <b>7.5.1.0</b>                 | Introduced on the C-Series.               |
| <b>E-Series legacy command</b> |                                           |

## snmp-server trap-source

Configure a specific interface as the source for SNMP traffic.

**Syntax** `snmp-server trap-source interface`

To disable sending traps out a specific interface, use the `no snmp trap-source` command.

**Parameters** ***interface*** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** The IP address assigned to the management interface is the default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810                   |
| 8.5.1.0    | Added support for 4-port 40G line cards.  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

#### E-Series legacy command

**Usage Information** To enable this `snmp-server trap-source` command, configure an IP address on the interface and enable the interface configured as an SNMP trap source.

**Related Commands**

- [snmp-server community](#) — sets the community string.

## snmp-server user

Configure a new user to an SNMP group.

**Syntax**

```
snmp-server user name {group_name remote ip-address vrf vrf-name udp-port
port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password]
[priv {des56 | aes128} priv password] [access access-list-name | ipv6
access-list-name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

## Parameters

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>name</i></b>                                   | Enter the name of the user (not to exceed 20 characters), on the host that connects to the agent.                                                                                                                                                                                                                                                                                                |
| <b><i>group_name</i></b>                             | Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults): <ul style="list-style-type: none"><li>• <code>v1v2creadu</code> — maps to a community with <code>ro</code> permissions.</li><li>• <code>v1v2cwriteu</code> — maps to a community <code>rw</code> permissions.</li></ul> |
| <b><i>remote ip-address</i></b>                      | Enter the keywords <code>udp-port</code> then the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                                       |
| <b><i>vrf vrf-name</i></b>                           | Enter the keywords <code>vrf</code> and then the name of the VRF this is used to connect to the SNMP server.<br> <b>NOTE:</b> Use this attribute to specify a VRF name that is used to connect to the remote host. If no VRF is specified, then the default VRF is used.                                        |
| <b><i>udp-port port-number</i></b>                   | Enter the keywords <code>udp-port</code> then the UDP (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                                       |
| <b>1   2c   3</b>                                    | (OPTIONAL) Enter the security model version number (1, 2c, or 3): <ul style="list-style-type: none"><li>• 1 is the least secure version.</li><li>• 3 is the most secure of the security modes.</li><li>• 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li></ul> The default is <b>1</b> .                            |
| <b><i>encrypted</i></b>                              | (OPTIONAL) Enter the keyword <code>encrypted</code> to specify the password appear in encrypted format (a series of digits, masking the true characters of the string).                                                                                                                                                                                                                          |
| <b><i>auth</i></b>                                   | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                         |
| <b><i>md5   sha</i></b>                              | (OPTIONAL) Enter the keyword <code>md5</code> or <code>sha</code> to designate the authentication level. <ul style="list-style-type: none"><li>• <code>md5</code> — Message Digest Algorithm</li><li>• <code>sha</code> — Secure Hash Algorithm</li></ul>                                                                                                                                        |
| <b><i>auth-password</i></b>                          | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host. Minimum: eight characters long.                                                                                                                                                                                                                                      |
| <b><i>priv</i></b>                                   | (OPTIONAL) Enter the keywords <code>priv</code> to initiate a privacy authentication level setting.                                                                                                                                                                                                                                                                                              |
| <b><i>des56   aes128</i></b>                         | (OPTIONAL) Enter the keyword <code>des56</code> or <code>aes128</code> to specify the encryption mode. <ul style="list-style-type: none"><li>• <code>aes128</code> — Use 128 bit AES algorithm in CFB mode for encryption.</li><li>• <code>des56</code> — Use 56 bit DES algorithm in CBC mode for encryption.</li></ul>                                                                         |
| <b><i>priv password</i></b>                          | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent. Minimum: eight characters long.                                                                                                                                                                                                           |
| <b><i>access access-list-name</i></b>                | (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                                                         |
| <b><i>ipv6 access-list-name</i></b>                  | (Optional) Enter the keyword <code>ipv6</code> then the IPv6 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                               |
| <b><i>access-list-name ipv6 access-list-name</i></b> | (Optional) Enter both an IPv4 and IPv6 access list name.                                                                                                                                                                                                                                                                                                                                         |

## Defaults

As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                   |
|------------|-----------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.     |
| 9.10(0.0)  | Introduced on the S3148.                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                   |
| 9.8(2.0)   | Introduced on the S3100 series.               |
| 9.8(1.0)   | Introduced on the Z9100-ON.                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                   |
| 9.8(0.0P2) | Introduced on the S3048-ON.                   |
| 9.7(0.0)   | Introduced on the S6000-ON.                   |
| 9.6.(0.0)  | Added aes 128 encryption algorithm parameter. |
| 9.4.(0.0)  | Added support for VRF.                        |
| 9.2(1.0)   | Introduced on the Z9500.                      |
| 9.0.2.0    | Introduced on the S6000.                      |
| 8.3.19.0   | Introduced on the S4820T.                     |
| 8.3.11.1   | Introduced on the Z9000.                      |
| 8.3.7.0    | Introduced on the S4810.                      |
| 7.6.1.0    | Introduced on the S-Series.                   |

**Usage Information**

 **NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP. TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs port rules are not valid for SNMP.

No default values exist for authentication or privacy algorithms and no default password exists. If you forget a password, you cannot recover it; the user must be reconfigured. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password is stored in the configuration in an encrypted form and displayed as encrypted in the `show running-config` command.

If you have an encrypted password, you can specify the encrypted string instead of the plain-text password. The following command is an Example of how to specify the command with an encrypted string.

 **NOTE:** The number of configurable users is limited to 16.

**Example**

```
DellEMC# snmp-server user privuser v3group v3 encrypted auth md5
9fc53d9d908118b2804fe80e3ba8763d priv des56
d0452401a8c3ce42804fe80e3ba8763d
```

**Usage Information**

The following command is an example of how to enter a plain-text password as the string `authpasswd` for user `authuser` of group `v3group`.

**Example**

```
DellEMC#conf
DellEMC(conf)# snmp-server user authuser v3group v3 auth md5 authpasswd
```

**Usage Information**

The following command configures a remote user named `n3user` with a `v3` security model and a security level of `authNOPriv`.

**Example**

```
DellEMC#conf
DellEMC(conf)# snmp-server user n3user ngroup remote 172.31.1.3 udp-port
```

```
5009 3
auth md5 authpasswd
```

### Related Commands

- [show snmp user](#) — displays the information configured on each SNMP user name.

## snmp-server user (for AES128-CFB Encryption)

Specify that AES128-CFB encryption algorithm needs to be used for transmission of SNMP information. The Advanced Encryption Standard (AES) Cipher Feedback (CFB) 128-bit encryption algorithm is in compliance with RFC 3826. RFCs for SNMPv3 define two authentication hash algorithms, namely, HMAC-MD5-96 and HMAC-SHA1-96. These are the full forms or editions of the truncated versions, namely, HMAC-MD5 and HMAC-SHA1 authentication algorithms.

### Syntax

```
snmp-server user name [group_name remote ip-address udp-port port-number]
[1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 |
aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-
name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user name [group_name remote ip-address udp-port port-number] [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

### Parameters

- auth-password*** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host and to send packets to the host. Minimum: eight characters long.
- aes128*** (OPTIONAL) Enter the keyword `aes128` to initiate the AES128-CFB encryption algorithm for transmission of SNMP packets.
- priv-password*** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent and to decrypt the contents of the message it receives from the agent. Minimum: eight characters long.

### Defaults

If no authentication or privacy option is configured, then the messages are exchanged (attempted anyway) without any authentication or encryption.

**Command Modes** CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                |
| 9.10(0.0)  | Introduced on the S3148.                                                                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                              |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                              |
| 9.3(0.0)   | Added support for the AES128-CFB encryption algorithm on the S4820T, S4810, S6000 and Z-Series platforms |

## Usage Information

To enable robust, effective protection and security for SNMP packets transferred between the server and the client, you can use the `snmp-server user username group groupname 3 auth authentication-type auth-password priv aes128 priv-password` to specify that AES128-CFB encryption algorithm needs to be used.

You cannot modify the FIPS mode if SNMPv3 users are already configured and present in the system. An error message is displayed if you attempt to change the FIPS mode by using the `fips mode enable` command in Global Configuration mode. You can enable or disable FIPS mode only if SNMPv3 users are not previously set up. Otherwise, you must remove the previously configured users before you change the FIPS mode.

## Example

```
DellEMC# snmp-server user privuser v3group v3 encrypted auth md5
9fc53d9d908118b2804fe80e3ba8763d priv aes128
d0452401a8c3ce42804fe80e3ba8763d
```

## Related Commands

- [show snmp user](#) — Displays the information configured on each SNMP user name.

## snmp-server view

Configure an SNMPv3 view.

### Syntax

```
snmp-server view view-name oid-tree {included | excluded}
```

To remove an SNMPv3 view, use the `no snmp-server view view-name oid-tree {included | excluded}` command.

### Parameters

|                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|
| <b>view-name</b> | Enter the name of the view (not to exceed 20 characters).                                 |
| <b>oid-tree</b>  | Enter the OID sub tree for the view (not to exceed 20 characters).                        |
| <b>included</b>  | (OPTIONAL) Enter the keyword <code>included</code> to include the MIB family in the view. |
| <b>excluded</b>  | (OPTIONAL) Enter the keyword <code>excluded</code> to exclude the MIB family in the view. |

### Defaults

none

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |

**E-Series legacy command**

**Usage Information**

The `oid-tree` variable is a full sub-tree starting from 1.3.6 and cannot specify the name of a sub-tree or a MIB. The following Example configures a view named `rview` that allows access to all objects under 1.3.6.1.

**Example**

```
DellEMC# conf
DellEMC#(conf) snmp-server view rview 1.3.6.1 included
```

**Related Commands**

- [show running-config snmp](#) — displays the SNMP running configuration.

## snmp-server vrf

Configures an SNMP agent to bind to a specific VRF.

**Syntax**

```
snmp-server vrf vrf-name
```

To undo the SNMP agent configuration, use the `no snmp-server vrf vrf-name` command.

**Parameters**

**vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to associate an SNMP agent with that VRF.

**Defaults**

Not Enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.4(0.0)   | Introduced on the S-Series and Z9000.     |

**Usage Information**

Use this command to bind an SNMP agent to a VRF. The SNMP agent processes the requests from the interfaces that belong to the specified VRF. If no VRF is specified, then the default VRF is used.

**Related Commands**

- [show snmp user](#) — display the information configured on each SNMP user name.

## snmp trap link-status

Enable the interface to send SNMP link traps, which indicate whether the interface is up or down.

|                                |                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                  | <code>snmp trap link-status</code><br>To disable sending link trap messages, use the <code>no snmp trap link-status</code> command.                           |
| <b>Defaults</b>                | Enabled.                                                                                                                                                      |
| <b>Command Modes</b>           | INTERFACE                                                                                                                                                     |

| <b>Version</b>                 | <b>Description</b>                                                                                                                                            |
| <b>9.10(0.1)</b>               | Introduced on the S6010-ON and S4048T-ON.                                                                                                                     |
| <b>9.10(0.0)</b>               | Introduced on the S6100-ON.                                                                                                                                   |
| <b>9.8(2.0)</b>                | Introduced on the S3100 series.                                                                                                                               |
| <b>9.8(1.0)</b>                | Introduced on the Z9100-ON.                                                                                                                                   |
| <b>9.8(0.0P5)</b>              | Introduced on the S4048-ON.                                                                                                                                   |
| <b>9.8(0.0P2)</b>              | Introduced on the S3048-ON.                                                                                                                                   |
| <b>9.7(0.0)</b>                | Introduced on the S6000-ON.                                                                                                                                   |
| <b>9.2(1.0)</b>                | Introduced on the Z9500.                                                                                                                                      |
| <b>9.0.2.0</b>                 | Introduced on the S6000.                                                                                                                                      |
| <b>9.2(0.0)</b>                | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.                                                           |
| <b>8.3.19.0</b>                | Introduced on the S4820T.                                                                                                                                     |
| <b>8.3.11.1</b>                | Introduced on the Z9000.                                                                                                                                      |
| <b>8.3.7.0</b>                 | Introduced on the S4810.                                                                                                                                      |
| <b>7.6.1.0</b>                 | Introduced on the S-Series.                                                                                                                                   |
| <b>7.5.1.0</b>                 | Introduced on the C-Series.                                                                                                                                   |
| <b>E-Series legacy command</b> |                                                                                                                                                               |

**Usage Information** If the interface is expected to flap during normal usage, you could disable this command.

## Syslog Commands

The following commands allow you to configure logging functions on all Dell EMC Networking switches.

### clear logging

Clear the messages in the logging buffer.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear logging</code>                                                                                                                                    |
| <b>Defaults</b>        | none                                                                                                                                                          |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)                      | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)                      | Introduced on the S3148.                                                                            |
| 9.10(0.0)                      | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)                       | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)                       | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5)                     | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2)                     | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)                       | Introduced on the Z9500.                                                                            |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Related Commands**

- [show logging](#) — display logging settings and system messages in the internal buffer.

## clear logging auditlog

Clears audit log.

**Syntax** clear logging auditlog

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.9(0.0)   | Introduced on the FN IOM.                 |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.5(0.0)   | Introduced on the MXL.                    |

## Example

```
DellEMC(conf)# clear logging auditlog
```

## Related Commands

- [show logging auditlog](#) — display the audit log.

# default logging buffered

Return to the default setting for messages logged to the internal buffer.

**Syntax** `default logging buffered`

**Defaults** **size = 40960; level = 7 or debugging**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**E-Series legacy command**

**Related Commands**

- [logging trap](#) — limit messages logged to the Syslog servers based on severity.

# logging

Configure an IP address or host name of a Syslog server where logging messages are sent. Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Syntax** `logging {ip-address | ipv6-address | hostname} {{udp {port}} | {tcp {port}} [vrf vrf-name]}`

To disable logging, use the `no logging` command.

|                   |                     |                                                                                                                                                                                                                                                                                                                                      |
|-------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ip-address</b>   | Enter the IPv4 address in dotted decimal format.                                                                                                                                                                                                                                                                                     |
|                   | <b>ipv6-address</b> | Enter the IPv6 address in the x:x:x::X format.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.                                                                                                                   |
|                   | <b>hostname</b>     | Enter the name of a host already configured and recognized by the switch.                                                                                                                                                                                                                                                            |
|                   | <b>udp</b>          | Enter the keyword <code>udp</code> to enable transmission of log message over UDP followed by port number. The default port is 514                                                                                                                                                                                                   |
|                   | <b>tcp</b>          | Enter the keyword <code>tcp</code> to enable transmission of log message over TCP followed by port number.                                                                                                                                                                                                                           |
|                   | <b>vrf vrf-name</b> | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to enable the logging process in VRF mode.<br> <b>NOTE:</b> Use this attribute to specify the VRF that is used to contact the host. By default, the default VRF is used. |

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Added <b>udp</b> and <b>tcp</b> keywords for the Z9500.                                             |
| 9.5(0.0)   | Added <b>udp</b> and <b>tcp</b> keywords for the S4810, S4820T, S6000, Z9000, and MXL.              |
| 9.4.(0.0)  | Added support for VRF.                                                                              |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |
| 8.4.1.0    | Added support for IPv6.                                                                             |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |

**E-Series legacy command**

**Usage Information**

Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Related Commands**

- [logging on](#) — enables the logging asynchronously to logging buffer, console, Syslog server, and terminal lines.
- [logging trap](#) — enables logging to the Syslog server based on severity.

## logging buffered

Enable logging and specify which messages are logged to an internal buffer. By default, all messages are logged to the internal buffer.

**Syntax**

`logging buffered [level] [size]`

To return to the default values, use the `default logging buffered` command.

To disable logging stored to an internal buffer, use the `no logging buffered` command.

**Parameters**

|              |                                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level</b> | (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following equivalent words: <code>emergencies</code> , <code>alerts</code> , <code>critical</code> , <code>errors</code> , <code>warnings</code> , <code>notifications</code> , <code>informational</code> , or <code>debugging</code> . The default is <b>7</b> or <b>debugging</b> . |
| <b>size</b>  | (OPTIONAL) Indicate the size, in bytes, of the logging buffer. The number of messages buffered depends on the size of each message. The range is from 40960 to 524288. The default is <b>40960 bytes</b> .                                                                                                                                         |

**Defaults**

level = **7**; size = **40960 bytes**

**Command Modes**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy command**

**Usage Information**

When you decrease the buffer size, all messages stored in the buffer are lost. Increasing the buffer size does not affect messages stored in the buffer.

**Related Commands**

- [clear logging](#) — clears the logging buffer.
- [default logging buffered](#) — returns the logging buffered parameters to the default setting.
- [show logging](#) — displays the logging setting and system messages in the internal buffer.

## logging console

Specify which messages are logged to the console.

**Syntax**

`logging console [level]`

To return to the default values, use the `default logging console` command.

To disable logging to the console, use the `no logging console` command.

**Parameters**

**level** (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **7** or **debugging**.

**Defaults**

level = **7**; size = **debugging**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |

**E-Series legacy command**

**Related Commands**

- [clear logging](#) — clears the logging buffer.
- [default logging console](#) — returns the logging console parameters to the default setting.
- [show logging](#) — displays the logging setting and system messages in the internal buffer.

## logging extended

Logs security and audit events to a system log server.

**Syntax** `logging extended`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5(0.1)   | Introduced on the Z9500.                                |
| 9.5(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

**Usage Information**

This command is available with or without RBAC enabled. When RBAC is enabled you can restrict access to audit and security logs based on the CLI sessions' user roles. If extended logging is disabled, you can only view system events, regardless of RBAC user role.

When you enabled RBAC and extended logging:

- Only the system administrator role can execute this command.
- The system administrator and system security administrator roles can view security events and system events.
- The system administrator role can view audit, security, and system events.
- The network administrator and network operator roles can view system events.

**Examples**

```
DellEMC(conf)#logging extended
```

**Related Commands**

- [show logging auditlog](#) — display the audit log.
- [clear logging auditlog](#) — clear the audit log.

# logging facility

Configure the Syslog facility used for error messages sent to Syslog servers.

**Syntax** `logging facility [facility-type]`

To return to the default values, use the `no logging facility` command.

**Parameters**

***facility-type***

(OPTIONAL) Enter one of the following parameters:

- `auth` (authorization system)
- `cron` (Cron/at facility)
- `daemon` (system daemons)
- `kern` (kernel)
- `local10` (local use)
- `local11` (local use)
- `local12` (local use)
- `local13` (local use)
- `local14` (local use)
- `local15` (local use)
- `local16` (local use)
- `local17` (local use)
- `lpr` (line printer system)
- `mail` (mail system)
- `news` (USENET news)
- `sys9` (system use)
- `sys10` (system use)
- `sys11` (system use)
- `sys12` (system use)
- `sys13` (system use)
- `sys14` (system use)
- `syslog` (Syslog process)
- `user` (user process)
- `uucp` (Unix to Unix copy process)

The default is **local7**.

**Defaults** `local7`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy command**

**Related Commands**

- [logging](#) — enables logging to a Syslog server
- [logging on](#) — enables logging.

## logging history

Specify which messages are logged to the history table of the switch and the SNMP network management station (if configured).

**Syntax** `logging history level`

To return to the default values, use the `no logging history` command.

**Parameters** `level` Indicate a value from 0 to 7 or enter one of the following equivalent words: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is **4** or **warnings**.

**Defaults** `warnings or 4`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

| Version | Description |
|---------|-------------|
|---------|-------------|

|                                |  |
|--------------------------------|--|
| <b>E-Series legacy command</b> |  |
|--------------------------------|--|

**Usage Information**

When you configure the `snmp-server trap-source` command, the system messages logged to the history table are also sent to the SNMP network management station.

**Related Commands**

- [show logging](#) — displays information logged to the history buffer.

## logging history size

Specify the number of messages stored in the Dell EMC Networking logging history table.

**Syntax**

`logging history size size`

To return to the default values, use the `no logging history size` command.

**Parameters**

**size**

Indicate a value as the number of messages to be stored. The range is from 0 to 500. The default is **1 message**.

**Defaults**

**1 message**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|--------------------------------|--|

**Usage Information**

When the number of messages reach the limit you set with the `logging history size` command, older messages are deleted as newer ones are added to the table.

**Related Commands**

- [show logging](#) — displays information logged to the history buffer.

# logging monitor

Specify which messages are logged to Telnet applications.

**Syntax** `logging monitor [level]`

To disable logging to terminal connections, use the `no logging monitor` command.

**Parameters** *level* Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **7** or **debugging**.

**Defaults** **7** or **debugging**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>               | Introduced on the S6010-ON and S4048T-ON.                                                           |
| <b>9.10(0.0)</b>               | Introduced on the S3148.                                                                            |
| <b>9.10(0.0)</b>               | Introduced on the S6100-ON.                                                                         |
| <b>9.8(2.0)</b>                | Introduced on the S3100 series.                                                                     |
| <b>9.8(1.0)</b>                | Introduced on the Z9100-ON.                                                                         |
| <b>9.8(0.0P5)</b>              | Introduced on the S4048-ON.                                                                         |
| <b>9.8(0.0P2)</b>              | Introduced on the S3048-ON.                                                                         |
| <b>9.7(0.0)</b>                | Introduced on the S6000-ON.                                                                         |
| <b>9.2(1.0)</b>                | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>                | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>                 | Introduced on the S6000.                                                                            |
| <b>8.3.19.0</b>                | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>                | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>                 | Introduced on the S4810.                                                                            |
| <b>7.6.1.0</b>                 | Introduced on the S-Series.                                                                         |
| <b>7.5.1.0</b>                 | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Related Commands**

- [default logging monitor](#) — returns the logging monitor parameters to the default setting.

# logging on

Specify that debug or error messages are asynchronously logged to multiple destinations, such as the logging buffer, Syslog server, or terminal lines.

**Syntax** `logging on`

To disable logging to logging buffer, Syslog server and terminal lines, use the `no logging on` command.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |

**E-Series legacy command**

**Usage Information** When you use the `no logging on` command, messages are logged only to the console.

- Related Commands**
- [logging](#) — enable logging to the Syslog server.
  - [logging buffered](#) — set the logging buffered parameters.
  - [logging console](#) — set the logging console parameters.
  - [logging monitor](#) — set the logging parameters for the terminal connections.

## logging source-interface

Specify that the IP address of an interface is the source IP address of Syslog packets sent to the Syslog server.

**Syntax** `logging source-interface interface`

To disable this command and return to the default setting, use the `no logging source-interface` command.

- Parameters**
- interface*** Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>               | Introduced on the S6010-ON and S4048T-ON.                                                           |
| <b>9.10(0.0)</b>               | Introduced on the S3148.                                                                            |
| <b>9.10(0.0)</b>               | Introduced on the S6100-ON.                                                                         |
| <b>9.8(2.0)</b>                | Introduced on the S3100 series.                                                                     |

| <b>9.8(0.0P5)</b>              | Introduced on the S4048-ON.                                                                         |
| <b>9.8(0.0P2)</b>              | Introduced on the S3048-ON.                                                                         |
| <b>9.7(0.0)</b>                | Introduced on the S6000-ON.                                                                         |
| <b>9.2(1.0)</b>                | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>                | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>                 | Introduced on the S6000.                                                                            |
| <b>8.3.19.0</b>                | Introduced on the S4820T.                                                                           |
| <b>8.3.11.1</b>                | Introduced on the Z9000.                                                                            |
| <b>8.3.7.0</b>                 | Introduced on the S4810.                                                                            |
| <b>8.5.1.0</b>                 | Added support for 4-port 40G line cards on the E-Series.                                            |
| <b>7.6.1.0</b>                 | Introduced on the S-Series.                                                                         |
| <b>7.5.1.0</b>                 | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Usage Information** Syslog messages contain the IP address of the interface used to egress the router. By configuring the `logging source-interface` command, the Syslog packets contain the IP address of the interface configured.

**Related Commands**

- [logging](#) — enables logging to the Syslog server.

## logging synchronous

Synchronize unsolicited messages and Dell EMC Networking OS output.

**Syntax** `logging synchronous [level level | all] [limit number-of-buffers]`  
 To disable message synchronization, use the `no logging synchronous [level level | all] [limit number-of-buffers]` command.

**Parameters**

**all** Enter the keyword `all` to ensure that all levels are printed asynchronously.

**level *level*** Enter the keyword `level` then a number as the severity level. A high number indicates a low severity level and vice versa. The range is from 0 to 7. The default is **2**.

|                                |                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                     | Enter the keyword <code>all</code> to turn off all.                                                                                                                                         |
| <b>limit number-of-buffers</b> | Enter the keyword <code>limit</code> then the number of buffers to be queued for the terminal after which new messages are dropped. The range is from 20 to 300. The default is <b>20</b> . |

**Defaults** Disabled. If enabled without the `level` or `number-of-buffers` options specified, `level = 2` and `number-of-buffers = 20` are the defaults.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |

**E-Series legacy command**

**Usage Information** When you enable `logging synchronous`, unsolicited messages appear between software prompts and outputs. Only the messages with a severity at or below the set level are sent to the console.

If the message queue limit is reached on a terminal line and messages are discarded, a system message appears on that terminal line. Messages may continue to appear on other terminal lines.

**Related Commands**

- [logging on](#) — enables logging.

## logging trap

Specify which messages are logged to the Syslog server based the message severity.

**Syntax** `logging trap [level]`

To return to the default values, use the default `logging trap` command.

To disable logging, use the `no logging trap` command.

**Parameters**

**level** Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **6** or **informational**.

**Defaults** 6 or **informational**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series, S55.          |
| 7.5.1.0    | Introduced on the C-Series.               |

**E-Series legacy command**

**Usage Information** To block a type of message parameter, set the logging trap level to a lower number. For example, to block severity messages at level 6, set the level to 5.

- Related Commands**
- [logging](#) — enables the logging to another device.
  - [logging on](#) — enables logging.

## logging version

Displays syslog messages in a RFC 3164 or RFC 5424 format.

**Syntax** `logging version {0|1}`

**Defaults** 0

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5(0.1)   | Introduced on the Z9500.                                |
| 9.5(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

### Usage Information

To display syslog messages in a RFC 3164 or RFC 5424 format, use the **log version** command in configuration mode. By default, the system log version is set to **0**.

The following describes the two supported log messages formats:

- 0 – Displays syslog messages format as described in RFC 3164, The BSD syslog Protocol
- 1 – Displays SYSLOG message format as described in RFC 5424, The Syslog Protocol

### Example

```
DellEMC(conf)#logging version ?
<0-1> Select syslog version (default = 0)
DellEMC(conf)#logging version 1
```

## show logging auditlog

Displays an audit log.

**Syntax** show logging auditlog

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                             |
|------------|---------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0)  | Introduced on the S3148.                                |
| 9.10(0.0)  | Introduced on the S6100-ON.                             |
| 9.8(2.0)   | Introduced on the S3100 series.                         |
| 9.8(1.0)   | Introduced on the Z9100-ON.                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                             |
| 9.8(0.0P2) | Introduced on the S3048-ON.                             |
| 9.7(0.0)   | Introduced on the S6000-ON.                             |
| 9.5(0.1)   | Introduced on the Z9500.                                |
| 9.5(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

### Example

```
DellEMC(conf)# show logging auditlog
```

### Related Commands

- [clear logging auditlog](#) — clear the audit log.

## show logging

Display the logging settings and system messages logged to the internal buffer of the switch.

**Syntax** `show logging [number | history [reverse][number] | reverse [number] | summary]`

**Parameters**

- number** (OPTIONAL) Enter the number of messages displayed in the output. The range is from 1 to 65535.
- history** (OPTIONAL) Enter the keyword `history` to view only information in the Syslog history table.
- reverse** (OPTIONAL) Enter the keyword `reverse` to view the Syslog messages in FIFO (first in, first out) order.
- summary** (OPTIONAL) Enter the keyword `summary` to view a table showing the number of messages per type and per slot. Slots \*7\* and \*8\* represent RPMs.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |
| 7.6.1.0    | Introduced on the S-Series.                                                                         |
| 7.5.1.0    | Introduced on the C-Series.                                                                         |

### E-Series legacy command

#### Example (Partial)

```
DelleMC#show logging
Syslog logging: enabled
 Console logging: level debugging
 Monitor logging: level debugging
 Buffer logging: level debugging, 5604 Messages Logged, Size (524288
bytes)
 Trap logging: level informational
Oct 8 09:25:37: %RPM1:RP1 %BGP-5-ADJCHANGE: Connection with neighbor
223.80.255.254 closed. Hold time
```

```

expired
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.200.13.2 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.13 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 1.1.14.2 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.14 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 1.1.11.2 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.5 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.4.1.3 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.4 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.6 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.12 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.15 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.1.1.3 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.200.12.2 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 1.1.10.2 Up
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Session closed by neighbor
1.1.10.2 (Hold time expired)
Oct 8 09:25:38: %RPM1:RP1 %BGP-5-ADJCHANGE: Neighbor 192.200.14.7 Up
Oct 8 09:26:25: %RPM1:RP1 %BGP-5-ADJCHANGE: Connection with neighbor
1.1.11.2 closed. Neighbor recycled
Oct 8 09:26:25: %RPM1:RP1 %BGP-5-ADJCHANGE: Connection with neighbor
1.1.14.2 closed. Neighbor recycled
--More--

```

### Example (History)

```

DelleMC#show logging history
Syslog History Table: 1 maximum table entries,
saving level Warnings or higher
SNMP notifications not Enabled
%RPM:0:0 %CHMGR-2-LINECARDDOWN - Line card 3 down - IPC timeout
DelleMC#

```

## show logging driverlog stack-unit

Display the driver log for the specified hardware component.

**Syntax** `show logging driverlog stack-unit stack-unit-number`

**Parameters**

|                                            |                                                                                                                                        |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit <i>stack-unit-number</i></b> | Enter the keywords <code>stack-unit</code> followed by the stack member ID of the switch for which you want to display the driver log. |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

**defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |

```

### Usage Information

This command displays internal software driver information, which may be useful during troubleshooting switch initialization errors, such as a downed Port-Pipe.

## terminal monitor

Configure the Dell EMC Networking OS to display messages on the monitor/terminal.

**Syntax** terminal monitor

To return to default settings, use the `terminal no monitor` command.

**defaults** Disabled.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |

## SNMP Traps

This section lists the traps sent by the Dell EMC Networking OS. Each trap is listed by the fields Trap Type, Trap Name, Object Name, and MIB file.

**Table 9. SNMP Trap List**

| TRAP TYPE | TRAP NAME                    | TRAP OID                          | Object Name                     | MIB File                                | Explanation                                                                   |
|-----------|------------------------------|-----------------------------------|---------------------------------|-----------------------------------------|-------------------------------------------------------------------------------|
| 1         | TR_COLD_START                | 1.3.6.1.6.3.1.1.5.1               | COLDSTART                       | rfc3418.mib                             | SNMP COLD_START trap sent.                                                    |
| 2         | TR_WARM_START                | 1.3.6.1.6.3.1.1.5.2               | WARMSTART                       | rfc3418.mib                             | SNMP WARM_START trap sent.                                                    |
| 3         | TR_LINK_DOWN                 | 1.3.6.1.6.3.1.1.5.3               | LINKDOWN                        | rfc3418.mib                             | changed interface state to down.                                              |
| 4         | TR_LINK_UP                   | 1.3.6.1.6.3.1.1.5.4               | LINKUP                          | rfc3418.mib                             | changed interface state to up.                                                |
| 5         | TR_AUTHENTICAT<br>ION_FAILED | 1.3.6.1.6.3.1.1.5.5               | Authenticationfailur<br>e       | rfc3418.mib                             | SNMP Authentication failed.                                                   |
| 9         | TR_BER_ERR                   | 1.3.6.1.4.1.6027.3.3.<br>1.2.0.3  | Not available.                  | Not available.                          | High Ber detected on interface.                                               |
| 10        | TR_BER_ERR_CL<br>R           | 1.3.6.1.4.1.6027.3.3.<br>1.2.0.4  | Not available.                  | Not available.                          | High Ber cleared on interface.                                                |
| 11        | TR_CHM_CARD_D<br>OWN         | 1.3.6.1.4.1.6027.3.2<br>6.1.5.1.1 | dellNetSysAlarmCa<br>rdDown     | DELL-<br>NETWORKING-<br>CHASSIS-MIB.mib | The driver/agent generate this trap when a card operational status is down.   |
| 12        | TR_CHM_CARD_U<br>P           | 1.3.6.1.4.1.6027.3.2<br>6.1.5.1.2 | dellNetSysAlarmCa<br>rdUp       | DELL-<br>NETWORKING-<br>CHASSIS-MIB.mib | The driver/agent generate this trap when a card operational status is up.     |
| 14        | TR_CHM_CARD_O<br>FFLINE      | 1.3.6.1.4.1.6027.3.2<br>6.1.5.1.3 | dellNetSysAlarmCa<br>rdOffline  | DELL-<br>NETWORKING-<br>CHASSIS-MIB.mib | The driver/agent generate this trap when a card is set to offline.            |
| 15        | TR_CHM_CARD_<br>MISMATCH     | 1.3.6.1.4.1.6027.3.2<br>6.1.5.1.4 | dellNetSysAlarmCa<br>rdMismatch | DELL-<br>NETWORKING-<br>CHASSIS-MIB.mib | The driver/agent generate this trap when a card is not the same as configured |

**Table 9. SNMP Trap List (continued)**

| TRAP TYPE | TRAP NAME             | TRAP OID                           | Object Name                          | MIB File                        | Explanation                                                                                                                               |
|-----------|-----------------------|------------------------------------|--------------------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

This notification should not be sent more than once per second. The OAM entity can be derived from extracting the ifIndex from the variable bindings. The objects in the notification correspond to the values in a row instance of the dot3OamEventLog Table. The management entity should periodically check dot3OamEventLog Table to detect any missed events |

| 138       | TR_ENT_CONFIG_CHANGE | 1.3.6.1.2.1.47.2.0.1 | entConfigChange | entity.mib | <p>An entConfigChange notification is generated when the value of entLastChangeTime changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls. An agent should not generate more than one entConfigChange 'notification-event' in a given time interval (five seconds is the suggested default). A 'notification-event' is the transmission of a single trap or inform PDU to a list of notification destinations. If additional configuration changes occur within the throttling period, then notification-events for these changes should be suppressed by the agent until the current throttling period expires. At the end of a throttling period, one notification-event should be generated if any configuration changes occurred since the start of the throttling period. In such a case, another throttling period is started right away. An NMS should periodically check the value of entLastChangeTime to detect any missed entConfigChange</p> |

# Stacking

All commands in this chapter are specific to the Dell EMC Networking OS.

You can use the commands to pre-configure a switch, so that the configuration settings are invoked when the switch is attached to other S-Series units.

For information about using the S-Series stacking feature, see the *Stacking S-Series Switches* section in the *Dell EMC Networking OS Configuration Guide*.

**CAUTION:** You cannot enable stacking simultaneously with virtual link trunking (VLT). If you enable both at the same time, unexpected behavior occurs.

The Dell EMC Networking OS commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

## Topics:

- [redundancy disable-auto-reboot](#)
- [redundancy force-failover stack-unit](#)
- [redundancy protocol](#)
- [reset stack-unit](#)
- [show redundancy](#)
- [show system stack-ports](#)
- [stack-unit priority](#)
- [stack-unit provision](#)
- [stack-unit stack-group](#)
- [upgrade system stack-unit](#)

## redundancy disable-auto-reboot

Prevent the S-Series stack management unit, stack member unit, and standby unit from rebooting if they fail.

**Syntax** `redundancy disable-auto-reboot stack-unit [members | 1-6]`  
To return to the default, use the `no redundancy disable-auto-reboot stack-unit` command.

**Parameters**

|                   |                                                |
|-------------------|------------------------------------------------|
| <b>stack-unit</b> | Enter the stack-unit number.                   |
| <b>members</b>    | Enter the keyword members for all stack-units. |

**Defaults** Disabled (the failed switch is automatically rebooted).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000.                  |

| Version  | Description                            |
|----------|----------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.7.0  | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 8.3.1.0  | Added the <code>members</code> option. |

**Usage Information**

Enabling this command keeps the failed switch in the Failed state. The switch does not reboot until it is manually rebooted. When enabled, it is not displayed in the running-config. When disabled, it is displayed in the running-config.

**Related Commands**

[show redundancy](#) — displays the current redundancy status.

## redundancy force-failover stack-unit

Force the standby unit in the stack to become the management unit.

**Syntax** `redundancy force-failover stack-unit`

**Defaults** Not enabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.1.0    | Added the <code>members</code> option.    |

**Usage Information**

Executing this command on the master unit reboots the master unit and the standby unit becomes the new master. A new standby unit is elected depending on the priority and MAC address.

**Example**

```
DellEMC#redundancy force-failover stack-unit
System configuration has been modified. Save? [yes/no]: yes
!
Apr 20 11:44:03: %STKUNIT1-M:CP %FILEMGR-5-FILESAVED: Copied running-
config to startup-config in flash by default
Synchronizing data to peer stack-unit
!!!

...
Proceed with stack-unit hot failover [confirm yes/no]:yes
```

# redundancy protocol

Enable hitless failover for a protocol.

**Syntax** `redundancy protocol`

**Protocols**

|             |                                                              |
|-------------|--------------------------------------------------------------|
| <b>lacp</b> | Enter the LACP protocol                                      |
| <b>xstp</b> | Enter one of the following protocols: STP, RSTP, MSTP, PVST. |

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.1.0    | Added the <code>members</code> option.    |

# reset stack-unit

Reset any designated stack member except the management unit (master unit).

**Syntax** `reset stack-unit stack-unit-number hard`

**Parameters**

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| <b>stack-unit</b> | Enter the stack-unit number. The range is from 1 to 6.  |
| <b>hard</b>       | Reset the stack unit if the unit is in a problem state. |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.7.0    | Introduced on the S4810.                  |

| Version  | Description                               |
|----------|-------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.1.0  | Added the <code>hard reset</code> option. |

### Usage Information

Resetting the management unit is not allowed, and an error message displays if you try to do so. Resetting is a soft reboot, including flushing the forwarding tables.

Starting with Dell EMC Networking OS version 7.8.1.0, you can run this command directly on the stack standby unit (standby master) to reset the standby. You cannot reset any other unit from the standby unit.

### Example

```
Stack MAC : 00:01:e8:8b:1a:36
Reload-Type : normal-reload [Next boot : normal-reload]
-- Stack Info --
Unit UnitType Status ReqTyp CurTyp Version Ports

0 Management online S6000 S6000 9.7.0.0 128
1 Standby online S6000 S6000 9.7.0.0 128

```

### Related Commands

- [reload](#) – reboots Dell EMC Networking OS.

## show redundancy

Display the current redundancy configuration (status of automatic reboot configuration on stack management unit).

**Syntax** `show redundancy`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |

### Usage Information

To modify your results, use the `show redundancy [pipe]` command, as follows:

- `except` — show only text that does not match a pattern.

- `find` — search for the first occurrence of a pattern.
- `grep` — show only text that matches a pattern.
- `no-more` — do not paginate the output.
- `save` — save the output to a file.

### Example

```
DellEMC# show redundancy
-- Stack-unit Status --

Mgmt ID: 0
Stack-unit ID: 5
Stack-unit Redundancy Role: Primary
Stack-unit State: Active
Stack-unit SW Version: 1-0(0-3556)
Link to Peer: Down
Peer Stack-unit: not present
-- Stack-unit Redundancy Configuration --

Primary Stack-unit: mgmt-id 0
Auto Data Sync: Full
Failover Type: Hot Failover
Auto reboot Stack-unit: Disabled
Auto failover limit: 3 times in 60 minutes
-- Stack-unit Failover Record --

Failover Count: 0
Last failover timestamp: None
Last failover Reason: None
Last failover type: None
-- Last Data Block Sync Record: --

stack-unit Config: no block sync done

Runtime Event Log: no block sync done
 Running Config: no block sync done
 ACL Mgr: no block sync done
 LACP: no block sync done
 STP: no block sync done
 SPAN: no block sync done
DellEMC#
```

## show system stack-ports

Display information about the stacking ports on all switches in the stack.

**Syntax** `show system stack-ports [status | topology]`

**Parameters**

|                 |                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------|
| <b>status</b>   | (OPTIONAL) Enter the keyword <code>status</code> to display the command output without the Connection field.       |
| <b>topology</b> | (OPTIONAL) Enter the keyword <code>topology</code> to limit the table to just the Interface and Connection fields. |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                     |
|------------|---------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.7.0    | Introduced on the S4810.        |
| 8.3.11.1   | Introduced on the Z9000.        |

#### Usage Information

The following describes the `show system stack-ports` command shown in the following example.

| Field               | Description                                                                    |
|---------------------|--------------------------------------------------------------------------------|
| <b>Topology</b>     | Lists the topology of stack ports connected: Ring, Daisy chain, or Standalone. |
| <b>Interface</b>    | The unit/port ID of the connected stack port on this unit.                     |
| <b>Link Speed</b>   | Link Speed of the stack port (10 or 40) in Gb/s.                               |
| <b>Admin Status</b> | The only currently listed status is Up.                                        |
| <b>Connection</b>   | The stack port ID to which this unit's stack port is connected.                |

#### Example

```
DellEMC#show system stack-ports
Topology: Ring
Interface Connection Link Speed Admin Link
 (Gb/s) Status Status

 1/4 5/4 42 up up
 1/12 2/1 42 up up
 2/1 1/12 42 up up
 2/4 5/12 42 up up
 5/4 1/4 42 up up
 5/12 2/4 42 up up
```

#### Example (Status)

#### Example (Topology)

```
DellEMC#show system stack-ports topology
Topology: Daisy chain
Interface Connection

 1/25/1 3/25/1
 1/26/1
 1/27/1
 1/28/1
 3/25/1 1/25/1
 3/26/1
 3/27/1
 3/28/1
```

#### Related Commands

- [reset stack-unit](#) – resets the designated stack member.
- [show hardware stack-unit](#) – displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- [show system](#) – displays the current status of all stack members or a specific member.

## stack-unit priority

Configure the ability of a switch to become the management unit of a stack.

**Syntax** `stack-unit stack-number priority priority-value`

**Parameters**

***stack-number*** Enter the stack member unit identifier.

***priority-value*** This preference parameter allows you to specify the management priority of one backup switch over another, with 1 as the lowest priority and 14 being the highest. The switch with the highest priority value is chosen to become the management unit if the active management unit fails or on the next reload.

**Defaults** 1

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

**Related Commands**

- [reload](#) – reboots Dell EMC Networking OS.

## stack-unit provision

Preconfigure a logical stacking ID of a switch that joins the stack. This is an optional command that is executed on the management unit.

**Syntax** `stack-unit [stack-number] provision {model-identifier}`

**Parameters**

***stack-number*** Enter a stack member identifier of the switch that you want to add to the stack.

***model-identifier*** Enter the model identifier of the switch to be added as a stack member. This identifier is also referred to as the *provision type*.

**Defaults** When this value is not set, a switch joining the stack is given the next available sequential stack member identifier.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |

| Version  | Description              |
|----------|--------------------------|
| 8.3.11.1 | Introduced on the Z9000. |

**Related Commands**

- [reload](#) – reboot the Dell EMC Networking OS.
- [show system](#) – display the status of all stack members or a specific member.

## stack-unit stack-group

Configure the stacking unit and stacking group by specifying an ID when adding units to a stack to ensure the unit is assigned to the correct group.

**Syntax** `stack-unit unit-id stack-group stack-group-id`

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-id` command.

**Parameters**

**unit-id** Enter the stack unit ID.

**stack-group-id** Enter the stack group ID.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version    | Description                                    |
|------------|------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.      |
| 9.10(0.0)  | Introduced on the S6100-ON.                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                    |
| 9.7(0.0)   | Introduced on the S6000.                       |
| 8.3.19.0   | Introduced on the S4820T.                      |
| 8.3.7.1    | Introduced on the S4810.                       |
| 8.3.12.0   | Reset command mode from EXEC to CONFIGURATION. |

**Usage Information** The following message displays to confirm the command.

```
Setting ports Fo 1/60 as stack group will make their interface configs
obsolete after a reload.[confirm yes/no]: If "y" is entered, all non-
default configurations on any member ports of the current stack group
will be removed when the unit is rebooted.
```

**NOTE:** Any scripts used to streamline the stacking configuration process must be updated to reflect the Command Mode change from EXEC Privilege to CONFIGURATION to allow the scripts to work correctly.

## upgrade system stack-unit

Copy the boot image or Dell EMC Networking OS from the management unit to one or more stack members.

**Syntax** `upgrade {boot | system} stack-unit {all | stack-unit-number | A | B}`

|                   |                   |                                                                                                                                          |
|-------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>boot</b>       | Enter the keyword <code>boot</code> to copy the boot image from the management unit to the designated stack members.                     |
|                   | <b>system</b>     | Enter the keyword <code>system</code> to copy the Dell EMC Networking OS image from the management unit to the designated stack members. |
|                   | <b>stack-unit</b> | Enter the stack-unit number. The range is from 1 to 6.                                                                                   |
|                   | <b>all</b>        | Enter the keyword <code>all</code> to copy the designated image to all stack members.                                                    |
|                   | <b>A</b>          | Enter the keyword <code>A</code> to upgrade all stacked units in System A ( only).                                                       |
|                   | <b>B</b>          | Enter the keyword <code>B</code> to upgrade all stacked units in System B ( only).                                                       |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

**Usage Information** To reboot using the new image, use the `upgrade boot system stack-unit` command.

- Related Commands**
- [reload](#) — reboots Dell EMC Networking OS.
  - [reset stack-unit](#) — resets the designated stack member.
  - [show system](#) — displays the status of all stack members or a specific member.
  - [show version](#) — displays the current Dell EMC Networking OS version information on the system.

## Storm Control

The Dell EMC Networking OS storm control feature allows you to limit or suppress traffic during a traffic storm (Broadcast/Unknown Unicast Rate Limiting or Multicast on the C-Series and S-Series).

Storm control is supported on Dell EMC Networking OS.

### Important Points to Remember

- Interface commands can only be applied on physical interfaces (virtual local area networks [VLANs] and link aggregation group [LAG] interfaces are not supported).
  - An INTERFACE-level command only supports storm control configuration on ingress.
  - An INTERFACE-level command overrides any CONFIGURATION-level ingress command for that physical interface, if both are configured.
  - You can apply the CONFIGURATION-level storm control commands at ingress or egress and are supported on all physical interfaces.
  - When storm control is applied on an interface, the percentage of storm control applied is calculated based on the advertised rate of the line card. It is not based on the speed setting for the line card.
  - Do not apply per-VLAN quality of service (QoS) on an interface that has storm control enabled (either on an interface or globally).
  - When you enable broadcast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 1 is configured for the data traffic, the traffic goes to queue 1 instead of queue 0.
  - Similarly, if you enable unicast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 2 is configured for the data traffic, the traffic goes to queue 2 instead of queue 0.
- i NOTE:** Bi-directional traffic (unknown unicast and broadcast) along with egress storm control causes the configured traffic rates split between the involved ports. The percentage of traffic that each port receives after the split is not predictable. These ports can be in the same/different port pipes or the same/different line cards.
- i NOTE:** After applying the storm-control configuration, traffic drop is expected if ingress traffic follows a burst pattern. For example, `storm-control broadcast 1000 in`. This configuration allows the switch to forward only 1 packet per millisecond. If a higher number of packets ingress at the switch interface within a duration of 1 millisecond, the switch forwards the first packet and drops the remaining packets.
- i NOTE:** The policy discard drop counters are common across storm-control drops, ACL drops and QoS drops. If your configuration includes ACL and QoS, those drops are also computed and displayed in the policy discard drops counter field along with storm-control drops. The packets dropped by the storm control feature can be monitored by viewing the value of the Policy Discard Drops field of the output of the `show hardware stack-unit stack-unit-number drops` command.

## disable storm-control pfc

You can disable the PFC storm globally.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | disable                                                                                                                                                       |
| <b>Parameters</b>      | None                                                                                                                                                          |
| <b>Defaults</b>        | None                                                                                                                                                          |
| <b>Command Modes</b>   | CONFIGURATION (conf-storm-control-pfc)                                                                                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version          | Description                                             |
|------------------|---------------------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.               |
| <b>9.10(0.0)</b> | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information** The `disable` command is used to disable the PFC storm feature globally. By default, PFC storm feature is enabled on all the interfaces on which "storm-control pfc in queue-drop" configuration has been applied.

**Example** Use the `storm-control pfc` command in the configuration mode to enter the 'storm-control-pfc' configuration mode. The commands provisioned in this mode are applicable for all the interfaces that have PFC storm enabled.

```
DellEMC(conf)#storm-control pfc
DellEMC(conf-storm-control-pfc)#disable
```

## polling-interval

You can set the time interval to poll the queue depth and egress counters.

|                        |                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | polling-interval { <i>interval in milli-seconds</i> }                                                                                                                                                             |
| <b>Parameters</b>      | <b><i>interval in milli-seconds</i></b> Enter the polling interval in milliseconds. The range is 200 to 1000. The interval should be entered in multiples of 100. The default interval value is 100 milliseconds. |
| <b>Defaults</b>        | 100 milli-seconds                                                                                                                                                                                                 |
| <b>Command Modes</b>   | CONFIGURATION (conf-storm-control-pfc)                                                                                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                     |

| Version          | Description                                             |
|------------------|---------------------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.               |
| <b>9.10(0.0)</b> | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information** The `polling-interval` command is used to set the interval in milliseconds to poll the queue traffic and egress counters. You can use the polling results to detect the inconsistencies in the PAUSE frames received.

**Example** Use the `storm-control pfc` command in the configuration mode to enter the 'storm-control-pfc' configuration mode. The commands provisioned in this mode are applicable for all the interfaces that have PFC storm enabled.

```
DellEMC(conf)#storm-control pfc
DellEMC(conf-storm-control-pfc)#polling-interval 200
```

## queue-drop backoff-force

You can remove the queue-drop state after the specified number of polling is done.

**Syntax** `queue-drop backoff-force polling-count {number of polling-interval }`

**Parameters**

|                                          |                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------|
| <b><i>number of polling-interval</i></b> | Enter the number of polling intervals. The range is from 0 to 1000. The default value is 0. |
|------------------------------------------|---------------------------------------------------------------------------------------------|

**Defaults** 0

**Command Modes** CONFIGURATION (conf-storm-control-pfc)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                             |
|-----------|---------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information** The `queue-drop backoff-force polling-count` command is used to remove the queue-drop state unconditionally after the specified number of polling is done. The queue-drop state, which has been activated due to the detection of PFC storm, is forced to get removed. By default, the queue-drop state is not removed until it is explicitly cleared using the `storm-control pfc in queue-drop-state clear` command.

**Example** Use the `storm-control pfc` command in the configuration mode to enter the 'storm-control-pfc' configuration mode. The commands provisioned in this mode are applicable for all the interfaces that have PFC storm enabled.

```
DellEMC(conf)#storm-control pfc
DellEMC(conf-storm-control-pfc)#queue-drop backoff-force polling-count 20
```

## queue-drop backoff-on-norxpf

You can remove the queue-drop state when additional PFCs are not received.

**Syntax** `queue-drop backoff-on-norxpf polling-count {number of polling-interval }`

**Parameters**

|                                          |                                                                                              |
|------------------------------------------|----------------------------------------------------------------------------------------------|
| <b><i>number of polling-interval</i></b> | Enter the number of polling intervals. The range is from 0 to 1000. The default value is 10. |
|------------------------------------------|----------------------------------------------------------------------------------------------|

**Defaults** 10

**Command Modes** CONFIGURATION (conf-storm-control-pfc)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                             |
|-----------|---------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information**

The `queue-drop backoff-on-norxpfcc polling-count` command is used to remove the queue-drop state if additional PFCs are not received for the specified number of polling intervals.

**Example**

Use the `storm-control pfc` command in the configuration mode to enter the 'storm-control-pfc' configuration mode. The commands provisioned in this mode are applicable for all the interfaces that have PFC storm enabled.

```
DellEMC(conf)#storm-control pfc
DellEMC(conf-storm-control-pfc)#queue-drop backoff-on-norxpfcc polling-count 20
```

## show storm-control broadcast

Display the storm control broadcast configuration.

**Syntax** `show storm-control broadcast [interface]`

**Parameters** *interface* (OPTIONAL) Enter one of the following interfaces to display the interface-specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                              |
|------------|----------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)  | Introduced on the S3148.                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                              |
| 9.8(2.0)   | Introduced on the S3100 series.                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                              |
| 9.2(1.0)   | Introduced on the Z9500.                                 |
| 9.0.2.0    | Introduced on the S6000.                                 |
| 8.3.19.0   | Introduced on the S4820T.                                |
| 8.3.11.1   | Introduced on the Z9000.                                 |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.5.1.0 | Introduced on the E-Series. |

## show storm-control multicast

Display the storm control multicast configuration.

**Syntax** `show storm-control multicast [interface]`

**Parameters** *interface* (OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                              |
|------------|----------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                |
| 9.10(0.0)  | Introduced on the S3148.                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                              |
| 9.8(2.0)   | Introduced on the S3100 series.                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                              |
| 9.2(1.0)   | Introduced on the Z9500.                                 |
| 9.0.2.0    | Introduced on the S6000.                                 |
| 8.3.19.0   | Introduced on the S4820T.                                |
| 8.3.11.1   | Introduced on the Z9000.                                 |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series. |
| 8.3.7.0    | Introduced on the S4810.                                 |
| 7.6.1.0    | Introduced on the C-Series and S-Series.                 |

## Example

```
DellEMC# show storm-control multicast Tengigabitethernet 1/1/1
Multicast storm control configuration
Interface Direction Packets/Second

Te 1/1/1 Ingress 5
DellEMC#
```

## show storm-control pfc status

You can view the status of the PFC storm on a stack unit with specific port set.

**Syntax** `show storm-control pfc status stack-unit {unit-number} port-set {portpipe-number}`

**Parameters**

- unit-number*** Enter the stack unit number.
- portpipe-number*** Enter the port set number.

**Defaults** None

**Command Modes** EXEC Privilege.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                            |
|-----------|--------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.              |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S6100-ON, Z9100-ON. |

**Usage Information** The `show storm-control pfc status` command is used to view the status of the PFC storm on the specified stack unit and the port set.

## Example

## show storm-control pfc statistics

You can view the statistical details of the PFC storm on a stack unit with specified port set.

**Syntax** `show storm-control pfc statistics stack-unit {unit-number} port-set {portpipe-number}`

**Parameters**

- unit-number*** Enter the stack unit number.
- portpipe-number*** Enter the port set number.

**Defaults** None

**Command Modes** EXEC Privilege.

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                            |
|-----------|--------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.              |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S6100-ON, Z9100-ON. |

## Usage Information

The `show storm-control pfc statistics` command is used to view the statistical data of the PFC storm on the specified stack unit and the port set.

## Example

```
DellEMC#show storm-control pfc statistics stack-unit 1 port-set 0

# show storm-control unknown-unicast

Display the storm control unknown-unicast configuration.

## Syntax

```
show storm-control unknown-unicast [interface]
```

## Parameters

***interface***

(OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

## Defaults

None

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### Version

### Description

- |                  |                                           |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series.                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |
| 7.6.1.0    | Introduced on the S-Series.                                                                         |
| 7.5.1.0    | Introduced on the C-Series.                                                                         |
| 6.5.1.0    | Introduced on the E-Series.                                                                         |

## storm-control broadcast (Configuration)

Configure the percentage of broadcast traffic allowed in the network.

**Syntax** `storm-control broadcast [packets_per_second in]`

To disable broadcast rate-limiting, use the `no storm-control broadcast [packets_per_second in]` command.

**storm-control broadcast** [percentage decimal\_value in | out] [wred-profile name] [packets\_per\_second in]

To disable broadcast rate-limiting, use the **storm-control broadcast** [percentage decimal\_value in | out] [wred-profile name] [packets\_per\_second in] command.

**Parameters**

**percentage decimal\_value in | out** E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%. The decimal range is from .1 to .9.

**wred-profile name** E-Series Only: Enter the keyword **wred-profile** followed by the profile name to designate a wred-profile.

**packets\_per\_second in** Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults** none

**Command Modes** CONFIGURATION (conf)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-MUX (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |
| 7.6.1.0    | Introduced on the S-Series.                                                                         |
| 7.5.1.0    | Introduced on the C-Series.                                                                         |
| 7.4.1.0    | E-Series Only: Added the <code>percentage decimal value</code> option.                              |
| 6.5.1.0    | Introduced on the E-Series.                                                                         |

**Usage Information**

Broadcast storm control is valid on Layer 2/Layer 3 interfaces only. Layer 2 broadcast traffic is treated as unknown-unicast traffic.

## storm-control broadcast (Interface)

Configure the percentage of broadcast traffic allowed on an interface (ingress only).

**Syntax** `storm-control broadcast [packets_per_second in]`  
 To disable broadcast storm control on the interface, use the `no storm-control broadcast [packets_per_second in]` command.

**Parameters** **packets\_per\_second in** Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults** none

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |

| Version  | Description                                                            |
|----------|------------------------------------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                                               |
| 8.3.19.0 | Introduced on the S4820T.                                              |
| 8.3.11.1 | Introduced on the Z9000.                                               |
| 8.3.7.0  | Introduced on the S4810.                                               |
| 7.6.1.0  | Introduced on the S-Series.                                            |
| 7.5.1.0  | Introduced on the C-Series.                                            |
| 7.4.1.0  | E-Series Only: Added the <code>percentage decimal value</code> option. |
| 6.5.1.0  | Introduced on the E-Series.                                            |

## storm-control PFC/LLFC

Shut down the port if it receives the PFC/LLFC frames more than the configured rate.

**Syntax** `storm-control pfc-llfc [pps]in shutdown`

**Parameters**

- `pfc-llfc in`** Enter the keyword `pfc-llfc` to get the flow control traffic. The range is from 0 to 33554368 packets per second.
- `shutdown`** Enter the keyword `shutdown` to shut down the port when the rate exceeds.

**Defaults** none

**Command Modes** INTERFACE (*conf-if-interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                      |
| 9.9(0.0)  | Introduced on the C9010, S4810, S4820T, S5000, S6000, Z9500, S3048-ON, S4048-ON, and S6000-ON. |

**Usage Information**

 **NOTE:** PFC/LLFC storm control enabled interfaces disable the interfaces if it receives continuous PFC/LLFC packets. It can be a result of a faulty NIC/Switch that sends spurious PFC/LLFC packets.

## storm-control pfc in queue-drop

When a PFC storm is detected on a port or priority, you can drop the traffic meant for the specified port or priority, so that the traffic in other queues is not disturbed. You can apply `storm-control pfc in queue-drop` on an interface, to enable dropping of the traffic on all the lossless queues of the port.

**Syntax** `storm-control pfc in queue-drop`

**Parameters** None

**Defaults** None

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                             |
|-----------|---------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information**

The `storm-control pfc in queue-drop` command is used to drop the traffic meant for egressing through the specified port or priority where PFC storm has been detected.

**Example**

```
DellEMC(conf-if-te-1/24)# storm-control pfc in queue-drop
```

## storm-control pfc in queue-drop-state clear

You can clear the queue-drop state on an interface where the PFC storm has been triggered.

**Syntax** `storm-control pfc in queue-drop-state clear`

**Parameters** None

**Defaults** None

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                             |
|-----------|---------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information**

The `storm-control pfc in queue-drop-state clear` command is used to clear the queue-drop state on a particular interface where the PFC storm has been triggered.

**Example**

```
DellEMC(conf-if-te-1/1/1)# storm-control pfc in queue-drop-state clear
```

## storm-control multicast (Configuration)

Configure the packets per second (pps) of multicast traffic allowed into the C-Series and S-Series networks only.

**Syntax** `storm-control multicast packets_per_second in`

To disable storm-control for multicast traffic into the network, use the `no storm-control multicast packets_per_second in` command.

**Parameters** **packets\_per\_second in** Enter the packets per second of multicast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults** none

**Command Modes** CONFIGURATION (conf)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-MUX (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                                            |
| 8.3.7.0    | Introduced on the S4810.                                                                            |
| 7.6.1.0    | Introduced on the C-series and S-Series.                                                            |

**Usage Information**

Broadcast traffic (all 0xFs) should be counted against the broadcast storm control meter, not against the multicast storm control meter. It is possible, however, that some multicast control traffic may get dropped when storm control thresholds are exceeded.

## storm-control multicast (Interface)

Configure the percentage of multicast traffic allowed on an C-Series or S-Series interface (ingress only) network only.

**Syntax**

`storm-control multicast packets_per_second in`

To disable multicast storm control on the interface, use the `no storm-control multicast packets_per_second in` command.

**Parameters**

**packets\_per\_second in** Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults**

none

**Command Modes**

INTERFACE (*conf-if-interface-slot/port*)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-series and S-Series. |

## storm-control unknown-unicast (Configuration)

Configure the percentage of unknown-unicast traffic allowed in or out of the network.

**Syntax** `storm-control unknown-unicast [packets_per_second in]`  
 To disable storm control for unknown-unicast traffic, use the `no storm-control unknown-unicast [packets_per_second in]` command.

**Parameters** **packets\_per\_second in** Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                            |
|------------|------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                              |
| 9.10(0.0)  | Introduced on the S3148.                                               |
| 9.10(0.0)  | Introduced on the S6100-ON.                                            |
| 9.8(2.0)   | Introduced on the S3100 series.                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                            |
| 9.7(0.0)   | Introduced on the S6000-ON.                                            |
| 9.2(1.0)   | Introduced on the Z9500.                                               |
| 9.0.2.0    | Introduced on the S6000.                                               |
| 8.3.19.0   | Introduced on the S4820T.                                              |
| 8.3.11.1   | Introduced on the Z9000.                                               |
| 8.3.7.0    | Introduced on the S4810.                                               |
| 7.6.1.0    | Introduced on the S-Series.                                            |
| 7.5.1.0    | Introduced on the C-Series.                                            |
| 7.4.1.0    | E-Series Only: Added the <code>percentage decimal value</code> option. |
| 6.5.1.0    | Introduced on the E-Series.                                            |

**Usage Information** Unknown Unicast Storm-Control is valid for Layer 2 and Layer 2/Layer 3 interfaces.

# storm-control unknown-unicast (Interface)

Configure percentage of unknown-unicast traffic allowed on an interface (ingress only).

**Syntax** `storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]`

To disable unknown-unicast storm control on the interface, use the `no storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]` command.

## Parameters

|                                            |                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>percentage decimal_value [in   out]</b> | E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%.<br><br>The percentage is from 0 to 100: <ul style="list-style-type: none"><li>• 0% blocks all related traffic.</li><li>• 100% allows all traffic into the interface.</li></ul> The decimal range is from 0.1 to 0.9. |
| <b>wred-profile name</b>                   | E-Series Only: (Optionally) Enter the keywords <code>wred-profile</code> followed by the profile name to designate a wred-profile.                                                                                                                                                                                                                                                            |
| <b>packets_per_second in</b>               | C-Series and S-Series Only: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554431.                                                                                                                                                                                                                                                      |

**Defaults** none

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                            |
|------------|------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                              |
| 9.10(0.0)  | Introduced on the S3148.                                               |
| 9.10(0.0)  | Introduced on the S6100-ON.                                            |
| 9.8(2.0)   | Introduced on the S3100 series.                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                            |
| 9.7(0.0)   | Introduced on the S6000-ON.                                            |
| 9.2(1.0)   | Introduced on the Z9500.                                               |
| 9.0.2.0    | Introduced on the S6000.                                               |
| 8.3.19.0   | Introduced on the S4820T.                                              |
| 8.3.11.1   | Introduced on the Z9000.                                               |
| 8.3.7.0    | Introduced on the S4810.                                               |
| 7.6.1.0    | Introduced on the S-Series.                                            |
| 7.5.1.0    | Introduced on the C-Series.                                            |
| 7.4.1.0    | E-Series Only: Added the <code>percentage decimal_value</code> option. |
| 6.5.1.0    | Introduced on the E-Series.                                            |

# xoff-state threshold polling-count

When a lossless queue in an interface is not able to forward traffic for a particular duration of time, it is detected as PFC storm. You can set the duration by providing the number of polling intervals. If a port/priority remains in xoff state for the specified duration, then it is detected as PFC storm condition.

**Syntax** `xoff-state threshold polling-count {number of polling-interval}`

**Parameters** ***number of polling interval*** Enter the number of polling intervals. The range is from 2 to 10.

**Defaults** 2

**Command Modes** CONFIGURATION (conf-storm-control-pfc)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                             |
|-----------|---------------------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.               |
| 9.10(0.0) | Introduced on the S6000, S6000-ON, S61000-ON, Z9100-ON. |

**Usage Information** The `xoff-state threshold polling-count` command is used to set the number of times the polling should be done. If a port/priority remains in the 'xoff' state for the configured threshold number of polling-intervals, then it would be detected as PFC storm condition. The 'xoff' state means no transmission of data happens out of a port/queue even though there are packets buffered in that queue.

**Example** Use the `storm-control pfc` command in the configuration mode to enter the 'storm-control-pfc' configuration mode. The commands provisioned in this mode are applicable for all the interfaces that have PFC storm enabled.

```
DellEMC(conf)#storm-control pfc
DellEMC(conf-storm-control-pfc)#xoff-state threshold polling-count 2
```

# Spanning Tree Protocol (STP)

The commands in this section configure and monitor the IEEE 802.1d spanning tree protocol (STP) and are supported on the Dell EMC Networking switch/routing platform.

## Topics:

- [bridge-priority](#)
- [bpdu-destination-mac-address](#)
- [debug spanning-tree](#)
- [description](#)
- [disable](#)
- [forward-delay](#)
- [hello-time](#)
- [max-age](#)
- [protocol spanning-tree](#)
- [show config](#)
- [show spanning-tree 0](#)
- [spanning-tree](#)

## bridge-priority

Set the bridge priority of the switch in an IEEE 802.1D spanning tree.

**Syntax** `bridge-priority {priority-value | primary | secondary}`  
To return to the default value, use the `no bridge-priority` command.

**Parameters**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <b>priority-value</b> | Enter a number as the bridge priority value. The range is from 0 to 65535. The default is <b>32768</b> . |
| <b>primary</b>        | Enter the keyword <code>primary</code> to designate the bridge as the root bridge.                       |
| <b>secondary</b>      | Enter the keyword <code>secondary</code> to designate the bridge as a secondary root bridge.             |

**Defaults** `priority-value = 32768`

**Command Modes** SPANNING TREE (The prompt is "config-stp".)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |

| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## bpdu-destination-mac-address

Use the Provider Bridge Group address in Spanning Tree or GVRP PDUs.

**Syntax** `bpdu-destination-mac-address [stp | gvrp] provider-bridge-group`

| Parameters  |                                                                                                                 |  |
|-------------|-----------------------------------------------------------------------------------------------------------------|--|
| <b>xstp</b> | Force STP, RSTP, and MSTP to use the Provider Bridge Group address as the destination MAC address in its BPDUs. |  |
| <b>gvrp</b> | Forces GVRP to use the Provider Bridge GVRP Address as the destination MAC address in its PDUs.                 |  |

**Defaults** The destination MAC address for BPDUs is the Bridge Group Address.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the S4810.                  |
| 8.2.1.0    | Introduced on the C-Series and S-Series.  |

## debug spanning-tree

Enable debugging of the spanning tree protocol and view information on the protocol.

**Syntax** `debug spanning-tree {stp-id [all | bpdu | config | events | exceptions | general | root] | protocol}`

To disable debugging, use the `no debug spanning-tree` command.

### Parameters

|                        |                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b><i>stp-id</i></b>   | Enter zero (0). The switch supports one spanning tree group with a group ID of 0.                                     |
| <b><i>protocol</i></b> | Enter the keyword for the type of STP to debug, either <code>mstp</code> , <code>pvst</code> , or <code>rstp</code> . |
| <b><i>all</i></b>      | (OPTIONAL) Enter the keyword <code>all</code> to debug all spanning tree operations.                                  |
| <b><i>bpdu</i></b>     | (OPTIONAL) Enter the keyword <code>bpdu</code> to debug bridge protocol data units.                                   |
| <b><i>config</i></b>   | (OPTIONAL) Enter the keyword <code>config</code> to debug configuration information.                                  |
| <b><i>events</i></b>   | (OPTIONAL) Enter the keyword <code>events</code> to debug STP events.                                                 |
| <b><i>general</i></b>  | (OPTIONAL) Enter the keyword <code>general</code> to debug general STP operations.                                    |
| <b><i>root</i></b>     | (OPTIONAL) Enter the keyword <code>root</code> to debug STP root transactions.                                        |

**Command Modes** EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |

| <b>7.7.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

### Usage Information

When you enable `debug spanning-tree bpdu` for multiple interfaces, the software only sends information on BPDUs for the last interface specified.

### Related Commands

- [protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

## description

Enter a description of the spanning tree.

### Syntax

```
description {description}
```

To remove the description from the spanning tree, use the `no description {description}` command.

|                        |                                                                                                                                                               |                                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Parameters</b>      | <i>description</i>                                                                                                                                            | Enter a description to identify the spanning tree (80 characters maximum). |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                                            |

**Related Commands**

- [protocol spanning-tree](#) — enter SPANNING TREE mode on the switch.

## disable

Disable the spanning tree protocol globally on the switch.

**Syntax**                    `disable`

To enable Spanning Tree Protocol, use the `no disable` command.

**Defaults**                    Enabled (that is, the spanning tree protocol is disabled.)

**Command Modes**          SPANNING TREE

**Command History**          This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Related Commands**

- [protocol spanning-tree](#) — enter SPANNING TREE mode on the switch.

## forward-delay

The amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

**Syntax**

`forward-delay seconds`

To return to the default setting, use the `no forward-delay` command.

**Parameters**

**seconds** Enter the number of seconds the Dell EMC Networking OS waits before transitioning STP to the Forwarding state. The range is from 4 to 30. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command Modes**

SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.2.1.1 | Introduced on the E-Series. |

**Related Commands**

- [max-age](#) — changes the wait time before STP refreshes protocol configuration information.
- [hello-time](#) — changes the time interval between BPDUs.

## hello-time

Set the time interval between generation of the spanning tree bridge protocol data units (BPDUs).

**Syntax**

`hello-time seconds`

To return to the default value, use the `no hello-time` command.

**Parameters**

**seconds**

Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

**Defaults**

**2 seconds**

**Command Modes**

SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 6.2.1.1    | Introduced on the E-Series.               |

## Usage Information

STP is not enabled when you enter SPANNING TREE mode. To enable STP globally on the switch, use the `no disable` command from SPANNING TREE mode.

## Example

```
DellEMC(conf)# protocol spanning-tree 0
DellEMC(config-stp)#
```

## Related Commands

- `disable` — disables spanning tree group 0. To enable spanning tree group 0, use the `no disable` command.

# show config

Display the current configuration for the mode. Only non-default values display.

**Syntax** `show config`

**Command Modes** SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

### Example

```
DellEMC(config-stp)# show config
protocol spanning-tree 0
 no disable
DellEMC(config-stp)#
```

## show spanning-tree 0

Display the spanning tree group configuration and status of interfaces in the spanning tree group.

**Syntax** `show spanning-tree 0 [active | brief | guard | interface interface | root | summary]`

| Parameters                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b>                          | Enter 0 (zero) to display information about that specific spanning tree group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>active</b>                     | (OPTIONAL) Enter the keyword <code>active</code> to display only active interfaces in spanning tree group 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>brief</b>                      | (OPTIONAL) Enter the keyword <code>brief</code> to display a synopsis of the spanning tree group configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>guard</b>                      | (OPTIONAL) Enter the keyword <code>guard</code> to display the type of guard enabled on an STP interface and the current port state.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>interface <i>interface</i></b> | (OPTIONAL) Enter the keyword <code>interface</code> and the type slot/port of the interface you want displayed. Type slot/port options are the following: <ul style="list-style-type: none"> <li>For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
| <b>root</b>                       | (OPTIONAL) Enter the keyword <code>root</code> to display configuration information on the spanning tree group root.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>summary</b>                    | (OPTIONAL) Enter the keyword <code>summary</code> to only the number of ports in the spanning tree group and their state.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.                                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                                           |
| 8.3.19.0   | Introduced on the S4820T.                                                                          |
| 8.3.11.1   | Introduced on the Z9000.                                                                           |
| 8.5.1.0    | Added support for 4-port 40G line cards on the E-Series.                                           |
| 8.4.2.1    | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series. |
| 8.3.7.0    | Introduced on the S4810.                                                                           |
| 7.7.1.0    | Introduced on the S-Series.                                                                        |
| 7.5.1.0    | Introduced on the C-Series.                                                                        |
| 6.2.1.1    | Introduced on the E-Series.                                                                        |

#### Usage Information

Enable spanning tree group 0 prior to using this command.

The following describes the `show spanning-tree 0` command shown in the example.

| Field                  | Description                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| “Bridge Identifier...” | Lists the bridge priority and the MAC address for this STP bridge.                                                                                                            |
| “Configured hello...”  | Displays the settings for hello time, max age, and forward delay.                                                                                                             |
| “We are...”            | States whether this bridge is the root bridge for the STG.                                                                                                                    |
| “Current root...”      | Lists the bridge priority and MAC address for the root bridge.                                                                                                                |
| “Topology flag...”     | States whether the topology flag and the detected flag were set.                                                                                                              |
| “Number of...”         | Displays the number of topology changes, the time of the last topology change, and on what interface the topology change occurred.                                            |
| “Timers”               | Lists the values for the following bridge timers: hold time, topology change, hello time, max age, and forward delay.                                                         |
| “Times”                | List the number of seconds since the last: <ul style="list-style-type: none"> <li>• hello time</li> <li>• topology change</li> <li>• notification</li> <li>• aging</li> </ul> |
| “Port 1...”            | Displays the Interface type slot/port information and the status of the interface (Disabled or Enabled).                                                                      |
| “Port path...”         | Displays the path cost, priority, and identifier for the interface.                                                                                                           |
| “Designated root...”   | Displays the priority and MAC address of the root bridge of the STG that the interface belongs.                                                                               |

| Field                | Description                      |
|----------------------|----------------------------------|
| "Designated port..." | Displays the designated port ID. |

### Example

```
DelleMC# show spann 0

Executing IEEE compatible Spanning Tree Protocol
Bridge Identifier has priority 32768, Address 0001.e800.0a56
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Current root has priority 32768 address 0001.e800.0a56
Topology change flag set, detected flag set
Number of topology changes 1 last change occurred 0:00:05 ago
 from TenGigabitEthernet 1/1/3
Timers:hold 1, topology change 35
 hello 2, max age 20, forward delay 15
Times:hello 1, topology change 1, notification 0, aging 2

Port 26 (TenGigabitEthernet 1/1/1) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.26
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.26, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 27 (TenGigabitEthernet 1/1/2) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.27
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.27, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 28 (TenGigabitEthernet 1/1/3) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.28
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.28, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:31, received 0
The port is not in the portfast mode

```

### Usage Information

The following describes the show spanning-tree 0 guard command shown in the example.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | STP interface.                                                                                                          |
| <b>Instance</b>       | STP 0 instance.                                                                                                         |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

#### Example (Guard)

```
DellEMC#show spanning-tree 0 guard
Interface
Name Instance Sts Guard type

Te 1/1/1 0 INCON(Root) Rootguard
Te 1/1/2 0 LIS Loopguard
Te 1/1/3 0 EDS (Shut) Bpduguard
```

## spanning-tree

Assigns a Layer 2 interface to STP instance 0 and configures a port cost or port priority, or enables loop guard, root guard, or the Portfast feature on the interface.

#### Syntax

```
spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast
[bpduguard [shutdown-on-violation]] | priority priority}
```

To disable Spanning Tree group on an interface, use the `no spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority priority}` command.

#### Parameters

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>stp-id</i></b>                                                             | Enter the STP instance ID. The range is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>cost cost</i></b>                                                          | Enter the keyword <code>cost</code> then a number as the cost. The range is from 1 to 65535. The defaults are: <ul style="list-style-type: none"> <li>1-Gigabit Ethernet interface = <b>4</b>.</li> <li>10-Gigabit Ethernet interface = <b>2</b>.</li> <li>Port Channel interface with 100 Mb/s Ethernet = <b>18</b>.</li> <li>Port Channel interface with 1 Gigabit Ethernet = <b>3</b>.</li> <li>Port Channel interface with 10 Gigabit Ethernet = <b>1</b>.</li> </ul> |
| <b><i>loopguard</i></b>                                                          | Enter the keyword <code>loopguard</code> to enable STP loop guard on a port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>rootguard</i></b>                                                          | Enter the keyword <code>rootguard</code> to enable STP root guard on a port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>portfast</i><br/><i>[bpduguard</i><br/><i>[shutdown-on-violation]]</i></b> | Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.<br><br>Enter the optional keyword <code>bpduguard</code> to disable the port when it receives a BPDU.<br><br>Enter the optional keyword <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                     |
| <b><i>priority priority</i></b>                                                  | Enter keyword <code>priority</code> then a number as the priority. The range is from zero (0) to 15. The default is <b>8</b> .                                                                                                                                                                                                                                                                                                                                            |

#### Defaults

`cost` = depends on the interface type; `priority` = **8**

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                         |
| 9.10(0.0)  | Introduced on the S3148.                                                                                          |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                       |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                   |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                       |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                       |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                       |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                          |
| 9.0.2.0    | Introduced on the S6000.                                                                                          |
| 8.3.19.0   | Introduced on the S4820T.                                                                                         |
| 8.3.11.1   | Introduced on the Z9000.                                                                                          |
| 8.3.10.1   | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the S4810.                            |
| 8.4.2.1    | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series, C-Series, and S-Series. |
| 8.3.7.0    | Introduced on the S4810.                                                                                          |
| 8.2.1.0    | Introduced the <code>shutdown-on-violation</code> option.                                                         |
| 7.7.1.0    | Introduced on the S-Series.                                                                                       |
| 7.5.1.0    | Introduced on the C-Series.                                                                                       |
| 6.2.1.1    | Introduced on the E-Series.                                                                                       |

## Usage Information

If you enable `portfast bpduguard` on an interface and the interface receives a BPDU, the software disables the interface and sends a message stating that fact. The port is in `ERR_DISABLE` mode, yet appears in the `show interface` commands as enabled. If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

STP loop guard and root guard are supported on a port or port-channel enabled in any Spanning Tree mode: Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and Per-VLAN Spanning Tree Plus (PVST+).

Root guard is supported on any STP-enabled port or port-channel except when used as a stacking port. When enabled on a port, root guard applies to all VLANs configured on the port.

STP root guard and loop guard cannot be enabled at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

Do not enable Portfast BPDU guard and loop guard at the same time on a port. Enabling both features may result in a port that remains in a blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

To display the type of STP guard (Portfast BPDU, root, or loop guard) enabled on a port, enter the `show spanning-tree 0` command.

# SupportAssist

SupportAssist sends troubleshooting data securely to Dell. SupportAssist in this Dell EMC Networking OS release does not support automated email notification at the time of hardware fault alert, automatic case creation, automatic part dispatch, or reports. SupportAssist requires Dell EMC Networking OS 9.9(0.0) and SmartScripts 9.7 or later to be installed on the Dell EMC Networking device. For more information on SmartScripts, see *Dell EMC Networking Open Automation guide*.

**NOTE:** SupportAssist is enabled by default on the system. To disable SupportAssist, enter the `eula-consent support-assist reject` command in Global Configuration mode and save the configuration.

## Topics:

## eula-consent

Accept or reject the end user license agreement (EULA).

**Syntax** `eula-consent {support-assist} {accept | reject}`

**Parameters**

|                       |                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <b>support-assist</b> | Enter the keywords <code>support-assist</code> to either accept or reject the EULA for the specified service. |
| <b>accept</b>         | Enter the keyword <code>accept</code> to accept the EULA for the specified service.                           |
| <b>reject</b>         | Enter the keyword <code>reject</code> to reject the EULA for the specified service.                           |

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                 |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Usage Information

- When you run the command, the system displays a message with the information directing to the URL for further information.
- Even before you accept or reject the EULA, the configuration data is sent to the default centrally deployed SupportAssist Server. If you reject the EULA, the configuration data is not transmitted to the SupportAssist server.
- If there is an existing SupportAssist configuration, the configuration is not removed and the feature is disabled.

## Example

Accept the EULA:

```
DellEMC(conf)# eula-consent support-assist accept
I accept the terms of the license agreement. You can reject
the license agreement by configuring this command
'eula-consent support-assist reject'.
```

By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration & performance information and related data ("Collected Data") and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: [www.dell.com/aeula](http://www.dell.com/aeula), you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dells Privacy Policy, available at: [www.dell.com/privacypolicycountryspecific](http://www.dell.com/privacypolicycountryspecific), in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell,. You further agree to allow Dell to transmit and store the Collected Data from SupportAssist in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dells affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection, transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.

Reject the EULA:

```
DellEMC(conf)#eula-consent support-assist reject
Aug 24 22:35:38: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-SUPASSIST_EVT: Event
monitor service stopped
I do not accept the terms of the license agreement. The SupportAssist
feature has
been deactivated and can no longer be used.
To enable SupportAssist configurations, accept the terms of the license
agreement
by configuring this command 'eula-consent support-assist accept'.
DellEMC(conf)#
DellEMC(conf)#
Aug 24 22:35:49: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-
```

```
SUPASSIST_PKG UNINSTALLED: SupportAssist package uninstalled
DellEMC (conf) #
```

### Related Commands

- [support-assist](#) — moves to the SupportAssist Configuration mode.

## support-assist

Move to the SupportAssist configuration mode.

**Syntax** `support-assist`  
To remove all the configuration of the SupportAssist service, use the `no support-assist` command.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** If you reject the EULA, the data is not transmitted to the SupportAssist server.

**Related Commands** • [eula-consent](#) — accept or reject the EULA.

## support-assist activate

Launch the configuration wizard that enables SupportAssist service and guides through a series of commands to configure SupportAssist.

**Syntax** `support-assist activate`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** You are guided through a series of queries to configure SupportAssist. The generated commands are added to the running configuration, including the DNS resolve commands, if configured.

This command starts the configuration wizard for the SupportAssist. At any time, you can exit by entering Ctrl-C. If necessary, you can skip some data entry.

Once you exit the wizard, the Dell EMC Networking OS starts a full transfer.

## support-assist activity

Trigger an activity event immediately.

**Syntax** `support-assist activity {full-transfer | core-transfer} start now`

**Parameters**

**full-transfer** Enter the keyword `full-transfer` to specify transfer of configuration, inventory, logs, and other information.

**core-transfer** Enter the keyword `core-transfer` to specify transfer of core files.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** Use the command to trigger the activity that enables transfer of information. You can choose a full transfer that includes all the details or core transfer that includes only the core files.

 **NOTE:** The full transfer includes the core files as well in the information sent. The core transfer does not send core files that are older than 30 days.

## SupportAssist Commands

Dell EMC Networking OS supports the following SupportAssist mode commands.

### activity

Move to the SupportAssist Activity mode for an activity. Allow the user to configure customized details for a specific activity.

**Syntax** `activity {activity-name}`

To remove all customized detail for a specific activity, use the `no activity {activity-name}` command.

**Parameters**

**activity-name** Enter one of the following keywords:

- Enter the keyword `full-transfer` to enable or disable full transfer. You can create a custom file to transfer the outputs from a set of show commands. By default, the full transfer runs once in every 30 days.
- Enter the keyword `core-transfer` to enable or disable core transfer.
- Enter the keyword `event-transfer` to enable or disable event transfer. You can create a custom file to monitor a set of events.

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                                                                      |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.<br>Introduced the <code>core-transfer</code> and <code>event-transfer</code> parameters. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                                                               |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                                                                |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                                                                          |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.                                                |

**Usage Information** By default, each activity follows a set of default actions using a default schedule. Using this command, you can customize the set of actions and disable a certain activity.

## contact-company

Configure the contact information for the company.

**Syntax** `contact-company name {company-name} [company-next-name] ... [company-next-name]`

To remove the contact company information, use the `no contact-company` command.

**Parameters**

|                                 |                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>company-name</i></b>      | Enter the name for the company. If there are multiple words in the name, use optional additional fields. |
| <b><i>company-next-name</i></b> | (OPTIONAL) Enter the next components of the company name, up to 5 components are allowed.                |

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                       |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                 |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** You can configure only one contact-company.

It is not possible to remove the components of the company name. The `no` form of the command removes the entire contact-company entry.

This command is optional for SupportAssist service configuration.

## contact-person

Configure the contact name for an individual.

**Syntax** `contact-person [first <first-name>] last <last-name>`  
To remove the contact person and all their details, use the `no contact-person [first <first-name>] last <last-name>` command.

**Parameters**

|                          |                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>first-name</i></b> | (Optional) Enter the first name for the contact person. This is optional provided each contact person name is unique. To include a space, enter a space within double quotes. |
| <b><i>last-name</i></b>  | Enter the last name for the contact person. To include a space, enter a space within double quotes.                                                                           |

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information**

Each contact person must be unique by their name.

You can configure only one contact person.

It is not possible to remove the first name or last name. The `no` form of the command removes the entire `contact-person` entry.

This command is optional for SupportAssist service configuration.

## enable

Enable all activities and severs for the SupportAssist service.

**Syntax** `enable all`  
To disable the SupportAssist activities temporarily, use the `no enable all` command.

**Parameters**

|            |                                                                                    |
|------------|------------------------------------------------------------------------------------|
| <b>all</b> | Enter the keyword <code>all</code> to enable all SupportAssist service activities. |
|------------|------------------------------------------------------------------------------------|

**Defaults** Enabled or All Enabled

**Command Modes** SUPPORTASSIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                    |
|-----------|----------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                 |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                      |
| 9.10(0.0) | Introduced on the S3148.                                       |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series. |

| Version  | Description                                                                              |
|----------|------------------------------------------------------------------------------------------|
| 9.9(0.0) | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## server

Configure the name of the remote SupportAssist Server and move to SupportAssist Server mode.

|                        |                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>server {default   server-name}</code><br>To delete a server, use the <code>no server server-name</code> command.                                                                                                                             |
| <b>Parameters</b>      | <p><b>default</b> Enter the keyword <code>default</code> for the default server.</p> <p><b>server-name</b> Enter the name of the custom server to which the logs would be transferred. To include a space, enter a space within double quotes.</p> |
| <b>Defaults</b>        | Default server has URL <code>stor.g3.ph.dell.com</code>                                                                                                                                                                                            |
| <b>Command Modes</b>   | SUPPORTASSIST                                                                                                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                      |

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## SupportAssist Activity Commands

Dell EMC Networking OS supports the following SupportAssist Activity mode commands.

### action-manifest get

Copy an action-manifest file for an activity to the system.

|                   |                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>action-manifest get tftp   ftp   flash &lt;file-specification&gt; &lt;local-file-name&gt;</code>                                                                                                                                                                                                                            |
| <b>Parameters</b> | <p><b>file-specification</b> Enter the full file specification for the action-manifest file. For example:</p> <ul style="list-style-type: none"> <li>• <code>tftp://hostip/filepath</code></li> <li>• <code>ftp://userid:password@hostip/filepath</code></li> <li>• <code>scp://userid:password@hostip/filepath</code></li> </ul> |

***local-file-name*** Enter the name of the local action-manifest file, up to 32 characters long. Allowable characters are: a to z, A to Z, 0 to 9, -, \_, and space.

**Command Modes** SUPPORTASSIST ACTIVITY FULL-TRANSFER  
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** The remote file specification for full transfer includes the protocol that is used to copy the file from the remote system.  
The default Manifest-file for full transfer includes records like alarms, logs, operational, and configuration data.

**Related Commands**

- [action-manifest install](#) — configure the action-manifest to use for a specific activity.
- [action-manifest show](#) — view the list of action-manifest for a specific activity.
- [action-manifest remove](#) — remove the action-manifest file for an activity.

## action-manifest install

Configure action-manifest to transfer a set of customized records for full transfer and to monitor a set of specified events for event transfer.

**Syntax** `action-manifest install {default | <local-file-name>}`

To revert to the default action-manifest file, use the `action-manifest install default` command.

**Parameters**

|                               |                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>default</b>                | Enter the keyword <code>default</code> to revert back to the default set of actions for an activity.                 |
| <b><i>local-file-name</i></b> | Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space. |

**Defaults** Default

**Command Modes** SUPPORTASSIST ACTIVITY FULL-TRANSFER  
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                    |
|-----------|----------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                 |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                      |
| 9.10(0.0) | Introduced on the S3148.                                       |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series. |

| Version         | Description                                                                              |
|-----------------|------------------------------------------------------------------------------------------|
| <b>9.9(0.0)</b> | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information**

To replace the default action-manifest with a customized one, copy the action-manifest file to the system using the `action-manifest get` command and then use the `action-manifest install` command. To revert to the default action-manifest file, use the `action-manifest install default` command.

**Related Commands**

- [action-manifest get](#) — copy an action-manifest file for an activity to the system.
- [action-manifest show](#) — view the list of action-manifest for a specific activity.
- [action-manifest remove](#) — remove the action-manifest file for an activity.

## action-manifest remove

Remove the action-manifest file from Dell EMC Networking OS.

**Syntax** `action-manifest remove <local-file-name>`

**Parameters** **local-file-name** Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, \_, and space.

**Command Modes** SUPPORTASSIST ACTIVITY FULL-TRANSFER  
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                 |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information**

To revert to the default action-manifest file, use the `action-manifest install` command. If necessary, you can then remove the custom action-manifest file.

**Related Commands**

- [action-manifest get](#) — copy an action-manifest file for an activity to the system.
- [action-manifest install](#) — configure the action-manifest to use for a specific activity.
- [action-manifest show](#) — view the list of action-manifest for a specific activity.

## action-manifest show

View the list of action-manifest for a specific activity.

**Syntax** `action-manifest show {all}`

**Parameters** **all** Enter the keyword `all` to view the entire list of action-manifests that are available for an activity.

**Command Modes** SUPPORTASSIST ACTIVITY FULL-TRANSFER  
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Related Commands

- [action-manifest get](#) — copy an action-manifest file for an activity to the system.
- [action-manifest install](#) — configure the action-manifest to use for a specific activity.
- [action-manifest remove](#) — remove the action-manifest file for an activity.

## enable

Enable a specific SupportAssist activity.

### Syntax

`enable`

To disable a particular SupportAssist activity, use the `no enable` command.

### Defaults

Enabled

### Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER  
SUPPORTASSIST ACTIVITY CORE-TRANSFER  
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Usage Information

Enter the specific SupportAssist activity mode and then enable it.

 **NOTE:** By default, the full transfer includes the core files. When you disable the core transfer activity, the full transfer excludes the core files.

## Related Commands

- [activity](#) — move user to the SupportAssist Activity mode for that activity.

## SupportAssist Company Commands

Dell EMC Networking OS supports the following SupportAssist Company mode commands.

## address

Configure the address information for the company.

**Syntax** `address [city company-city] [{province | region | state} name] [country company-country] [{postalcode | zipcode} company-code]`

To remove a portion of the company address information, use the `no address [city | province | region | state | country | postalcode | zipcode]` command. For example, to remove the city alone, use the `no address city` command.

To remove the complete company contact information, use the `no address` command.

**Parameters**

|                                          |                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>city company-city</b>                 | (OPTIONAL) Enter the keyword <code>city</code> then the city or town for the company site. To include a space, enter a space within double quotes.                                                                      |
| <b>province   region   state name</b>    | (OPTIONAL) Enter the keyword <code>province</code> , <code>region</code> or <code>state</code> then the name of province, region or state for the company site. To include a space, enter a space within double quotes. |
| <b>country company-country</b>           | (OPTIONAL) Enter the keyword <code>country</code> then the country for the company site. To include a space, enter a space within double quotes.                                                                        |
| <b>postalcode   zipcode company-code</b> | (OPTIONAL) Enter the keyword <code>postalcode</code> or <code>zipcode</code> then the postal code or zip code for the company site, as one string with no spaces.                                                       |

**Command Modes** SUPPORTASSIST COMPANY

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** The optional parameters must be provided in the following order: `city state country postalcode`. If specified in a different order, the command returns an error as follows:

```
DellEMC(conf-supportassist-cmpy-test)# address city Minneapolis
postalcode 55344 country USA state Minnesota
 ^
% Error: Invalid input at "" marker.
```

This command is optional for SupportAssist service configuration.

**Example** `DellEMC(conf-supportassist-cmpy-test)# address city Minneapolis state Minnesota country USA postalcode 55344`

## street-address

Configure the street address information for the company.

**Syntax** `street-address {address1} [address2]...[address8]`

To remove the street address, use the `no street-address` command.

**Parameters** **address1** Enter the street address for the company.

**address2..address8** (OPTIONAL) Enter the street address of the company site. Up to 8 fields are allowed.

**Command Modes** SUPPORTASSIST COMPANY

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** This command is optional for SupportAssist service configuration.

## territory

Configure the territory and set the coverage for the company site.

**Syntax** `territory company-territory`

To remove the company territory information, use the `no territory` command.

**Parameters** **company-territory** Enter the territory name for the company. To include a space, enter a space within double quotes. Use three-letter country codes like USA, IND, FRA, GER and so on.

**Command Modes** SUPPORTASSIST COMPANY

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** This command is optional for SupportAssist service configuration.

## SupportAssist Person Commands

Dell EMC Networking OS supports the following SupportAssist Person mode commands.

## email-address

Configure the email addresses to reach the contact person.

**Syntax** `email-address primary email-address [alternate email-address]`

To remove an email address, use the `no email-address` command. To remove the primary and the alternate email addresses, use the `no email-address primary` and `no email-address alternate` commands respectively.

**Parameters**

**primary email-address** Enter the keyword `primary` then the primary email address for the person.

**alternate email-address** Enter the keyword `alternate` then the alternate email address for the person.

**Command Modes** SUPPORTASSIST PERSON

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** The email addresses must have the standard form of `<username>@<email system>` to be considered valid.

This command is optional for SupportAssist service configuration.

**Related Commands**

- [preferred-method](#) — configure the preferred method for contacting the person.

## phone

Configure phone numbers to reach the contact person.

**Syntax** `phone primary phone [alternate phone]`

To remove a phone number, use the `no phone` command. To remove the primary and alternate phone numbers, use the `no phone primary` and `no phone alternate` commands respectively.

**Parameters**

**primary phone** Enter the keyword `primary` then the primary phone number for the person.

**alternate phone** Enter the keyword `alternate` then the alternate phone number for the person.

**Command Modes** SUPPORTASSIST PERSON

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                    |
|-----------|------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM. |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.      |

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

### Usage Information

The phone numbers may contain country codes, area codes and extensions, if necessary. Allowable characters are 0 to 9, x, (, ), - and +.

This command is optional for SupportAssist service configuration.

### Related Commands

- [preferred-method](#) — configure the preferred method for contacting the person.

## preferred-method

Configure the preferred method for contacting the person.

### Syntax

```
preferred-method {email | no-contact | phone}
```

### Parameters

|                   |                                                                                          |
|-------------------|------------------------------------------------------------------------------------------|
| <b>email</b>      | Enter the keyword <code>email</code> to specify email as preferred method.               |
| <b>no-contact</b> | Enter the keywords <code>no-contact</code> to specify that there is no preferred method. |
| <b>phone</b>      | Enter the keyword <code>phone</code> to specify phone as preferred method.               |

### Defaults

no-contact

### Command Modes

SUPPORTASSIST PERSON

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the M I/O Aggregator and FN IOM.                                           |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                                 |
| <b>9.10(0.0)</b> | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| <b>9.9(0.0)</b>  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

### Related Commands

- [email-address](#) — configure email addresses to reach the contact person.
- [phone](#) — configure phone numbers to reach the contact person.

## time-zone

Configure the time zone for contacting the person.

### Syntax

```
time-zone zone +-HH:MM[start-time HH:MM] [end-time HH:MM]
```

To remove the time zone, use the `no time-zone [zone | start-time | end-time]` command.

### Parameters

|                         |                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>zone +-HH:MM</b>     | Enter the keyword <code>zone</code> then a time difference from GMT expressed as HH:MM. This number may be preceded by either a + or - sign. |
| <b>start-time HH:MM</b> | Enter the keywords <code>start-time</code> then a starting time expressed as HH:MM. Use the 24-hour clock format.                            |

**stop-time** *HH:MM* Enter the keywords `stop-time` then a stopping time expressed as HH:MM. Use the 24-hour clock format.

**Command Modes** SUPPORTASSIST PERSON

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

**Usage Information** This command is optional for SupportAssist service configuration.

## SupportAssist Server Commands

Dell EMC Networking OS supports the following SupportAssist Server mode commands.

### proxy-ip-address

Configure a proxy for reaching the SupportAssist remote server.

**Syntax** `proxy-ip-address {ipv4-address | ipv6-address} port port-number [ username userid password [encryption-type] password ]`

To remove the proxy, use the `no proxy-ip-address` command.

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4-address</b>     | Enter the IP address of the proxy server in a dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ipv6-address</b>     | Enter the IPv6 address of the proxy server in the x:x:x:x format.<br> <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.<br> <b>NOTE:</b> To use the IPv6 address, the Open Automation package should also support IPv6 communications. For this purpose, SupportAssist requires Dell EMC Networking Open Automation 9.10(0.0) package or later. |
| <b>port port-number</b> | Enter the keyword <code>port</code> then the TCP/IP port number. The port number range is from 1024 to 65534.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>username userid</b>  | (OPTIONAL) Enter the keyword <code>username</code> then the user ID used for the proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>password</b>         | Enter the keyword <code>password</code> then the encryption-type or the user password.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>encryption-type</b>  | (OPTIONAL) Enter an encryption type for the <code>password</code> you enter. <ul style="list-style-type: none"><li>• 0 directs the system to interpret the password as clear text.</li><li>• 7 indicates that the password is encrypted using a DES hashing algorithm.</li></ul>                                                                                                                                                                                                                                                                   |
| <b>password</b>         | Enter a string up to 32 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Defaults** encryption-type for the password is 0.

**Command Modes** SUPPORTASSIST SERVER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Usage Information

The passwords are stored encrypted in the running configuration.

## enable

Enable communication with the SupportAssist server.

**Syntax** `enable`  
To disable communication to a specific SupportAssist server, use the `no enable` command.

**Defaults** Enabled

**Command Modes** SUPPORTASSIST SERVER

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.                                           |
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.                                                |
| 9.10(0.0) | Introduced on the S3148.                                                                 |
| 9.10(0.0) | Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.                           |
| 9.9(0.0)  | Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL. |

## Related Commands

- [server](#) — configure the name of the remote SupportAssist server.

## url

Configure the URL to reach the SupportAssist remote server.

**Syntax** `url uniform-resource-locator`  
To delete the URL for the server, use the `no url` command.

## Parameters

### *uniform-resource-locator*

Enter a text string for the URL using one of the following formats:

- `http://[username:password@]<hostip>:<portNum>/<filepath>`
- `https://[username:password@]<hostip>:<portNum>/<filepath>`

 **NOTE:** The host IP for the server may be specified as an IPv4 address, an IPv6 address or as a DNS hostname. If using the DNS hostname, the DNS resolver will need to be configured and enabled.

**Command Modes** SUPPORTASSIST SERVER

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## System Time and Date

The commands in this section configure time values on the system, either using the Dell EMC Networking OS, or the hardware, or using the network time protocol (NTP). With NTP, the switch can act only as a client to an NTP clock host.

For more information, see “Network Time Protocol” of the *Management* section in the *Dell EMC Networking OS Configuration Guide*.

The commands in this chapter are generally supported on Dell EMC Networking OS with some exceptions, as notes in the Command History fields.

### Topics:

- [clock summer-time date](#)
- [clock summer-time recurring](#)
- [clock timezone](#)
- [debug ntp](#)
- [ntp authenticate](#)
- [ntp broadcast client](#)
- [ntp control-key-passwd](#)
- [ntp disable](#)
- [ntp master <stratum>](#)
- [ntp server](#)
- [ntp source](#)
- [ntp step-threshold](#)
- [ntp trusted-key](#)
- [ntp authentication-key](#)
- [show clock](#)
- [show ntp associations](#)
- [show ntp vrf associations](#)
- [show ntp status](#)

## clock summer-time date

Set a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

**Syntax**                    `clock summer-time time-zone date start-month start-day start-year start-time end-month end-day end-year end-time [offset]`

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

|                   |                           |                                                                                                                                                      |
|-------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>time-zone</i></b>   | Enter the three-letter name for the time zone. This name is displayed in the show clock output.                                                      |
|                   | <b><i>start-month</i></b> | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.        |
|                   | <b><i>start-day</i></b>   | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year. |
|                   | <b><i>start-year</i></b>  | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                               |
|                   | <b><i>start-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                           |
|                   | <b><i>end-day</i></b>     | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year. |

|                         |                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>end-month</i></b> | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year. |
| <b><i>end-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                    |
| <b><i>end-year</i></b>  | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                        |
| <b><i>offset</i></b>    | (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to1440. The default is <b>60 minutes</b> .   |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.1.1.0</b>    | Introduced on the E-Series.               |

- Related Commands**
- [clock summer-time recurring](#) — sets a date (and time zone) on which to convert the switch to daylight saving time each year.
  - [show clock](#) — displays the current clock settings.

## clock summer-time recurring

Set the software clock to convert to daylight saving time on a specific day each year.

**Syntax** `clock summer-time time-zone recurring [start-week start-day start-month start-time end-week end-day end-month end-time [offset]]`

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

**Parameters**

***time-zone*** Enter the three-letter name for the time zone. This name is displayed in the show clock output. You can enter up to eight characters.

***start-week*** (OPTIONAL) Enter one of the following as the week that daylight saving begins and then enter values for start-day through end-time:

- `week-number`: Enter a number from 1 to 4 as the number of the week in the month to start daylight saving time.
- `first`: Enter this keyword to start daylight saving time in the first week of the month.
- `last`: Enter this keyword to start daylight saving time in the last week of the month.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>start-day</i></b>   | Enter the name of the day that you want daylight saving time to begin. Use English three letter abbreviations; for example, Sun, Sat, Mon, and so on. The range is from Sun to Sat.                                                                                                                                                                                                                                                                                                                |
| <b><i>start-month</i></b> | Enter the name of one of the 12 months in English.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>start-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>end-week</i></b>    | Enter the one of the following as the week that daylight saving ends: <ul style="list-style-type: none"> <li>• <code>week-number</code>: enter a number from 1 to 4 as the number of the week to end daylight saving time.</li> <li>• <code>first</code>: enter the keyword <code>first</code> to end daylight saving time in the first week of the month.</li> <li>• <code>last</code>: enter the keyword <code>last</code> to end daylight saving time in the last week of the month.</li> </ul> |
| <b><i>end-day</i></b>     | Enter the weekday name that you want daylight saving time to end. Enter the weekdays using the three letter abbreviations; for example Sun, Sat, Mon, and so on. The range is from Sun to Sat.                                                                                                                                                                                                                                                                                                     |
| <b><i>end-month</i></b>   | Enter the name of one of the 12 months in English.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>end-time</i></b>    | Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>offset</i></b>      | (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is <b>60 minutes</b> .                                                                                                                                                                                                                                                                                                                                                       |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |

| Version | Description                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 7.5.1.0 | Introduced on the C-Series.                                                                                                               |
| 7.4.1.0 | Updated the <code>start-day</code> and <code>end-day</code> options to allow for using the three-letter abbreviation of the weekday name. |
| 6.1.1.0 | Introduced on the E-Series.                                                                                                               |

#### Related Commands

- [ntp trusted-key](#) — configures a trusted key.
- [clock summer-time date](#) — sets a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.
- [show clock](#) — displays the current clock settings.

## clock timezone

Configure a timezone for the switch.

**Syntax** `clock timezone timezone-name offset`  
 To delete a timezone configuration, use the `no clock timezone` command.

**Parameters**

***timezone-name*** Enter the name of the timezone. You cannot use spaces.

***offset*** Enter one of the following:

- a number from 1 to 23 as the number of hours in addition to universal time coordinated (UTC) for the timezone.
- a minus sign (-) then a number from 1 to 23 as the number of hours.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

## Usage Information

Coordinated universal time (UTC) is the time standard based on the International Atomic Time standard, commonly known as Greenwich Mean time. When determining system time, include the differentiator between UTC and your local timezone. For example, San Jose, CA is the Pacific Timezone with a UTC offset of -8.

## debug ntp

Display Network Time Protocol (NTP) transactions and protocol messages for troubleshooting.

**Syntax** `debug ntp {level level-number}`  
To disable debugging of NTP transactions, use the `no debug ntp {level level-number}` command.

**Parameters**

|              |                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level</b> | Enter the keyword <code>level</code> then the <code>level-number</code> to display information about NTP logs. The log level range is from 1 to 6. |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

- 1 is the most important log level.
- 6 is the least important log level.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(1.0)</b> | Introduced on the S4810 and S4820T.                                                                                                      |
| <b>9.14(0.0)</b> | Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

## ntp authenticate

Enable authentication of NTP traffic between the switch and the NTP time serving hosts.

**Syntax** `ntp authenticate`  
To disable NTP authentication, use the `no ntp authentication` command.

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information**

You also must configure an authentication key for NTP traffic using the `ntp authentication-key` command.

## ntp broadcast client

Set up the interface to receive NTP broadcasts from an NTP server.

**Syntax** `ntp broadcast client`  
 To disable broadcast, use the `no ntp broadcast client` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

# ntp control-key-passwd

Configure control key password for NTPQ authentication. NTP control key supports encrypted and unencrypted option.

**Syntax** `ntp control-key-passwd [encryption-type] password`  
To delete the control key, use the `no ntp control-key-passwd [encryption-type] password` command.

**Parameters**

**encryption-type** (OPTIONAL) Enter one of the following numbers:

- 0 (zero) directs the system to store the password as clear text. It is the default encryption type when using the password option.
- 7 (seven) indicates that a password is encrypted using a DES hashing algorithm. It specifies a hidden authentication data.
- WORD is the un-encrypted (cleartext) authentication data.

**password** Enter a string up to 32 characters as the password.

**Defaults** NTPQ

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(1.0) | Introduced on the S4810 and S4820T.                                                                                                      |
| 9.14(0.0) | Introduced on the C9010, FN-IOM, MIOA, MXL, S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Usage Information** NTP control key is not configured by default. If the encryption-type (0 or 7) is not specified, then 0 is selected by default.

# ntp disable

Prevent an interface from receiving NTP packets.

**Syntax** `ntp disable`  
To re-enable NTP on an interface, use the `no ntp disable` command.

**Defaults** Disabled (that is, if you configure an NTP host, all interfaces receive NTP packets)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

| Version  | Description                 |
|----------|-----------------------------|
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## ntp master <stratum>

Configure the switch as NTP Server.

**Syntax** `ntp master <stratum>`

**Parameters** **ntp master <stratum>** Enter the `stratum` number to identify the NTP Server's hierarchy. The `stratum` range value is from 2 to 15 and the default value is 8.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                      |
|------------|------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                        |
| 9.10(0.0)  | Introduced on the S3148.                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                      |
| 9.6(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500. |
| 9.2(1.0)   | Introduced on the Z9500.                                         |

## ntp server

Configure an NTP time-serving host.

**Syntax** `ntp server[vrf vrf-name] {hostname | ipv4-address | ipv6-address} [keyid] [prefer] [version number] [minpoll] [maxpoll]`

**Parameters** **vrf vrf-name** (Optional) Enter the keyword `vrf` and then the name of the VRF to configure an NTP time-serving host corresponding to that VRF.

|                                           |                                                                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ipv4-address   ipv6-address</i></b> | Enter an IPv4 address (A.B.C.D) or IPv6 address (X:X:X::X) of NTP server.                                                                     |
| <b><i>hostname</i></b>                    | Enter the host name of the server.                                                                                                            |
| <b><i>key keyid</i></b>                   | (OPTIONAL) Enter the keyword <code>key</code> and a number as the NTP peer key. The range is from 1 to 65534.                                 |
| <b><i>prefer</i></b>                      | (OPTIONAL) Enter the keyword <code>prefer</code> to indicate that this peer has priority over other servers.                                  |
| <b><i>version number</i></b>              | (OPTIONAL) Enter the keyword <code>version</code> and a number to correspond to the NTP version used on the server. The range is from 1 to 4. |
| <b><i>minpoll polling-interval</i></b>    | (OPTIONAL) Enter the keyword <code>minpoll</code> then the polling-interval. The polling interval range is from 4 to 16.                      |
| <b><i>maxpoll polling-interval</i></b>    | (OPTIONAL) Enter the keyword <code>maxpoll</code> then the polling-interval. The polling interval range is from 4 to 16.                      |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                                                                                                                                     |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9.14(0.0)</b>  | The trusted-key range value is increased from 1 to 65534. Also, introduced the <code>minpoll</code> and <code>maxpoll</code> polling interval options. |
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                                                                              |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                                                                               |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                                                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                                                                        |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                                                                            |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                                                                            |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                                                                            |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                                                                            |
| <b>9.6(0.0)</b>   | Added support for VRF.                                                                                                                                 |
| <b>9.4.(0.0)</b>  | Added support for VRF.                                                                                                                                 |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                                                                               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                                                                               |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                                                                               |
| <b>8.4.1.0</b>    | Added IPv6 support.                                                                                                                                    |
| <b>7.6.1.0</b>    | Introduced on the S-Series.                                                                                                                            |
| <b>7.5.1.0</b>    | Introduced on the C-Series.                                                                                                                            |
| <b>6.1.1.0</b>    | Introduced on the E-Series.                                                                                                                            |

**Usage Information** You can configure multiple time-serving hosts. From these time-serving hosts, the Dell EMC Networking OS chooses one NTP host with which to synchronize. To determine which server is selected, use the `show ntp associations` command.

Because many polls to NTP hosts can affect network performance, Dell EMC Networking recommends limiting the number of hosts configured.

By default, the system performs a time synchronization if the time difference from the time source is greater than one second.

When the Dell EMC Networking OS NTP client receives inconsistent timestamp in the origin timestamp field, it logs the syslog message. It is due to the older versions of NTPD server implementation. Upgrade the system to the latest NTPD package in the NTP server and the system logs the following NTP syslog message:

```
Dell EMC# May 30 13:27:46 %STKUNIT2-:CP %ntp-6-: receive: Unexpected
origin timestamp 0xdeb95bee.06ba346e does not match aorg
0000000000.00000000 from server@10.16.151.117 xmt 0xdeb95bee.30907a87
```

In general, the packet denied services are dropped with no further action except incrementing the statistics counters. In certain cases, a more proactive response is required to cause the client to slow down the process. A special packet is created to serve this purpose, and it is called the kiss-o-Death (KoD) packet. When the Dell EMC Networking OS client receives KoD packets, it logs the following syslog message:

```
Dell EMC# May 27 14:32:13 %STKUNIT1-:CP %ntp-6-: receive: KoD packet
from 300::2 has inconsistent xmt/org/rec timestamps. Ignoring.
```

### Related Commands

- [show ntp associations](#)—displays the NTP servers that are configured and their status.

## ntp source

Specify an interface's IP address to be included in the NTP packets.

**Syntax** `ntp source interface`

To delete the configuration, use the `no ntp source` command.

### Parameters

#### **interface**

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|                  |                                                                                     |
|------------------|-------------------------------------------------------------------------------------|
| <b>9.14.1.0</b>  | The support for configuring management interface is introduced in S4810 and S4820T. |
| <b>9.13.0.0</b>  | Added support for configuring Management interface.                                 |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                           |
| <b>9.10(0.0)</b> | Introduced on the S3148.                                                            |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                                                         |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.                                                     |

| Version    | Description                              |
|------------|------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100-ON.              |
| 9.8(0.0P5) | Introduced on the S4048-ON.              |
| 9.8(0.0P2) | Introduced on the S3048-ON.              |
| 9.7(0.0)   | Introduced on the S6000-ON.              |
| 9.2(1.0)   | Introduced on the Z9500.                 |
| 9.0.2.0    | Introduced on the S6000.                 |
| 8.3.11.1   | Introduced on the Z9000.                 |
| 8.5.1.0    | Added support for 4-port 40G line cards. |
| 7.6.1.0    | Introduced on the S-Series.              |
| 7.5.1.0    | Introduced on the C-Series.              |
| 6.1.1.0    | Introduced on the E-Series.              |

## ntp step-threshold

Configure the step-threshold time interval.

**Syntax** `ntp step-threshold value`  
 To return to the default NTP step-threshold value, use the `no ntp step-threshold` command.

**Parameters** **value** Enter the threshold value in milliseconds. The range is from 128 to 5000 milliseconds (5 seconds).

**Defaults** 128 milliseconds

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

| Version   | Description                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(2.3) | Introduced on the C9000, S3048-ON, S3100 series, S4048-ON, S4048T-ON, S5048F-ON, S6000, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Usage Information** The `ntp step-threshold` command is used to configure a step threshold value from 128 to 5000 milliseconds (5 seconds). You can use the `no` form of the command to reset to the default value of 128 milliseconds.

**Example**

```
DellEMC(config)# ntp step-threshold 5000
```

## ntp trusted-key

Set a key to authenticate the system to which NTP synchronizes.

**Syntax** `ntp trusted-key number`  
 To delete the key, use the `no ntp trusted-key number` command.

**Parameters** **number** Enter a number as the trusted key ID. The range is from 1 to 65534.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                      |
|------------|------------------------------------------------------------------|
| 9.14(1.0)  | Introduced the trusted-key range update on the S4810 and S4820T. |
| 9.14(0.0)  | The trusted-key range value is increased from 1 to 65534.        |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                        |
| 9.10(0.0)  | Introduced on the S3148.                                         |
| 9.10(0.0)  | Introduced on the S6100-ON.                                      |
| 9.8(2.0)   | Introduced on the S3100 series.                                  |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                      |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                      |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                      |
| 9.7(0.0)   | Introduced on the S6000-ON.                                      |
| 9.2(1.0)   | Introduced on the Z9500.                                         |
| 9.0.2.0    | Introduced on the S6000.                                         |
| 8.3.11.1   | Introduced on the Z9000.                                         |
| 7.6.1.0    | Introduced on the S-Series.                                      |
| 7.5.1.0    | Introduced on the C-Series.                                      |
| 6.1.1.0    | Introduced on the E-Series.                                      |

**Usage Information** The `number` parameter in the `ntp trusted-key` command must be the same number as the `number` parameter in the `ntp authentication-key` command. If you change the `ntp authentication-key` command, you must also change the `ntp trusted-key` command.

**Related Commands**

- [ntp authentication-key](#)—sets an authentication key for NTP.
- [ntp authenticate](#)—enables the NTP authentication parameters you set.

## ntp authentication-key

Specify a key for authenticating the NTP server.

**Syntax** `ntp authentication-key key-number {md5 | sha1} {0 | 7} key`

**Parameters**

|                   |                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>key-number</b> | Specify a number for the authentication key. The range is from 1 to 65534. This number must be the same as the <code>number</code> parameter configured in the <code>ntp trusted-key</code> command. |
| <b>md5</b>        | Specify that the authentication key is encrypted using MD5 encryption algorithm.                                                                                                                     |
| <b>sha1</b>       | Specify that the authentication key is encrypted using SHA1 encryption algorithm.                                                                                                                    |
| <b>0</b>          | Specify that authentication key is entered in an unencrypted format (default).                                                                                                                       |
| <b>7</b>          | Specify that the authentication key is entered in DES encrypted format.                                                                                                                              |
| <b>key</b>        | Enter the authentication key in the previously specified format.                                                                                                                                     |

**Defaults** NTP authentication is not configured by default. If you do not specify the option [0 | 7], **0** is selected by default.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| 9.14(1.0)  | Introduced the <code>sha1</code> option. Also, introduced on the S4810 and S4820T. |
| 9.14(0.0)  | The trusted-key range value is from 1 to 65534.                                    |
| 9.12(1.0)  | Introduced on the S5048F-ON.                                                       |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                          |
| 9.10(0.0)  | Introduced on the S3148.                                                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                        |
| 9.8(2.0)   | Introduced on the S3100 series.                                                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                        |
| 9.2(1.0)   | Introduced on the Z9500.                                                           |
| 9.0.2.0    | Introduced on the S6000.                                                           |
| 8.3.11.1   | Introduced on the Z9000.                                                           |
| 8.2.1.0    | Added options [0   7] for entering the authentication key.                         |
| 7.6.1.0    | Introduced on the S-Series.                                                        |
| 7.5.1.0    | Introduced on the C-Series.                                                        |
| 6.1.1.0    | Introduced on the E-Series.                                                        |

## Usage Information

After configuring the `ntp authentication-key` command, configure the `ntp trusted-key` command to complete NTP authentication.

Dell EMC Networking OS versions 8.2.1.0 and later use an encryption algorithm to store the authentication key that is different from previous Dell EMC Networking OS versions; beginning in version 8.2.1.0, Dell EMC Networking OS uses DES encryption to store the key in the startup-config when you enter the `ntp authentication-key` command. Therefore, if your system boots with a startup-configuration from an Dell EMC Networking OS versions prior to 8.2.1.0 in which you have configured `ntp authentication-key`, the system cannot correctly decrypt the key, and cannot authenticate NTP packets. In this case you must re-enter this command and save the running-config to the startup-config.

## Related Commands

- [ntp authenticate](#) — enables NTP authentication.
- [ntp trusted-key](#) — configures a trusted key.

# show clock

Display the current clock settings.

**Syntax** `show clock [detail]`

**Parameters** **detail** (OPTIONAL) Enter the keyword `detail` to view the source information of the clock.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.1.1.0    | Introduced on the E-Series.               |

#### Example

```
DellEMC#show clock
11:05:56.949 UTC Thu Oct 25 2001
DellEMC#
```

#### Example (Detail)

```
DellEMC# show clock detail
12:18:10.691 UTC Wed Jan 7 2009
Time source is RTC hardware
Summer time starts 02:00:00 UTC Sun Mar 8 2009
Summer time ends 02:00:00 ABC Sun Nov 1 2009
DellEMC#
```

#### Related Commands

- [clock summer-time recurring](#) — displays the time and date from the switch hardware clock.

## show ntp associations

Display the NTP master and peers.

**Syntax** `show ntp associations`

- Command Modes**
- EXEC
  - EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network OS Command Line Reference Guide*.

| Version   | Description                               |

| 7.5.1.0    | Introduced on the C-Series. |
| 6.1.1.0    | Introduced on the E-Series. |

### Usage Information

The following describes the `show ntp associations` command shown in the Example below.

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>(none)</b>    | One or more of the following symbols could be displayed: <ul style="list-style-type: none"> <li>• * means synchronized to this peer.</li> <li>• # means almost synchronized to this peer.</li> <li>• + means the peer was selected for possible synchronization.</li> <li>• - means the peer is a candidate for selection.</li> <li>• x means designated falsesticker by the intersection algorithm.</li> </ul> |
| <b>remote</b>    | Displays the remote IP address of the NTP peer.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ref clock</b> | Displays the IP address of the remote peer's reference clock.                                                                                                                                                                                                                                                                                                                                                   |
| <b>st</b>        | Displays the peer's stratum, that is, the number of hops away from the external time source. A . in this column means the NTP peer cannot reach the time source.                                                                                                                                                                                                                                                |
| <b>when</b>      | Displays the last time the switch received an NTP packet.                                                                                                                                                                                                                                                                                                                                                       |
| <b>poll</b>      | Displays the polling interval (in seconds).                                                                                                                                                                                                                                                                                                                                                                     |
| <b>reach</b>     | Displays the reachability to the peer (in octal bitstream).                                                                                                                                                                                                                                                                                                                                                     |
| <b>delay</b>     | Displays the time interval or delay for a packet to complete a round-trip to the NTP time source (in milliseconds).                                                                                                                                                                                                                                                                                             |
| <b>offset</b>    | Displays the relative time of the NTP peer's clock to the switch clock (in milliseconds).                                                                                                                                                                                                                                                                                                                       |
| <b>offset</b>    | Displays the relative time of the NTP peer's clock to the switch clock (in milliseconds).                                                                                                                                                                                                                                                                                                                       |
| <b>disp</b>      | Displays the dispersion.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>LOCAL(0)</b>  | Indicates that the local machine has synced with itself. Generally, only a NTP master syncs with itself. Synchronization of the local machine takes place to this peer.                                                                                                                                                                                                                                         |
| <b>.LOCL.</b>    | Indicates the reference clock of the NTP master.                                                                                                                                                                                                                                                                                                                                                                |

### Example (without ntp master configuration)

```
DellEMC# show ntp associations
 remote vrf-Id ref clock st when poll reach delay offset disp
=====
*10.16.151.117 0 45.127.112.2 3 8 16 17 1.383 362.704 0.008
* master (synced), # backup, + selected, - outlier, x falseticker
```

### Example (with ntp master configuration)

```
Dell EMC#show ntp associations
 remote vrf-Id ref clock st when poll reach delay offset disp
```

```

=====
*LOCAL(0) 0 .LOCL. 7 6 16 377 0.000 0.000
0.002
 10.16.127.86 0 10.16.127.26 5 9 16 1 65.292 13829.9
0.002
 10.16.127.144 0 10.16.127.26 5 6 16 1 0.829 13795.2
0.002
 10.16.127.44 0 10.16.127.26 5 - 16 1 0.799 13791.5
0.002
* master (syncd), # backup, + selected, - outlier, x falseticker
Dell EMC#

```

In the above example,

- LOCAL(0) indicates that the local machine synchronizes with itself.
- .LOCL. indicates reference clock of the NTP master.
- [show ntp status](#) — displays the current NTP status.

#### Related Commands

## show ntp vrf associations

Displays the NTP servers configured for the VRF instance <vrf-name>.

**Syntax** show ntp [*vrf*] <vrf-name> associations.

**Command Modes** EXEC/EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |

**Usage Information**

The following describes the `show ntp status` command shown in the Example below.

| Field                   | Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| “Clock is...”           | States whether or not the switch clock is synchronized, which NTP stratum the system is assigned and the IP address of the NTP peer. |
| “frequency is...”       | Displays the frequency (in ppm), stability (in ppm) and precision (in Hertz) of the clock in this system.                            |
| “reference time is...”  | Displays the reference time stamp.                                                                                                   |
| “clock offset is...”    | Displays the system offset to the synchronized peer and the time delay on the path to the NTP root clock.                            |
| “root dispersion is...” | Displays the root and path dispersion.                                                                                               |
| “peer mode is...”       | State what NTP mode the switch is. This should be Client mode.                                                                       |

**Example**

```
DellEMC#> show ntp status
Clock is synchronized, stratum 4, reference is 10.16.151.117, vrf-id is 0
frequency is 0.000 ppm, stability is 0.000 ppm, precision is -18
reference time dec0e68a.07b308ac [Wed, Apr 7 0 9:42:34.030 UTC] UTC
clock offset is 0.000000 msec, root delay is 152.003 msec
root dispersion is 1381.293 msec, peer dispersion is 937.690 sec
peer mode is client
DellEMC#
```

**Related Commands**

- [show ntp associations](#) — displays information on the NTP master and peer configurations.

# Tunneling

Tunneling is supported on Dell EMC Networking OS.

## Topics:

| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                       |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                          |
| <b>9.4(0.1)</b>   | Introduced on the S4810, S4820T, S6000 and Z9000. |
| <b>9.3(0.1)</b>   | Introduced on the S5000 and Z9000.                |

## Usage Information

The `ip unnumbered` command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is `ipv6ip` (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ip unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

## ipv6 unnumbered

Configure a tunnel interface to operate without a unique IPv6 address and select the interface from which the tunnel borrows its address.

### Syntax

```
ipv6 unnumbered {interface-type interface-number}
```

To set the tunnel back to default logical address use the `no ipv6 unnumbered` command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv4 address.

### Parameters

**interface-type** Enter the interface type, followed by the type, and then the slot/port/subport information.

**interface-number**

### Defaults

None.

**Command Modes** INTERFACE TUNNEL

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                  |
| <b>9.4(0.0)</b>   | Introduced on the S4810, S4820T.          |
| <b>9.3(0.1)</b>   | Introduced on the S6000 and Z9000.        |

## Usage Information

The `ipv6 unnumbered` command fails in two conditions:

- If the logical IP address is configured.
- If Tunnel mode is `ipv6ip` (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ipv6 unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

# tunnel allow-remote

Configure an IPv4 or IPv6 address or prefix whose tunneled packets are accepted for decapsulation. If you do not configure allow-remote entries, tunneled packets from any remote peer address is accepted.

This feature is supported on Dell EMC Networking OS.

**Syntax** `tunnel allow-remote {ip-address | ipv6-address} [mask]`

To delete a configured allow-remote entry use the `no tunnel allow-remote` command. Any specified address/mask values must match an existing entry for the delete to succeed. If the address and mask are not specified, this command deletes all allow-remote entries.

**Parameters**

|                     |                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-address</b>   | Enter the source IPv4 address in A.B.C.D format.                                                                                                                                                                        |
| <b>ipv6-address</b> | Enter the source IPv6 address in X:X:X::X format.                                                                                                                                                                       |
| <b>mask</b>         | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D to match a range of remote addresses. The default mask is /32 for IPv4 addresses and /128 for IPv6 addresses, which match only the specified address. |

**Defaults** If you do not configure tunnel allow remote , all traffic which is destined to tunnel source address is decapsulated.

**Command Modes** INTERFACE TUNNEL

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                       |
|------------|---------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.         |
| 9.10(0.0)  | Introduced on the S3148.                          |
| 9.10(0.0)  | Introduced on the S6100-ON.                       |
| 9.8(2.0)   | Introduced on the S3100 series.                   |
| 9.8(1.0)   | Introduced on the Z9100-ON.                       |
| 9.8(0.0P5) | Introduced on the S4048-ON.                       |
| 9.8(0.0P2) | Introduced on the S3048-ON.                       |
| 9.7(0.0)   | Introduced on the S6000-ON.                       |
| 9.5(0.1)   | Introduced on the Z9500.                          |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000 and Z9000. |
| 9.3(0.1)   | Introduced on the S6000 and Z9000.                |

**Usage Information** You can configure up to eight allow-remote entries on any multipoint receive-only tunnel.

This command fails if the address family entered does not match the outer header address family of the tunnel mode, tunnel source, or any other tunnel allow-remote.

If you configure any allow-remote , the tunnel source or tunnel mode commands fail if the outer header address family does not match that of the configured allow-remote.

# tunnel destination

Set a destination endpoint for the tunnel.

**Syntax** `tunnel destination {ip-address | ipv6-address}`

To delete a tunnel destination address, use the `no tunnel destination {ip-address | ipv6-address}` command.

|                        |                                                                                                                                                               |                                                    |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Parameters</b>      | <b><i>ip-address</i></b>                                                                                                                                      | Enter the destination IPv4 address for the tunnel. |
|                        | <b><i>ipv6-address</i></b>                                                                                                                                    | Enter the destination IPv6 address for the tunnel. |
| <b>Defaults</b>        | none                                                                                                                                                          |                                                    |

| Version    | Description                                    |
|------------|------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.      |
| 9.10(0.0)  | Introduced on the S3148.                       |
| 9.10(0.0)  | Introduced on the S6100-ON.                    |
| 9.9(0.0)   | Introduced on the C9010.                       |
| 9.8(2.0)   | Introduced on the S3100 series.                |
| 9.8(1.0)   | Introduced on the Z9100-ON.                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                    |
| 9.7(0.0)   | Introduced on the S6000-ON.                    |
| 9.5(0.1)   | Introduced on the Z9500.                       |
| 9.3(0.0)   | Introduced on the S6000, S4810, S4820T, Z9000. |

**Usage Information**

This command configures the method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or the IPv6 traffic class in the outer IP header.

A value of 0 copies original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

## tunnel flow-label

Configure the method to set the IPv6 flow label value in the outer tunnel header.

**Syntax**

`tunnel flow-label value`

To return to the default value of 0, use the `no tunnel flow-label value` command.

**Parameters**

**value** Enter a value to set the IPv6 flow label value in the tunnel header. The range is from 0 to 1048575. The default value is **0**.

**Defaults**

**0** (Mapped original packet flow-label value to tunnel header flow-label value)

**Command Modes**

INTERFACE TUNNEL (conf-if-tu)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.7(0.0)   | Introduced on the S6000-ON.                    |
| 9.5(0.1)   | Introduced on the Z9500.                       |
| 9.3(0.0)   | Introduced on the S6000, S4810, S4820T, Z9000. |

**Usage Information**

This command is only valid for tunnel interfaces with an IPv6 outer header.

# tunnel hop-limit

Configure the method to set the IPv4 time-to-live or the IPv6 hop limit value in the outer tunnel header.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tunnel hop-limit value</code><br>To restore the default tunnel hop-limit, use the <code>no tunnel hop-limit</code> command.                             |
| <b>Parameters</b>      | <b>value</b> Enter the hop limit (ipv6) or time-to-live (ipv4) value to include in the tunnel header. The range is from 0 to 255. The default is <b>64</b> .  |
| <b>Defaults</b>        | <b>64</b> (Time-to-live for IPv4 outer tunnel header or hop limit for IPv6 outer tunnel header)                                                               |
| <b>Command Modes</b>   | INTERFACE TUNNEL (conf-if-tu)                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                                    |
|-------------------|------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.      |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                       |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                    |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                    |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                    |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                    |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                    |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                       |
| <b>9.3(0.0)</b>   | Introduced on the S6000, S4810, S4820T, Z9000. |

|                          |                                                                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | A value of 0 copies the inner packet hop limit (ipv6) or time-to-live (ipv4) in the encapsulated packet to the tunnel header hop limit (ipv6) or time-to-live (ipv4) value. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# tunnel keepalive

Configure the tunnel keepalive target, interval and attempts.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>tunnel keepalive {ip-address   ipv6-address}[interval {seconds}] [attempts {count   unlimited}]</code><br>To disable the tunnel keepalive probes use the <b>no tunnel keepalive</b> command.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b> | <b>ip-address ipv6 address</b> Enter the IPv4 or IPv6 address of the peer to which the keepalive probes will be sent.<br><b>interval seconds</b> Enter the keyword <code>interval</code> then the interval time, in seconds, after which the restart process to keepalive probe packets.<br>The range is from 5 to 255. The default is 5.<br><b>count</b> (OPTIONAL) Enter the keyword <b>count</b> to count packets processed by the filter.<br>The range is from 3 to 10. The default is 3.<br><b>unlimited</b> Enter the keyword <b>unlimited</b> to specify the unlimited number of keepalive probe packets. |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Tunnel keepalive is disabled.                                                                                                                                 |
| <b>Command Modes</b>   | INTERFACE TUNNEL                                                                                                                                              |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>Enabling tunnel keepalive causes ICMP echo packets to be sent to the keepalive target. The ICMP echo will be sourced from the tunnel interface logical IPv4 or IPv6 address and will be tunnel encapsulated. The response will be accepted whether it returns tunnel encapsulated or not.</p> <p>When configuring tunnel keepalive at both end points of a tunnel interface it is recommended to set the tunnel keepalive target to the logical IPv4 or IPv6 address of the far end tunnel peer, rather than to the tunnel destination. This reduces the chance of both ends of the tunnel staying in keepalive down state. If both ends get into a keepalive down state that does not clear in a few seconds, then performing shutdown - no shutdown sequence on one end should bring both ends back to up.</p> |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## tunnel-mode

Enable a tunnel interface.

|               |                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>tunnel mode {<i>ipip</i>   <i>ipv6</i>   <i>ipv6ip</i>} [<i>decapsulate-any</i>]</code> |
|               | To disable an active tunnel interface, use the <b>no tunnel</b> mode command.                 |

|                   |                               |                                                                                                  |
|-------------------|-------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>ipip</i></b>            | Enable tunnel in RFC 2003 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv4 tunnel. |
|                   | <b><i>ipv6</i></b>            | Enable tunnel in RFC 2473 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv6 tunnel. |
|                   | <b><i>ipv6ip</i></b>          | Enable tunnel in RFC 4213 mode and encapsulate IPv6 datagrams inside an IPv4 tunnel.             |
|                   | <b><i>decapsulate-any</i></b> | (Optional) Enable tunnel in multipoint receive-only mode.                                        |

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | There is no default tunnel mode.                                                                                                                              |
| <b>Command Modes</b>   | INTERFACE TUNNEL                                                                                                                                              |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>Version</b>   | <b>Description</b>                        |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                        |
|------------|------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.           |
| 9.10(0.0)  | Introduced on the S6100-ON.        |
| 9.8(2.0)   | Introduced on the S3100 series.    |
| 9.8(1.0)   | Introduced on the Z9100-ON.        |
| 9.8(0.0P5) | Introduced on the S4048-ON.        |
| 9.8(0.0P2) | Introduced on the S3048-ON.        |
| 9.7(0.0)   | Introduced on the S6000-ON.        |
| 9.5(0.1)   | Introduced on the Z9500.           |
| 9.4(0.0)   | Added the decapsulate-any command. |
| 9.3(0.1)   | Introduced on the S6000 and Z9000. |

### Usage Information

To enable a tunnel interface, use this command. You must define a tunnel mode for the tunnel to function. If you previously defined the tunnel destination or source address, the tunnel mode must be compatible.

Including the decapsulate-any option causes the command to fail if any of the following tunnel transmit options are configured: tunnel destination, tunnel dscp, tunnel flow-label, tunnel hop-limit, or tunnel keepalive. Conversely, if you configure any tunnel allow-remote entries, the `tunnel-mode` command fails unless the decapsulate-any option is included.

Configuration of IPv6 commands over decapsulate-any tunnel causes an error.

## tunnel source

Set a source address for the tunnel.

**Syntax** `tunnel source {ip-address | ipv6-address | interface-type-number | anylocal}`

To delete the current tunnel source address, use the `no tunnel source` command.

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>            | Enter the source IPv4 address in A.B.C.D format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>ipv6-address</i></b>          | Enter the source IPv6 address in X:X:X::X format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>interface-type-number</i></b> | <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> <li>For a port-channel interface, enter the keywords <code>port-channel</code> then the port-channel ID.</li> </ul> |
| <b><i>anylocal</i></b>              | Enter the <code>anylocal</code> command to allow the multipoint receive-only tunnel to decapsulate tunnel packets destined to any local ip address.                                                                                                                                                                                                                                                                                                                                                                    |

**Defaults** none

**Command Modes** INTERFACE TUNNEL (conf-if-tu)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| <b>Version</b>    | <b>Description</b>                                |
|-------------------|---------------------------------------------------|
| <b>9.10(0.0)</b>  | Introduced on the S6100–ON.                       |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                   |
| <b>9.8(1.0)</b>   | Introduced on the Z9100–ON.                       |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                       |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                       |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                       |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                          |
| <b>9.4(0.0)</b>   | Added the tunnel source anylocal command.         |
| <b>9.3(0.0)</b>   | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage  
Information**

Added an optional keyword **“anylocal”** to the tunnel source command. The anylocal argument can be used in place of the ip address or interface, but only with the multipoint receive-only mode tunnels. The tunnel source `anylocal` command allows the multipoint receive-only tunnel to decapsulate tunnel packets addressed to any IPv4 or IPv6 (depending on the tunnel mode) address configured on the switch that is operationally **Up**.

# Uplink Failure Detection (UFD)

Uplink failure detection (UFD) provides detection of the loss of upstream connectivity and, if you use this with NIC teaming, automatic recovery from a failed link.

## Topics:

- [clear ufd-disable](#)
- [debug uplink-state-group](#)
- [description](#)
- [downstream](#)
- [downstream auto-recover](#)
- [downstream disable links](#)
- [enable](#)

- [show uplink-state-group](#)
- [uplink-state-group](#)
- [upstream](#)

## clear ufd-disable

Re-enable one or more downstream interfaces on the switch/router that are in a UFD-Disabled Error state so that an interface can send and receive traffic.

**Syntax** `clear ufd-disable {interface interface | uplink-state-group group-id}`

### Parameters

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><b><i>interface</i></b>               | Specify one or more downstream interfaces. For <i>interface</i> , enter one of the following interface types: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the <i>slot/port/subport</i>   <i>slot/port/subport-range</i></li> <li>• 40-Gigabit Ethernet: <code>fortyGigE</code> {<i>slot/port</i>}</li> <li>• Port channel: <code>port-channel</code> {<i>1-128</i>   <i>port-channel-range</i>}</li> </ul> <p>Where <i>port-range</i> and <i>port-channel-range</i> specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: <code>gigabitethernet 1/1-2,5,9,11-12</code> <code>port-channel 1-3,5</code>. A comma is required to separate each port and port-range entry.</p> |
| <b>uplink-state-group</b><br><b><i>group group-id</i></b> | Re-enables all UFD-disabled downstream interfaces in the group. The valid <i>group-id</i> values are from 1 to 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Defaults** A downstream interface in a UFD-disabled uplink-state group is also disabled and is in a UFD-Disabled Error state.

**Command Modes** CONFIGURATION

| <b>9.8(2.0)</b>  | Introduced on the S3100 series. |
| <b>9.10(0.0)</b> | Introduced on the S3148.        |

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

**Related Commands**

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## debug uplink-state-group

Enable debug messages for events related to a specified uplink-state group or all groups.

**Syntax**

`debug uplink-state-group [group-id]`

To turn off debugging event messages, enter the `no debug uplink-state-group [group-id]` command.

**Parameters**

**group-id** Enables debugging on the specified uplink-state group. The valid group-id values are from 1 to 16.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

## Example

```
DellEMC(conf-uplink-state-group-16) # description test
DellEMC(conf-uplink-state-group-16) #
```

## Related Commands

- [uplink-state-group](#) — create an uplink-state group and enables the tracking of upstream links.

# downstream

Assign a port or port-channel to the uplink-state group as a downstream interface.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

**Usage Information**

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

**Related Commands**

- [upstream](#) — assigns a port or port-channel to the uplink-state group as an upstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## downstream auto-recover

Enable auto-recovery so that UFD-disabled downstream ports in an uplink-state group automatically come up when a disabled upstream port in the group comes back up.

**Syntax** `downstream auto-recover`

To disable auto-recovery on downstream links, use the `no downstream auto-recover` command.

**Defaults** The auto-recovery of UFD-disabled downstream ports is enabled.

**Command Modes** UPLINK-STATE-GROUP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |

| Version  | Description                     |
|----------|---------------------------------|
| 8.3.19.0 | Introduced on the S4820T.       |
| 8.3.12.0 | Introduced on the S4810.        |
| 8.4.2.3  | Introduced on the S-Series S50. |

**Related Commands**

- [downstream](#) — assign a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — create an uplink-state group and enables the tracking of upstream links.

## downstream disable links

Configure the number of downstream links in the uplink-state group that are disabled if one upstream link in an uplink-state group goes down.

**Syntax** `downstream disable links {number |all}`  
 To revert to the default setting, use the `no downstream disable links` command.

**Parameters**

|               |                                                                                        |
|---------------|----------------------------------------------------------------------------------------|
| <b>number</b> | Enter the number of downstream links the UFD brings down. The range is from 1 to 1024. |
| <b>all</b>    | Brings down all downstream links in the group.                                         |

**Defaults** No downstream links are disabled when an upstream link in an uplink-state group goes down.

**Command Modes** UPLINK-STATE-GROUP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

**Usage Information**

When one upstream interface in an uplink-state group goes down, you can configure the number of downstream interfaces in an uplink-state group are put into a link-down state with an UFD-Disabled error message.

If all upstream interfaces in an uplink-state group go down, all downstream interfaces in the same uplink-state group are put into a link-down state.

**Related Commands**

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# enable

Enable uplink state group tracking for a specific UFD group.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>enable</code><br>To disable upstream-link tracking without deleting the uplink-state group, use the <code>no enable</code> command.                     |
| <b>Defaults</b>        | Upstream-link tracking is automatically enabled in an uplink-state group.                                                                                     |
| <b>Command Modes</b>   | UPLINK-STATE-GROUP                                                                                                                                            |

### Example

### Related Commands

- [show running-config uplink-state-group](#) — displays the current configuration of one or more uplink-state groups.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# uplink-state-group

Create an uplink-state group and enable the tracking of upstream links on a switch or router.

**Syntax** `uplink-state-group group-id`

To delete an uplink-state group, enter the `no uplink-state-group group-id` command.

**Parameters** `group-id` Enter the ID number of an uplink-state group. The range is from 1 to 16.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |

| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

**Usage Information** After you enter the command, to assign upstream and downstream interfaces to the group, enter Uplink-State-Group Configuration mode.

An uplink-state group is considered operationally up if at least one upstream interface in the group is in the Link-Up state.

An uplink-state group is considered operationally down if no upstream interfaces in the group are in the Link-Up state. No uplink-state tracking is performed when a group is disabled or in an operationally down state.

To disable upstream-link tracking without deleting the uplink-state group, use the `no enable` command in uplink-state-group configuration mode.

## Example

```
DellEMC(conf)# uplink-state-group 16
DellEMC(conf)#
02:23:17: %RPM0-P:CP %IFMGR-5-ASTATE_UP: Changed uplink state group
Admin state to up: Group 16
DellEMC(conf)#
```

## Related Commands

- [show running-config uplink-state-group](#) — displays the current configuration of one or more uplink-state groups.
- [show uplink-state-group](#) — displays the status information on a specified uplink-state group or all groups.

# upstream

Assign a port or port-channel to the uplink-state group as an upstream interface.

**Syntax** `upstream interface`

To delete an uplink-state group, use the `no upstream interface` command.

**Parameters** *interface* Enter one of the following interface types:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the `slot/port/subport | slot/port/subport-range`
- 40-Gigabit Ethernet: `fortyGigE {slot/port}`
- Port channel: `port-channel {1-128 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

**Defaults** none

**Command Modes** UPLINK-STATE-GROUP

| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |
| 8.4.2.3    | Introduced on the S-Series S50.                                                                     |

**Usage Information** You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

## Example

**Related Commands**

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# VLAN Stacking

With the virtual local area network (VLAN)-stacking feature (also called stackable VLANs and QinQ), you can “stack” VLANs into one tunnel and switch them through the network transparently.

The Dell EMC Networking OS supports this feature.

For more information about basic VLAN commands, see the *Virtual LAN (VLAN) Commands* section in [Layer 2](#).

## Important Points to Remember

- If you do not enable the spanning tree protocol (STP) across the stackable VLAN network, STP bridge protocol data units (BPDUs) from the customer’s networks are tunneled across the stackable VLAN network.
- If you do enable STP across the stackable VLAN network, STP BPDUs from the customer’s networks are consumed and not tunneled across the stackable VLAN network unless you enable protocol tunneling.
  - **NOTE:** For more information about protocol tunneling on the E-Series, see [Service Provider Bridging](#).
- Layer 3 protocols are not supported on a stackable VLAN network.
- Assigning an IP address to a stackable VLAN is supported when all the members are only stackable VLAN trunk ports. IP addresses on a stackable VLAN-enabled VLAN are not supported if the VLAN contains stackable VLAN access ports. This facility is provided for the simple network management protocol (SNMP) management over a stackable VLAN-enabled VLAN containing only stackable VLAN trunk interfaces. Layer 3 routing protocols on such a VLAN are not supported.
- Dell EMC Networking recommends that you do not use the same MAC address, on different customer VLANs, on the same stackable VLAN.
- Interfaces configured using stackable VLAN access or stackable VLAN trunk commands do not switch traffic for the default VLAN. These interfaces are switch traffic only when they are added to a non-default VLAN.
- Starting with Dell EMC Networking OS version 7.8.1 for C-Series and S-Series (Dell EMC Networking OS version 7.7.1 for E-Series, 8.2.1.0 for E-Series ExaScale), a vlan-stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the vlan-stack trunk port is also a member of an untagged vlan, the port must be in Hybrid mode. For more information, see [portmode hybrid](#).

## dei enable

Enable packets to be dropped based on their DEI value.

**Syntax** `dei enable`

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S6100-ON.               |
| 9.8(2.0)  | Introduced on the S3100 series.           |
| 9.8(1.0)  | Introduced on the Z9100-ON.               |
| 9.7(0.0)  | Introduced on the S6000-ON.               |
| 9.0.2.0   | Introduced on the S6000.                  |
| 8.3.19.0  | Introduced on the S4820T.                 |
| 8.3.11.1  | Introduced on the Z9000.                  |
| 8.3.7.0   | Introduced on the S4810.                  |
| 8.3.1.0   | Introduced on the C-Series and S-Series.  |

**Usage Information** When packets are colored green; no packets are dropped.

## dei honor

Honor the incoming DEI value by mapping it to a Dell EMC Networking OS drop precedence. Enter the command once for 0 and once for 1.

**Syntax** `dei honor {0 | 1} {green | red | yellow}`

**Parameters**

|                             |                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0   1</b>                | Enter the bit value you want to map to a color.                                                                                                                                                                                                                                                                            |
| <b>green   red   yellow</b> | Choose a color: <ul style="list-style-type: none"> <li>• Green: High priority packets that are the least preferred to be dropped.</li> <li>• Yellow: Lower priority packets that are treated as best-effort.</li> <li>• Red: Lowest priority packets that are always dropped (regardless of congestion status).</li> </ul> |

**Defaults** Disabled; Packets with an unmapped DEI value are colored green.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |

| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |

| Version | Description                              |
|---------|------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                 |
| 8.3.1.0 | Introduced on the C-Series and S-Series. |

**Usage Information**

Enable DEI before using this command.

## dei mark

Set the DEI value on egress according to the color currently assigned to the packet.

## S6000–ON

**Syntax** `dei mark {green | yellow} {0 | 1}`

**Parameters**

- 0 | 1** Enter the bit value you want to map to a color.
- green | red | yellow** Choose a color:
  - **Green:** High priority packets that are the least preferred to be dropped.
  - **Yellow:** Lower priority packets that are treated as best-effort.

**Defaults** All the packets on egress are marked with DEI 0.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 9.10(0.0)  | Introduced on the S6100–ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100–ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.3.1.0    | Introduced on the C-Series and S-Series.  |

**Usage Information**

Enable DEI before using this command.

# member

Assign a stackable VLAN access or trunk port to a VLAN. The VLAN must contain the `vlan-stack compatible` command in its configuration.

**Syntax** `member interface`

To remove an interface from a Stackable VLAN, use the `no member interface` command.

**Parameters** **interface** Enter the following keywords and the interface information:

- For a Port Channel interface, enter the keywords `port-channel`, and then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** Not configured.

**Command Modes** CONF-IF-VLAN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.2.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |

**Usage Information** Enable the stackable VLAN (using the `vlan-stack compatible` command) on the VLAN prior to adding a member to the VLAN.

**Related Commands**

- [vlan-stack compatible](#) — enables stackable VLAN on a VLAN.

# stack-unit stack-group

Configure a stacking group specified by an ID.

**Syntax** `[no] stack-unit unit-id stack-group stack-group-id`

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-id` command.

|                   |                              |                                                      |
|-------------------|------------------------------|------------------------------------------------------|
| <b>Parameters</b> | <b><i>unit-id</i></b>        | Enter the stack unit ID.                             |
|                   | <b><i>stack-group-id</i></b> | Enter the stack group ID. The range is from 0 to 16. |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>    | <b>Description</b>                        |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |

| <b>8.3.10.2</b>   | Introduced on the S4810.                  |

**Usage Information**

 **CAUTION:** The following message displays to confirm the command: All non-default configurations on the related member ports ports (<ports listed here>) will be removed. Do you want to continue (y/n)? If you enter “y”, all non-default configurations on any member ports of the current stack group are removed when you reboot the unit.

## vlan-stack access

Specify a Layer 2 port or port channel as an access port to the stackable VLAN network.

**Syntax** `vlan-stack access`  
To remove access port designation, use the `no vlan-stack access` command.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| 8.2.1.0  | Introduced on the E-Series.              |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

#### E-Series original Command

#### Usage Information

Prior to enabling this command, to place the interface in Layer 2 mode, enter the `switchport` command.

To remove the access port designation, remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

## vlan-stack compatible

Enable the stackable VLAN feature on a VLAN.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>vlan-stack compatible</code><br>To disable the Stackable VLAN feature on a VLAN, use the <code>no vlan-stack compatible</code> command.                 |
| <b>Defaults</b>        | Not configured.                                                                                                                                               |

| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 8.2.1.0    | Introduced on the E-Series.               |
| 7.6.1.0    | Introduced on the C-Series and S-Series.  |

## Version Description

### E-Series original Command

#### Usage Information

Prior to disabling the stackable VLAN feature, remove the members.

To view the stackable VLANs, use the `show vlan` command in EXEC Privilege mode. Stackable VLANs contain members, designated by the M in the Q column of the command output.

If you enabled VRF, you cannot enable the stacked VLAN feature using this command.

If you enabled IGMP snooping, you cannot enable the stacked VLAN feature using this command.

#### Example

```
DellEMC# show vlan
Codes: * - Default VLAN, G - GVRP VLANs

 NUM Status Q Ports
* 1 Inactive
 2 Active M Te 1/13/1
 M Te 1/1/1-1/1/3
 3 Active M Po1(Te 1/14/1-1/14/2)
 M Te 1/18/1
 M Te 1/4/1
 4 Active M Po1(Te 1/14/1-1/14/2)
 M Te 1/18/1
 M Te 1/5/1
 5 Active M Po1(Te 1/14/1-1/14/2)
 M Te 1/18/1
 M Te 1/6/1

DellEMC#
```

## vlan-stack dot1p-mapping

Map C-Tag dot1p values to an S-Tag dot1p value.

**Syntax** `vlan-stack dot1p-mapping c-tag-dot1p values sp-tag-dot1p value`

**Parameters**

**c-tag-dot1p value** Enter the keyword `c-tag-dot1p` then the customer dot1p value that is mapped to a service provider dot1p value. The range is from 0 to 7.

**sp-tag-dot1p value** Enter the keyword `sp-tag-dot1p` then the service provider dot1p value. The range is from 0 to 7.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

## Version Description

**9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.

**9.10(0.0)** Introduced on the S3148.

**9.10(0.0)** Introduced on the S6100-ON.

**9.8(2.0)** Introduced on the S3100 series.

**9.8(1.0)** Introduced on the Z9100-ON.

**9.8(0.0P5)** Introduced on the S4048-ON.

**9.8(0.0P2)** Introduced on the S3048-ON.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.2(1.0) | Introduced on the Z9500.                 |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.3.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information**

You can separate the C-Tag values by commas or dashed ranges. In the case of conflicts, dynamic mode CoS overrides any Layer 2 QoS configuration.

## vlan-stack protocol-type

Define the stackable VLAN tag protocol identifier (TPID) for the outer VLAN tag (also called the VMAN tag). If you do not configure this command, the Dell EMC Networking OS assigns the value 0x9100.

**Syntax** `vlan-stack protocol-type number`

**Parameters** *number* Enter the hexadecimal number as the stackable VLAN tag.  
You may specify both bytes of the 2-byte S-Tag TPID. The range is from 0 to FFFF. The default is **9100**.

**Defaults** 0x9100

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                   |

| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                     |
| 9.10(0.0)  | Introduced on the S3148.                                                                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                   |
| 9.8(2.0)   | Introduced on the S3100 series.                                                               |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                   |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                   |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                   |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                   |
| 9.2(1.0)   | Introduced on the Z9500.                                                                      |
| 9.0.2.0    | Introduced on the S6000.                                                                      |
| 8.3.19.0   | Introduced on the S4820.                                                                      |
| 8.3.7.0    | Introduced on the S4810.                                                                      |
| 8.2.1.0    | Introduced on the E-Series. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| 8.2.1.0    | Introduced on the E-Series.                                                                   |
| 7.6.1.0    | Introduced on the C-Series and S-Series.                                                      |

**E-Series original Command**

## Usage Information

For specific interoperability limitations regarding the S-Tag TPID, see the *Dell EMC Networking OS Configuration Guide*.

The four characters you may enter are shown in the following table.

| Number      | Resulting TPID |
|-------------|----------------|
| <b>1</b>    | 0x0001         |
| <b>10</b>   | 0x0010         |
| <b>81</b>   | 0x0081         |
| <b>8100</b> | 0x8100         |

## Related Commands

- [portmode hybrid](#) — sets a port (physical ports only) to accept both tagged and untagged frames. A port configured this way is identified as a hybrid port in report displays.
- [vlan-stack trunk](#) — specifies a Layer 2 port or port channel as a trunk port to the Stackable VLAN network.

# vlan-stack trunk

Specify a Layer 2 port or port channel as a trunk port to the stackable VLAN network.

## Syntax

```
vlan-stack trunk
```

To remove a trunk port designation from the selected interface, use the `no vlan-stack trunk` command.

## Defaults

Not configured.

## Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                                      |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                      |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                     |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                                      |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                                      |
| <b>8.2.1.0</b>    | Introduced on the E-Series. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| <b>7.8.1.0</b>    | Functionality augmented for C-Series and S-Series to enable multi-purpose use of the port.    |
| <b>7.7.1.0</b>    | Functionality augmented for E-Series to enable multi-purpose use of the port.                 |

| Version | Description                              |
|---------|------------------------------------------|
| 7.6.1.0 | Introduced on the C-Series and S-Series. |

### E-Series original Command

### Usage Information

Prior to using this command, to place the interface in Layer 2 mode, use the `switchport` command.

To remove the trunk port designation, first remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

In Example 1, a VLAN-Stack trunk port is configured and then made part of a single-tagged VLAN.

In Example 2, the tag protocol identifier (TPID) is set to 88A8. The Te 3/10/1 port is configured to act as a VLAN-Stack access port; the Te 5/1/1 port acts as a VLAN-Stack trunk port, switching stackable VLAN traffic for VLAN 10, while also switching untagged traffic for VLAN 30 and tagged traffic for VLAN 40. (To allow VLAN 30 traffic, you need the native VLAN feature. Use the `portmode hybrid` command. For more information, see the [portmode hybrid](#) command.

### Example 1

```
DelleMC(conf-if-te-1/23/1)# switchport
DelleMC(conf-if-te-1/23/1)# vlan-stack trunk
DelleMC(conf-if-te-1/23/1)# show config
!
interface TenGigabitEthernet 1/23/1
 no ip address
 switchport
 vlan-stack trunk
 no shutdown
DelleMC(conf-if-te-1/23/1)# interface vlan 100
DelleMC(conf-if-vl-100)# vlan-stack compatible
DelleMC(conf-if-vl-100-stack)# member tengigabitethernet 1/23/1
DelleMC(conf-if-vl-100-stack)# show config
!
interface Vlan 100
 no ip address
 vlan-stack compatible
 member TenGigabitEthernet 1/23/1
 shutdown
DelleMC(conf-if-vl-100-stack)# interface vlan 20
DelleMC(conf-if-vl-20)# tagged Tengigabitethernet 1/23/1
DelleMC(conf-if-vl-20)# show config
!
interface Vlan 20
 no ip address
 tagged TenGigabitEthernet 1/23/1
 shutdown
DelleMC(conf-if-vl-20)# do show vlan
Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
 x - Dot1x untagged, X - Dot1x tagged
 G - GVRP tagged, M - Vlan-stack

 NUM Status Description Q Ports
* 1 Inactive
 20 Active T Te 1/23/1
 100 Active M Te 1/23/1
DelleMC(conf-if-vl-20)#
```

### Example 2

```
DelleMC(config)# vlan-stack protocol-type 88A8
DelleMC(config)# interface TenGigabitethernet 3/10/1
DelleMC(conf-if-te-3/10/1)# no shutdown
DelleMC(conf-if-te-3/10/1)# switchport
DelleMC(conf-if-te-3/10/1)# vlan-stack access
DelleMC(conf-if-te-3/10/1)# exit

DelleMC(config)# interface TenGigabitethernet 5/1/1
DelleMC(conf-if-te-5/1/1)# no shutdown
DelleMC(conf-if-te-5/1/1)# portmode hybrid
```

```
DelleMC(conf-if-te-5/1/1)# switchport
DelleMC(conf-if-te-5/1/1)# vlan-stack trunk
DelleMC(conf-if-te-5/1/1)# exit

DelleMC(config)# interface vlan 10
DelleMC(conf-if-vlan)# vlan-stack compatible
DelleMC(conf-if-vlan)# member Te 4/1/1, Te 3/10/1, TenGi 5/1/1
DelleMC(conf-if-vlan)# exit

DelleMC(config)# interface vlan 30
DelleMC(conf-if-vlan)# untagged TenGi 5/1/1
DelleMC(conf-if-vlan)# exit
DelleMC(config)#

DelleMC(config)# interface vlan 40
DelleMC(conf-if-vlan)# tagged TenGi 5/1/1
DelleMC(conf-if-vlan)# exit
DelleMC(config)#
```

# Virtual Routing and Forwarding (VRF)

Virtual routing and forwarding (VRF) allows multiple instances of a routing table to coexist on the same router at the same time.

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                |

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version    | Description                 |
|------------|-----------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON. |
| 9.7(0.0)   | Introduced on the S6000-ON. |
| 9.4(0.0)   | Introduced on the S-Series. |

**Usage Information**

Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the `no ip unknown-unicast` command previously. This will be the default configuration after reload.

## ipv6 unknown-unicast

Disable soft forwarding of unknown IPv6 destination packets.

**Syntax** `[no] ipv6 unknown-unicast`

**Defaults** Soft forwarding is enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information**

All the default catch-all entries in the longest prefix match (LPM) table collect and transmit all unresolved IPv6 packets to the CPU, even if they are destined for unknown destinations.

## description

Specify a name for a customer VRF.

**Syntax** `description string`

To delete the descriptive name for a customer VRF, use the `no description string` command.

**Parameters** **string** Enter a descriptive name for the VRF.

**Defaults** None.

**Command Modes** VRF MODE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.0)   | Introduced on the Z9500.                  |
| 9.4.(0.0)  | Introduced on the S-Series.               |

## ip vrf forwarding

Attach an interface to a VRF.

**Syntax** `ip vrf forwarding {vrf-name | management}`  
 To delete an interface associated with a configured VRF, use the `no ip vrf forwarding {vrf-name | management}` command.

**Parameters**

|                   |                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------|
| <b>vrf-name</b>   | Enter name of the VRF that you want to associate the interface to.                         |
| <b>management</b> | Enter the keyword <code>management</code> to associate an interface to the management VRF. |

**Defaults** none

**Command Modes** INTERFACE-CONFIG

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON and Z9500.     |
| 9.4.(0.0)  | Introduced on the S-Series and Z9000.     |

**Usage Information** You can attach an interface to either a nondefault VRF or a management VRF.  
 To assign a port-back to a default VRF, remove the VRF association from the interface. You can use this only if there is no IP address configured on the interface.

There must be no prior Layer 3 configuration on the interface when configuring VRF.

You must enable VRF before using this command.

You can configure an IP subnet or address on a physical or VLAN interface that overlaps the same IP subnet or address configured on another interface only if the interfaces are assigned to different VRFs. If you assign two interfaces to the same VRF, you cannot configure overlapping IP subnets or the same IP address to them.

### Example

```
DelleMC# configure terminal
DelleMC(conf)# ip vrf red
DelleMC(conf-vrf)# description "Red Network"
DelleMC(conf-vrf)# show config
!
ip vrf red 4
 description "Red Network"
DelleMC(conf-vrf)#

DelleMC(conf-if-te-1/4/1)# int te 1/4/2
DelleMC(conf-if-te-1/4/2)# no shut
DelleMC(conf-if-te-1/4/2)# ip vrf forwarding red
DelleMC(conf-if-te-1/4/2)# ip add 100.1.1.1/24
DelleMC(conf-if-te-1/4/2)#
DelleMC(conf-if-te-1/4/2)#
DelleMC(conf-if-te-1/4/2)#
DelleMC(conf-if-te-1/4/2)# show config
!
interface TenGigabitEthernet 1/4/2
 ip vrf forwarding red
 ip address 100.1.1.1/24
 no shutdown
DelleMC(conf-if-te-1/4/2)#
```

## ip http vrf

Configure an HTTP client with a VRF used to connect to the HTTP server.

### S6000-ON

**Syntax** `ip http vrf {management | vrf-name}`

To undo the HTTP client configuration, use the `ip http vrf` command.

|                   |                   |                                                                                                                     |
|-------------------|-------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>management</b> | Enter the keyword <code>management</code> for configuring the management VRF that uses an HTTP client.              |
|                   | <b>vrf-name</b>   | Enter a VRF name that the HTTP client uses. If you do not specify a VRF name, the HTTP client uses the default VRF. |

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON.                                         |
| 9.8(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information**

To make the HTTP clients VRF-aware, use the `ip http vrf` command. The HTTP client uses the VRF name that you specify to reach the HTTP server. If you do not specify a VRF name, the HTTP client uses the default VRF.

## ip route-export

Enables route leaking between VRFs. This command exports or shares IPv4 routes corresponding to one VRF with other nondefault VRFs.

**Syntax** `ip route-export tag [route-map-name]`

**Parameters**

|                       |                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-export</b>   | Enter the keywords <code>route-export</code> to leak or share routes between VRFs.                                                                                                                                                                                                                                                                                               |
| <b>tag</b>            | Enter a tag (export route target) to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.                                                                                                                                                                              |
| <b>route-map-name</b> | (Optional) Enter the name of the route-map to filter the exported routes.<br>You can leak global routes to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs. |

- VRF mode
  - CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                           |
| 9.10(0.0)  | Introduced on the S3148.                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                         |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information**

To export all the routes corresponding to a source VRF, you can use the `ip route-export tag` command without specifying the route-map attribute. This action exposes source VRF routes to various other VRFs, which then import these routes using the `ip route-import tag` command.

In Dell EMC Networking OS, you can configure one route-export per VRF as you can only expose one set of routes for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.

You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. For example, you cannot import one set of routes from one VRF and another set of routes from another VRF.

Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.

#### Related Commands

- [ip route-import](#) — imports routes from another VRF.

## ip route-import

Imports IPv4 routes that another VRF leaks using the VRF tag during the export of these routes.

**Syntax** `ip route-import tag [route-map-name]`

#### Parameters

- route-import** Enter the keywords `route-import` to import routes into the VRF.
- tag** Enter a tag (ASN number) to specify an import route target for importing routes from another VRF.
- To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.
- route-map-name** Enter the name of the route-map to filter the imported routes.

 **NOTE:** Use the route-map attribute while importing routes from the global RTM. Route-maps allow you to filter routes at the import end based on the matching criteria that you define in the route-map.

- Command Modes**
- CONFIGURATION
  - VRF mode

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                         |
|-------------------|---------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                         |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

#### Usage Information

It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

#### Related Commands

- [ip route-export](#) – exports routes to another VRF.

# ipv6 route-export

Enables route leaking between VRFs. This command exports or shares IPv6 routes corresponding to one VRF with other nondefault VRFs.

**Syntax** `ipv6 route-export tag [route-map-name]`

**Parameters**

- route-export** Enter the keywords route-export to leak or share routes between VRFs.
- tag** Enter a tag (ASN number) as the export route target to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.
- route-map-name** (Optional) Enter the name of the route-map to filter the exported routes. You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

**Defaults** N/A

**Related Commands**

- [ipv6 route-import](#) – imports IPv6 routes from another VRF.

# ipv6 route-import

Imports IPv6 routes that another VRF leaks using the tag that VRF specifies during export of these routes.

**Syntax** `ipv6 route-import tag [route-map-name]`

**Parameters**

|                       |                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-import</b>   | Enter the keywords <code>route-import</code> to import IPv6 routes into the VRF.                                                                                                                                                                                                |
| <b>tag</b>            | Enter a tag (ASN number) to specify an import route target for importing routes from another VRF. To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.                                             |
| <b>route-map-name</b> | Enter the name of the route-map to filter the imported routes.<br><b>NOTE:</b> Use the route-map attribute while importing routes from the global RTM. Route-maps allow you to filter routes at the import end based on the matching criteria that you define in the route-map. |

**Defaults** N/A

**Command Modes**

- VRF mode
- CONFIGURATION mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                           |
| 9.10(0.0)  | Introduced on the S3148.                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                         |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information** It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match the protocol and prefix-list options. Other options that you configure in the route-maps are ignored.

**Related Commands**

- [ipv6 route-export](#) — exports IPv6 routes to another VRF.

# match source-protocol

Specify matching source-protocol criteria while exporting or importing routes.

**Syntax** `match source-protocol {bgp | isis | ospf | connected | static}`

**Parameters**

|                  |                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------|
| <b>bgp</b>       | Enter the keyword <code>bgp</code> to leak or share routes corresponding to the BGP protocol.        |
| <b>isis</b>      | Enter the keyword <code>isis</code> to leak or share routes corresponding to the ISIS protocol.      |
| <b>ospf</b>      | Enter the keyword <code>ospf</code> to leak or share routes corresponding to the OSPF protocol.      |
| <b>connected</b> | Enter the keyword <code>connected</code> to leak or share connected routes corresponding to the VRF. |

**static** Enter the keyword `static` to leak or share static routes corresponding to the VRF.

**Command Modes** ROUTE MAP MODE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                         |
|-------------------|---------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                         |
| <b>9.7(0.0)</b>   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information** Specify the matching criteria only after defining a route-map. Before using this command, you must enter Route Map mode using the `route-map route-map-name` command. The match criteria that you specify is associated with the route-map that you define.

The export-target and import-target options support only the match protocol and match prefix-list options. Other options that you configure in the route-maps are ignored.

**Related Commands**

- [ipv6 route-import](#) – imports IPv6 routes from another VRF.

## redistribute

Redistributes leaked or exported routes corresponding to specific protocols.

**Syntax** `redistribute {imported-bgp | import-ospf | import-isis}`

**Parameters**

|                      |                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>imported-bgp</b>  | Enter the keywords <code>imported-bgp</code> to redistribute leaked routes that are learned using the BGP protocol.   |
| <b>imported-ospf</b> | Enter the keywords <code>imported-ospf</code> to redistribute leaked routes that are learned using the OSPF protocol. |
| <b>imported-isis</b> | Enter the keywords <code>imported-isis</code> to redistribute leaked routes that are learned using the ISIS protocol. |
| <b>route-map</b>     | Enter the name of the route-map to specify the filtering criteria for imported routes.                                |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |

| Version    | Description                                                         |
|------------|---------------------------------------------------------------------|
| 9.8(1.0)   | Introduced on the Z9100-ON.                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                         |
| 9.7(0.0)   | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Related Commands**

- [ip route-import](#) — import routes from another VRF.

## interface management

Associates a management port with a management VRF.

**Syntax** `interface management`

To delete the association between a management port and a management VRF, use the `no interface management` command.

**Command Modes** VRF MODE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.0)   | Introduced on the Z9500.                  |
| 9.4.(0.0)  | Introduced on the S-Series and Z9000.     |

**Usage Information** When you use this command, the management ports corresponding to both the active unit and the standby unit are associated with the management VRF.

## maximum dynamic-routes

Specify the maximum number of dynamic (protocol) routes a VRF can have.

**Syntax** `maximum dynamic-routes limit {warn-threshold threshold-value | warning-only}`

To remove the limit on the maximum number of routes used, use the `no maximum dynamic-routes` command.

**Parameters** *limit* Maximum number of routes allowed in a VRF. The valid range is from 1 to 16,000 (or maximum allowable for that platform if a smaller value).

**warning-threshold** The warning threshold value is a percentage of the limit value. When the number of routes reaches the specified percentage of the limit, a warning message appears. The valid range is from 1 to 100.

After the limit is reached, additional dynamic routes are not allowed.

**warning-only** When you use the `warning-only` option, when the maximum number of dynamic routes reaches the limit, a warning message appears.

After the limit is reached, additional dynamic routes are still allowed.

**Defaults** No limit is set on the maximum number of dynamic routes for a VRF.

**Command Modes** CONFIGURATION-VRF

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON and Z9500.     |
| <b>9.4(0.0)</b>   | Introduced on the S-Series.               |

**Usage Information** If you do not specify the maximum route limit for a VRF, the VRF has unlimited space that extends to the maximum number of entries allowed for the system.

## show ip vrf

Displays information corresponding to the VRFs that you configure in the system.

**Syntax** `show ip [vrf vrf-name]`

**Parameters** **vrf vrf-name** Enter the keyword `vrf` then the name of the VRF to display information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version          | Description                               |
|------------------|-------------------------------------------|
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b> | Introduced on the S3148.                  |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>  | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>  | Introduced on the Z9100-ON.               |

| Version    | Description                           |
|------------|---------------------------------------|
| 9.8(0.0P5) | Introduced on the S4048-ON.           |
| 9.8(0.0P2) | Introduced on the S3048-ON.           |
| 9.7(0.0)   | Introduced on the S6000-ON.           |
| 9.5(0.0)   | Introduced on the Z9500.              |
| 9.4.(0.0)  | Introduced on the S-Series and Z9000. |

### Example

```
DelleMC# show ip vrf
VRF-Name VRF-ID Interfaces

default 0 Te 1/1/1-1/3/1,1/8/1-1/4/7,
 Fo 1/9/1,1/7/1,1/8/1,1/10/2,
 Ma 1/1,
 Ma 2/1,
 Ma 3/1,
 Ma 4/1,
 Ma 5/1,
 Ma 6/1,

 Nu 0,
 Vl 1
test1 1 Te 1/25/1,1/28/4-1/29/3
test2 2 Te 1/32/1
management 64

DelleMC# show ip vrf test1
VRF-Name VRF-ID Interfaces

test1 1 Te 1/29/4,1/30/1-1/31/3
DelleMC#
```

## show run vrf

Displays configuration information corresponding to all the VRFs in the system.

**Syntax** `show run vrf vrf-name`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |

| <b>Version</b>   | <b>Description</b>                    |
|------------------|---------------------------------------|
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON and Z9500. |
| <b>9.4.(0.0)</b> | Introduced on the S-Series and Z9000. |

**Usage  
Information**

This command displays information from the running-config corresponding to either a specific VRF or all the VRFs in the system.

**Example**

```
DelleMC# show run vrf test3
!
ip vrf test3
 description "Banking Customer Chennai"
DelleMC#
```

# VLT Proxy Gateway

The virtual link trucking (VLT) proxy gateway feature allows a VLT domain to locally terminate and route L3 packets that are destined to a Layer 3 (L3) end point in another VLT domain. Enable the VLT proxy gateway using the link layer discover protocol (LLDP) method or the static configuration. For more information, see the *Command Line Reference Guide*.

## Topics:

- [proxy-gateway lldp](#)
- [proxy-gateway static](#)
- [remote-mac-address exclude-vlan](#)
- [peer-domain-link port-channel exclude-vlan](#)
- [proxy-gateway peer-timeout](#)
- [vlt-peer-mac transmit](#)
- [show vlt-proxy-gateway](#)

## proxy-gateway lldp

Enables the proxy-gateway feature using the LLDP protocol.

**Syntax** [no] proxy-gateway lldp

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.          |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                           |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                        |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                    |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                        |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                        |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                        |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                        |
| <b>9.4(0.0)</b>   | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information** The configuration is cached and sent to LLDP only in one of the following conditions:

1. The port-channel connecting the two VLT domains, across the DC, is a VLT LAG.
2. The `protocol lldp` command is globally enabled.
3. The proxy-gateway LLDP configuration is applied.

## Example

```
DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain)# proxy-gateway lldp
DellEMC(conf-vlt-domain)#
```

# proxy-gateway static

Enables the proxy-gateway feature using static configurations.

**Syntax** [no] proxy-gateway static

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                    |
|------------|------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.      |
| 9.10(0.0)  | Introduced on the S3148.                       |
| 9.10(0.0)  | Introduced on the S6100-ON.                    |
| 9.8(2.0)   | Introduced on the S3100 series.                |
| 9.8(1.0)   | Introduced on the Z9100-ON.                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                    |
| 9.7(0.0)   | Introduced on the S6000-ON.                    |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000. |

**Usage Information** When you add a proxy-gateway static configuration, the setting is saved in the Layer 2 module. When you remove the static proxy gateway configuration, each proxy-gateway static MAC configured is deleted from the Layer 2 module.

## Example

```
DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain)# proxy-gateway static
DellEMC(conf-vlt-domain)#
```

# remote-mac-address exclude-vlan

Configure the proxy-gateway static entry and exclude a VLAN or a range of VLANs from proxy routing.

**Syntax** [no] remote-mac-address mac-address [exclude-vlan vlan-range]

**Parameters**

- remote-mac-address** Specify the mac-addresses of the VLT peers which are in the remote VLT domain.
- mac-address** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.
- vlan-range** Enter the VLAN IDs in which proxy gateway is not needed. The VLANs are excluded from doing proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:  
Comma-separated: 3, 4, 6  
Range: 5-10  
Combination: 3, 4, 5-10, 8

**Command Modes** VLT DOMAIN PROXY GW STATIC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

### Usage Information

You can configure the MAC address of a VLT peer in a remote VLT domain to associate with the static VLT proxy gateway and exclude a VLAN, or a range of VLANs, from proxy routing.

### Example

```
DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain#proxy-gateway static
DellEMC(conf-vlt-domain-proxy-gw-static)# remote-mac-address
00:01:e8:06:95:ac exclude-vlan 3
DellEMC(conf-vlt-domain-proxy-gw-static)#
```

## peer-domain-link port-channel exclude-vlan

Configure the VLT port channel, which is connected to the remote VLT domain, for the proxy gateway or configure the VLANs you want to exclude from VLT proxy gateway.

### S6000-ON

#### Syntax

```
[no] peer-domain-link port-channel interface-identifier exclude-vlan vlan-range
```

#### Parameters

|                             |                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>port-channel</b>         | Configure the proxy-gateway interface port-channel.                                                                                                                                                                                                               |
| <b>interface-identifier</b> | Enter the interface type.                                                                                                                                                                                                                                         |
| <b>vlan-range</b>           | Enter the VLAN IDs that you want to exclude from the proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:<br><br>Comma-separated: 3, 4, 6<br>Range: 5-10<br>Combination: 3, 4, 5-10, 8 |

**Command Modes** VLT DOMAIN PROXY GW LLDP

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |
| 9.10(0.0) | Introduced on the S6100-ON.               |

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.5(0.1)   | Introduced on the Z9500.                           |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information**

You must configure the VLT port channel interface which is connecting to the remote VLT domain as peer-domain-link. You can also configure the VLANs you want to exclude from the VLT proxy gateway.

**Example**

```
DellEMC(conf)#vlt-domain 1
DellEMC(conf-vlt-domain)#proxy-gateway lldp
DellEMC(conf-vlt-domain-proxy-gw-lldp)#peer-domain-link port-channel 20
exclude-vlan 3
```

## proxy-gateway peer-timeout

Enables the VLT node to timeout the transmission of the peer MAC address when the VLT peer is down.

**Syntax** [no] peer-timeout *value*

**Parameters** *value* Enter the timeout value (in seconds). The range is from 1 to 65535. The default is **infinity**.

**Default** Infinity

**Command Modes** VLT DOMAIN PROXY GW LLDP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                    |
|------------|----------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                      |
| 9.10(0.0)  | Introduced on the S6100-ON.                                    |
| 9.8(2.0)   | Introduced on the S3100 series.                                |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                    |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                    |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                    |
| 9.7(0.0)   | Introduced on the S6000-ON.                                    |
| 9.7(0.0)   | Removed the default value on the S-Series and Z-Series.        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch. |

**Usage Information**

When a VLT peer goes down, the local VLT node stops sending its peer's MAC address. If you configure this timeout, the local VLT node sends its peer's MAC address until the timer expires.

Use this timer when you enable `vlt-peer-mac transmit`. A typical use example is a square VLT topology with a single link connecting to the remote peers.

**Example**

```
DellEMC(conf-vlt-domain-proxy-gw-lldp)# peer-timeout 5
```

# vlt-peer-mac transmit

Enables the device to transmit the peer MAC address along with its own MAC address in LLDP TLV packets to the remote VLT domain.

## S6000–ON

**Syntax** [no] vlt-peer-mac transmit

**Command Modes** VLT DOMAIN PROXY GW LLDP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100–ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100–ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information** This command enables the device to transmit its VLT peer MAC address along with its own MAC address to the remote VLT domain. By default, a node sends only its own MAC address to the remote VLT domain.

This configuration is applicable only for an LLDP proxy gateway. A typical use example is a square VLT topology with single link connecting to the remote peers.

### Example

```
DellEMC(conf-vlt-domain-proxy-gw-lldp)# vlt-peer-mac transmit
```

# show vlt-proxy-gateway

Displays the VLT proxy gateway configuration.

## S6000–ON

**Syntax** show vlt-proxy-gateway [info] {lldp | static}

**Parameters**

|               |                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|
| <b>lldp</b>   | Enter the keyword <code>lldp</code> to display details about the LLDP VLT proxy gateway configuration.     |
| <b>static</b> | Enter the keyword <code>static</code> to display details about the static VLT proxy gateway configuration. |

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Introduced on the S6000-ON.                        |
| 9.4(0.0)   | Introduced on the S4810, S4820T, S6000, and Z9000. |

## Usage Information

The proxy-gateway feature may go operationally down for any of the following reasons:

- LLDP is globally disabled.
- LDP is disabled per port.
- VLT port-channel is down.
- LLDP neighbor is down.

If any of these conditions is true, the proxy-gateway feature could be operationally down. If so, it is shown in the `show` command output.

When more than one VLT port-channel terminates on the same ToR, the `show vlt proxy-gateway info lldp` command output may show the port-channel ID incorrectly.

## Example

```
DellEMC#show vlt proxy-gateway
VLT Proxy Gateway Brief

Config Mode: LLDP
Global LLDP Config Status: Enabled
peer-mac-transmit Status: Disabled

DellEMC#show vlt proxy-gateway info static
Mac Address Exclude Vlan

00:01:e8:8a:e8:f7 3,7-8
00:01:e8:8b:1c:c0 3,7-8

DellEMC#show vlt proxy-gateway info lldp
LagId Mac Address Exclude Vlan

Po 55 00:01:e8:8a:e8:f7 3,7-8 << Macs learnt via port-channel 55
Po 55 00:01:e8:8b:1c:c0 3,7-8
```

## Virtual Link Trunking (VLT)

Virtual link trunking (VLT) allows physical links between two chassis to appear as a single virtual link to the network core. VLT eliminates the requirement for Spanning Tree protocols by allowing link aggregation group (LAG) terminations on two separate distribution or core switches, and by supporting a loop-free topology.

VLT provides Layer 2 multipathing, creating redundancy through increased bandwidth and enabling multiple parallel paths between nodes and load-balancing traffic where alternative paths exist.

**i NOTE:** When you launch the VLT link, the VLT peer-ship is not established if any of the following is **TRUE**:

- The VLT System-MAC configured on both the VLT peers do not match.
- The VLT Unit-Id configured on both the VLT peers are identical.
- The VLT System-MAC or Unit-Id is configured only on one of the VLT peers.
- The VLT domain ID is not the same on both peers.

If the VLT peer-ship is already established, changing the System-MAC or Unit-Id does not cause VLT peer-ship to go down.

Also, if the VLT peer-ship is already established and the VLT Unit-Id or System-MAC are configured on both peers, then changing the CLI configurations on the VLT Unit-Id or System-MAC is rejected if any of the following become **TRUE**:

- After making the CLI configuration change, the VLT Unit-Id becomes identical on both peers.
- After making the CLI configuration change, the VLT System-MAC do not match on both peers.

When the VLT peer-ship is already established, you can remove the VLT Unit-Id or System-MAC configuration from either or both peers. However, removing configuration settings can cause the VLT ports to go down if you configure the Unit-Id or System-MAC on only one of the VLT peers.

# back-up destination

Configure the IPv4 or IPv6 address of the management interface on the remote VLT peer used as the VLT backup link endpoint for sending out-of-band (OOB) hello messages.

**Syntax** `back-up destination {[ipv4-address] | [ipv6 ipv6-address] [interval seconds] vrf [management vrf-name | vrf-name]}`

**Parameters**

- ipv4-address** Enter the IPv4 address of the backup destination.
- ipv6** Enter the keyword `ipv6` then an IPv6 address in the X:X:X::X format.
- interval seconds** Enter the keyword `interval` to specify the time interval to send hello messages. The range is from 1 to 5 seconds. The default is 1 second.
- vrf management vrf-name** (OPTIONAL) Configures the management VRF instance for the backup IPv4 or IPv6 address.
- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF.

**Defaults** `1 second`

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2)   | Added support for IPv6.                                                                             |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.0.0.0    | Introduced on the Z9000.                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.8.0    | Introduced on the S4810.                                                                            |

**Example** Following example shows that the VRF management is configured:

```
DellEMC#show ip vrf
VRF-Name VRF-ID Interfaces
default 0 Vl 1
management 512 Ma 1/1
```

Hence, the `back-up destination` command must be configured as:

```
DellEMC(conf-vlt-domain)#back-up destination <ip address> vrf management vrf-name
```

# clear vlt statistics

Clear the VLT operation statistics.

**Syntax** `clear vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]`

|                   |                   |                                               |
|-------------------|-------------------|-----------------------------------------------|
| <b>Parameters</b> | <b>domain</b>     | Clear the VLT statistics for the domain.      |
|                   | <b>multicast</b>  | Clear the VLT statistics for multicast.       |
|                   | <b>mac</b>        | Clear the VLT statistics for the MAC address. |
|                   | <b>arp</b>        | Clear the VLT statistics for ARP.             |
|                   | <b>igmp-snoop</b> | Clear the VLT statistics for IGMP snooping.   |
|                   | <b>ndp</b>        | Clear the VLT statistics for NDP.             |

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2)   | Added <code>multicast</code> and <code>ndp</code> parameters.                                       |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 9.0.0.0    | Introduced on the Z9000.                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.12.0   | Introduced on the S4810.                                                                            |

## Example

```
VLT ARP Statistics

ARP Tunnel Pkts sent:0
ARP Tunnel Pkts Rcvd:0
ARP-sync Pkts Sent:0
ARP-sync Pkts Rcvd:0
ARP Reg Request sent:19
ARP Reg Request rcvd:10
```

## Related Commands

- [show vlt statistics](#) — displays statistics on VLT operations.

# delay-restore

Configure the delay in bringing up VLT ports after reload or peer-link restoration between the VLT peer switches.

|                        |                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>delay-restore</code>                                                                                                                                                                                                                          |
| <b>Parameters</b>      | <b>delay-restore</b> Enter the amount of time, in seconds, to delay bringing up the VLT ports after the VLTi device reloads or after the peer-link restores between VLT peer switches. The range from 1 to 1200. The default is <b>90 seconds</b> . |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                     |
| <b>Command Modes</b>   | VLT DOMAIN                                                                                                                                                                                                                                          |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                                                                                       |

| Version           | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                            |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                                         |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                     |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                                         |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                         |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b>   | Introduced on the S8420T.                                                                           |
| <b>8.3.12.0</b>   | Introduced on the S4810.                                                                            |

**Usage Information** To delay the system from bringing up the VLT port for a brief period to allow IGMP snooping and Layer 3 routing protocols to converge, use the `delay-restore` command. Use this command:

- after a VLT device reloads.
- if the peer VLT device was up at the time the VLTi link failed.

**Related Commands**

- [show vlt statistics](#) — displays statistics on VLT operations.

# delay-restore abort-threshold

Increase the boot up timer to a value greater than 60 seconds.

**Syntax** `delay-restore abort-threshold <interval>`  
To remove the boot up timer value, use the `no delay-restore abort-threshold` command.

**Parameters** **interval** Enter the interval value (in seconds) for the delay restore timer to abort. The range is from 1 to 1800 seconds. The default is **60 seconds**.

This delay restore timer applies only during reload/boot-up and not in other scenarios (for example, during ICL flap).

**Defaults** 60 seconds

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                               |
|------------|---------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                 |
| 9.10(0.0)  | Introduced on the S3148.                                                  |
| 9.10(0.0)  | Introduced on the S6100-ON.                                               |
| 9.8(2.0)   | Introduced on the S3100 series.                                           |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                               |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                               |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                               |
| 9.7(0.0)   | Introduced on the S4820T, S4810, S6000, S5000, Z9000, S6000-ON and Z9500. |

**Usage Information** To abort the VLT delay restore timer value as the maximum threshold, during reload, apply the maximum time interval to the hold-down ICL peer-up in the start-up configurations.

## lacp ungroup member-independent

Prevent possible loop during the VLT peer switch bootup or on a device that accesses the VLT domain.

**Syntax** lacp ungroup member-independent {vlt | port-channel}

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <b>vlt</b>          | Force all VLT LACP members to become switchports.          |
| <b>port-channel</b> | Force all LACP port-channel members to become switchports. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |

| Version  | Description                                |
|----------|--------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                   |
| 9.0.0.0  | Introduced on the Z9000.                   |
| 8.3.19.0 | Introduced on the S4820T.                  |
| 8.3.12.0 | Added port-channel parameter on the S4810. |
| 8.3.8.0  | Introduced on the S4810.                   |

### Usage Information

LACP on the VLT ports (on a VLT switch or access device), which are members of the VLT, are not brought up until the VLT domain is recognized on the access device.

During boot-up in a stacking configuration, the system must be able to reach the DHCP server with the boot image and configuration image. To receive an offer on static LAGs between switches, only untagged DHCP requests are sent to the DHCP server. Configure the DHCP server to start in BMP mode.

If the switches are connected using LACP port-channels (for example, the VLT peer and top of rack [ToR]), use the `port-channel` option on the ToR-side configuration to allow member ports of an ungrouped LACP port-channel to inherit VLAN membership of that port channel. This ensures untagged VLT peer device packets reach the DHCP server on the ToR.

To ungroup the VLT and port-channel configurations, use the `no lacp ungroup member independent` command on a VLT port channel.

If you reboot both VLT peers in BMP mode with static VLT LAGs, the DHCP server reply to the DHCP discover offer may not be forwarded by the ToR to the correct node. To avoid this issue, configure the VLT LAGs to the ToR and the ToR port channel to the VLT peers with LACP.

If supported by the ToR, enable the `lacp-ungroup` feature on the ToR using the `lacp ungroup member-independent port-channel` command.

If the `lacp-ungroup` feature is not supported on the ToR, reboot the VLT peers one at a time. After rebooting, verify that VLTi (ICL) is active before attempting DHCP connectivity.

Use the `lacp ungroup member-independent` command only if the system connects to nodes using bare metal provisioning (BMP) to upgrade or boot from the network. Otherwise, when the member links flap, the links become independent switch ports and forward the traffic even before LACP is formed on that port.

Ensure that you configure all port channels as hybrid ports and as untagged members of a VLAN where the LACP ungroup option is applicable.

BMP uses untagged dynamic host configuration protocol (DHCP) packets to communicate with the DHCP server.

To disable this feature on VLT and port channels, use `no lacp ungroup member-independent {vlt | port-channel}` command under the configuration mode.

### Example

```
DellEMC(conf)#lacp ungroup member-independent ?
port-channel LACP port-channel members become switchports
vlt All VLT LACP members become
switchports
```

## multicast peer-routing timeout

To retain synced multicast routes or synced multicast outgoing interface (OIF) after a VLT peer node failure, configure the timeout value for a VLT node.

**Syntax** `multicast peer-routing timeout value`

To restore the default value, use the `no multicast peer-routing timeout` command.

**Parameters** **value** Enter the timeout value (in seconds). The range is from 1 to 1200. The default is 150.

**Command Modes** VLT DOMAIN (conf-vlt-domain)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2)   | Introduced on the Z9000, S4810, and S4820T.                                                         |
| 9.0.2.0    | Introduced on the S6000.                                                                            |

## peer-link port-channel

Configure the specified port channel as the chassis interconnect trunk between VLT peers in the domain.

**Syntax** `peer-link port-channel port-channel-number {peer-down-vlan vlan id}`

**Parameters**

|                               |                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>port-channel-number</b>    | Enter the port-channel number that acts as the interconnect trunk. The range is from 1 to 128.                                             |
| <b>peer-down-vlan vlan id</b> | Enter the keywords <code>peer-down-vlan</code> then a VLAN ID to configure the VLAN that the VLT peer link uses when the VLT peer is down. |

**Defaults** Not configured.

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Added support for the <code>peer-down-vlan</code> option.                                           |
| 8.3.8.0  | Introduced on the S4810.                                                                            |

**Usage Information**

To configure the VLAN from where the VLT peer forwards packets received over the VLTi from an adjacent VLT peer that is down, use the `peer-down-vlan` option. When a VLT peer with bare metal provisioning (BMP) is booting up, it sends untagged DHCP discover packets to its peer over the VLTi. To ensure that the DHCP discover packets are forwarded to the VLAN that has the DHCP server, use this configuration.

## peer-routing

Enable Layer 3 (L3) VLT peer-routing. This command is applicable for both IPv6 and IPv4 interfaces.

**Syntax** `peer-routing`  
 To disable L3 VLT peer-routing, use the `no peer-routing` command.

**Defaults** Disabled.

**Command Modes** VLT DOMAIN (conf-vlt-domain)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.4(0.0)   | Added the support for IPV6 / IPV4.                                                                  |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2)   | Introduced on the Z9000, S4810, and S4820T.                                                         |

# peer-routing-timeout

Configure the delay after which peer routing disables when the peer is unavailable. This command is applicable for both IPv6 and IPv4.

|                        |                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>peer-routing-timeout value</code><br>To restore the default value, use the <code>no peer-routing-timeout</code> command.                                |
| <b>Parameters</b>      | <b>value</b> Enter the timeout value (in seconds). The range is from 1 to 65535. The default value is <b>infinity</b> .                                       |
| <b>Command Modes</b>   | VLT DOMAIN (conf-vlt-domain)                                                                                                                                  |
| <b>Default</b>         | Infinity                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| Version           | Description                                                   |
|-------------------|---------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                     |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                      |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                   |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                               |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                   |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                   |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                   |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                   |
| <b>9.7(0.0)</b>   | Added support for default value on the S-Series and Z-Series. |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                      |
| <b>9.4(0.0)</b>   | Added the support for IPV6 / IPV4.                            |
| <b>9.2(0.2)</b>   | Introduced on the Z9000, S4810, and S4820T.                   |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                      |

|                          |                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | When the timer expires, the software checks to see if the VLT peer is available. If the VLT peer is not available, peer-routing disables on that peer.<br>If you do not configure this delay value, peer-routing is not disabled even when the peer is unavailable. |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# primary-priority

Assign the priority for master election among VLT peers.

|                        |                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>[no] primary-priority</code>                                                                                                                                                          |
| <b>Parameters</b>      | <b>value</b> To configure the primary role on a VLT peer, enter a lower value than the priority value of the remote peer. The range is from 1 to 65535. The default value is <b>32768</b> . |
| <b>Default</b>         | <b>32768</b>                                                                                                                                                                                |
| <b>Command Modes</b>   | VLT DOMAIN                                                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .                               |

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0    | Introduced on the S6000.                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                           |
| 8.3.8.0    | Introduced on the S4810.                                                                            |

#### Usage Information

After you configure a VLT domain on each peer switch and connect (cable) the two VLT peers on each side of the VLT interconnect, the system elects a primary and secondary VLT peer device. To configure the primary and secondary roles before the election process, use the `primary-priority` command. Enter a lower value on the primary peer and a higher value on the secondary peer.

If the primary peer fails, the secondary peer (with the higher priority) takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role (there is no preemption).

## show vlt brief

Displays summarized status information about VLT domains configured on the switch.

**Syntax** `show vlt brief`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version  | Description               |
|----------|---------------------------|
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

**Usage Information**

The version shown in the `show vlt brief` output command displays the VLT version number which is different from the Dell EMC Networking OS version number. VLT version numbers begin with odd numbers.

**Example (Brief)**

```
DellEMC#show vlt brief
VLT Domain Brief

Domain ID : 1
Role : Secondary
Role Priority : 32768
ICL Link Status : Up
HeartBeat Status : Up
VLT Peer Status : Up
Version : 6(3)
Local System MAC address : 00:01:e8:8a:e9:91
Remote System MAC address : 00:01:e8:8a:e9:76
Remote system version : 6(3)
Delay-Restore timer : 90 seconds
Delay-Restore Abort Threshold : 60 seconds
Peer-Routing : Disabled
Peer-Routing-Timeout timer : 0 seconds
Multicast peer-routing timeout: 150 seconds
DellEMC#
```

## show vlt backup-link

Displays information about the backup link operation.

**Syntax** `show vlt backup-link`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |

| Version | Description              |
|---------|--------------------------|
| 8.3.8.0 | Introduced on the S4810. |

### Example

```
Dell_VLTpeer1# show vlt backup-link

VLT Backup Link

Destination: 10.11.200.18
Peer HeartBeat status: Up
HeartBeat Timer Interval: 1
HeartBeat Timeout: 3
UDP Port: 34998
HeartBeat Messages Sent: 1026
HeartBeat Messages Received: 1025
```

## show vlt counters

Displays counter information.

**Syntax** `show vlt counters [arp| igmp-snoop | interface | mac | ndp]`

| Parameters        |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <b>arp</b>        | Enter the keyword <code>arp</code> to display the ARP counter information for the VLT.                   |
| <b>igmp-snoop</b> | Enter the keywords <code>igmp-snoop</code> to display the igmp-snooping counter information for the VLT. |
| <b>interface</b>  | Enter the keyword <code>interface</code> to display the interface counter information for the VLT.       |
| <b>mac</b>        | Enter the keyword <code>mac</code> to display the MAC address counter information for the VLT.           |
| <b>ndp</b>        | Enter the keyword <code>ndp</code> to display the VLT counter information for NDP.                       |

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.12.0   | Introduced on the S4810.                  |

## Usage Information

If you do not add a parameter such as `arp` or `mac`, the output displays all the counters.

### Example

```
DelleMC# show vlt counter
Total VLT counters

L2 Total MAC-Address Count :
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
ARP entries count :
```

### Example (igmp-snoop)

```
DelleMC# show vlt counter igmp-snoop
Total IGMP VLT counters

IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 5
```

### Example (igmp-snoop interface port-channel)

```
DelleMC#show vlt counter igmp-snoop interface port-channel 2
VLT Port-ID: 2 IGMP Counter

IGMP MRouter Vlans count : 0
IGMP Mcast Groups count : 5

DelleMC# show vlt counter igmp-snoop interface port-channel 100
VLT Port-ID: 100 IGMP Counter

IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 0
Ve
```

### Example (NDP and Non-VLT ARP)

```
DelleMC#show vlt counters
Total VLT Counters

L2 Total MAC-Address Count: 2
Total Arp Entries Learnt : 0
Total Arp Entries Synced : 0
Total Non-VLT Arp entries Learnt: 0
Total Non-VLT Arp Entries Synced 0
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
Total VLT Ndp Entries Learnt : 2
Total VLT Ndp Entries Synced : 0
Total Non-VLT Ndp Entries Learnt : 0
Total Non-VLT Ndp Entries Synced : 0
```

## show vlt detail

Displays detailed status information about VLT domains configured on the switch.

**Syntax** `show vlt detail`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0) | Introduced on the S3148.                  |

| Version    | Description                     |
|------------|---------------------------------|
| 9.10(0.0)  | Introduced on the S6100-ON.     |
| 9.8(2.0)   | Introduced on the S3100 series. |
| 9.8(1.0)   | Introduced on the Z9100-ON.     |
| 9.8(0.0P5) | Introduced on the S4048-ON.     |
| 9.8(0.0P2) | Introduced on the S3048-ON.     |
| 9.7(0.0)   | Introduced on the S6000-ON.     |
| 9.5(0.1)   | Introduced on the Z9500.        |
| 9.0.2.0    | Introduced on the S6000.        |
| 9.0.0.0    | Introduced on the Z9000.        |
| 8.3.19.0   | Introduced on the S4820T.       |
| 8.3.8.0    | Introduced on the S4810.        |

### Example

```
DellEMC# DellEMC(conf-if-vl-100)#show vlt detail
Local LAG Id Peer LAG Id Local Status Peer Status Active VLANs

10 10 UP UP 100, 200, 300, 400,
```

## show vlt inconsistency

Display run-time inconsistencies in the incoming interface (IIF) for spanned multicast routes (mroutes).

**Syntax** `show vlt inconsistency ip mroute`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)   | Introduced on the Z9500.                                                                            |
| 9.2(0.2)   | Introduced on the Z9000, S4810, and S4820T.                                                         |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0    | Introduced on the S6000.                                                                            |

### Example

```
DellEMC#show vlt inconsistency ip mroute
Spanned Multicast Routing IIF Inconsistency

Multicast Route LocalIIF PeerIIF
```

```

(22.22.22.200, 225.1.1.2) VLAN 5 VLAN 6
(*, 225.1.1.2) VLAN 15 te 1/5/1
DellEMC#

```

## show vlt mismatch

Display mismatches in VLT parameters.

**Syntax** `show vlt mismatch`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| 9.13(0.0)  | Updated to show mismatch in VXLAN instance parameters.                                                          |
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                       |
| 9.10(0.0)  | Introduced on the S3148.                                                                                        |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                     |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                 |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                     |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                     |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                     |
| 9.7(0.0)   | Introduced support for Q-in-Q implementation over VLT on the S-Series and Z-Series. Introduced on the S6000-ON. |
| 9.5(0.1)   | Introduced on the Z9500.                                                                                        |
| 9.2(0.2)   | Introduced on the Z9000, S4810, and S4820T.                                                                     |
| 9.2(0.0)   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.             |
| 9.0.2.0    | Introduced on the S6000.                                                                                        |

## show vlt role

Displays the VLT peer status, role of the local VLT switch, VLT system MAC address and system priority, and the MAC address and priority of the local VLT device.

**Syntax** `show vlt role`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.5(0.1)   | Introduced on the Z9500.                  |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

### Example

```
Dell_VLTpeer1# show vlt role

VLT Role

VLT Role: Primary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:bc
Local System Role Priority: 32768

Dell_VLTpeer2# show vlt role

VLT Role

VLT Role: Secondary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:e6
Local System Role Priority: 32768
```

## show vlt statistics

Displays VLT operations statistics.

**Syntax** `show vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]`

| Parameters        | Description                                                                             |
|-------------------|-----------------------------------------------------------------------------------------|
| <b>arp</b>        | Enter the keyword <code>arp</code> to display the ARP VLT statistics.                   |
| <b>domain</b>     | Enter the keyword <code>domain</code> to display the domain VLT statistics.             |
| <b>igmp-snoop</b> | Enter the keywords <code>igmp-snoop</code> to display the IGMP snooping VLT statistics. |
| <b>mac</b>        | Enter the keyword <code>mac</code> to display the VLT MAC addresses VLT statistics.     |
| <b>multicast</b>  | Enter the keyword <code>multicast</code> to display the multicast VLT statistics.       |
| <b>ndp</b>        | Enter the keyword <code>ndp</code> to display the NDP VLT statistics.                   |

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |

| Version    | Description                                                  |
|------------|--------------------------------------------------------------|
| 9.8(0.0P2) | Introduced on the S3048-ON.                                  |
| 9.7(0.0)   | Introduced on the S6000-ON.                                  |
| 9.5(0.1)   | Introduced on the Z9500.                                     |
| 9.2(0.2)   | Added parameters <code>multicast</code> and <code>ndp</code> |
| 9.0.2.0    | Introduced on the S6000.                                     |
| 9.0.0.0    | Introduced on the Z9000.                                     |
| 8.3.19.0   | Introduced on the S4820T.                                    |
| 8.3.12.0   | Added support in the output for ARP, MAC, and IGMP snooping. |
| 8.3.8.0    | Introduced on the S4810.                                     |

## Related Commands

- [clear vlt statistics](#) — clears the statistics on VLT operations.

## Example

**NOTE:** The following example shows the statistics for all the VLT parameters. If you enter a specific keyword, such as `mac`, only the statistics for that VLT parameter displays.

```
Dell_VLTpeer1# show vlt statistics

## unit-id

Configure the default unit ID of a VLT peer switch.

**Syntax** `unit-id [0 | 1]`

**Parameters**      **0 | 1**      Configure the default unit ID of a VLT peer switch. Enter 0 for the first peer. Enter 1 for the second peer.

**Defaults**      Automatically assigned based on the MAC address of each VLT peer. The peer with the lower MAC address is assigned unit 0; the peer with the higher MAC address is assigned unit 1.

**Command Modes**      VLT DOMAIN

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                           |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                                            |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                                                     |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                                         |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                         |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>    | Introduced on the S4810.                                                                            |

**Usage Information**      When you create a VLT domain on a switch, the Dell EMC Networking OS automatically assigns a unique unit ID (0 or 1) to each peer switch. The unit IDs are used for internal system operations. To explicitly configure the unit ID of a VLT peer, use the `unit-id` command. Configure a different unit ID (0 or 1) on each peer switch.

This command minimizes the time required for the VLT system to determine the unit ID assigned to each peer switch when one peer reboots.

## vlt domain

Enable VLT on a switch, configure a VLT domain, and enter VLT-Domain Configuration mode.

**Syntax**      `vlt domain domain-id`

**Parameters**      **domain-id**      Enter the domain ID number. Configure the same domain ID on the peer switch. The range of domain IDs is from 1 to 1000.

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |

| Version           | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                                         |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                                         |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                                                            |
| <b>9.2(0.0)</b>   | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                                            |
| <b>9.0.0.0</b>    | Introduced on the Z9000.                                                                            |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                                           |
| <b>8.3.8.0</b>    | Introduced on the S4810.                                                                            |

**Usage Information**

The VLT domain ID must be the same between the two VLT devices. If the domain ID is not the same, a syslog message generates and VLT does not launch.

**Related Commands**

- [show vlt brief](#) — display the delay-restore value.

## vlt-peer-lag port-channel

Associate the port channel to the corresponding VLT peer port channel for the VLT connection to an attached device.

**Syntax**

`vlt-peer-lag port-channel id-number`

**Parameters**

***id-number*** Enter the respective VLT port-channel number of the peer device. The range is from 1 to 128.

**Defaults**

Not configured.

**Command Modes**

INTERFACE PORT-CHANNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                                           |

- `vxlan-instance static`
- `vxlan-vnid`
- `show running-config vxlan`
- `show vxlan vxlan-instance`
- `show vxlan vxlan-instance logical network`
- `show vxlan vxlan-instance physical-locator`
- `show vxlan vxlan-instance statistics interface`
- `show vxlan vxlan-instance statistics remote-vtep-ip`
- `show vxlan vxlan-instance unicast-mac-local`
- `show vxlan vxlan-instance unicast-mac-remote`
- `show vxlan vxlan-instance vtep-vni-map`

## clear mac-address-table dynamic

Clear the MAC address table of specific or all MAC address learned dynamically.

**Syntax** `clear mac-address-table dynamic {vxlan {interface interface-type | remote-vtep-ip ip-address | vnid vnid} | all | interface | vlan | vxlan}`

| Parameters                                 |                                                                                                                                                                   |  |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>interface</b><br><i>interface-type</i>  | Enter the keyword <code>interface</code> and the interface type to clear all MAC addresses learnt on that interface. The same is also notified to the controller. |  |
| <b>remote-vtep-ip</b><br><i>ip-address</i> | Enter the keyword <code>remote-vtep-ip</code> and the IP address of the remote VTEP to clear all MAC addresses learnt from that VTEP.                             |  |
| <b>vnid</b> <i>vnid</i>                    | Enter the keyword <code>vnid</code> and the VNID of to clear all MAC addresses learnt from all access interfaces that belong the VNID.                            |  |
| <b>all</b>                                 | Enter the keyword <code>all</code> to clear both MAC address of the VXLAN and legacy VLAN.                                                                        |  |

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <b>interface</b> | Enter the keyword <code>interface</code> to clear MAC address from a specific interface. |
| <b>vlan</b>      | Enter the keyword <code>vlan</code> to clear MAC address from a specific vlan.           |
| <b>vxlan</b>     | Enter the keyword <code>vxlan</code> to clear MAC address from a specific vxlan.         |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.12(1.0)</b>    | Introduced on the S5048F-ON.              |
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>     | Introduced on the S4048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>    | Introduced on the S6000.                  |

## clear vxlan vxlan-instance statistics

Clear the remote VTEP and access port statistics.

**Syntax** `clear vxlan vxlan-instance instance ID statistics`

**Parameters** **instance ID** Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*

| Version          | Description                                                                        |
|------------------|------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Usage Information** Use this command to clear the remote VTEP and access port statistics.

## controller

Configures controller for the VXLAN instance on the platform.

**Syntax** `controller controller ID ip address port port-number tcp|ssl`

**Parameters**

- controller ID** Enter the controller ID.
- ip address** Enter the IP address of the controller.
- port port-number** (OPTIONAL) Enter the keyword `port` and the port number. The range is from 1 to 6632. The default port number is 6632.
- tcp** (OPTIONAL) Enter the keyword `tcp` to configure tcp connection to controller.

**ssl** (OPTIONAL) Enter the keyword `ssl` to configure ssl connection to controller (Default).

**Defaults** Disabled

**Command Modes** VXLAN INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                               |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>     | Introduced on the S4048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.4(0.0)</b>     | Introduced on the S6000.                  |

**Related Commands** [vxlan-instance](#) — Enable VXLAN instance configuration on the platform.

## debug vxlan

Debug messages between the Gateway and Controller.

**Syntax** `debug vxlan`

**Defaults** Disabled

**Command Modes** EXEC Privilege

| Command History | Version             | Description                               |
|-----------------|---------------------|-------------------------------------------|
|                 | <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
|                 | <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
|                 | <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.               |
|                 | <b>9.8(0.0)</b>     | Introduced on the S4048-ON.               |
|                 | <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
|                 | <b>9.4(0.0)</b>     | Introduced on the S6000.                  |

## disable-mac-learn

Disable MAC address learning on the network port of a static VXLAN tunnel.

**Syntax** `disable-mac-learn remote-vtep-ip`

To return to the default state of **enabled**, use the `no disable-mac-learn` command.

**Parameters** **remote-vtep-ip** Enter the IP address of the remote VTEP that connects to the VXLAN tunnel on which MAC learning should be disabled.

 **NOTE:** The remote VTEP should already be configured.

**Defaults** **Enabled**

**Command Modes** VXLAN-INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

| Version | Description |
|---------|-------------|
|---------|-------------|

|           |                                                                                 |
|-----------|---------------------------------------------------------------------------------|
| 9.14(2.3) | Introduced on the S4048-ON, S4048T-ON, S6000, S6010-ON, S6100-ON, and Z9100-ON. |
|-----------|---------------------------------------------------------------------------------|

**Usage Information** Use the `disable-mac-learn` command in the VXLAN-INSTANCE mode.

**NOTE:**

- This command is only applicable for static VXLAN and does not work for the other modes of VXLAN (controller and nuage).
- The remote VTEP should already be configured.
- In case of static VXLAN VLT deployments, this configuration should be symmetric across VLT nodes.

## fail-mode

Configures failure-mode on the platform.

**Syntax** `fail-mode secure`

To disable the `fail-mode secure`, use the `no fail-mode secure` command.

**Parameters** **secure** Enter the keyword `secure` to delete all its database and hardware flows/resources, when the VTEP loses connectivity with the controller.

**Defaults** `non secure`

**Command Modes** VXLAN INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version | Description |
|---------|-------------|
|---------|-------------|

|           |                                           |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |
|-----------|-------------------------------------------|

|           |                             |
|-----------|-----------------------------|
| 9.10(0.0) | Introduced on the S6100-ON. |
|-----------|-----------------------------|

|              |                             |
|--------------|-----------------------------|
| 9.10(0.1P10) | Introduced on the Z9100-ON. |
|--------------|-----------------------------|

|          |                             |
|----------|-----------------------------|
| 9.8(0.0) | Introduced on the S4048-ON. |
|----------|-----------------------------|

|          |                             |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
|----------|-----------------------------|

|           |                          |
|-----------|--------------------------|
| 9.4.(0.0) | Introduced on the S6000. |
|-----------|--------------------------|

**Related Commands** [vxlan-instance](#)— Enable VXLAN Instance configuration on the platform.

## feature vxlan

Enable VXLAN configuration globally on the platform.

**Syntax** `feature vxlan`

To disable the VXLAN, use the `no feature vxlan` command.

|                        |                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Disabled                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>Version</b>       | <b>Description</b>                        |
|----------------------|-------------------------------------------|
| <b>9.10(0.1)</b>     | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>     | Introduced on the S6100-ON.               |
| <b>9.10(0.1P10))</b> | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>      | Introduced on the S4048-ON.               |
| <b>9.7(0.0)</b>      | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>     | Introduced on the S6000.                  |

**Usage Information** You must configure feature VXLAN to configure VXLAN-instance.

**Related Commands** [vxlan-instance](#) — Enable VXLAN Instance configuration on the platform.

## gateway-ip

Configures gateway IP address on the platform.

|                        |                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>gateway-ip IP address</code>                                                                                                                                 |
| <b>Parameters</b>      | <b>IP address</b> Enter the IP address of the gateway for the VXLAN instance.                                                                                      |
| <b>Defaults</b>        | Disabled                                                                                                                                                           |
| <b>Command Modes</b>   | VXLAN INSTANCE                                                                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |

| <b>Version</b>      | <b>Description</b>                        |
|---------------------|-------------------------------------------|
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.               |
| <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.               |
| <b>9.8(0.0)</b>     | Introduced on the S4048-ON.               |
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.4.(0.0)</b>    | Introduced on the S6000.                  |

**Related Commands** [vxlan-instance](#) — Enable VXLAN Instance configuration on the platform.

## local-vtep-ip

Set the local IP Address to be used as the source IP for VXLAN tunnels.

|               |                                                                         |
|---------------|-------------------------------------------------------------------------|
| <b>Syntax</b> | <code>local-vtep-ip IP Address</code>                                   |
|               | To disable the settings, use the <code>no local-vtep-ip</code> command. |

|                          |                          |                                                                                                                                                                    |
|--------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>        | <b><i>IP Address</i></b> | Enter the local IP Address to be used as a source for VXLAN tunnels.                                                                                               |
| <b>Defaults</b>          |                          | None.                                                                                                                                                              |
| <b>Command Modes</b>     |                          | VXLAN INSTANCE                                                                                                                                                     |
| <b>Command History</b>   |                          | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |
|                          | <b>Version</b>           | <b>Description</b>                                                                                                                                                 |
|                          | <b>9.11(0.0)</b>         | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.                                                                                 |
| <b>Usage Information</b> |                          | Use the <code>local-vtep-ip <i>IP Address</i></code> command to set the local IP Address that would be used as source for VXLAN tunnels.                           |

## max\_backoff

Configures time to wait between connection attempts with controller.

|                          |                     |                                                                                                                                                                    |
|--------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>            |                     | <code>max_backoff <i>time</i></code>                                                                                                                               |
| <b>Parameters</b>        | <b>time</b>         | Enter the time in milliseconds. The range is from 1000-180000. The default value is 30000.                                                                         |
| <b>Defaults</b>          |                     | 30000                                                                                                                                                              |
| <b>Command Modes</b>     |                     | VXLAN INSTANCE                                                                                                                                                     |

|                          | <b>Version</b>      | <b>Description</b>                                                                                                                                                 |
|                          | <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON.                                                                                                                          |
|                          | <b>9.10(0.0)</b>    | Introduced on the S6100-ON.                                                                                                                                        |
|                          | <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.                                                                                                                                        |
|                          | <b>9.8(0.0)</b>     | Introduced on the S4048-ON.                                                                                                                                        |
|                          | <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                                                                                                                                        |
|                          | <b>9.4.(0.0)</b>    | Introduced on the S6000.                                                                                                                                           |
| <b>Usage Information</b> |                     | The retry interval value caps at the value configured on the max-backoff.                                                                                          |
| <b>Related Commands</b>  |                     | <a href="#">vxlan-instance</a> — Enable VXLAN Instance configuration on the platform.                                                                              |

## peer-ovsdbserver-ip

Specify the IP address of the peer OVSDB server in a VLT setup.

|                   |                               |                                                                                                           |
|-------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     |                               | <code>peer-ovsdbserver-ip <i>peer-ip-address</i></code>                                                   |
|                   |                               | To remove the configuration, use the <code>no peer-ovsdbserver-ip</code>                                  |
| <b>Parameters</b> | <b><i>peer-ip-address</i></b> | Enter the peer OVSDB server IP address. This is usually the management IP address of the peer VLT device. |

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not configured                                                                                                                                                 |
| <b>Command Modes</b>   | VXLAN-INSTANCE                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |
|                        |                                                                                                                                                                |
|                        |                                                                                                                                                                |
|                        |                                                                                                                                                                |
|                        |                                                                                                                                                                |
| <b>Version</b>         | <b>Description</b>                                                                                                                                             |
| <b>9.14(0.0)</b>       | Introduced on the S6000, S6000-ON, S6010-ON, S4048-ON, S4048T-ON, S5048F-ON, S6100-ON, and Z9100-ON.                                                           |

## remote-vtep-ip

Create a remote VTEP and associate it to specified VNIDs.

**Syntax** `remote-vtep-ip IP Address vni-profile profile name`  
 To delete the remote VTEP, use the `no remote-vtep-ip` command.

**Parameters**

|                    |                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address</b>  | Enter the IP Address of the remote VTEP.                                                                                      |
| <b>vni-profile</b> | Enter the keyword <code>vni-profile</code> followed by the <i>profile name</i> to which the remote VTEP has to be associated. |

**Defaults** None.

**Command Modes** VXLAN-INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <b>Version</b>   | <b>Description</b>                                                                 |
| <b>9.11(0.0)</b> | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Usage Information** Use this command to associate a specific VNID to a remote VTEP. Provide a valid profile name while associating to the remote VTEP.

 **NOTE:** The remote VTEP IP Address cannot be any of the local IP Addresses configured in the switch.

## vnid

Associate a range of VNID numbers to a specific VNI profile.

**Syntax** `vnid VNID-Range`  
 To remove the association, use the `no vnid` command.

**Parameters**

|                   |                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------|
| <b>VNID-Range</b> | Enter the range of VNIDs that need to be members of the specific VNI profile. The range is from 1 to 16777215. |
|-------------------|----------------------------------------------------------------------------------------------------------------|

**Defaults** None.

**Command Modes** VNI-PROFILE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

### Usage Information

Use this command to associate the specified range of VNIDs to a VNI profile.

## vni-profile

Create a VNI profile to associate with remote VTEP configuration.

**Syntax** `vni-profile profile name`  
 To delete the VNI profile, use the `no vni-profile` command.

**Parameters** **profile name** Enter a valid and unique profile name. The profile name can have a maximum of 32 characters.

**Defaults** None

**Command Modes** VXLAN-INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

### Usage Information

Use this command to create a VNI profile with a unique profile name to associate with remote VTEP. You can create a maximum of 1024 VNI profiles and remote VTEP IPs.

You can use this command only when you configure static VXLAN.

## vxlan-instance

Enable VXLAN Instance configuration on the platform.

**Syntax** `vxlan-instance instance ID [nsx | nuage | static]`  
 To delete `vxlan-instance` from the system, use `no vxlan-instance instance ID` command.

**Parameters**

- instance ID** Enter the VXLAN instance ID. The platform supports only the instance ID 1.
- nsx** Enter the keyword `nsx` to connect to an NSX controller.  
 **NOTE:** When no keyword is specified, the `nsx` option is applied.
- nuage** Enter the keyword `nuage` to connect to a Nuage controller.
- static** Enter the keyword `static` to configure static VXLANs.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 9.14(0.0)    | Introduced <code>nsx</code> and <code>Nuage</code> keywords on the S5048F-ON.                                                              |
| 9.13(0.0)    | Introduced <code>nsx</code> and <code>Nuage</code> keywords on the S4048-ON, S4048T-ON, S6000, S6000-ON, S6100-ON, S6010-ON, and Z9100-ON. |
| 9.12(1.0)    | Introduced on the S5048F-ON.                                                                                                               |
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                                                                                                  |
| 9.10(0.0)    | Introduced on the S6100-ON.                                                                                                                |
| 9.10(0.1P10) | Introduced on the Z9100-ON.                                                                                                                |
| 9.8(0.0)     | Introduced on the S4048-ON.                                                                                                                |
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                                                                |
| 9.4(0.0)     | Introduced on the S6000.                                                                                                                   |

### Usage Information

You must configure VXLAN globally before using VXLAN-instance. Use the `no shutdown` command to enable the VXLAN instance.

### Example

Enable VXLAN instance:

```
DellEMC(conf)#int 1/5/1
DellEMC(conf-if-te-1/5/1)#vxlan-instance 1
DellEMC(conf-if-te-1/5/1-vxlan-inst-1)#no shutdown
```

Disable VXLAN instance:

```
DellEMC(conf)#no vxlan-instance 1
```

### Related Commands

[feature vxlan](#) — Enable VXLAN configuration globally on the platform.

## vxlan-instance (VAP)

To configure a VXLAN-Access Port (VAP) in to VXLAN-instance

### Syntax

`vxlan-instance instance ID`

To unconfigure VAP, use the `no vxlan-instance 1` command.

### Parameters

**instance ID** Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

### Defaults

Disabled

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.10(0.1P10) | Introduced on the Z9100-ON.               |
| 9.8(0.0)     | Introduced on the S4048-ON.               |
| 9.4(0.0)     | Introduced on the S6000.                  |

**Usage Information** You must disable `vxlan-instance` before unconfiguring VAP.

**Related Commands** [feature vxlan](#) — Enable VXLAN configuration globally on the platform.

## vxlan-instance loopback

Provision VXLAN and non-VXLAN loopback ports that support routing in and out of VXLAN tunnels and enable MAC level loopback on all these ports.

**Syntax** `vxlan-instance instance ID loopback [port-channel id]`

**Parameters**

|                        |                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>instance ID</b>     | Enter the VXLAN instance ID. The platform supports only the instance ID 1.                                                                                                       |
| <b>port-channel id</b> | (Optional) Enter the keyword <code>port-channel</code> and the port-channel ID to provision VXLAN and non-VXLAN loopback ports that support routing in and out of VXLAN tunnels. |

**Defaults** Disabled.

**Command Modes** PORT CHANNEL CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| 9.14(0.0) | Updated to enable MAC level loopback.                                                     |
| 9.13(0.0) | Introduced on the S4048T-ON, S4048-ON, S6010-ON, S6000-ON, S6100-ON, S6000, and Z9100-ON. |

**Usage Information** You must configure VXLAN globally before using VXLAN-instance. Use the `no shutdown` command to enable the VXLAN instance.

**Example** External Loopback:

```
DellEMC(conf-if-po-127)#sho c
!
interface Port-channel 127
 vxlan-instance 1 loopback
```

Internal Loopback:

```
DellEMC(conf-if-te-1/2/2/3)#sho c
!
interface TenGigabitEthernet 1/2/2/3
 description connected IXIA card 1 port 14
 vxlan-instance 1
```

Disable VXLAN Instance:

```
DellEMC(conf)#no vxlan-instance 1
```

**Related Commands** [feature vxlan](#) — Enable VXLAN configuration globally on the platform.

## vxlan-instance static

Enable VXLAN instance configuration to be static on the platform.

**Syntax** `vxlan-instance instance ID [static]`

To delete VXLAN instance from the system, use `no vxlan-instance instance ID` command.

|                        |                                                                                                                                                                    |                                                                                                   |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>instance ID</b>                                                                                                                                                 | Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release. |
|                        | <b>static</b>                                                                                                                                                      | Enter the keyword <code>static</code> to set the VXLAN instance in static mode.                   |
| <b>Defaults</b>        | Controller mode.                                                                                                                                                   |                                                                                                   |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                      |                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> . |                                                                                                   |

| <b>Version</b>   | <b>Description</b>                                                                 |
|------------------|------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Usage Information**

By default, VXLAN instance is created in controller mode. You need a controller to configure VTEP. When you create VXLAN instance in static mode, you can configure VTEP through CLIs.

Use the `no shutdown` command to enable the VXLAN instance.

Only one VXLAN instance can exist in a system.

You cannot modify a VXLAN instance mode. If you need to change the mode, you can delete the existing VXLAN instance and create a new instance with the required mode.

**Example** Enable VXLAN instance:

```
DellEMC(conf)#feature vxlan
DellEMC(conf)#vxlan-instance 1 static
DellEMC(conf-vxlan-inst-1)#no shutdown
```

Disable VXLAN instance:

```
DellEMC(conf)#no vxlan-instance 1 static
```

## vxlan-vnid

Associate VNID to VLAN.

**Syntax** `vxlan-vnid VNID`

To remove the association, use the `no vxlan-vnid` command.

**Parameters** **VNID** Enter the logical network identifier.

**Defaults** None

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                               |
|------------------|------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S4048, S4048T, S6000, S6010, S6100, and Z9100. |

**Usage Information** Use this command to associate a VNID to specific VLAN. Each VLAN is mapped to a single VNID.

# show running-config vxlan

Displays the VXLAN configuration information from running configuration.

**Syntax** `show running-config vxlan`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------|
| 9.11(0.0)    | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                                                          |
| 9.10(0.0)    | Introduced on the S6100-ON.                                                                        |
| 9.10(0.1P10) | Introduced on the Z9100-ON.                                                                        |
| 9.8(0.0)     | Introduced on the S4048-ON.                                                                        |
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                        |
| 9.4(0.0)     | Introduced on the S6000.                                                                           |

## Example

### Static Mode:

```
DellEMC#show running-config vxlan
!
feature vxlan
!
vxlan-instance 1 static
 local-vtep-ip 1.1.1.1
 no shutdown
 vni-profile nil
 vnid 1
 remote-vtep-ip 2.2.2.2 vni-profile nil
```

### Controller Mode:

```
DellEMC#show running-config vxlan
!
feature vxlan
!
vxlan-instance 1
 gateway-ip 3.3.3.3
 fail-mode secure
 controller 1 192.168.122.6 port 6632 ssl
 no shutdown
```

**Related Commands** [vxlan-instance](#)- Enable VXLAN Instance configuration on the platform.

# show vxlan vxlan-instance

Displays information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax** `show vxlan vxlan-instance instance ID`

**Parameters**      *instance ID*      Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------|
| 9.11(0.0)    | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                                                          |
| 9.10(0.0)    | Introduced on the S6100-ON.                                                                        |
| 9.10(0.1P10) | Introduced on the Z9100-ON.                                                                        |
| 9.8(0.0)     | Introduced on the S4048-ON.                                                                        |
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                        |
| 9.4(0.0)     | Introduced on the S6000.                                                                           |

**Example**

```
DelleMC#show vxlan vxlan-instance 1
Instance : 1
Admin State : enabled
Management IP : 192.168.200.200
Gateway IP : 3.3.3.3
MAX Backoff : 30000
Controller 1 : 192.168.122.6:6632 ssl (connected)
Fail Mode : secure
Port List :
 Fo 1/4 Te 1/16/1 Te 1/20/1 Po 2
```

**Related Commands**      [vxlan-instance](#)- Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance logical network

Displays logical network information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax**      show vxlan vxlan-instance *instance ID* logical-network [name *name*]

**Parameters**

*instance ID*      Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

*name name*      (OPTIONAL) Enter the keyword *name* and enter the name of VXLAN logical network up to a length of maximum 30 characters.

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)    | Introduced on the S6100-ON.               |
| 9.10(0.1P10) | Introduced on the Z9100-ON.               |
| 9.8(0.0)     | Introduced on the S4048-ON.               |
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.4.(0.0)    | Introduced on the S6000.                  |

### Example

```
DelleMC#show vxlan vxlan-instance 1 logical-network
Instance : 1
Total LN count : 1
 Name VNID
 bffc3be0-13e6-4745-9f6b-0bcbc5877f01 4656

DelleMC#$n-instance 1 logical-network n 2a8d5d19-8845-4365-
ad04-243f0b6df252
Name : 2a8d5d19-8845-4365-ad04-243f0b6df252
Description :
Tunnel Key : 2
VFI : 28674
Unknown Multicast MAC Tunnels:
 192.168.122.133 : vxlan_over_ipv4 (up)
Port Vlan Bindings:
 Te 1/8/1: VLAN: 2 (0x800000001),
 Fo 1/4: VLAN: 2 (0x800000004),
```

### Related Commands

[vxlan-instance](#) — Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance physical-locator

Displays physical locators related to Network Virtualization Overlay (NVO) Gateway.

**Syntax** `show vxlan vxlan-instance instance ID physical-locator [vtep-ip A.B.C.D]`

**Parameters**

- instance ID*** Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- A.B.C.D*** Enter the IP address of the VTEP.

**Defaults** Disabled

**Command Modes** VXLAN INSTANCE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version      | Description                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------|
| 9.11(0.0)    | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |
| 9.10(0.1)    | Introduced on the S6010-ON and S4048T-ON.                                                          |
| 9.10(0.0)    | Introduced on the S6100-ON.                                                                        |
| 9.10(0.1P10) | Introduced on the Z9100-ON.                                                                        |
| 9.8(0.0)     | Introduced on the S4048-ON.                                                                        |
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                        |

| Version   | Description              |
|-----------|--------------------------|
| 9.4.(0.0) | Introduced on the S6000. |

#### Example

```
DellEMC#show vxlan vxlan-instance 1 physical-locator
Instance : 1
Tunnel : count 1
 36.1.1.1 : vxlan_over_ipv4 (up)
```

#### Related Commands

[vxlan-instance](#) — Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance statistics interface

Displays the port VLAN statistics information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax** `show vxlan vxlan-instance instance ID statistics interface interface VLAN-ID`

| Parameters                |                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|---------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>instance ID</i></b> | Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release. |                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>interface</i></b>   | Enter the following keywords and the interface information:                                       | <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Port Channel, enter the keywords <code>port-channel</code>.</li> </ul> |
| <b><i>VLAN-ID</i></b>     | Enter the VLAN ID.                                                                                |                                                                                                                                                                                                                                                                                                                                                                                    |

**Defaults** Disabled

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

#### Example

#### Related Commands

[vxlan-instance](#)- Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance statistics remote-vtep-ip

Displays VXLAN statistics for a specific VXLAN tunnel.

**Syntax** `show vxlan vxlan-instance instance ID statistics remote-vtep-ip IP Address`

|                   |                           |                                                                                                     |
|-------------------|---------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>instance ID</i></b> | Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.   |
|                   | <b>remote-vtep-ip</b>     | Enter the keyword <code>remote-vtep-ip</code> followed by the <i>IP Address</i> of the remote VTEP. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                 |
|------------------|------------------------------------------------------------------------------------|
| <b>9.11(0.0)</b> | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

**Example**

```
DellEMC# show vxlan vxlan-instance 1 statistics remote-vtep-ip 1.1.1.1
Statistics for Remote-vtep-ip : 1.1.1.1
Unicast:
Rx Packets : 0
Rx Bytes : 0
Tx Packets : 0
Tx Bytes : 0
Non-Unicast:
Tx Packets : 0
Tx Bytes : 0
```

## show vxlan vxlan-instance unicast-mac-local

Displays the information of the local unicast MAC associated with the logical network related to Network Virtualization Overlay (NVO) Gateway.

**Syntax** `show vxlan vxlan-instance instance ID unicast-mac-local [logical-network name | vnid VNID]`

|                   |                           |                                                                                                                |
|-------------------|---------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>instance ID</i></b> | Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.              |
|                   | <b><i>name</i></b>        | (Optional) Enter the name of VXLAN logical network with a maximum length of 30 characters.                     |
|                   | <b><i>vnid VNID</i></b>   | (Optional) Enter the keyword <code>vnid</code> and enter the ID of the VXLAN. The range is from 1 to 16777215. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| <b>Version</b>   | <b>Description</b>                                                                                 |
|------------------|----------------------------------------------------------------------------------------------------|
| <b>9.13(0.0)</b> | Updated to show VLT peer's local macs.                                                             |
| <b>9.11(0.0)</b> | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |
| <b>9.10(0.1)</b> | Introduced on the S6010-ON and S4048T-ON.                                                          |
| <b>9.10(0.0)</b> | Introduced on the S6100-ON.                                                                        |

| Version          | Description                 |
|------------------|-----------------------------|
|                  | Introduced on the Z9100-ON. |
| <b>9.8(0.0)</b>  | Introduced on the S4048-ON. |
| <b>9.7(0.0)</b>  | Introduced on the S6000-ON. |
| <b>9.4.(0.0)</b> | Introduced on the S6000.    |

### Example

```
DelleMC# show vxlan vxlan-instance <1> unicast-mac-local
Total Local Mac Count: 5
VNI MAC PORT VLAN
4656 00:00:02:00:03:00 Te 1/17/1 0
4656 00:00:02:00:03:01 Te 1/17/1 0
4656 00:00:02:00:03:02 Te 1/17/1 0
4656 00:00:02:00:03:03 Te 1/17/1 0
4656 00:00:02:00:03:04 Te 1/17/1 0
```

```
DelleMC#show vxlan vxlan-instance <1> unicast-mac-local
Total Local Mac Count: 1
VNI MAC PORT VLAN
100 00:00:00:33:33:33 Te 0/0 100
100 00:00:00:33:33:34 (N) Po 128 100
```

### Related Commands

[vxlan-instance](#)- Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance unicast-mac-remote

Displays the information of the remote unicast MACs associated with the logical network related to Network Virtualization Overlay (NVO) Gateway.

**Syntax** `show vxlan vxlan-instance instance ID unicast-mac-remote [logical-network name | vnid VNID]`

| Parameters | Parameter                 | Description                                                                                                         |
|------------|---------------------------|---------------------------------------------------------------------------------------------------------------------|
|            | <b><i>instance ID</i></b> | Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.                   |
|            | <b><i>name</i></b>        | (Optional) Enter the name of VXLAN logical network with a maximum length of 30 characters.                          |
|            | <b><i>vnid VNID</i></b>   | (Optional) Enter the keyword <code>vnid</code> and then enter the ID of the VXLAN. The range is from 1 to 16777215. |

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version             | Description                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------|
| <b>9.13(0.0)</b>    | Updated to show VLT peer's local macs.                                                             |
| <b>9.11(0.0)</b>    | Introduced the static mode on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |
| <b>9.10(0.1)</b>    | Introduced on the S6010-ON and S4048T-ON.                                                          |
| <b>9.10(0.0)</b>    | Introduced on the S6100-ON.                                                                        |
| <b>9.10(0.1P10)</b> | Introduced on the Z9100-ON.                                                                        |

| Version  | Description                 |
|----------|-----------------------------|
| 9.8(0.0) | Introduced on the S4048-ON. |
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.4(0.0) | Introduced on the S6000.    |

#### Example

```
DellEMC#show vxlan vxlan-instance 1 unicast-mac-remote
Total Remote Mac Count: 1
VNI MAC TUNNEL
100 00:00:07:00:02:00 (N) 60.1.1.1
```

#### Related Commands

[vxlan-instance](#)- Enable VXLAN Instance configuration on the platform.

## show vxlan vxlan-instance vtep-vni-map

Displays information on VTEP to VNI mapping for a specific remote VTEP or all remote VTEPs

**Syntax** `show vxlan vxlan-instance instance ID vtep-vni-map remote-vtep-ip IP-Address`

**Parameters**

- instance ID*** Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- remote-vtep-ip** Enter the keyword `remote-vtep-ip` followed by the IP address of the remote VTEP.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| 9.11(0.0) | Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON. |

#### Example

```
DellEMC# show vxlan 1 vtep-vni-map
Remote Vtep IP : 10.10.10.10
VNI profile : Profile1
VNID count : 4
VNID list : 100, 200, 300, 400

Remote Vtep IP : 10.10.10.11
VNI profile : Profile2
VNID count : 3
VNID list : 100, 200, 500
```

# Virtual Router Redundancy Protocol (VRRP)

Virtual router redundancy protocol (VRRP) is supported by the Dell EMC Networking OS.

## Topics:

- [IPv4 VRRP Commands](#)
- [IPv6 VRRP Commands](#)

## IPv4 VRRP Commands

The following are IPv4 VRRP commands.

### advertise-interval

Set the time interval between VRRP advertisements.

**Syntax** `advertise-interval {seconds | centiseconds centiseconds }`  
To return to the default settings, use the `no advertise-interval` command.

**Parameters**

|                                            |                                                                                                                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>                             | Enter the number of seconds. The range is from 1 to 255. The default is <b>1 second</b> .                                                                                          |
| <b>centiseconds</b><br><b>centiseconds</b> | Enter the keyword <code>centiseconds</code> then the number of centiseconds in multiples of 25 centiseconds. The range is 25 to 4075 centiseconds in multiples of 25 centiseconds. |

**Defaults** 1 second or 100 centiseconds.

**Command Modes** INTERFACE-VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.                                   |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                                    |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                                                 |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                                             |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                                                 |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                                                 |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                                                 |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                                                 |
| <b>9.5(0.0)</b>   | Added support for centiseconds on the Z9000, S6000, S4820T, S4810, and MXL. |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                                                    |
| <b>9.0.2.0</b>    | Introduced on the S6000.                                                    |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                                                   |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                                                    |
| <b>8.3.7.0</b>    | Introduced on the S4810.                                                    |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

Dell EMC Networking recommends keeping the default setting for this command. If you do change the time interval between VRRP advertisements on one router, change it on all routers.

## authentication-type

Enable authentication of VRRP data exchanges.

**Syntax**

`authentication-type simple [encryption-type] password`

To delete an authentication type and password, use the `no authentication-type` command.

**Parameters**

|                        |                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>simple</b>          | Enter the keyword <code>simple</code> to specify simple authentication.                                                                                                                                                                                                                      |
| <b>encryption-type</b> | (OPTIONAL) Enter one of the following: <ul style="list-style-type: none"> <li>0 (zero) specifies an unencrypted authentication data follows.</li> <li>7 (seven) specifies a hidden authentication data follows.</li> <li>LINE is the unencrypted (cleartext) authentication data.</li> </ul> |
| <b>password</b>        | Enter a character string up to eight characters long as a password. If you do not enter an encryption-type, the password is stored as clear text.                                                                                                                                            |

**Defaults**

Not configured.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

## Usage Information

The system encrypts the password and the `show config` command displays the encrypted text string.

# clear counters vrrp

Clear the counters maintained on VRRP operations.

**Syntax** `clear counters vrrp [vrrp-id] [ipv6]`

**Parameters**

|                |                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------|
| <b>vrrp-id</b> | (OPTIONAL) Enter the number of the VRRP group ID to clear the group's counters. The range is from 1 to 255. |
| <b>ipv6</b>    | (OPTIONAL) Enter the keyword <code>ipv6</code> to clear counters from the IPv6 VRRP group.                  |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                              |
| 9.10(0.0)  | Introduced on the S3148.                                                               |
| 9.9(0.0)   | Added support to clear the interface configurations corresponding to a range of ports. |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                            |
| 9.8(2.0)   | Introduced on the S3100 series.                                                        |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                            |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                            |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                            |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                            |
| 9.4.(0.0)  | Added support for VRF.                                                                 |
| 9.2(1.0)   | Introduced on the Z9500.                                                               |
| 9.0.2.0    | Introduced on the S6000.                                                               |
| 8.3.19.0   | Introduced on the S4820T.                                                              |
| 8.3.11.1   | Introduced on the Z9000.                                                               |
| 8.3.7.0    | Introduced on the S4810.                                                               |
| 7.6.1.0    | Introduced on the S-Series.                                                            |
| 7.5.1.0    | Introduced on the C-Series.                                                            |
| 6.2.1.1    | Introduced on the E-Series.                                                            |

## Usage Information

**i NOTE:** This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to clear the port configurations corresponding to all ports

between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1/1 - 1/1/4`.

## debug vrrp

Enable VRRP debugging.

**Syntax** `debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}`

To disable debugging, use the `no debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}` command.

|                   |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrrp-id</b>   | (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | <b>all</b>       | Enter the keyword <code>all</code> to enable debugging of all VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>bfd</b>       | Enter the keyword <code>bfd</code> to enable debugging of VRRP BFD interactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b>database</b>  | Enter the keyword <code>database</code> to enable debugging of configuration changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | <b>interface</b> | Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For Port Channel interface types, enter the keywords <code>port-channel</code> then the number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then the VLAN ID. The VLAN ID range is from 1 to 4094.</li></ul> |
|                   | <b>interface</b> | Enter the keyword <code>interface</code> to enable debugging of interface state changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                   | <b>ipv6</b>      | Enter the keyword <code>ipv6</code> to enable debugging for IPv6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b>packets</b>   | Enter the keyword <code>packets</code> to enable debugging of VRRP control packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                   | <b>state</b>     | Enter the keyword <code>state</code> to enable debugging of VRRP state changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>timer</b>     | Enter the keyword <code>timer</code> to enable debugging of the VRRP timer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

### Usage Information

If you do not specify an option, debug is active on all interfaces and all VRRP groups.

## description

Configure a short text string describing the VRRP group.

**Syntax** `description text`  
To delete a VRRP group description, use the `no description` command.

**Parameters** `text` Enter a text string up to 80 characters long.

**Defaults** Not enabled.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

## disable

Disable a VRRP group.

**Syntax** `disable`

To re-enable a disabled VRRP group, use the `no disable` command.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

**Usage Information** To enable VRRP traffic, assign an IP address to the VRRP group using the `virtual-address` command and enter `no disable`.

**Related Commands**

- [virtual-address](#) — specify the IP address of the virtual router.

## hold-time

Specify a delay (in seconds) before a switch becomes the MASTER virtual router. By delaying the initialization of the VRRP MASTER, the new switch can stabilize its routing tables.

**Syntax** `hold-time {seconds | centisecs centisecs}`

To return to the default value, use the `no hold-time` command.

**Parameters**

|                            |                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>             | Enter the number of seconds. The range is from 0 to 65535. The default is <b>zero (0) seconds</b> .                                                                 |
| <b>centisecs centisecs</b> | Enter the keyword <code>centisecs</code> then the number of <code>centisecs</code> in units of 25 centisecs. The range is from 0 to 65525 in units of 25 centisecs. |

**Defaults** **zero (0) seconds or (0) centiseconds**

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version   | Description                               |
|-----------|-------------------------------------------|
| 9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. |

| Version    | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| 9.10(0.0)  | Introduced on the S3148.                                                    |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                 |
| 9.8(2.0)   | Introduced on the S3100 series.                                             |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                 |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                 |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                 |
| 9.5(0.0)   | Added support for centiseconds on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0)   | Introduced on the Z9500.                                                    |
| 9.0.2.0    | Introduced on the S6000.                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                    |
| 7.6.1.0    | Introduced on the S-Series.                                                 |
| 7.5.1.0    | Introduced on the C-Series.                                                 |
| 6.2.1.1    | Introduced on the E-Series.                                                 |

**Usage Information**

If a switch is a MASTER and you change the hold timer, disable and re-enable VRRP for the new hold timer value to take effect.

**Related Commands**

- `disable` — disables a VRRP group.

## preempt

To preempt or become the MASTER router, configure a BACKUP router with a higher priority value.

**Syntax**

`preempt`

To prohibit preemption, use the `no preempt` command.

**Defaults**

Enabled (that is, a BACKUP router can preempt the MASTER router).

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## priority

Specify a VRRP priority value for the VRRP group. The VRRP protocol uses this value during the MASTER election process.

**Syntax** `priority priority`

To return to the default value, use the `no priority` command.

**Parameters** `priority` Enter a number as the priority. Enter 255 only if the router's virtual address is the same as the interface's primary IP address (that is, the router is the OWNER). The range is from 1 to 255. The default is **100**.

**Defaults** **100**

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.2(1.0)   | Introduced on the Z9500.                  |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.16.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

**Usage Information** To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual address with same IP address as the interface's primary IP address and change the priority of the VRRP group to 255.

If you set the `priority` command to 255 and the `virtual-address` is not equal to the interface's primary IP address, an error message appears.

## show config

View the non-default VRRP configuration.

**Syntax** `show config [verbose]`

**Parameters** **verbose** (OPTIONAL) Enter the keyword `verbose` to view all the VRRP group configuration information, including default information.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.2(1.0)</b>   | Introduced on the Z9500.                  |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>8.3.19.0</b>   | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>   | Introduced on the Z9000.                  |
| <b>8.3.7.0</b>    | Introduced on the S4810.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series.               |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

### Example

```
DellEMC(conf-if-vrid-4)# show config
vrrp-group 4
 virtual-address 119.192.182.124
!
DellEMC(conf-if-vrid-4)#
```

## show vrrp

View the VRRP groups that are active. If no VRRP groups are active, the Dell EMC Networking OS returns `No Active VRRP group`.

**Syntax** `show vrrp [vrrp-id][brief][interface type][ipv6][interface type][vrf vrf-name]`

|                   |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>vrrp-id</i></b>        | (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                              |
|                   | <b>brief</b>                 | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information about the VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                               |
|                   | <b><i>interface type</i></b> | (OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code>, and then the VLAN ID. The VLAN ID range is from 1 to 4094.</li> </ul> |
|                   | <b>ipv6</b>                  | (OPTIONAL) Enter the keyword <code>ipv6</code> to view only VRRP IPv6 groups.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                   | <b>vrf <i>vrf-name</i></b>   | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view active VRRP groups corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

**Usage Information** The following describes the `show vrrp brief` command.

| <b>Item</b>      | <b>Description</b>                                                                                                                                                                                                                       |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Lists the interface type, slot, and port of the configured VRRP group.                                                                                                                                                                   |
| <b>Grp</b>       | Displays the VRRP group ID.                                                                                                                                                                                                              |
| <b>Pri</b>       | Displays the priority value assigned to the interface. If you configured the <code>track</code> command to track that interface and you disable the interface, the cost is subtracted from the priority value assigned to the interface. |

| Item                   | Description                                                                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pre</b>             | States whether preempt is enabled on the interface: <ul style="list-style-type: none"> <li>• Y = Preempt is enabled.</li> <li>• N = Preempt is not enabled.</li> </ul>                                                                                                                                            |
| <b>State</b>           | Displays the operational state of the interface using one of the following: <ul style="list-style-type: none"> <li>• NA/IF (the interface is not available).</li> <li>• MASTER (the interface associated with the MASTER router).</li> <li>• BACKUP (the interface associated with the BACKUP router).</li> </ul> |
| <b>Master addr</b>     | Displays the IP address of the MASTER router.                                                                                                                                                                                                                                                                     |
| <b>Virtual addr(s)</b> | Displays the virtual IP addresses of the VRRP routers associated with the interface.                                                                                                                                                                                                                              |

### Example (Brief)

```
Dell EMC> Interface Grp Pri Pre State Master addr Virtual addr(s)
Description-----
Te 1/3/1 1 100 Y Master 200.200.200.200 200.200.200.201
Te 1/3/1 2 100 Y Master 200.200.200.200 200.200.200.202 200.200.200.203
Description
Te 1/3/1 3 100 Y Master 1.1.1.1 1.1.1.2
Te 1/3/1 4 100 Y Master 200.200.200.200 200.200.200.206
200.200.200.207 ... short desc

Dell EMC>
```

### Usage Information

The following describes the `show vrrp` command.

| Item                             | Description                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TenGigabitEthernet 1/3...</b> | Displays the interface, VRRP group ID, and network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network address.                                                                                                                                                                                         |
| <b>State: master...</b>          | Displays the interface's state: <ul style="list-style-type: none"> <li>• Na/If (not available)</li> <li>• master (MASTER virtual router)</li> <li>• backup (BACKUP virtual router)</li> </ul> Also displays the interface's priority and IP address of the MASTER.                                                                        |
| <b>Hold Down:...</b>             | Displays additional VRRP configuration information: <ul style="list-style-type: none"> <li>• Hold Down displays the hold down timer interval in seconds.</li> <li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li> <li>• AdvInt displays the Advertise Interval in seconds.</li> </ul>       |
| <b>Adv rcvd:...</b>              | Displays counters for the following: <ul style="list-style-type: none"> <li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li> <li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li> <li>• Gratuitous ARP sent displays the number of gratuitous ARPs sent.</li> </ul> |
| <b>Virtual MAC address</b>       | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                       |
| <b>Virtual IP address</b>        | Displays the virtual IP address of the interface's VRRP router.                                                                                                                                                                                                                                                                           |
| <b>Authentication:...</b>        | States whether authentication is configured for the VRRP group. If it is configured, this lists the authentication type and password.                                                                                                                                                                                                     |
| <b>Tracking states..</b>         | Displays if the <code>track</code> command is configured on an interface. Also displays the following information about the tracked interface:                                                                                                                                                                                            |

## Item Description

- Dn or Up states whether the interface is down or up.
- The interface type slot/port information.

### Example

```
DellEMC> show vrrp

TenGigabitEthernet 1/1/3, VRID: 1, Net: 10.1.1.253
VRF: 0 default
State: Master, Priority: 105, Master: 10.1.1.253 (local)
Hold Down: 0 sec, Preempt: TRUE, AdvInt: 1 sec
Adv rcvd: 0, Adv sent: 1862, Gratuitous ARP sent: 0
Virtual MAC address:

## track

Monitor an interface and lower the priority value of the VRRP group on that interface if it is disabled.

**Syntax** track *interface* [priority-cost *cost*]

To disable monitoring, use the no track interface command.

**Parameters** *interface* (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan`, and then the VLAN ID. The VLAN ID range is from 1 to 4094.

**priority-cost** (OPTIONAL) Enter a number as the amount to subtract from the priority value. The range is from 1 to 254. The default is **10**.

**Defaults** priority cost = **10**

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                               |
|-------------------|-------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON. |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                  |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.               |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.           |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.               |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.               |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.               |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>    | Introduced on the S6000.                  |
| <b>7.6.1.0</b>    | Introduced on the S-Series (S50 only).    |
| <b>7.5.1.0</b>    | Introduced on the C-Series.               |
| <b>6.2.1.1</b>    | Introduced on the E-Series.               |

**Usage Information** If you disable the interface, the cost value is subtracted from the priority value and forces a new MASTER election if the priority value is lower than the priority value in the BACKUP virtual routers.

## virtual-address

Configure up to 12 virtual router IP addresses in the VRRP group. To start sending VRRP packets, set at least one virtual IP address for the VRRP group.

**Syntax** `virtual-address ip-address1 [... ip-address12]`

To delete one or more virtual IP addresses, use the `no virtual-address ip-address1 [... ip-address12]` command.

**Parameters**

***ip-address1*** Enter an IP address of the virtual router in dotted decimal format. The IP address must be on the same subnet as the interface's primary IP address.

***... ip-address12*** (OPTIONAL) Enter up to 11 additional IP addresses of virtual routers in dotted decimal format. Separate the IP addresses with a space. The IP addresses must be on the same subnet as the interface's primary IP address.

**Defaults** Not configured.

**Command Modes** VRRP

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                 |
|------------|---------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                   |
| 9.10(0.0)  | Introduced on the S3148.                                                                    |
| 9.8(2.0)   | Introduced on the S3100 series.                                                             |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                 |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                 |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                 |
| 9.0.2.0    | Introduced on the S6000.                                                                    |
| 8.3.19.0   | Introduced on the S4820T.                                                                   |
| 8.3.11.1   | Introduced on the Z9000.                                                                    |
| 8.3.7.0    | Introduced on the S4810.                                                                    |
| 7.6.1.0    | Introduced on the S-Series.                                                                 |
| 7.5.1.0    | Introduced on the C-Series.                                                                 |
| 7.4.1.0    | Introduced support for telnetting to the VRRP group IP address assigned using this command. |
| 6.2.1.1    | Introduced on the E-Series.                                                                 |

## Usage Information

The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.

A system message appears after you enter or delete the `virtual-address` command.

To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual IP address with the same address as the interface's primary IP address and change the priority of the VRRP group to 255.

You can ping the virtual IP addresses configured in all VRRP groups.

## vrrp delay minimum

Set the delay time for VRRP initialization after an interface comes up.

**Syntax** `vrrp delay minimum seconds`

**Parameters** ***seconds*** Enter the number of seconds for the delay for VRRP initialization after an interface becomes operational. The range is from 0 to 900 (0 indicates no delay).

**Defaults** 0

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |

| Version  | Description               |
|----------|---------------------------|
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

#### Usage Information

This command applies to a single interface. When you use this command with the `vrrp delay reload` command, the later timer rules VRRP enabling. For example, if `vrrp delay reload` is 600 and `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

#### Related Command

- [vrrp delay reload](#) — sets the delay time for VRRP initialization after a system reboot.

## vrrp delay reload

Set the delay time for VRRP initialization after a system reboot.

**Syntax** `vrrp delay reload seconds`

**Parameters** **seconds** Enter the number of seconds for the delay. The range is from 0 to 900 (0 indicates no delay).

**Defaults** 0

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 9.0.0.0    | Introduced on the Z9000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.8.0    | Introduced on the S4810.                  |

#### Usage Information

This command applies to all the VRRP interfaces on a system. When you use this command with the `vrrp delay minimum` command, the later timer rules VRRP enabling. For example, if `vrrp delay reload` is 600 and `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.

- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

For the delay timers to take effect, save the configuration and reload the system.

**Related Command**

- [vrrp delay minimum](#) — sets the delay time for VRRP initialization after a line card reboot.

## vrrp-group

Assign a VRRP ID to an interface. You can configure up to 12 VRRP groups per interface.

**Syntax** `vrrp-group vrrp-id`

**Parameters** `vrrp-id` Enter a number as the group ID. The range is from 1 to 255.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                               |
|------------|-------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON. |
| 9.10(0.0)  | Introduced on the S3148.                  |
| 9.10(0.0)  | Introduced on the S6100-ON.               |
| 9.8(2.0)   | Introduced on the S3100 series.           |
| 9.8(1.0)   | Introduced on the Z9100-ON.               |
| 9.8(0.0P5) | Introduced on the S4048-ON.               |
| 9.8(0.0P2) | Introduced on the S3048-ON.               |
| 9.7(0.0)   | Introduced on the S6000-ON.               |
| 9.0.2.0    | Introduced on the S6000.                  |
| 8.3.19.0   | Introduced on the S4820T.                 |
| 8.3.11.1   | Introduced on the Z9000.                  |
| 8.3.7.0    | Introduced on the S4810.                  |
| 7.6.1.0    | Introduced on the S-Series.               |
| 7.5.1.0    | Introduced on the C-Series.               |
| 6.2.1.1    | Introduced on the E-Series.               |

**Usage Information** The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual IP address, the VRRP group stops sending VRRP packets.

**Related Command**

- [virtual-address](#) — assigns up to 12 virtual IP addresses per VRRP group.

## version

Set the VRRP protocol version for the IPv4 group.

**Syntax** `version {2 | 3 | both}`

To return to the default setting, use the `no version` command.

|                   |             |                                                                                                                                |
|-------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>2</b>    | Enter the keyword <code>2</code> to specify VRRP version 2 as defined by RFC 3768, <i>Virtual Router Redundancy Protocol</i> . |
|                   | <b>3</b>    | Enter the keyword <code>3</code> to specify VRRP version 3 as defined by RFC 5798, <i>Virtual Router Redundancy Protocol</i> . |
|                   | <b>both</b> | Enter the keyword <code>both</code> for in-service migration from VRRP version 2 to VRRP version 3.                            |

**Defaults** 2

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version           | Description                                             |
|-------------------|---------------------------------------------------------|
| <b>9.10(0.1)</b>  | Introduced on the S6010-ON and S4048T-ON.               |
| <b>9.10(0.0)</b>  | Introduced on the S3148.                                |
| <b>9.10(0.0)</b>  | Introduced on the S6100-ON.                             |
| <b>9.8(2.0)</b>   | Introduced on the S3100 series.                         |
| <b>9.8(1.0)</b>   | Introduced on the Z9100-ON.                             |
| <b>9.8(0.0P5)</b> | Introduced on the S4048-ON.                             |
| <b>9.8(0.0P2)</b> | Introduced on the S3048-ON.                             |
| <b>9.7(0.0)</b>   | Introduced on the S6000-ON.                             |
| <b>9.5(0.1)</b>   | Introduced on the Z9500.                                |
| <b>9.5(0.0)</b>   | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information** You can use the `both` command to migrate from VRRPv2 to VRRPv3. When you set the VRRP protocol version to `both`, the switch sends only VRRPv3 advertisements but can receive either VRRPv2 or VRRPv3 packets. To migrate an IPv4 VRRP group from VRRPv2 to VRRPv3:

1. Set the switches with the lowest priority to `both`.
2. Set the switch with the highest priority to version 3.
3. Set all the switches from `both` to version 3.

 **NOTE:** Do not run VRRP version 2 and version 3 in the same group for an extended period of time.

### Example

```
DellEMC(conf-if-te-1/1/1-vrid-100)# version ?
2 VRRPv2

## IPv6 VRRP Commands

The following are IPv6 VRRP commands.

- `clear counters vrrp ipv6`
- `debug vrrp ipv6`
- `show vrrp ipv6`
- `vrrp-ipv6-group`

The following commands apply to IPv4 and IPv6:

- `advertise-interval`
- `description`

- [disable](#)
- [hold-time](#)
- [preempt](#)
- [priority](#)
- [show config](#)
- [virtual-address](#)

## clear counters vrrp ipv6

Clear the counters recorded for IPv6 VRRP groups.

**Syntax** `clear counters vrrp ipv6 [vrid | vrf vrf-name]`

**Parameters**

- vrid** (OPTIONAL) Enter the number of an IPv6 VRRP group; range is from 1 to 255.
- vrf vrf-name** (OPTIONAL) Enter the name of a VRF instance to clear the counters of all IPv6 VRRP groups in the specified VRF. The maximum is 32 characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                                            |
| 9.9(0.0)   | Added support to clear the interface configurations corresponding to a range of ports.                              |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                                           |
| 8.3.10.0   | Introduced on the S4810.                                                                                            |
| 8.4.1.0    | Introduced on E-Series, C-Series, and S-Series. Support was added for IPv6 VRRP groups in nondefault VRF instances. |
| 8.3.2.0    | Introduced on the E-Series.                                                                                         |

### Usage Information

**NOTE:** You can also clear the port configurations corresponding to a range of ports. For Open Networking (ON) platforms, the notation for specifying the port range in the command is different from how you specify the port range in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1/1 - 1/1/4`.

# debug vrrp ipv6

Enable VRRP debugging.

**Syntax** `debug vrrp ipv6 interface [vrid] {all | packets | state | timer}`

|                   |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b> | Enter the following keywords and the interface information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Port Channel interface, enter the keywords <code>port-channel</code>, and then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code>, and then the VLAN ID. The VLAN ID range is from 1 to 4094.</li></ul> |
|                   | <b>vrid</b>      | (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                   | <b>all</b>       | Enter the keyword <code>all</code> to enable debugging of all VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | <b>bfd</b>       | Enter the keyword <code>bfd</code> to enable debugging of all VRRP BFD interactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | <b>database</b>  | Enter the keyword <code>database</code> to display changes related to group, prefix, and interface entries in the VRRP table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                   | <b>packets</b>   | Enter the keyword <code>packets</code> to enable debugging of VRRP control packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>state</b>     | Enter the keyword <code>state</code> to enable debugging of VRRP state changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                   | <b>timer</b>     | Enter the keyword <code>timer</code> to enable debugging of the VRRP timer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Version    | Description                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                           |
| 9.10(0.0)  | Introduced on the S3148.                                                                                            |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                                         |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                                     |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                                         |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                                         |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                                         |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                                         |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                            |
| 8.3.19.0   | Introduced on the S4820T.                                                                                           |
| 8.3.10.0   | Introduced on the S4810.                                                                                            |
| 8.4.1.0    | Introduced on E-Series, C-Series, and S-Series. Support was added for IPv6 VRRP groups in nondefault VRF instances. |
| 8.3.2.0    | Introduced on the E-Series.                                                                                         |

**Usage Information** If you do not specify an option, debugging is active on all interfaces and all VRRP groups.

# show vrrp ipv6

View the active IPv6 VRRP groups. If no VRRP groups are active, the Dell EMC Networking OS returns `No Active VRRP group`.

|                   |                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show vrrp ipv6 [vrid] [interface] [brief] [vrf vrf-name]</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b> | <b>vrid</b>                                                           | (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | <b>interface</b>                                                      | Enter the following keywords and the number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port/subport information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a port channel interface, enter the keywords <code>port-channel</code>, and then a number.</li><li>For a VLAN interface, enter the keyword <code>vlan</code>, and then a number from 1 to 4094.</li></ul> |
|                   | <b>brief</b>                                                          | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                   | <b>vrf vrf-name</b>                                                   | Enter the keyword <code>vrf</code> then the name of the VRF to view IPv6 VRRP groups corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                        |
|------------|----------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.          |
| 9.10(0.0)  | Introduced on the S3148.                           |
| 9.10(0.0)  | Introduced on the S6100-ON.                        |
| 9.8(2.0)   | Introduced on the S3100 series.                    |
| 9.8(1.0)   | Introduced on the Z9100-ON.                        |
| 9.8(0.0P5) | Introduced on the S4048-ON.                        |
| 9.8(0.0P2) | Introduced on the S3048-ON.                        |
| 9.7(0.0)   | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(1.0)   | Introduced on the Z9500.                           |
| 8.3.19.0   | Introduced on the S4820T.                          |
| 8.3.10.0   | Introduced on the S4810.                           |
| 8.3.2.0    | Introduced on the E-Series.                        |

**Usage Information** The following describes the `show vrrp ipv6` command.

| Line starting with       | Description                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GigabitEthernet..</b> | Displays the interface, VRRP group ID, and network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network IP address. |
| <b>VRF</b>               | VRF instance to which the VRRP group interface belongs.                                                                                              |
| <b>State: master...</b>  | Displays the interface's state:                                                                                                                      |

| Line starting with         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | <ul style="list-style-type: none"> <li>• Na/If (not available)</li> <li>• master (MASTER virtual router)</li> <li>• backup (BACKUP virtual router)</li> </ul> <p>Also displays the interface's priority and IP address of the MASTER.</p>                                                                                                                                                                                                                                                                                     |
| <b>Hold Down:...</b>       | <p>Displays additional VRRP configuration information:</p> <ul style="list-style-type: none"> <li>• Hold Down displays the hold down timer interval in seconds.</li> <li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li> <li>• AdvInt displays the Advertise Interval in seconds.</li> </ul>                                                                                                                                                                                    |
| <b>Adv rcvd:...</b>        | <p>Displays counters for the following:</p> <ul style="list-style-type: none"> <li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li> <li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li> <li>• Bad pkts rcvd displays the number of invalid packets received on the interface.</li> </ul>                                                                                                                                                               |
| <b>Virtual MAC address</b> | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Virtual IP address</b>  | Displays the virtual IP address of the VRRP router to which the interface is connected.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tracking states...</b>  | <p>Displays information on the tracked interfaces or objects configured for a VRRP group (<code>track</code> command), including:</p> <ul style="list-style-type: none"> <li>• UP or DOWN state of the tracked interface or object (Up or Dn).</li> <li>• Interface type and slot/port[/subport] or object number, description, and time since the last change in the state of the tracked object.</li> <li>• Cost subtracted from the VRRP group priority if the state of the tracked interface/object goes DOWN.</li> </ul> |

## Example

```
DellEMC# show vrrp ipv6

TenGigabitEthernet 5/6/1, IPv6 VRID: 255, Version: 3, Net:
fe80::201:e8ff:fe7a:6bb9
VRF: 0 default-vrf
State: Master, Priority: 101, Master: fe80::201:e8ff:fe7a:6bb9 (local)
Hold Down: 0 centisec, Preempt: TRUE, AdvInt: 100 centisec
Accept Mode: FALSE, Master AdvInt: 100 centisec
Adv rcvd: 0, Bad pkts rcvd: 0, Adv sent: 64
Virtual MAC address:
 00:00:5e:00:02:ff
Virtual IP address:
 1::255 fe80::255
```

## vrrp-ipv6-group

Assign an interface to a VRRP group.

|                      |                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>vrrp-ipv6-group vrid</code>                                                                                |
| <b>Parameters</b>    | <p><b><i>vrid</i></b> Enter the virtual-router ID number of the VRRP group. The VRID range is from 1 to 255.</p> |
| <b>Defaults</b>      | Not configured.                                                                                                  |
| <b>Command Modes</b> | INTERFACE                                                                                                        |

## Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

| Version    | Description                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------|
| 9.10(0.1)  | Introduced on the S6010-ON and S4048T-ON.                                                                |
| 9.10(0.0)  | Introduced on the S3148.                                                                                 |
| 9.10(0.0)  | Introduced on the S6100-ON.                                                                              |
| 9.8(2.0)   | Introduced on the S3100 series.                                                                          |
| 9.8(1.0)   | Introduced on the Z9100-ON.                                                                              |
| 9.8(0.0P5) | Introduced on the S4048-ON.                                                                              |
| 9.8(0.0P2) | Introduced on the S3048-ON.                                                                              |
| 9.7(0.0)   | Introduced on the S6000-ON.                                                                              |
| 9.2(1.0)   | Introduced on the Z9500.                                                                                 |
| 8.4.2.1    | The range of valid VRID values on the E-Series when VRF microcode is loaded in CAM changed from 1 to 15. |
| 8.4.1.0    | Introduced on the E-Series, C-Series, and S-Series.                                                      |
| 8.3.19.0   | Introduced on the S4820T.                                                                                |
| 8.3.7.0    | Introduced on the S4810.                                                                                 |
| 8.3.2.0    | Introduced on the E-Series.                                                                              |

## Usage Information

The VRRP group only becomes active and sends VRRP packets when you configure a link-local virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.

- When you do not load the VRF microcode in the CAM, the VRID for a VRRP group is the same as the VRID number configured with the `vrrp-group` or `vrrp-ipv6-group` commands.
- When you load the VRF microcode in the CAM, the VRID for a VRRP group equals 16 times the `vrrp-group` or `vrrp-ipv6-group vrid` number, plus the `ip vrf vrf-id` number. For example, if you load the VRF microcode and you configure the VRRP group as 10 in VRF 2, the VRID for the VRRP group is  $(16 \times 10) + 2$ , or 162. This VRID value is used in the lowest byte of the virtual MAC address of the VRRP group and is also used for VRF routing.

 **NOTE:** For all routers to interoperate, configure the same VRID on neighboring routers (Dell EMC Networking or non- Networking) in the same VRRP group.

## Related Commands

- [virtual-address](#) — assigns up to 12 virtual IP addresses per VRRP group.

# X.509v3

X.509v3 is a standard for public key infrastructure (PKI) to manage digital certificates and public key encryption. This standard specifies a format for public-key certificates or digital certificates.

Dell EMC Networking OS supports X.509v3 standards.

## Topics:

## crypto ca-cert delete

Deletes a CA certificate.

**Syntax** `crypto ca-cert delete [index]`

**Parameters** **index** (Optional) Enter the keyword `index` to specify the index of the CA certificate. If `index` is not specified, the system deletes all of the installed CA certificates.

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

Before deleting a CA certificate, the system checks whether that certificate is an issuer of other installed certificate on the system. If so, the system informs you to delete other installed certificates first.

**Related Commands** [crypto ca-cert install](#)[crypto cert generate](#)[crypto ca-cert install](#)

# crypto ca-cert install

Downloads and installs the certificate of a Certificate Authority (CA) on to the device.

**Syntax** `crypto ca-cert install path`

**Parameters** **path** Enter the path where the CA certificate is available for download. The format that you use to specify the location of the CA certificate also includes the protocol that is used to contact the CA. You can use the following options that you can use to download and install a certificate from the CA:

- tftp — `tftp://ca-ip-address/tftp/CAcert.pem`
- usbflash: — `usbflash:/certs/CAcert.pem`
- ftp — `ftp://userid:password@ca-ip-address/certs/CAcert.pem`
- scp — `scp://userid:password@ca-ip-address/certs/CAcert.pem`
- http — `http://192.168.1.100/certs/CAcert.pem`
- flash — `flash://filepath/filename`

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Upon successful installation, the system displays a notification on the device. If remote logging is configured, the notification is also sent to the syslog server. Contents of the CA certificate's subject are displayed.

**Related Commands**

- [crypto cert install](#)

# crypto cert delete

Deletes a trusted certificate.

**Syntax** `crypto cert delete`

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

The certificate matching the current FIPS state is deleted. If the system is in FIPS mode, the FIPS certificate is deleted. If the system is in non-FIPS mode, the non-FIPS certificate is deleted.

Before deleting the system's trusted certificate, the system prompts you to specify whether to proceed with deletion. If you proceed, the system deletes the certificate and also the private key.

#### Related Commands

- [crypto ca-cert install](#)
- [crypto cert generate](#)

## crypto cert generate

Generates a Certificate Signing Request (CSR) or a self-signed certificate.

**Syntax** `crypto cert generate {self-signed | request} [cert-file cert-path key-file {private | key-path}] [country 2-letter code] [state state] [locality city] [organization organization-name] [orgunit unit-name] [cname common-name] [email email-address] [validity days] [length length] [altname alt-name]`

#### Parameters

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>self-signed</b>                           | Enter the keyword <code>self-signed</code> to create a self-signed certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>request</b>                               | Enter the keyword <code>request</code> to create a certificate signing request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>cert-file</b>                             | Enter the keyword <code>cert-file</code> to specify that the certificate needs to be created.<br><span style="border-left: 1px solid blue; padding-left: 10px;"><b>NOTE:</b> If the <code>cert-file</code> option is not specified in the command, then the system interactively prompts you to fill in rest of the fields of the certificate signing request (CSR).</span>                                                                                                                                                                                 |
| <b><i>cert-path</i></b>                      | Enter the path to locally store the self-signed certificate or CSR. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the CSR file is stored. You can then export the CSR to a CA using the "copy" command. Following is an example of a path that you can specify: <code>flash://certs/s4810-001-request.csr</code> .                                                                                                                                                  |
| <b>key-file</b>                              | Enter the keyword <code>key-file</code> to specify the private key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>private</b>                               | Enter the keyword <code>private</code> to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>key-path</i></b>                       | Enter the absolute or relative location on the device where the key is stored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>country <i>2-letter-code</i></b>          | (OPTIONAL) Enter the keyword <code>country</code> followed by the two letter code that is used to identify the country name.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>state <i>state</i></b>                    | (OPTIONAL) Enter the keyword <code>state</code> followed by the name of the state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>locality <i>city</i></b>                  | (OPTIONAL) Enter the keyword <code>locality</code> followed by the name of the city.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>organization <i>organization-name</i></b> | (OPTIONAL) Enter the keyword <code>organization</code> followed by the name of the organization.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>orgunit <i>unit-name</i></b>              | (OPTIONAL) Enter the keyword <code>orgunit</code> followed by the name of the unit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cname <i>common-name</i></b>              | Enter the keyword <code>cname</code> followed by the common name that you want to assign.<br><span style="border-left: 1px solid blue; padding-left: 10px;"><b>NOTE:</b> Common Name is an important attribute while creating a CSR or a self-signed certificate. Common name is the main identity presented to connecting entities. By default, the device's host name acts as the common name. However, you can still configure a different common name for the device. For example, you can specify an IP address to act as a Common Name for the</span> |

device. If the Common Name does not match the device's presented identity, then even a properly signed certificate does not validate correctly.

**email *email-address***

(OPTIONAL) Enter the keyword `email` followed a valid email address used for communication with the organization.

**validity *days***

(OPTIONAL) Enter the keyword `validity` followed by the number of days for which the certificate is valid.

**i** **NOTE:** For CSRs, validity has no effect. For self-signed certificates, if validity is not specified, it defaults to 3650 days, or 10 years.

**length *length***

(OPTIONAL) Enter the keyword `length` followed by a bit length value. The default key length for both FIPS and non-FIPS mode is 2048. Minimum key length value for FIPS mode is 2048. The range is from 2048 to 4096. Minimum key length value for non-FIPS mode is 1024. The range is from 1024 to 4096.

**altname *altname***

(OPTIONAL) Enter the keyword `altname` followed by the subject alternate name for the organization. For example, `altname IP:192.168.1.100`.

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

If the `cert-file` option is not specified in the command, then the system interactively prompts you to fill in various fields of the certificate signing request (CSR). You are prompted to fill out some metadata information for the certificate. The following example shows the fields that you are prompted to fill:

```
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a
DN.
There are quite a few fields but you can leave some blank.
For some fields there will be a default value; if you enter '.', the
field will be left blank.

Country Name (2 letter code) [US]:
State or Province Name (full name) [Some-State]:California
Locality Name (eg, city) []:San Francisco
Organization Name (eg, company) []:Starfleet Command
Organizational Unit Name (eg, section) []:NCC-1701A
Common Name (eg, YOUR name) [S4810-001]:
Email Address []:scotty@starfleet.com
```

You can enter only 256 characters per command. If you have field values that are larger than 256 characters in length, use the interactive mode of the command.

**Related Commands**

- [crypto ca-cert install](#)

# crypto cert install

Installs a trusted certificate on a device.

**Syntax** `crypto cert install cert-file cert-path key-file {key-path | private} [password passphrase]`

|                   |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>cert-file</b>           | Enter the keyword <code>cert-file</code> to specify that the certificate needs to be downloaded.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>cert-path</b>           | Enter the path where the certificate is locally stored. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the certificate file is stored. Following are example of a path that you can specify: <code>flash://certs/s4810-001-request.crt</code> and <code>usbflash:/certs/s4810-001-cert.pem</code><br><b>NOTE:</b> Before installing a trusted certificate, you first need to download it from a remote CA using the <code>copy</code> command. |
|                   | <b>key-file</b>            | Enter the keyword <code>key-file</code> to specify the private key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>private</b>             | Enter the keyword <code>private</code> to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>key-path</b>            | Enter the absolute or relative location on the device where the key is stored.<br><b>NOTE:</b> After the certificate is successfully installed, the private key is deleted from the specified location and copied to the hidden location in NVRAM.                                                                                                                                                                                                                                                                                    |
|                   | <b>password passphrase</b> | (Optional) Enter the keyword <code>password</code> followed by the password phrase used to decrypt the private key.<br><b>NOTE:</b> You can generate the private key and certificate on another host. While doing so, you must keep the private key encrypted with a passphrase so that the private key is not compromised during transport. The password phrase acts a facility to decrypt the private key before installing it on the switch.                                                                                       |

**Defaults** NA.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

| Version  | Description             |
|----------|-------------------------|
| 9.11.0.0 | Introduced the command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Certain parameters must be met in order for this command to succeed:

- The downloaded certificate should be formatted properly.
- In order for verification to work, the CA certificate must be installed on the system before running this command.
- The downloaded certificate's public key must correspond to the private key.
- If the certificate is not self-signed, then the CA certificate (from the CA that has signed the certificate) must be installed on the system prior to running this command for verification to work.

**NOTE:** It is possible for the switch to store two types of certificates: one for the FIPS mode and one for the non-FIPS mode. If the system is in FIPS mode, the certificate is installed as the FIPS

certificate. If the system is in non-FIPS mode, the certificate is installed as the non-FIPS certificate. When FIPS mode is enabled or disabled, the certificates (and keys) are switched by the system.

**NOTE:** For the switch, there are two possible certificates stored - one for FIPS mode, one for non-FIPS mode. If the system is in FIPS mode, the certificate will be installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate will be installed as the non-FIPS certificate. When FIPS mode is enabled/disabled, the certificates (and keys) are switched by the system.

#### Related Commands

- [crypto ca-cert install](#)

## crypto x509 ocspp

Configures the OCSP behavior.

**Syntax** `crypto x509 ocspp [nonce] [sign-requests]`

**Parameters**

|                      |                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nonce</b>         | Enter the keyword <code>nonce</code> to use the nonce feature for the OCSP requests to OCSP responder communication. This is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature. |
| <b>sign-requests</b> | Enter the keyword <code>sign-requests</code> to sign the OCSP requests to OCSP responder communication with the system's own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.                                                                                |

**Defaults** NA.

**Command Modes** CONFIGURATION

## crypto x509 revocation

Configure the revocation check behavior for the certificate.

**Syntax** `crypto x509 revocation ocspp {accept | reject}`

**Parameters**

|              |                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ocspp</b> | Enter the method used to check certificate revocation details. In this release, OCSP is the only option that is supported. So, you can specify OCSP as the method-list value. |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- accept** Enter the keyword `accept` to accept the presented certificate and log in if OCSP retrieval fails.
- reject** Enter the keyword `reject` to reject the presented certificate and log in if OCSP retrieval fails.

**Defaults** `crypto x509 revocation ocsf accept`

**Command Modes**

- CONFIGURATION Mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Related Commands**

- [crypto x509 ocsf](#)

## debug crypto

This command allows you to test a certificate chain file for validity and checking revocation outside of its use in TLS communication.

**Syntax** `debug crypto {flash://path}`

**Parameters** **path** Enter the path to a local file where a certificate chain is stored in PEM format.

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

You can use this command to verify an X509 certificate outside of use with Syslog over TLS.

**Related Commands**

- [crypto cert install](#)
- [crypto cert generate](#)
- [crypto ca-cert install](#)

## logging secure

Creates a log file for various events related to X.509v3 certificates.

**Syntax** `logging {hostname} {secure | tcp | udp} [vrf vrf-name] [sha1 fingerprint] [port port-number]`

|                   |                                |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>hostname</b>                | Enter the name of the host or device for which you wish to record logs corresponding to the certificates.<br> <b>NOTE:</b> The hostname can be an IPV4 address, an IPV6 address, or a DNS hostname—with or without DNS suffix.                                                                  |
|                   | <b>secure</b>                  | Enter the keyword <code>secure</code> to enable the Syslog feature to communicate with a compatible Syslog server using the secure TLS protocol over the default port (6514). The range is from 1024 to 65535.                                                                                                                                                                   |
|                   | <b>tcp</b>                     | Enter the keyword <code>tcp</code> to enable TCP.                                                                                                                                                                                                                                                                                                                                |
|                   | <b>udp</b>                     | Enter the keyword <code>udp</code> to enable UDP.                                                                                                                                                                                                                                                                                                                                |
|                   | <b>vrf <i>vrf-name</i></b>     | Enter the keyword <code>vrf</code> followed by the name of the VRF.                                                                                                                                                                                                                                                                                                              |
|                   | <b>sha1 <i>fingerprint</i></b> | Enter the keyword <code>sha1</code> followed by the finger print. This option is only available when the <code>secure</code> option is configured. This new option enables the Syslog feature to compare the received certificate's sha-1 fingerprint against this configured sha-1 fingerprint. If present, only the fingerprint is used for certificate revocation validation. |
|                   | <b>port <i>port-number</i></b> | Enter the keyword <code>port</code> followed by the port number. The default port number is 6514 for secure logging.                                                                                                                                                                                                                                                             |

**Defaults** None.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| <b>Version</b>  | <b>Description</b>       |
|-----------------|--------------------------|
| <b>9.11.0.0</b> | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- `sysadmin`
- `secadmin`

Following are the pre-requisites to configure logging:

- The logging command must be configured to enable event logging.
- A certificate must be installed on the switch. This certificate is only used for secure logging.
- At least one CA certificate must be installed on the switch so that the logging server's certificate can be verified. If a SHA1 fingerprint is present, only the fingerprint is used for certificate revocation validation.

- Related Commands**
- [crypto cert install](#)
  - [crypto ca-cert install](#)
  - [crypto cert generate](#)

## crypto x509 ca-keyid

Creates a per-certificate configuration context using the specified subject key identifier.

**Syntax** `crypto x509 ca-keyid subject-key-identifier`

Use to the `no crypto x509 ca-keyid` command to remove this configuration.

**Parameters**

***subject-key-identifier*** Enter the content of the `SubjectKeyIdentifier` field from the CA certificate.

**NOTE:** To get the subject key identifier details, enter the `show crypto ca-cert` command. This command displays the CA certificate details.

**Defaults** None.

**Command Modes** • CONFIGURATION Mode

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information** The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

When you use this command, the device maps the current certificate context in the certificate store to a CA certificate through the subject key identifier field. The subject key identifier field contains the SHA-1 hash of the CA's public key. This configuration provides a way to uniquely identify a CA and associate it with any CA-specific settings.

This context is used to store certificate-specific settings such as alternate CRL and OCSP locations. Incoming X.509 certificates whose `AuthorityKeyIdentifier` extensions match the configured subject key identifier has these settings applied to them.

The `crypto x509 ca-keyid` command when used with the `ocsp-server` command in the global configuration mode creates a per-certificate configuration context under which the remaining commands are entered.

**Related Commands**

- [ocsp-server](#)
- [crypto x509 ocsp](#)

## ocsp-server

Configures OCSP server on a CA.

**Syntax** `ocsp-server url [nonce] [sign-requests]`

**Parameters**

|                      |                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>url</b>           | Enter the URL for the OCSP responder using standard URI format. Either http or https protocol can be used. For example, <code>http://[1100::101]:8888</code> .                                                                                                                                                                                                                               |
| <b>nonce</b>         | Enter the keyword <code>nonce</code> to use the nonce feature for the OCSP requests to OCSP responder communication. This number is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature. |
| <b>sign-requests</b> | Enter the keyword <code>sign-requests</code> to sign the OCSP requests to OCSP responder communication with the system's own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.                                                                                       |

**Defaults** None.

**Command Modes** CERTIFICATE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information**

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Multiple OCSP responders may be configured per CA. The system tries each one until it gets a valid response. No priority may be specified or guaranteed; the system tries them in the order in which they were configured.

**Related Commands**

- [crypto x509 ocsf](#)

## ocsp-server prefer

Configures OCSP responder preference. You can configure the preference or order that the CA or a device should follow while contacting multiple OCSP responders.

**Syntax** `ocsp-server prefer`

**Defaults** None.

**Command Modes** CERTIFICATE

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information**

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

When this command is specified, the system checks the configured OCSP URLs before checking the URL of the OCSP server in the authorityInfoAccess extension of the certificate. If this command is not specified, then the system checks the OCSP server in the authorityInfoAccess extension of the certificate before checking the configured OCSP servers.

**Related Commands**

- [crypto x509 ocsf](#)

## show crypto ca-cert

Displays the certificate information corresponding to the root CA.

**Syntax** `show crypto ca-certs`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information**

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

This show command should display the index, the certificate's subject field in plaintext, not-before and not-after dates, and the fingerprint in hexadecimal format. The index assigned to each CA certificate is used by the crypto cert delete certificate-authority command to allow the user to specify which certificate authority to remove.

**Related Commands**

- [crypto ca-cert install](#)

## show crypto cert

Displays the certificate information that is specified.

**Syntax** `show crypto cert {path}`

**Parameters**

|             |                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>path</b> | (OPTIONAL) Enter the path to a local file where a certificate chain is stored in PEM format. If a path is not specified, display the certificate that is currently installed on the system. |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command:

| Version  | Description              |
|----------|--------------------------|
| 9.11.0.0 | Introduced this command. |

**Usage Information**
